In regard to religion, m single faith was dominant. Buddhism still in full bloom in Eastern Turkestan and still strong in the upper Oxes provinces, where it was the seem of the northern branch of the Hephthalites (see RAYATILA) who put up such a strenuous resistance to the Arabs in the later 1st/7th and early and/8th centuries, and where Balkh (q.v.) still major Buddhist centre; but it had, for some time, waning in Soghdia. When the Chinese Buddhist pilgrim Hipen-Tsang arrived in Samarkand in co. 630. he found the Zoroastrians completely in the ascendant there and the Buddhist monasteries deserted; the restorative which he took can only have arrested this decline temporarily. For as in the linguistic field, cultural pressures from Sāsānid Persia must have given Zoroastrianism an access of prestige and power in Transoxania, even though direct Sasanid military authority did not extend beyond Marw (ct. W. Barthold, Histoire des Times d'Asie Centrals, Paris 2945, 33-5). Manicheism and other dualist faiths were tolerated, and their adherents found an especially sympathetic haven in Eastern Turkestan and among the Uyghur Turks, as numerous surviving religious texts from the Tarim basin attest: as late as ca. 372/982 the Hudad al-falam, tr. Minorsky, London 1937, 113, § 25.13, records the presence in Samarkand of a conventual house of the Manichaeans, hhānagāh-i Mānawiyān, with auditores or nighāshāk. Mazdakltes are mentioned also in Samarkand, and if the followers of the late and/8th century heretic al-Mukanaa", the "wearers of white" (see below) were Mazdakites (or Manichaeans?), their adherents still persisted at Kish and Nakhshab in the time of the continuator of Narshakhi Ahmad b. Muhammad b. Naşr (Ta'rikh-i Bukhara, 88-9, tr. 75). The Christian presence was strong. A bishop is mentioned at Marw in 334 A.D. and there was probably one in Samarkand by the iiii century. Nestorians, Jacobites and Melkites were all represented in Transoxania. When the Samanid amir isma'll b. Ahmad [q.v.] conquered Talas = 180/893, a "great church" was transformed into mosque [ibid., toz, tr. 86-7). The absence of any one preponderant faith meant that there did not exist to Transoxania a dominant priesthood as there was in Sasanid Persia, though religious scholars (abbar; al-Tabari, ii, 1237) are mentioned in Khwarazm at the time of Kutayba's incursions of 93/712, perhaps Zoroastrian priests; but resistance there to the Arabs was on grounds of local patriotism rather than me religious basis.

Socially, there was an influential class of merchants in such Soghdian towns as Bukhara, Paykand and Samarkand, which was involved in long-distance trade operations with the Turkish peoples of the Siberian steppes and with the Chinese. The Amb invasions would not seriously hamper these trade movements, and indeed, the Soghdian merchants eventually found markets within the Islamic caliphate for the goods which they imported from limet Asia. The landed aristocracy of diligious was disulnant in the countryside and smaller towns, and the pattern of large estates in Klawarazm, along the Oxos channels and their canals, revealed by Soviet archaeology, was probably repeated in the irrigated lands of the Zarafshan valley and the upper Oxus ones. The local Iranian princes of Transoxania mentioned in the sources, such as those in tural IIIk [q.v. in Suppl.], Shāsh [q.v.] and Fergulus, and in cities like Samarkand and Bukhara, comprised the more powerful members of the dikkds class and bore Iranian regnal titles such as ihhabid [q.v.] from Old Persian hhabayathiya"king, ruler"), e.g. in Soghdia and Farghana. Such I land-owning class (which may be called, not anachronistically, one of feudal magnates) of dihkāns was the backbone of resistance to the Arabs, and continued III play a leading social role—eventually as an Islamised caste—in Transoxania till the end of the Sāmānid period, during which political authority was still to a considerably extent decentralised; its decline only came with the influx of Turkish steppe peoples in the 5th/11th century and after.

The Arabs who had invaded Persia and overthrown the Sāsānid empire penetrated to Tukhāristān
in 'Uhmān's caliphate, during the governorship in
Khurāsān of 'Abd Allāh b. 'Ārnir [q.v.], and alBalādhuri, Futāh, 408, records, on the authority
of Abd 'Ubayda, m piunder raid across the Oxus to
Māymurgh near Samarkand in 33/653-4. It would
have been obviously unwise to commit major Arab
forces across the river until some progress had been
made against the resistance of the Hephthalites
in Cisoxania and until a key point like Balkh had
been captured (first raided in 32/653, but not fully
scoured till the time of Kntayba, see BALKM) and
the Oxus crossing-points of Āmul-i Shatt [q.v.] and
Zamm taken.

In the spring of 54/674 Mu'āwiya's general 'Ubayd Allāh b. Ziyād [q.v.] crossed the Oxus, attacked Paykand and defeated the army of the local Soghdian ruler of Bukhārā, the Bukhār-Khudā. Yazād I's governor, Salm b. Ziyād (61-4/681-3) was the first Arab commander actually winter the theory with the river. Any hopes of Arab progress in Transoxania were dashed by the civil wars which broke out in the heart of the caliphate on Yazīd's death and the protracted resistance to the Umayyad government in Damaseus of the anti-caliph 'Abd ball b. al-Zubayr, even though the Soghdian cities remained disunited and their nominal suzerain the Chinese emperor was unable, despite embassies despatched to Peking and appeals

for help, to supply any assistance.

It was the great Kutayba b. Musiim al-Bāhill [q.v.] who was the first Arab general to establish a firmer Arab hold over Transoxania. Appointed governor of the east by al-Hadidiadi in 86/703, he was to enjoy a ten years' tonure of power, spanning the caliphate of al-Walld b. Abd al-Malik, a reign particularly significant for the extension of Muslim power in both east and west. Kutayba first campaigned successfully in the Upper Oxus provinces at the invitation of the ruler of Caghaniyan, who sought ald against local rivals (86/705). Between 37/706 and 90/ 709 be conquered Paykand and Bukhārā, installing in the latter city a local prince Tughshāda as his vassal, and received the submission of Tarkhan of Samarkand and his successor Gharak. Mosques were now built in Bukhārā, Samarkand, etc., 🖪 order to encourage the implantation of Islam and the inhabitants of Bukhára were forced to give up half the houses of the madina or shahrasian as billets for the incoming Arab garrison; but according to Narshakhi, 57, tr. 48, Kutayba had to pay the local inhabitants two dirkams a time to attend the Friday prayers. It was first in 88/707 that Kutayba had to repel Turkish forces which appeared in Transoxania when the people of Bukhara appealed to the powerful Kaghan of the Eastern Turks, whose name is known only in the Chinese transcription of Mo-co; and a further Turkish invasion into Soghdia in 93/712, at the invitation of the people of Samarkand, repulsed by Kutayba in the following year, may be that mentioned in the early Turkish Orkhon inscriptions (Khočo-Tsaidam, Kültigin I E 39) - the - undertaken by

the prince Kültigin which penetrated in far in Tamir Kapigk, the "Iron Gate" (sc. the present Buzgala defile between Kish and Tirmidh), "in order to organise the Soghdian people" (the connection of these seems fairly certain, as proposed by Marquart and Barthold; cl. R. Giraud, L'ampire des Tures edestes, les règnes d'Elterich, Qapphan et Bilga (680-734), Paris 1960, 44, 182-3, who also notes that this inscription (Kültigin I, E 3x) mentions an earlier expedition to the Iron Gate under Tonyukuk in 701). Kutayba further sent two expeditions against Khwarazm in 93/712, when the Khwarazm-Shah killed, although it was long before Islam became firmly implanted there [see KH"ARAZN]. His forces also campaigned in the Sir Darya valley in Ushrusana [q.v.] and Shash, meeting no resistance from the Turks, aithough the brief report in al-Tabari, ii, 1276, of a raid by one of his commanders as far as Kashghar, on the other side of the Tien Shan, seems improbable (see H. A. R. Gibb, The Arab invasion of Kashghar in A.D. 725, in BSOS, it [1923], 467-74).

The Turks' ability to intervene once more in Transoxanian affairs was for a while hampered by internal disputes between the Eastern and Western Turks, but after 7x6, ■ forceful ruler, Su-lu, made himself leader of the Western Turks or Turgesh. In 106/724 he inflicted = sharp defeat, the so-called "Day of thirst", on the Arab commander Sa9d b. 'Amr al-Harash' who had invaded Farghana, in the Sir Darya besin, and this reduced aggressive activity on the part of the Arabs for a decade or two. It is from these years, immediately after the fall of Kutayba, that there dates the important cache of documents in Soghdian, the archives of Divastic, prince of Pandikent on the upper reaches of the Zarafahān, kept at bis stronghold - Mount Mugh, sacked in 104/722-3 by the Arabs (al-Tabari, ii, 1447-8; cf. A. L. Mongait, Archaeology in the U.S.S.R., Moscow 1959, 289-95). In the ensuing years, the Arabs, now in the defensive, were pushed back by the joint efforts of the Soghdian princes and the Turks, so that by 110/728 the Arabs only held Samarkand and Dabosiyya. The Arabs themselves were divided after 115/734, when the rebellion of al-Hārith II. Suraydi al-Mudiāshifi [q.v.] broke out, first in Tukhāristān and then in Transoxania (where al-Hārith allied with the Kaghan of the Türgesh, Su-lu), lasting for several years. There was also much discontent amongst that part of the indigenous Transoxanian population which had been converted to Islam but which nevertheless found itself still liable to pay the poll-tax for the benefit of the Arab treasury.

Arab fortunes only revived under the energetic and experienced-he had fought under Kutaybagovernor Nasr b. Sayyar al-Kinani (q.v.) (120-30/ 738-48), who made a generous financial settlement for the new converts and for those inhabitants who had apostasised from Islam when Arab military control had been relaxed and looked like disappearing aftogether, and who brought al-Harith b. Suraydi to terms in 126/744. He carried Arab minto Farghana again, but spent most of his efforts in pacifying Soghdia and in conciliating its people. Arab embassies to the Chinese court were resumed by Nasr after an hiatus in the period 115-23/733-41, and the regulation of commercial contacts may have been me of the motives involved (see Gibb, Chinese records of the embassies of the Arabs in Central Asia, in BSOS, il [1923], 619-22).

Nasr was forced to abandon both Transoxania and Khurasan by the growing menace of the 'Abbas-

id de me under Abū Muslim [q.v.], and pro-'Abbāsid governors were installed if the East from 130/748 onwards. This internal revolution amongst the Arabs must have the welcomed by the diskdas of Transoxania, disturbed at the waning of their political and social influence through the increased momentum of conversions to Islam. In 233/750-1 there was, moreover, pro-'Alid rising among the Arab garrison of Bukhārā, bloodily suppressed by the now 'Abbāsid governor Ziyād b. Sālib al-Khuzā' [q.v.]. Although the Bukhār-Khudā had co-operated with the Arab authorities against the insurgents, he afterwards executed that Muslim's orders.

Meanwhile, the dissensions into which the Türgesh steppe confederation had fallon in 738 with Su-lu's defeat in battle at the hands of the Chinese and his assassination by a rival Turkish chief, permitted a recrudescence, now on a scale much more threatening than ever before to the Arabs, of Chinese activity in Central Asia. In 748 Chinese forces captured the Turgesh capital of Sayab, in the Cu river valley to the north-east of Farghaua, and in 749 executed the local ruler of Shash for "the non-fulfilment of his duties 🖿 a vassal". For several decades, virtually since the first coming of the Arabs, the Soghdian rulers and the princes of Tukharistan (including among the latter the Yabghu, Arabic Diabbuya) had been sending embassies to China appealing for help against the invaders. Now in 750-2 the Korean general Kao-haien-chih was sent by the Chinese governor of Kuča in Eastern Turkestan, firstly against rebels in the Pamirs region of Gilgit [q.v. in Suppl.], and then into Farghana. Here the Chinese army, assisted by the Turkish Karluk [q.v.], met m Arab force under Ziyad b. Şâlih at Athlakh or Atlakh near Talas in 133/731, and was soundly defeated, with heavy losses of killed and captured (see D. M. Dunkop, A new source of information on the Battle of Talas or Allakk, in Uralaltäischer Jahrbucher, xxxvi [1965], 326-30). Amongst the prisoners-of-war were Chinese artisans who are supposed to have taught the people of Samarkand the art of paper-making (al-Tha'dlibl, Lata'if al-ma'drif, tr. Bosworth, The book of curious and entertaining information, Edinburgh 1968, 140, and KAGHAD). This marked the end of Chinese attempts to assert their negemony west of the Tien-Shan; to the subsequent entreaties of the Iranian printes of Transoxania and Kh "arazm for help against the Arabs, the T'ang emperors, pre-occupied by succession quarrels 755-63, were compelled to return noncommitted answers. Arab authority was thus made reasonable firm in Transoxania for the first time, since the local potentates no longer had any strong allies either in the Turkish steppes (the Eastern Turkish confederation had collapsed with the death of the Kaghan Mo-ki-lien in 744, to be replaced by that of the Uyghurs, who were essentially concerned with Mongolia and Eastern Turkestan) or in the Far East, That masses of population in Transoxania were as yet far from wholly reconciled to Arab political and social domination was to be demonstrated by various outbreaks of religio-political protest in the early 'Abbasid period (see further me these, below), but Arab authority was by that time never periously jeopardised.

For the detailed history of this first century or so of Arab domination in Transoxania, see F. H. Shrine and E. D. Ross, The keart of Asia, m history of Russian Turkeslan and the Central Asian khanates from the earliest times, London 1899, 34-89; Gibb, The Arab conquests in Central Asia, London 1923; Barthold, Histoire des Tures d'Asia Centrale, 47 fL;

idem, Turkestan down to the Mongol invasion*, London 1968, 180-96; R. Grousset, L'empire des steppest, Paris 1952, 150-72; A. D. H. Bivar, in G. Hambly

elii, Central Asia, London 1969, 63-8.

Under the first 'Abbasids, Transoxania gradually became integrated politically as a province of the caliphate = a whole. The first governors appointed there by the victorious Abu Muslim speedily began intriguing against their patron at the instigation of the caliph Abu 'l-'Abbas al-Saffab, who became deeply suspicious of his over-mighty subject. Abu Muslim accordingly executed Sibas b. al-Nusman al-Azdi in 135/752-3 at Amul, whilst the fugitive Ziyad b. Salib me executed, to Abu Musiim's satisfaction, by the Iranian dikkin of Barkath, on the route from Samarkaud to Ushrusana. Discontent among Abd Muslim's own followers after his death at the caliph al-Mansur's hands in 137/755, discontent which came to regard the murdered leader as a semidivine, messianic figure who would return and establish a reign of justice (cf. G.-H. Sadighi, Les mouvements religioux iraniens au II° et au III° siècle de l'Adgire, Paris 1938, 134 ff.), united sectarian Islamic and non-Islamic religious dissent with politico-social resentment at Arab domination; these combined strands made Transoxania a muchtroubled region in the ensuing decades. The rapidlychanging series of Arab governors sent out to govern Khurāsān and Transoxania (see the list in Zambaur, Manuel, 48) were mostly intent on lining their own pockets during their expectedly brief tenure of power there rather than on trying to bring about a community of interest between the Arab central government representatives and the local populations. Several governors debased the Jocal silver currency, although it is favourably recorded by Nacshakhl that the governor Ghitril b. Ata' [q.v. in Suppl.], appointed to Khurasan in 175/791 by his own nephew Harûn al-Rashid, introduced the useful reform of alloy dirkams, called Ghitrifi, to replace the old, largely-vanished coinage of the Bukhar-Khudas (see Barthold, Turkestan, 203-6).

Most of what we know about Transoxania's specific history in this period from the advent of the 'Abbasids to the rise of the Samanids is concerned with various rebellions there. In the caliphate of al-Mahdl, 60, 159-60/776-7 and during the governorships of Humayd b. Kahtahn al-Ta'l and Aba 'Awn 'Abd al-Malik b. Yazid, there occurred the outbreak of the Kharidil manid Yusuf al-Barm al-Thakaff at Buighara and in the countryside of Badghis, and later, in the time of al-Ma'mun, Yusul's grandson Mansur b. 'Abd Allah also rebelled; such Kharidil activity was an aspect of the general vitality of Kharidii doctrines in Khūrāsān and Sistān at this period. More serious at the time and with a protracted aftermath was the movement of the "wearers of white garments" (almubayyida, ispidh-diamagan), followers of the "voiled prophet" al-Mukannas [q.v.], whose real name was Hashim b. Hakim or 'Ata', a former partisan of Abu Muslim's. The revolt, crupting during Humayd's governorship, is treated at length by Narshakh! (77-89, tr. 65-76; Barthold, Turkeston, 198-200; Sadighi, op. cit., 163-86; B. S. Amoretti, Sects and horesies, in Camb. hist. of Iran. iv. From the Arab invasion to the Saljugs, ed. R. N. Frye, Cambridge 1975, 498-503). It attracted widespread support in Soghdia, at Kish and at Nakhshab or Nasal, whilst in Bukhārā, the son of the Bukhār-Khudā Tughshāda, Bunyāt, renounced official Islam 📰 joined the movement. It is not easy to discern from the sources in exact nature of al-Mukinna"s

religious doctrines. He himself may have been originally a Zoroastrian, but his ideas may have come to include neo-Mazdakite elements and perhaps Manichaean ones; and certainly, Abū Musiim, whose avatar al-Mukanna' claimed to be, was accorded an exalted, almost divine position. The outbreak was suppressed during the governship of al-Musayyab b. Zuhayr al-Dabbi (163-6/780-3), but the "wearers of white garments" persisted in the rural areas of Transoxania and Khurasan for at least two centuries after this. The years 101-4/806-0 were characterised by the revolt centred - Transoxania, but with partisans joining his standard from the upper Oxus provinces of Caghaniyan and Khuttal and from Kh Tarazm, of Rafic b. Layth, the grandson of Nasr b. Sayyar. The motive behind this seems to have been purely personal, without any religious or ideological impulse, and doubtless the prestige of Rafic's descent from the popular Nasr b. Sayyar brought him support. The Arab governor of Samarkand was killed, and Rafic secured help from the Iranian prince of Shash, from the Karluk and the Toghuz-Oghuz Turks of the steppes and from Tibet before he submitted voluntarily to al-Ma'mun and secured pardon (see Barthold, Turkestan, 200-1).

Thus intervention by the Turks in Transoxanian affairs continued during the early 'Abbasid period. but not on the same scale as during the Umayyad one. The disintegration of Türgesh power in the Western Turkestan steppes was followed by the ascendancy of the Toghuz-Oghuz, precursors of the Oghuz or Ghuzz [g.v.] who are mentioned in the 4th/roth and 5th/rith century Islamic sources as harrying the borders of Samanid Transoxania and then emerging to form the tribal backing of the Saldjüks [q.v.] when they overthrew Ghaznawid power in Khurasan and entered northern Persia and the central lands of the Middle East. In the early Abbasid period, the Toghuz-Oghuz had their pasture grounds on the confines of Kh arasm and also along the lower Sir Darya. The Karluk, possibly the ancestors of the later liek Khans [q.v.] or Karakhanids, took over the eastern Sir Darya basin and Semiredya (Turkish Yeti Su, "the land of the seven rivers"), acquiring in 766 Suyab, the former capital of the Turresh. Islamic Transoxania suffered sporadically from their incursions, and these Turks continued also to give help on occasion to insurgent local Iranian princes and to rebels like Rafic b. Layth. To protect the settled agricultural lands, walls walls built to the north of Bukhāra and in Shāsh; in Ilak, in the great southern bend of the Sir Darya, the construction of a wall from the mountains to the river is ascribed to 'Abd Allah b. Humayd b. Kahtaba, governor of Khurasan in 159/776 after his father's death. As shows of strength, the Araba periodically sent expeditions into Farghana; Ghitrif b. 'Ata' sent thither an army to drive out the forces of the Yabghu of the Karluk, and Fadi b. Vahyā al-Barmaki (177-9/793-5) exacted the submission of the Afshlu = prince of Ushrusana, who according to Gardizi, had never before acknowledged the suzerainty of any outside ruler. The caliph al-Mahdl received in point the homage of various Central Asian rulers, amongst whom are mentioned the Ikhshld of Soghdia, the Aishin of Ushrusana, the prince of Farehina, the Yabghu of the Karluk, the Kaghan of the Toghuz-Oghuz, etc., but this cannot have meant much in practice. This was also a period when, because of the early 'Abbāsids' dependence on their Khurāsānian guards, Transoxanian fighting men entered the caliphal army in considerable numbers; in the reign of al-Mu'taşim, the Aishin of Ushrüsana, Haydar, was to play a leading role in suppressing the revolt of Bābak al-Khurrami [q.v.] in northwestern Porsia until his own spectacular fall in \$25/84x [see Aranin].

Of special concern to us here is the contemporary rise to power, under the overlordship of the Tabirids, of the Samanida, who laid the foundations for what became powerful amirate, at first in Transoxania and then also, in the 4th/roth century, in Khurasan (204-395/819-2005). Whether the semimythical ancestor of the Samanids, the person given the title of Saman-Khuda, was really a scion of the Sasanids or not (see Bosworth, The heritage of rulership in early Islamic Iron and the search for dynastic connections with the past, in Iran, JBIPS, zi [1973], 59-9) is impossible to decide, but the family was clearly a typical Iranian dikkon one bailing from Tukhāristān, A Sāmān-Khudā of the late Umayyad period is said to have accepted Islam at the hands of the governor Asad b. 'Abd Allah al-Kasri (105-9) 723-7), and in the caliphate of al-Ma'mun, his four grandsons, Nüb, Ahmad, Yahya and Ilyas received. as rewards for their fidelity to al-Ma'mun's interests, the governorships of Samarkand, Farghana, Shash and Harat respectively. The Harat branch was unable to maintain power south of the Oxus, and the Samanids developed essentially as the dominant power in Transoxania, being designated governors, in effect independent rulers there, by the caliph in 261/875 after the downfall of the Tahirids at the hands of the Saffarids Yarkub and 'Anir b. Layth [g.vc.]. For a detailed consideration of the Samanid dynasty its history, sand for the present, a useful general survey by Frye, The Samawids, in Camb. hist. of Iran, iv, 136-61.

Here it may merely be noted that it was a cardinal feature of Samanid policy, from the time of the real founder of the dynasty's fortunes, Isma'll Ahmad (279-95/892-907) [q.v.], unwards, to maintain those frontiers of Transoxania which faced the steppes against the pagan Turks and thereby provide a bastion against nomadic pressure from Inner Asia. Isma'll in 280/893 led a punitive expedition against the Karluk, taking an immense plunder (presumably of beasts and slaves) from them at Talas (modern Dzhambul), and he also brought to will the prince of Ushrusana. Other outlying Iranian principalities were however normally allowed to subsist as vassals, sending tribute and/or presents to the amirs, of the Samanids. This was the case with the Afrighid Khwarazm-Shahs, the Salfarids in Sistan, the Farighunids in Güzgan, the Abû Dawudids in Balkh, the Muhtadids E Caghaniyan, etc., and whilst the gestrs remained vigorous and incisive, this was no source of weakness. Contemporary geographers describe the fringes of Transoxania - dotted with ribājs [q.v.] against the pagan Karluk, Oghuz and Kimāk [q.v.], where ghātis or enthusiasts for the faith, from the Transoxanian towns, could work off their energies in the defence of Islam. In Isfidiab [q.v. in Suppl.], on the northernmost frontier of Islam, as many as 1,700 ribāts are mentioned, partly manned by volunteers from Nakshab, Bukhara and Samarkand, Even when we of these Turks had been nominally converted to Islam, ribits = centres for offensive and defensive operations were still necessary; al-Mukaddasi, 274, tells how two places on the middle Sir Darya, in the district of Isfidiab, were frontier points (thaghrdn) against the Türkmens (al-Turkmaniyyan) who had only become Muslims "out of fear". It was also from these frontier-posts that Sufis and other sealots set off into the terra

incognile of the steppes as evangelists, such as the missionary from Mahapar, one Abu 'l-Hasan Muharamad al-Kalimati, who worked amongst the Karluk in the middle years of the 4th/10th century and who played some part in the conversion of the founder of the Karakhanid Hae, Satuk Bughra Khan, the Islamic 'Abd al-Karlm (Barthold, Turkesian, 175-6, 234-6).

Transoxania flourished under the Samanids, and there a dying-down of sectarian religious and socio-political protest movements during their time. compared with the previous period, although these did not entirely disappear. The geographers and travellers praise the ease of life there, the plentifulness of provisious, the comparatively light hand of government and incidence of taxation and tolls. There was quite - complex central administration in the capital Bukhārā, known to us from the accounts of Narshakhī and of the encyclopaedist of the sciences Abu 'Abd Aliah al-Kh "arazmi [q.v.], with a cluster of discous or government departments adjacent to the palace built in Bukhārā by Nașt b. Ahmad (301-31/913-43); the model for these was doubtless the 'Abbasid bureaucraty in Baghdåd (see Narshakhi, 31-2, tr. 25-7; Bosworth, Abū 'Abdallāh al-Khwarazmi the technical terms of the secretary's art . . . in JESHO, xil [1969], 113-64). Because of the province's frontier position, the people of Transoxania are described tough, belticose and self-reliant; also, perhaps because of the continued social influence of the dialds class, the ancient Iranian virtues of hospitality and liberality were kept up (see Bosworth, The Chainavids, their empire in Afghanistan and eastern from 949-1040 Edinburgh 1963, 27-34). Culturally, both the Samanids themselves and the local, petty courts of the empire encouraged the persistance of Iranian oral and literary traditions, in the birth and florescence of New Persian lyrical and heroic poetry (by Shahid Baikhi, Rudawi, Daldigl, etc.) which characterised the 4th/roth century and prepared the way in the early part of the following century for such figures as Firdawsl and the Ghaznawid lyric poets (see G. Lazard, The rise of the New Persian language, in Camb. hist, of Iran, lv. 505-6321. At the same time, Transoxania shared to the full in the Arab-Islamic heritage of we caliphate as a whole. Several of the compilers of the canonical collections of hadities, the surian, were from Transoxania and Khurāsān, and their scholars played a large role in the consolidation and elaboration of orthodox Sunni theology (kaldm) and law (fikk). Similarly, the fourth section of al-Thafalibl's literary anthology, the Yatimas al-dahr, shows how brilliantly Arabic poetry and artistic prose were cultivated in <u>Kh</u>urāsān, Transoxania and <u>Kh</u>wārazm (see V. Dannet, Arabic literature in Iran, in Cambr. hist. of Iran, iv, 566-94; Bosworth, The interaction of Arabic and Persian culture in the 10th and early 11th centuries, in al-Abhāth, xxvii [2978-9], 60, III ff.).

As in other fields, during the period 750-2000 Transoxania acquired strong economic and commercial links with the heartlands of the caliphate, including with the supreme centre of consumption, Trait and its capital Baghdad. Instead of the old military systems of the Arab makhlia and then of the early 'Abbasids' Khurasanian guards, the calipha began in the 3rd/9th century to surround themselves with Turkish slave troops [see praysk.i and Ghulan.i]. Hence the trade in Turkish slaves, who passed from the Inner Asian steppes through Transoxania to the slave markets there, became highly important, Turkish slaves were un integral part of the annual

tribute which the Tabirids, whose governorate involved responsibility for Transoxania, forwarded to Baghdad; according to Ibn Khurradadhbib, 28, 20,000 were sent each year, their value amounting to 600,000 dishams. In the Samanid period, a century or m later, al-Mukaddasl, 340, states that the Samanid government issued special licenses (adjurius) for the transit across their lands of Turkish slave boys and collected dues for them at the Oxus crossings. The detailed list of the products of the Inner Asian steppes, the Siberian forest zone and the Volga. basin given by idem, 323-6, has been conveniently translated by Barthold, Turkestan, 235-6. Transoxania and Khwarazm processed and sewed together the furs of the forest lands, these being highly-prized, luxury articles in Islam (see FARW), and were important centres for the manufacture of cotton and other textiles. Particularly mentioned are the silks and satin brocades of Saniarkand; the towels of Karminiya; the cloth of the village of Zandana, pear Bukhārā used for the livery of the Samanids' palace guards; the cottons of Tawawis, also near Bukhara; and the cotton garments of Wadhar near Samarkand. Narshakhi, 24, tr. 19-20, mentions a first [q.v.] factory (kārgāh) in Bukhārā, where carpets, cloth, etc. were woven for the caliphs and which were also exported as far as Syria, Egypt and Byzantium; it may have been founded when al-Ma'mun was governor in Marw, but by Narshakhl's time (or by that of his continuator?) was no longer in use (see R. B. Serjeant, Islamic textiles, material for a history up to the Mongol conquest, Beirut 1972, 92-106). Another luxury item which came into the caliphate, certainly by sea but also probably overland through Central Asia and Transoxania, was Chinese porcelain, including the "imperial" variety, Eini faghfürl = the Chaznawid historian Abu 'l-Fadl Bayhaki calls it, imported in the time of Harun al-Raphid (see P. Kahle, Chinese porcelain in the lands of Islam, in Opera minora, Leiden 1956, 354); whilst from Ith-arazm, the local barandi melons were so coveted as to be exported for al-Ma'mun and al-Wathik in leaden. containers packed with snow (al-Iliafalibl, tr., The book of curious and interesting information, 142). The direct interest of the caliphs and their ministers in Central Asia, as well as being me in the bayt al-fires at Bukhara, to which the caliphs' taxcollectors came each year to collect the stimulated taxation in the city in textiles, is paralleled by the fact, mentioned by Ibn Fadlan, that in the opening years of the 4th/10th century, the caliph al-Muktadir's vizier Ibn al-Furât [q.v.] bad an extensive estate at Artakhushmithan in Khwarazm, administered by | local Christian steward or wakti (Reisebericht, ed. A. Z. V. Togan, Leipzig 1939, § 1, text 3-4, tr. 2-3, and Excussus 52, 110-11).

The increasingly acute internal dissensions within aminate of the later 4th/10th century, when powerful Turkish commanders like the Simdians, Firk and Begtuzun secured an ascendancy in the state, making and unnaking amirs at will, and when an internal financial crisis, bringing sharp increases in taxation, manifested itself, heralded the fall of the dynasty. The decisive factor here was the appearance on the northern frontiers of Transoxania, now unguarded, of the Karluk. The Karluk ware converted to Islam in co. 349/900, and from their centres at Kashghar and Balisaghūn [q.vo.] (the latter in the Cu valley, perhaps near modern Frunze) began to take advantage of the amirate's weakness. Apparently with some encouragement—as, in former times, against the Arab governors—from the local

Iranian dihhans, the Karluk temporarily occupied the capital Bukhara in 382/992. Further incursions foilowed, and in the end, we Karakhands or Bek/lig Khans, the ruling family of the Karluk begins to be called, divided up the Samanid dominions with Mahmud of Ghazna [q.v.], the Karakhands taking Transoxania and the Ghaznawids Khurasan (see Barthold, Turkestan, 246-71; idem, Histoire des Turcs d'Asie Centrale, 59 fl.; Grousset, L'ampire des steppes, 198-203).

For a detailed account of the political and dynastic changes in Transoxania over the next two centuries or so before the coming of the Mongols, ILEX-EHANS and for the next wave of Inner Asian peoples to enter Semiredye and Transoxania, the Kitai (Chinese Ki³-tan or Liao) from the Mongolian tringes of northern China, see HARA EMITAY; and since the history of the Great Saldiuks, suscerains of Transoxania in the sultanates of Matik-Shöh and Sandjar [gav.], inspinges on that of Transoxania,

further SALDIOKS.

The long-term political, social and ethnic effects of the Installation of Turkish and Mongol peoples like these in Transoxania were profound The pastoralisation of the land outside the and irrigated river valleys may have begun in the Karakhānid period, since we know about royal huntinggrounds (ghurues) being set up. The process certainly took effect under the Mongol Caghatayids and the Timurids, when urban life declined in the province after the savage sackings of towns by the Mongols in the 7th/13th century. Political authority was now decentralised, with tribally-organised nomadic confederations, often without firmly-fixed capitals. directing affairs, instead of the centralising states and autocratic rulers of the Perso-Islamic tradition. This is, indeed, one aspect of the fact that, with the fall of the Samanids, the ancient bastion which had for centuries protected the Iranian and Middle Eastern heartlands from the incursions of steppe people was now removed. Transoxania became a corridor of entry for these hordes—Karakhanids, Saldjüks, Mongols, etc. -- until the advent of the Şalawids in Persia, who, though themselves of Türkmen stock, constituted a powerful and resolute barrier state which increasingly had the advantages of better firearms and military techniques [see BARDD, v] and could accordingly withstand the assaults of the Shaybanid Uzbeks or Ozbegs and others from across the Oxus and the Atrek.

But by this time, so, the roth/16th century, the passing of the previous five or six centuries had almost completely accomplished the process of ethnic and linguistic Turkleisation in Transoxania and Kh "arazın, the old "Iran extériour". The contiqued influx of Turks gradually swamped the Iranians = Tadifks [q.v.], as the Turks called them in distinction from themselves, and the population became mixed, with the Turkish element emerging uppermost, it also did eventually at the other and of the modern Turkish world, i.e. in Adharbaydjan and Anatolia. It was the same in regard to language. It is unclear exactly when Soghdian died out, but this must have been roughly contemporaneous with the fall of the Samanids; and the New Persian which had been teplacing Soghdian during the Samanid period subsequently vanished also from most of Transoxunia. In Khwamem, Turkicisation began in Saldiuk times, although the indigenous Iranian languages persisted until the 8th/14th century (woo Barthold, Histoire des Tures d'Asie Centrale, 109-10). Only in the upper Oxus regions of what were the

mediaeval provinces of Caghaniyan, Khattal and Wakhsh did an Iranian-speaking population persist speaking the form of New Persian known as Tädjik/Tadzhik (see man. iii. Languages, in Suppl.], and living in what is now the Tadzhik SSR, their numbers amounting to under 13/4 millions (1970 census). It is also during these centuries of the Turkicisation of Transoxania that the region becomes known, at least in popular parlance, in Turkistän [q.v.].

Transozania and Eastern Turkestan or Käshgharia were of course the first Islamic lands which Cingiz Khān encountered when he came westwards with the Mongol hordes. Balāsāghūn [q.v.], the main urban centre of Semiredye, was occupied after it had already suffered a severe plundering by the Kara Khitāy. Bukhārā was ravaged in 616/1220, and soon afterwards, Otrat or Utrar [q.r.], the former Farab (q.v.), in the Sir Darya basin, and Samarkand were attacked before Cingiz pushed on into Khurasan in pursuit of the Khwarazm-Shah 'Ala' al-Din Muhammad [see KH "ARAZM-SKARS]. Gurgandi (q.v.) in Khwarazm was bravely defended, but 📰 to the Mongols (618/1221) and was later named Urgené. The Great Khan Ogedey (1227-41) appointed governors in Transoxania for Nakhshab, Bukhara and Samarkand, and the sedentary indigenous population was at the beginning of his reign ruled by his representative Mahmud Yalawac Khwarazmi [q.v.], appointed to collect the taxation there. | www.mi praises Mahmud Yalawac's just rule and that also of his Mas ud Beg [q.v.], stating that Bukhara reached its former level of prosperity (the latter governor was, for instance, the founder of the Mas'ūdiyya madrasa in Bukhārā), though in fact there was a popular, anti-Mongol rebellion there led by one Mahmud Tarabi, only ended by the appearance of a large Mongol army (636/1238-9) (see Barthold, Turkestan', 381-519; Grousset, L'empire des steppes, 293 ff., 324-8; Hambly, The career of Chingia Khon and The Mongol empire at its zenith, in Central Asia, 85-113).

Transoxania, together with those steppe lands to the north henceforth to be known as Mogholistan [q.r.] or Mughulistan, came within the ulus or patrimony of Cingiz's second ___ Cartatey, together with Eastern Turkestan (Kh "arazm came within the was of Dioci, the eldest son, together with western Siberia and South Russia); but the Caghatay khanate was not properly constituted till time after Caghatay's own death in co. 1241. Caghatay and his descendants took little interest in the sedeutary and urban life of Transoxania, Pre-Mongol Turkish landowners and chiefs, the successors of the Iranian dibbans, remained influential in the countryside; the descendants of the Karakhanids remained in power in Farghana, it seems (Barthold, Histoire des Tures d'Asia Contrale, 118-19). In Mogholistan, to the north of the Ili river, there are a distinct decline of urban life in favour of pastoralisation (see ibid., 149-55). Urban traditions in Transoxania were much stronger, and especially notable in the towns there is the prominent role, from Karakhanid times onwards, of local Hanaff religious leaders functioning as headmen (ru'asa', sing. ra'is), usually with the title of sade or sade i disade. Leaders with this title are found in Bukhārā, Samarkand, Kljudjand, Uzgend, Shash and Almaligh; the bestknown of these were the Al-i Burhan in Bukhara (till the revolt of Mahmad Tarabl in 636(1238) and their successors, the Al-i Mahbüb! (till the mid-8th/14th century) (see O. Pritsak, Al-i Berhan, in Ist., xxx

[1932], 81-96, and \$ADR). Because of this lack of interest in the settled lands on the part of the Cachatayid khāns, the nomadic traditions of the Mongols lasted longer amongst them, as also amongst the Golden Horde in South Russia and the Kipčak steppes [see DA387-1 Kirčan in Suppi.], than in the Persia of the Il-Khānids or the northern China III the Great Khans. The Caghatayid khans' favoured encampments were in Semiredye, in the Ili basin, with the town of Almaligh [q.v.], between the Tien-Shan and Lake Balkash, as their administrative centre; this town flourished and is favourably described by western travellers to the Great Khans' court until it was destroyed in the civil strile amongst the Mongols in the 8th/14th century. Rebek (ca. 1318-26), though still, like the previous khans, resistant to Islam, moved his capital to Transoxania proper and built a palace near Nakhshab in the Kashka Daryā valley, although this did not entail renunciation of the nomadic life; from the Mongol term for "palace", karshi, the nearby town of Nakhshab came to receive the name which it still bears today, that of Karshi/Karshi (see garshi), Kebek's move must nevertheless have favoured the eventual conversion of the Caghatay khans to Islam, from the time of Tarmashirin onwards (1326-14). Čaghatayid rule lasted in Transoxania till the rise of Timur (see below), and in other parts of Central Asia till after then, but Timur's successes were facilitated by increased disunity amongst the Caghatayld family, with Caghatayid puppet rulers placed = the throne by Turkish smirs. For an account of the khanate, see čaghatav khán and čaghatav khánate;; Barthold, Histoire des Turcs & Asic Centrale, 153 ff., 169-72; Grousset, L'ampire des stoppes, 397-420; Hambly, The Chaghatai hhanate, in Contral Asia, 127 If.

Timur, a Barlas Turk from Kish in Transoxania, succeeded by force of arms to the Caghatayid horitage there. In 771/1370 he became de facto ruler of Transoxenia, ruling in the name of fainéant descendants of Ogodey, sc. Soyurghatmish (771-90/1370-88) and then his son Mahmud (220-2816/1388-21413). He linked himself by marriage to the Caghatayid royal house, including to a daughter of Rhidr Khodia (d. 80s/1399) of Mogholistan, who me reputedly a of the last significant Caghatayid khān Tughluk Timur (760-71/1359-70). Under the tule of Timur's descendants, above all, that of Shahrukh (807-50/ 1403-47). Transoxania enjoyed much material prosperity, with Samarkand and Bukhārā becoming lively centres of artistic and literary life, of painting and book-production, and of poetry in both Persian and in Eastern Turkish or Caghatay, Samarkand was the city which Timur preferred to all others m his main capital. European travellers like the Spanish envoy Clavifo (1403) describe the splandour of his court, and fine buildings in Samarkand, of which the Gur Amir mausoleum and the Bibi Khānum mosque survive, attest the high aesthetic level of early Timurid architecture. The reign of Timur's grandson Ulugh Beg [q.v.] (ruler in Transozania from 814/1411, at first as Shahrukh's deputy, to 853/1449) is associated with his foundation of short-lived observatory in Samarkand and the compilation of astronomical tables (see Barthold, Ulugh-Beg, tr. V. and T. Minorsky, in Four studies on the history of Central Aria, it, Leidan 1958, 129-34). As his second capital, Timür developed Shahr-i Sabz in the Kashka Darya valley, in the heart of the area of the Barlas Turks and near his own birthplace, starting there the construction of impressive buildings, including his own temb (see Barthold, Shaler-i Sabs from Timur to Ulugh Beg, tr. J. M. Rogers, in Iran, JBIPS, avi [1978], 103-26, aviii [1980], 121-43}. Popular Islam, in the form of ■ cultivation of Suff mysticism and the growth of a network of dervish orders, especially flourished in Transoxania during Carbatavid and Timurid times, and the shayids and their orders enjoyed the patronage of the Timurid gulers. Thus the Nakshbandi shayah Kh adia Ubayd Allah Abrar (806-95/1404-90) strengthened the nascent farika in Transoxania, benefiting particularly from the favour of Timur's great-grandson Abu Sa'ld and his was Suitan Ahmad; the Nakshbandiyya were henceforth to play major cole in the history of Islam in Central Asia [see ARRAR, KETALIA, in Suppl.). Meanwhile, the Caghatayids managed to survive during these years in the lands beyond Transoxania, and under Esen Buka II (813-67/1120-61) flourished in Mogholistan and Eastern Turkestan, being hostile however to the fater Timurids. For the detailed history of this period, see Barthold, Histoire des Turcs d'Asie Centrale, 165.84; Grousset, op. cid., 486-546, 568-80; Mahin Halianpur, The Timurid empire, in Central Asia, 150-62; TIMOR and vimonins.

In 906/x500, Muhammad Shaybani, the scion of ■ line of Mongol khans, the descendant of Dioci's youngest son Shiban (one part of whom had remained In Siberia as khans and another part of whom had moved southwards into Transoxania, forming the horde of the Uzbeks [q.v.] or Ozbegs), seized power in Transoxania from the last Timurids. Transoxania was, indeed, to become the permanent home of the Shaybanids and the Uzbeks, this last Turkish people giving their name to the modern Uzbek SSR, in which they probably form some 70% of the present population. The Shaybanids brought into Trans-examia a Turkish following amongst whom the nomadic steppe traditions remained strong and who were virtually untouched by Iranian cultural and religious influences, me had been most of their predecessors there. It was the strength of popular religion, that of the dervishes and Suffs, already notable in Timurid times (see above), rather than that of the orthodox 'wland', which characterised Islam there in the time of the Uzbeka Like Timur, they exalted the cult of the Suff saint Ahmad Yasawi [q.v.], whose tomb in the lower Syr Daryà valley at Yasi bad long been a popular pilgrimage place for Turks from all over Inner Asia. The Shaybanids in fact made Yasi their capital for a while, and under them it received its new name of Turkistan, indicative of its importance to the Central Asian Turks in general.

Politically and diplomatically, Sunni Transoxania under the Uzbeks was to the roth/roth and rith/17th centuries frequently involved in warfare with the powerful and aggressive Shift monarchy of Safawid Persia. As so many earlier Tiwco-Mongol dynasties had done, the Shaybanids coveted the rich province of Khurasan, and invaded it on several occasions. But Muhammad Shaybani (905-16/1500-10) and successors of his like Abu 'l-Ghazi 'Ubayd Allah (940-6/2534-6) failed to overcome the experienced troops of Shah Isma'il and Shah Tahmasp, who had a greater approciation of the value of the modern weapon of firearms and who had seasoned troops In their Kizlibash Türkmens and then in their Georgian, Armenian, etc., slave guards. The longterm result of this warfare was the virtual scaling-off of Transoxania from the rest of the Islamic world through the erection by the Safawids of bulwark on their northeastern frontier. Although Turks from Central Asia and Alghans streamed into Muslim India mercenaries, adventurers, etc., the traffic was largely one-way. Hence Transoxania became culturally introverted and impoverished, since the stappelands of South Russia and western Siberia was by the 17th century beginning to come under Russian, Christian control, and the popular Islam of such orders as the Yasawiyya, the Cishtiyya and the Nakshbandiyya, though intense in religious fervour and emotion, was weak in intellectual content. Only in the sphere of Eastern Turkish or Caghatay literature may it be said that Transoxania made a significant contribution to the cultural stock of Eastern Islam at this time. It was a flexible and expressive enough language for Babur [4.0.] to write his memoirs in it; to produce a lively folkpoetry, seen e.g. in the verses of the r8th century Göklen Türkmen bard Makhdûm Kull; and to give rise to a genre of historiography amongst the Shaybanids, the Dianids or Ashtarkhanids and the Manglis of Bukhārā and the 'Arabshāhids of Khiwa in the former Khwarazm, although such outstanding figures as the toth/toth century Shaybanid historian Hafiz Tanish [q.v. in Suppl.] continued to write for preference in Persian. For the detailed history of the Shaybanids, see Hambly, The Shaybanids, in Central Asia, 163-74; Barthold, Histoire des Tures d'Asia Centrale, 185 ff .: and SEAYBANIDS.

In the course of the toth/tôth century, Bûkhārā and Khīwa formed themselves into separate, often mutually-hostile khānates, and then in the early 18th century, a third Uzbek khānate arose in the Farghāna valley, that of Khokand. The three principalities to have separate existences, punctuated by much squabbling and internecine warfare, till the Russian occupation of Central Asia in the second half of the 19th century, Bukhāra and Khīwa remaining, however, wirtual protectorates of Russia until the aftermath of the Bolshevik Revolution.

The history of these khanates can be followed under Burnara, khanam, khiwa, khokand; see further bianids, kungrat, mangita, and also inak in Suppl.

Bibliography: Given in the article.

MA' (A.) "water". The present article covers the religio-magical and the Islamic legal aspects of water, together with irrigation techniques, as follows:

- z. Hydromancy
- . Water in classical Islamic law
- 3. Hydraulic machines
- 4. Pre-20th century irrigation in Egypt
- 5. Irrigation in Mesopotamia
- Irrigation in Persia
- 7. Irrigation in North Africa and Spain
- 8. Irrigation in the Ottoman empire
- 9. Irrigation in pre-20th century Muslim India
- ro. Irrigation in Transoxania
- 11. Economic aspects of modern irrigation
- 12. Ornamental uses in Muslim India

2. HYDROMANCY

As a vehicle for the sacred, water has been employed for various techniques of divination, and in particular, for potamonancy (sc. divination by means of the colour of the waters of a river and their abbing and flowing; cf. Fr. Cumont, Etudes syrienus, Paris 1917, 250 ff., notably on the purification power of the Euphrates, consulted for divinatory reasons); for pegomancy (sc. omens given by rivers, springs, floods, a feature of Babylonian divination, cf.

A. Boissier, Choix de textes relatifs à la divination babylonisme, Geneva 1905-6, i, 235-50; Pr. Nötscher, in Orientalia, Serie prior, li-liv [1930], 121 ff., 137 ff., 146 ff., 131 ff., 141); hydromancy (called istinal, according to Doutté, Magie et religion, 389); lecanomancy (sc. divination from the waves set up on any shiny, liquid surface, such m water, blood, milk, honey, oil or petroleum, cf. Nötscher, in loc. cit., 110-21, 118-19); and crystallomancy and cataoptromancy (sc. omens drawn from the features appearing upon any polished, reflecting surface, cf. J. Hunger, Becheroahrsagung bei den Babylonier, in Leipziger Semilische Studien, if1, Leipzig 1903; G. Furlani, in Aegyptus [1927], 287-92).

The lack of perennial water courses in Arabia and the infrequency of springs prevented the development of such divinatory techniques in these amongst the Arabs. We have nothing to confirm that the reflective surfaces of waters in cases were ever used for these. Water, like perfume, was used in the rituals over the making of pacts and alliances [see LATABAT AL-DAM], but these procedures had in divinatory

character at all.

Bibliography: In addition to references given in the article, see T. Fahd, La divination asabe, Leiden 1966, 405-6.

(T. FAHD)

2. WATER - CLASSICAL ISLAMIC LAW

In Islamic law there are seven kinds of water which it is lawful to use for drinking or ablution: water from rain, snow, hail, springs, wells, rivers and the sea. These sources may, however, be rendered impure by the presence in them of unclean objects.

Questions of ownership and the right take water depend the nature of its source, whether natural or artificial watercourses, wells or springs (freshwater lakes are not generally discussed in the sources owing to their scarcity in the Islamic lands). Ownership of a source of water implies ownership of its harim (reserved area), consisting of that portion of land adjacent to the water sufficient to enable the source to be used. One hadily defines the extent of the harim of a well as 40 cubits on every side, but other measurements are also given.

The Sharka distinguishes three types of water source which may be the subject of use or ownership:

t. Water from rivers, which may be (a) great rivers, such as the Tigris and Euphrates, which are of such a size that they can be used by all for drinking and irrigation to any extent; (b) lesser rivers, in which case two possibilities may be distinguished:

(i) where there is generally enough water (or all users but where it is possible to cause shortage to other users by e.g. digging a canal to take water from higher up the river than other users (whether this is allowed or not must be decided after inquiry

into the consequences); or

(ii) where damming or the allocation of fixed times is necessary to provide enough water for irrigation. In such cases, the river is normally regarded as the joint property of the riparian cultivators, and the question of how much water may be retained by the highest riparian cultivator depends on differing circumstances, such as the season of the year, the type of crop irrigated, etc. (c) canals. These are the property of the landowner or landowners in whose property they situated; where they are the common property of several landowners, none of them may make unilateral changes in arrangements for sharing the water, or by building a mill or bridge over it, etc.

2. Wells: (a) Wells dug for the public benefit;

here the water is freely available to all, the digger merely having the right of first comer. (b) Wells dug by persons for their own use, e.g. wells dug in the desert by tribesmen. Such persons have first right to the water while they are living in the vicinity. but are obliged to give water to persons suffering from thirst. After they move away, the water becomes freely available to all. (c) Wells dug by persons intending them to be their property. Ownership, however, cannot be claimed until water has actually been found, and if the well needs lining, until it has been lined. The owner of the well has a duty to give water to anyone suffering from thirst. This is illustrated by a tradition which records that Umar made some owners of water pay the diya for a man who died of thirst after they had refused his request for water.

3. Springs: (a) Natural springs: these are treated as analogous to permanently flowing rivers. If the water supply is limited, the first person to undertake irrigation in the area has priority; otherwise the water has to be shared equally. (b) Springs opened up by digging: the person who does this becomes the owner, together with the surrounding harlim. (c) Springs opened up by persons on their own property. In such cases, the only claim against the owner is that of persons suffering from thirst. If the mean has a surplus of water, he may be obliged to give it gratis to other men's cattle, but not for irrigating crops.

A person who possesses water in a vossel is its sole owner, and he is not obliged to give in to others gratis; he is, however, obliged to relieve someone suffering from thirst in return for a recompense.

3. HYDRAULIC MACHINES

There is ample evidence from written and archacological sources for the widespread use in pre-Islamic times of all the main hydraulic machines, described below, in all the areas that were to form part of the Muslim world. The shaddly was known in ancient times. The sakiya, although it did not become fully effective before the introduction of the pawl In the 4th = 5th century A.D., was known in Roman times. Both machines are still in use today. The noria (nation) and the vertical undershot mill-wheel are both described by Vitruvius, without any claim to originality (On architecture, Loeb Classics, ed. P. Granger, 1970, ii, 303-7). Vertical mill-wheels were sometimes mounted on boats moored to the banks of rivers (N. Smith, Man and water, London 1975, 140). The origins of the horizontal, vaned millwheel are still obscure: it may have been referred to by a Greek writer of the 1st century B.C., and it was in use in Ireland in the 7th century A.D. (Smith, op. cit., 140). It is described in a Byzantine treatise, probably of the 7th century A.D., extant only in Arabic versions (Wiedemann, Anfattae, ii, 50-6, see Bibl.). Hand-operated force pumps were used by the Greeks and Romans; these had single vertical cylinders that were placed directly in the water without suction pipes (Vitruvius, 311-12, quoting Ctesibius, who lived 60. 200 B.C.). The problem of the origins and diffusion of these machines is largely unresolved, but mu chief concern here is that they were all in existence in the 1st/7th contury.

The shādāf is a simple machine consisting of a wooden beam pivoted on a raised fulcrum. At one end of the beam in a bucket, at the other end a counterweight. The bucket in dipped into the water, then the beam is rotated by means of the counterweight and the contents of the bucket are emptied into a cistern or supply channel. The flume-beam swape is in development of the shādāf. Instead of in solid beam, a channel is connected rigidly to the bucket; when this is raised the water runs through it into the outlet.

The sakiya is more complex, and indeed has over two hundred components parts. It consists essentially of a large vertical wheel erected over the water supply on a horizontal axie. This wheel carries a chain-of-pots or a bucket chain. On the other end of its axie is a gear-wheel that engages a horizontal gear-wheel to which the driving bar is attached. The animal is harnessed to the free end of this bar. and it walks in a circular path, the gears and the wheel carrying the chain-of-pots rotate. The pots dip in succession into the water and when they reach the top of their travel they empty late a channel. The noria (sometimes confused with the sāķīpa) is a large wheel driven by water. It is mounted on a borizontal axle over a flowing stream so that the water strikes the paddles that are set around its perimeter. The water is raised in pots attached to its rim or in bucket-like compartments sat into the rim. The large norias at Hamat in Syria can still be seen today; the first known mention of norias at Hamát is by Ahmad 📕 al-Tayyib in 271/ 884-5 (Suter, 33).

The Vitravian mill-wheel turns a vertical gear-wheel that meshes with a horizontal gear-wheel to which the driving shaft is attached. The horizontal vaned mill-wheel is fixed directly to the driving shaft; there of pages. It cannot be mounted directly in the stream since the water must be directed on to its vanes from a pipe or channel,

There can be no doubt that all these machines in continuous in Islam from the early conquests until the introduction of modern technology. (As mentioned above, the <u>shādūf</u> and the sāhīya are still in ure; they in cheaper and more easily maintained than motor-driven pumps.) The evidence comes from treatises on machines, references in the works of historians and geographers, and archaeological investigations. For a selection of the available evidence, the reader is referred to the Bibl. under Wiedemann, Aufsātus; Schieler; Hill 1 and 2. The remaining discussion will be confined to developments of particular importance in the history of technology.

Mills were used in Islam for other purposes beside the grinding of corn and other seeds, e.g. for crushing sugar cane and for sawing timber (A. Y. Hassan, Taqi al-Din and Arabic mechanical engineering fin Arabic], Aleppo 1976, 51, quoting al-Nuwayrl and Ibn 'Asākir). This suggests that rotary motion was converted to reciprocating, probably by means of trip-hammers. More examples of similar applications may be discovered when m systematic study of the historical and geographical works is undertaken.

Another and of interest is the use of the overshot mill-wheel, in which the water is conducted through a channel to the top of the wheel, which has bucketlike compartments around its rim. The overshot wheel works mainly by the weight of the water, whereas the Vitruvian one is operated by its force. In many conditions, the former is the more efficient of the two. Its use is recommended by a certain al-Murâdi in a treatise composed in Andalusia in the 5th/11th century (D. R. Hill, A treatise on machines, in Journal for the History of Arabic Science, ili (Aleppo 1977], 33-46. In this paper the treatise was wrongly attributed in the well-known astronomer Ibn Mufadh), Shams al-Din al-Dintashki, d. 727/1327. describes a similar wheel in operation near Tabria (ed. M. A. F. Mehron, 188). The overshot wheel did not come into general use in the West until about the 8th/rath century, Al-Diazart [q.v. in Suppl.] often uses small overshot wheels in his devices, but these are usually scoop-wheels, a kind of primitive Pelton wheel, the scoops being fixed to the ends of spokes that radiate from a solid disc.

It is reasonable to infer that the scoop-wheels used by al-Diazarl were miniature versions of wheels In full-size machines, an inference that is strengthened by the fact that he uses such a wheel in one of his water-raising machines (Category V, Ch. 3). The visible part of this is a sakiya, which is provided with a model cow to give the impression that this is the source of motive power. The actual power, however, is provided in a lower, concealed chamber and consists of a scoop-wheel and two gear-wheels. This system drives the vertical axle that passes up into the main chamber, where two further gear-wheels transmit the power to the chain-of-pots wheal. Such devices (without the model cow) were in everyday use. A similar machine was in continuous use on the River Yazid above Damascus from the 7th/13th century until about 1960 for water supply and irrigation. It was restored to working order by the staif and students of Aleppo University (Hassan, op. cit., 58-9).

Al-Diazarl describes four other water-raising machines in Category V. Chs. 1,2 and 4 deal with flume-beam swapes operated by animal power through gear trains. The first two of these incorporate sogmental gears. The earliest known occurrence of these gears in Europe is in the astronomical clock completed by Giovanni de' Dondi in 1365. The fifth machine is a slot-rod pump, driven through gears from a paddle wheel. It is remarkable for having two horizontally opposed cylinders and true suction pipes. Taki al-Din (10th/16th century) describes a similar pump, but equally remarkable is his sixcylinder "Monobloc" pump (Hassan, op. cit., 47-50). The vertical cylinders me fitted into a single wooden block which rests in the water. Delivery pipes lead out from the side of the cylinders, near their tops, and are brought together into single outlet. Each cylinder has a clack-valve at the bottom. The pistous - provided with weights at the top and lever arms at the sides. The lever-arms are supported at fulcrums and their free ends extend inside the perimeter of a scoop-wheel. As the water strikes the scoop-wheel it rotates, the scoops bear down in succession on the lever arms and the platons rise and fall in continuous succession.

It should be apparent from the foregoing brief discussion that Islamic engineers were active in the construction and development of hydraulic machines for water-raising and power supply throughout the mediaeval period and beyond. Similar activity took place in Europe, India and East Asia. Each region used the machines that were best suited to its needs, to the local hydraulic conditions, and to the available constructional materials.

Bibliography: (in addition to works mentioned in the text): two treatises are available in annotated English translations by D. R. Hill, The Book of knowledge of ingenious methanical devices by al-Jasari, Dordrecht 1974, see esp. 32, 95-6, 179-98, 275; and The Book of ingenious devices by the Band Mes4, (fl. Baghdad mid-3rd/9th century), Dordrocht 1979, see 222, 226, for horizontal waterwheels; there is . Arabic-English glossary that includes many terms used in hydraulic engineering; an Arabic edition of al-Diazarl, also with Arabic-English glossary, is now available, ed. A. Y. Hassan, Aleppo 1979; Abu 'Abd Allah al-Khwarazmi, Majdrik al-ulum, ed. van Vioten, 246-55 (this section contains definitions and brief descriptions of parts used in hydraulic and other machines); E. 4. PRE-20TH CENTURY IRRIGATION IN EGYPT

Until the aoth century, firigation in Egypt remained much it had been in Pharaonic times. The continuity of practice stemmed from the dependence on the annual Nile floods, which provided Egypt not only with water for irrigation but also with the alluvial soil deposits to renew the fertility of the cultivated lands. The great river, however, does not only bestow its gifts, but may also be the cause of misfortune to the country. Up to modern times and before major dams and irrigation projects were undertaken, a high Nile promised the richest increase to the fields, while with it low Nile the inevitable dread of a year of famine.

'Abd al-Latif al-Baghdadi (d. 629/1231) discussed this phenomenon and the rôle of the Nile in the irrigation and the agricultural situation in mediaeval Egypt. He states that after the water of the Nile overflowed and covered the soil for several days, it receded ill let the peasants plough and sow the fields. No further irrigation was needed until the crops were ready to be harvested. If the Nile exceeded some fingers beyond 20 cubits (dkirá's), some areas became submerged like lakes for a long time and the proper time for sowing passed without calculation being possible. Also, lands could not be cultivated if the Nile did not rise sufficiently to reach the minimum of the necessary flood (16 cubits). In such cases, the amount of land covered with water was insufficient, the size of the crop did not meet the needs of one year and there was a scarcity of food or less great in direct ratio to the water level above below sixteen cubits.

No me in pre-20th century Egypt feit secure be-

fore the flood reached the height of 16 cubits and when all necessary land had been naturally irrigated by the Nile. Until it reached that level, the news of its beight was kept secret from the common people. It seems that this was a custom introduced by the Fățimid Caliph al-Mu'izz în 362/973, when he prohibited the agnouncement in the streets of Cairo of the exact rising of the Nile before it had reached 26 dhird's. This was to prevent tension, fear and financial crises among the inhabitants; cf. al-Makrisi, Khitat, Cairo 1270/1853-4, i, 61, The person who was in charge of the Nilometer (sāhib al-mikyās (see MIRVAS)) used to call the increasing level of the Nils water in fingers without telling the exact cubit. Only when the water level reached the height of 16 cubits, normally in the Coptic month Misra (July-August), could the sahib al-mikvas proclaim it to the people in Cairo, and the sultan then had the right to impose the tharadi on the cultivated land, cf. al-Kalkashandi, Subh al-acsta, Cairo 1914, iii, 293-4, 297; al-Nuwayri, Nihāyat al-arab, Cairo 1923, i, 264; al-Makrizi, Khijai, i, 60, 273; H. M. Rabie, The financial system of Egyps A.H. 564-742/A.D. 1169-3347, London 1972, 73 and the sources cited therein.

Pre-20th century irrigation in Egypt did not rely only on the floods, but also on the yearly digging and cleaning of the irrigation canals and the maintenance of the irrigation dams. Both al-Nuwayel (i. 265) and al-Makrizi (Khijat, i, 61) state that without such maintenance there would be little benefit from the Nile. Al-Makrizi (i, 74-5) traces the importance of canals and irrigation dams in controlling the Nile in pre- and early Islamic periods. It was of the most important functions of both the sultans and the holders of the itta's [q.v.] under the Ayyuand the Mamiluks to dig and clean the canals and to maintain the Irrigation dams (the dissur). The sources provide us with ample information about the efforts of the sultans in Egypt in digging and cleaning canals. The irrigation dams (the djusts), which were of paramount importance for the irrigation of the fields, were classified into two types in mediaeval Egypt: the small irrigation dams (al-diuser albaladiyya) and the great irrigation dams (al-diws@r al-sulfaniyya). The first were important for conveying water from one field to another in the village. Each mukjat (holder of an ittat) with his clerks was responsible for the upkeep of these irrigation dams within the conlines of his ited. As for the great irrigation dams which were constructed for the beneilt of the provinces, the sultan was responsible for them, at least in theory. In practice, especially under the Mamilik sultans, the multiple's assisted the sultan in the construction of this type of dam by supplying peasants, oxen, harrows and tools, cf. Thu Maramati, Kawanin al-dawawin, ed. A. S. Atiya, Cuiro 1943, 232-3, 344; al-Kalkashandi, Subb, ill, 449; al-Makrizi, Khifat, i, 101.

Because of the importance of the great irrigation dams, both the Ayyūbid and the Mamlūk sultans used to select distinguished and able amirs and officials to supervise the work of their maintenance. Al-Nābulus! (d. 660/1261) states in the Kilāb Luma' al-audain al-madiyya (ed. C. H. Becker and C. Cahen in Bulletin al'diudes orientales, xvi [1938-60], 39-40) that every year the Ayyūbid sultan al-Malik al-Kāmil used to send him with 3 or 4 amīrs to the Dīlza promium during the flood period in order meets the dams of that province in good condition. It seems that the Ayyūbid sultan sent officials like al-Nābulusī to other Egyptian provinces for the same purpose. Under the Mamlūks there was an office called hash fal-diusār

(office of inspection of irrigation dams) for each province in Egypt. The holder of this office, called highly al-disear, was an amir who was added by assistants in the construction and maintenance of the irrigation dams in the province under his charge, cf. al-Kalkashandi, Subb, iii, 448-9.

Each year before the advent of the Nile flood, not only had the canals to be dug and the irrigation dams to be constructed and repaired, but also the land to be cultivated had to be prepared. The methods of that preparatory work as well as the tools used were more or less the same traditional was known to have been used by the Egyptian peasants for thousands of years. As for irrigation, al-Nuwayrl and al-Makrist state that when the Nile rose during the flood period, the water covered all cultivated lands. One could only reach the villages, which were established on hills and mounds, by boat = the great irrigation dams. When the soil had had sufficient water, the hhaulis (stewards) and the shayhh (village headmen) supervised the cutting off of the irrigation dams from specified places at certain times in order to draw off water from the fields, thus letting it flow benefit other places, of. al-Nuwayri, i, 264-5; al-Makrizi, Khitat, i. 6r; see also al-Mas'udi, Murüdi al-dhakab, Beirut 1963, i, 375; Nasir-i Khusraw, Safar-nama, ed. and tr. C. Scheier, 39, tr. 118, al-Kazwini (d. 692/ 1283), Athar al-bilda wa-ahhbar al-sibad, ed. Wüstenfeld, Göttingen 1848, 175, mentions that when the water of the Nile receded gradually after being on soil for forty days, the peasants began sowing.

The crops which were cultivated after the Nile flood season in mediaeval Egypt did not need any more irrigation than their inundation during the flood period, cf. Ibn Hawkall, 97; al-Istakhril, 49. This was the most common method of irrigation, called bi 'l-sayk by al-Nābulusī, Ta'vihh al-Fayyum, ed. B. Moritz, Calro 1899, 63, and ma' al-raka by al-Makrisl, Khilel, i. 102. The last term is still used by the contemporary fallah to denote irrigation without artificial implements. Crops watered in this manner were called "winter crops" in order to distinguish them from the summer which the peasants began sowing during the Coptic month Baramhat (February-March) and which relied on traigation by artificial means such as water-wheel, shadoof, etc., cf. 1bn Mainmail, 248.

Al-Makhaumi in the Minhadi and al-Makrizi in the Khifaf distinguish between the winter and summer crops when discussing the times of sowing and harvesting, al-Makhzumi states that the winter crops were wheat (comb), barley (shafir), beans (ful), bittervetch (divibán), lentils (fados) and flax (kaitān). al-Makrizi adds to al-Makhzumi's list of winter crops chick peas (hummus), clover (kurt), onions (başat), garlic (thum) and lupin (turness). For summer crops al-Makhzüml mentions unripe meions (fakküs), watermelons (bifflkh), kidney beans (lübiya),e (rimsim or samésim), cotton (kw/n or aktén), sugar-cane (kaşab al-sukkar) and colocasia antiquorum (kulķās). Although al-Makrisi lists the same for summer crops, adds aubergines (bádhindján), indigo (mila), radishes (fudil), turnips (lift), lettuce (khass) and cabbage (kurunb), and puts both the unripe melon and water-melon under the one name biffikk; cf. al-Makhzuml, Kitab al-Minhadi fl 'ilm hharadi blist, ms. B.M. London Add, 23483, ff. 30b-33b; al-Makrizi, Khifaf, i, 101-2.

There were many methods known in pre-20th century Egypt to krigate the soil under the summer crops. They were inherited from older times and continue until today, with the exception of one which was very primitive and arduous. This was the transportation of water to the fields in buckets, jars, etc., hung from the necks of the onen. This method was mentioned by al-Nābulusi as the means of irrigation for the two villages Dimarhina i-Bayam province, cf. Taviša al-Fayyūm, pg. 101. This method, which was a continuation of Pharaonic technique, seems to have been known in other Egyptian villages.

The other methods of irrigation used by the mediaeval Egyptian peasant employed any one of four artificial irrigation contrivances, namely, the natifical irrigation contrivances, namely, the four contrivances were used in Egypt before the advent of the Arabs and are still in current use.

There is no mention of what was known in the naffāla in the available classical sources, but the existence of such a device in Ancient Egypt, as well its depiction in the Description de l'Egyple, Etat moderne, Planches, Tome deuxième, Paris 1817, Arts et métiers, Pl. vi (4), proves its existence in pre-20th century Egypt. It is still in use in Egypt, as well as in many African countries. Two men stand face to face, each bolding two cords of palm-fibre ropes to which is attached a wide, shallow waterproof basket. This basket, made from twisted paim leaves or leather, is known in Egypt by the name balos. The two men holding the ropes band slightly toward the water, dip the basket and fill it. Then they straighten while turning to the field, thus raising the basket which is emptied into the mouth of the intigation canal, cf. Lane, An account of the manners and customs of the modern Egyptians, London 1871, it, 27.

The daliya or shadoof is a kind of draw-well which was used in Pharaonic Egypt and in mediaeval firak, and is still used in Egypt and other eastern countries for raising water for irrigation. It usually consists of two posts, beams of the acacia tree shalts of cane, about five feet in height. These posts are costed with mud and clay and then placed less than three feet spart. The two beams are joined at the top by a horizontal piece of wood, in the centre of which a lever is balanced. The shorter arm of the isver is weighted with a heavy rock or dried mud, while at the end of the longer arm hangs a rope carrying a leather pail. The peasant stands on a platform on the river bank and pulls down the balanced pole until the pail dips into the water and is filled. A slight upward push, which is helped by the counterweight, raises the bucket above the irrigation canal, into which it is emplied.

As for water-wheels, al-Mukaddasi (4th/10th century) states that there were many daudish (pl. of diliah, a Persian word which denotes a water-wheel) on the banks of the Nile for irrigating orchards during the low waters. He also says that the kādās was the bucket of the dūlāh, cf. Aksan al-takāsim, 208. In the next century, Nāṣir-i Khusraw mentions in his Safar-nāma, 39, French tr. 118, that "up the Nile there are different cities and villages, and they have established so many dūlāhs that they are difficult to count."

In mediaeval Egypt, there were two words used to denote wooden water-wheels, i.e. the samāṭī (sing. sāṭiya) and the maḥāi (sing. maḥāla), al-Nāḥuluṣī, Ta-'riṭḥ al-Fayyūm, 11, 27, 31, 48, 52, 54, 53, 94, 126, mentions that were rilages in the Fayyūm province had samāṭt to raise irrigation water. In Bāḍia, for example, he states that there was samāṭi which were running day and night. In the Kitāb Lumac al-ṭaudain, 48-9, al-Nābulusi warns the Ayyūbid Sultan al-Malik al-Ṣāliḥ Ayyūb of the negligence and dis-

864 MÅ

honesty of officials with which his own long experience in the work of offices had made him conversant. Specifically, he reports that ecacia trees, which were a state monopoly, have been illegally cut down to construct semili, presses and other instruments.

Al-Nuwayri, Nihayat al-arab, viii, a53-4, writing in the hamilik period, states that wells were dug in the land, apparently supplied by water from the underground bed of the Nile. At the mouth of these wells the sawābi, made from acada or other trees, were installed. Al-Nuwayri also states that these irrigation wheels were called al-mabbi in Egypt, while at Hamā in Syria they were called al-mabbi in Egypt, while at Hamā in Syria they were called al-mabbi in Syria, the differentiates, as does al-habaghandi, Subb, iv. 80, 140, in a later period, between the two kinds, by stating that the mabbi by oxen.

The Arabic word malial (sing. makala) denotes the huge pulley which is used for raising water from wells, cf. Ibn Manzur, LA, Betrut 1956, xi, 620-1. However, al-Makrizi in the Khitat, i, 102, uses it to refer to the water-wheel. When discussing the irrigation of sugar-came when the Nile water is low, al-Makrizi says that each of these mahali can raise the water to irrigate sight faddens of sugar-cane, providing that the waterwheel in installed close to the Nile and that sight excellent beasts are available to work it. When the wells are established at indistance from the Nile, each of the mahali cannot irrigate more than 4 to 6 faddins. Al-Makrizi also refers to the kādis, which al-Mukaddaal earlier explained as the bucket of the water-wheel.

It is apparent that the ordinary, contemporary Egyptian water-wheel is more or less the same as the mediaeval one, since it does not differ appreciably from the one deploted in the Description de l'Egypte, Etal moderne, il, i, 501-2; Planches, Tome deuxième, Arts et metiers, Pl. v. The flat horizontal wheel of the sāķiya is turned counter-clockwise by a single beast or pair of oxen. The flat wheel's rough cogs angage a vertical wheel which carries a long chain of earthen pots (hawadis). These clay pots are suspended from ropes and are lowered, mouthdownward, into the water. Following the path of the wheel, the pots scoop up water which they spill out into the irrigation channel as they arrive at the top of the wheel - their circular journey. The work of the peasant or his son is to goad the beast, to watch the turning wheel, and to avoid wasting water on the way to the field,

As for the idbit (water-screw), it was apparently invented by the Greek mathematician and inventor Archinedes (ca. 287-212 B.C.) white studying in Egypt. Observing the difficulty in raising water from the Nile, he is said to have designed this screw to facilitate the irrigation of the fields.

The water-screw has been continuously in use in Egypt when the level of water is not very low, from the times of the Ptolemys until the present. It consists of a wooden cylinder (about 6-9 feet in length) heoped with iron. While the spiral pipe is fixed between the inside wall of the tābūt and an iron axis, its upper extremity is bent into a crank and its lower end turns on a stake set under the water. One or two peasants crouch at the water's edge, endlessly turning the crank handle. The water rises from bend to bend in im spiral pipe until it flows out at the mouth of the canal.

However, using the primitive implements of the napaia, the daliya, the sakiya and the tabut, the pre-zoth century peasant in Egypt irrigated the land and managed to produce the necessary crops to maintain the economy of the country. Many of the

techniques and implements that he devised or used have proved to be efficacious to such a degree that they are still extant.

(HASSANEIN RABIE)

5. IRRIGATION IN TRAK

Since it is impossible here to look at the use of water in all its aspects and in regard to all the problems which it raises, the present section marely deals with irrigation in the same way as is done for other regions of the Islamic world.

Taken a whole, 'Irāk is a flat plain irrigated by two great rivers, whose risings and fallings lack however the comparative regularness of the Nile. Since the Euphrates (al-Furāt [q.v.]) flows at a higher level than that of the Tigris (Didfia [q.v.]), the canals which, from ancient times, have connected them run at an oblique angle in relationship to them. Aerial photography, together with other sources of information, has allowed Adams to supplement and complete, for the left bank of the Tigris,

the information of the mediaeval authors and, especfally, of the Sarafyun (Serapion). In regard to the zone between the two great rivers, periods of neglect before and after the coming of Islam have transformed part of central 'Irak into a marshland, the Bailina [q.v.], the drainage of which has not been possible. The rivers and the great canals, constructed and maintained by state, were important routes for communication, which were not impeded by the bridges of boats across them im by the mills. The upkeep of the smaller canals the responsibility of local people. An ancient system of customary law regulated the amount and the periods of water used amongst the holders of land along the banks, and specially-appointed officials had the task, through the manipulation of sluices and water-gates, of securing this regulation. The interest shown about irrigation questions by mediaeval authors arises from IIII fact that, both for the land-tax and for local dues, fixigated land was distinguished from non-irrigated land.

The anonymous author of the Kitab al-Haut (5th/rrth century) has provided us, in the shape of mathematical problems, with some interesting details about the administration of the canals and about hydraulic machinery in mediaeval Irak. He describes various kinds of waterwheels, dawlab, charrafa, shādhūf, giving their capacity for drawing up water and then spreading it for irrigation purposes, according to the season, and the numbers of men and animais required to work them. Then he moves on to the "balancing out of ground" intended to fix the levels of canals which have to be due out (see E. Wiedemann, EP, ast. mizin). Finally, he raises the question of the construction and upkeep of the raised canal banks, which he calls basand, m pre-Islamic term not listed in the classical dictionaries, hence often wrongly read. It is necessary to know the volume of earth, reeds and brushwood which has to be transported, which is counted according to a special unit, the azala = 100 cubic cubits "of balance", and it is to be understood that = asala is procured by 33 "spade loads", handled by two men, one digging and the other transporting the earth, etc. in sacks. The provision of materials and the labour, which seem never to have been done by slaves, are paid according to an official tariff.

6. IRRIGATION IN PERSEA

The distribution and density of population and the development of agriculture in Persia throughout history have been closely dependent upon the availability of water, and the nature of the Irrigation systems has influenced both the siting of settlements and the pattern of society. Precipitation is scanty seasonal; it is concentrated in the periphery of the country, as also are the major perennial rivers.

As a general rule, rainfall, which occurs between October and May, decreases from the north to the south of the country and from west to east, but in a number of areas the high relief of the Alburz and the Zagros mountains has modified this pattern. Along the Caspian Sea coast and the northern flanks of the Alburz, precipitation reaches more than 1,500 mm, near the mouth of the Safid Rud; annual totals fall to less than 500 mm, on the east side of the Caspian near Gunbad-i Kābūs. Along the western flanks and summits of the Zagros Mountains, precipitation amounts are thought to exceed 800 mm. on some of the higher peaks, and large to the west of Shiraz receive than 400 mm, in the north-western highlands, between the two belts of high precipitation, there is a zone of moderate precipitation of 250-400 mm. In the centre of the country occupied by the Dasht-i Kawir and the Dasht-i Lüt, great sterile deserts, precipitation totals almost everywhere less than 100 mm., though a higher precipitation is found on the eastern borders of the hawle in the highlands around Birdjand and Zahidan. Everywhere, with the exception of the Caspian littoral, low and episodic rainfall is a major constraint on agriculture, hence the importance of artificial irrigation.

Dependable supplies of surface water exist only in isolated districts around the margins of the country, but there is nowhere m annual surplus of water, and seasonal surpluses, except in the north and west, are insignificant. Run-off is episodic, and occurs only because precipitation momentarily exceeds the infiltration capacity of the surface. The flow of water in **the country** is seasonal and highly variable from year to year. Feak flows me too late for winter crops and the minimum discharge occurs when summer crops are in greatest need of moisture. The control of water by artificial irrigation is therefore lumensely important for agricultural production and prosperity. Without artificial irrigation the cultivation of plants native to regions where summer rainfall is normal, such as cotton, millet, rice and sugar would not im possible.

There are few great rivers in Persia-the great hydraulic civilisations have no place there. The largest are the Körün and the Karkha [q.ov.] which flow into the Persian Gulf, draining almost all the area between Abadau and Kirmanshah. Further south are the basins of the Mand [q.v.] and the Shur, which also drain into the Persian Gulf and the Gulf of Oman respectively. The Safld Rud flows into the Caspina, as also do the Aras [see AL-RASS] and the Atrek [q.v.]. The water of the two last-named, which flow along the modern Russo-Persian border in the north-west and the north-east respectively, is shared with Russia. The central zone of Persia. covering the largest part of the country, is an area of internal drainage. Small rivers flow into the closed basins of Lake Urumiyya (Rida'iyya) in Adharbaydjan, into the Hamun in Sistan and into dry lakes and saline marshes in structural basins in the East Zagros, the depression between the Zagros and the volcanic axis extending from Kumm to Kirman, the Diaz Muriyan basin, the southern Lut, Balučistán, the eastern highlands north of Birdiand and in the frontier zone with modern Afghanistan, South-west of the central desert is the basin of the Zāyanda Rūd, which supports Işfahān and to the south of this, the basin of the Kur. The discharge

of most streams in the central zone is small. Many of the larger streams, gathering in high mountains, have steep and irregular profiles. Leaving the mountains, they dwindle quickly as a result of evaporation. seepage and diversion for irrigation, leaving dry channels, the underflow of which now and then supports an exotic agricultural efflorescence. From ancient times, the water of these rivers and streams has been used for irrigation and has formed the basis on which flourishing civilisations have been established in pre-Islamic and Islamic times. The history of the water use of the Kur in the Marwdasht plain illustrates the importance of the role played by irrigation in the establishment of the early Persian empires in that region and the changes in the prosperity of the region and the density of settlement which took place the centuries as a result of fluctuations in the upkeep of dams and irrigation channels (see further, G. Kortum, Dia Marudaski-Ebene-Fass, Kiel 1976). For the most part, the rivers flowing into the southern end of the Caspian Sea, apart from the Oxus [see AMC DARVA] appear to have been less used for irrigation in early and mediacval times than the rivers in central, southern and eastern Persia. Hamd Allah Mustawii states that little of the water of the Djurglan River was used for irrigation and most of it ran to waste (Nuthat al-èulub, ed. G. Le Strange, 214). Similarly, hardly any of the water of the Safid Rud was used for irrigation, except for that little which watered the lands lying immediately along its bed; most of it was wasted (ibid., 217); and the same, he alleges, was true of its tributary, the Shahrud (ibid., 218), though this me not in the case of the rivers of the two Tarunis, which also flowed into the Safid Rud: in summer most of their waters were used for irrigation and little flowed into the Safld Rud (ibid., 221).

The smaller basins of the arid centre of Persia and the south-east, together with the fringes of the kawir, receive incoming water mainly by piedmont seepage of many small ephemeral streams. The traditional method of tapping this water is by kandt [q.v.], which, with its associated network of canals, is characteristic of irrigation on the Persian plateau; hence too the frequent siting of settlements on gentle slapes were distances from the foot of the hills that feed the bands. From earliest times, the material basis of the population - the Persian plateau has been provided by kanat water (H. Gobiot, Estat d'une histoire des techniques de l'eau sur le plateau franien, in Partice, viii [1979], 120). The various systems of irrigation—by river, kandl, spring = storage dam not mutually exclusive; many districts use more than one.

The configuration of settlements has been decided in many by the nature of the water supply. Where water is scarce, villages tend to be concentrated; elsewhere they may more scattered. They frequently flank water-courses and cluster about the outlet of bands - round springs. The - immediately round a town or village in usually intensively cultivated with irrigation-even in the dry farming regions there is often a small irrigated area in or near a town or village. Beyond the cultivated land there is sometimes a periphery of marginal land which may be cultivated in years when the water supply is extraordinarily plentiful. Similarly, mountain villeges in regions where the rainfall is sufficient for cultivation usually have an irrigated area, however small. In mountain valleys, the villages lend to be situated on rocky slopes rising above the intensely cultivated valley floors or to straggle along the mountain streams. Mountain stopes we often skilfully terraced, and much time and labour is expended on the construction and repair of dry stone retaining walls for the cultivated plots [cf. X. III Planho], Geography of settlement, in The Cambridge history of Iran, i, ed. W. B. Fisher, Cambridge 1968, 419-20. The need for regular attention iii the upkeep of irrigation works has, further, been an important factor in making the village, rather than the isolated farmstead, the typical form of settlement throughout most of Persia.

Artificial irrigation may already have existed in late Neolithic times. By the Achaemenid period, there was an extensive network of bands, and with the extension of irrigation there was an expansion of agriculture. It is probable that drainage schemes were also undertaken in different parts of the empire. Later, the Seleucids brought more land under cultivation by clearance and drainage and applied new techniques to irrigation (R. Ghirshman, Iran from the earliest times to the Islamic conquest, Harmondsworth 1914, 239). In Islamic times, control of water for irrigation remained crucial to prosperity and settlement.

Such control is a highly complex matter, and requires for its successful implementation not only technical skill but also political stability. The heavy load of solids carried by streams in spate makes storage and control both difficult and costly. Flash floods often destroy irrigation works, especially those connected with kandis, while spring floods may also cause much damage in lowland districts. On the plateau, the lowering of the stream-beds through normal erosion results in the lowering of the water-table itself and leaves irrigation canal intakes above the new water level. In modern times, the lowering of the water-table by the extraction of water by pump operation connected with the sinking of semi-deep wells has led to many kandts falling into disuse, especially round the central desert but also in other regions. Inadequate drainage, on the other hand, often leads a rising water-table under irrigated lands, water-logging, salinisation and alkalinisation, which result in considerable loss of output. These processes vary widely in different districts and different years. In some regions, notably Khûzistân and Sistân, deterioration of the soil because of a change in the watertable due to over-lavish irrigation and inadequate drainage, or both, has been a major problem. Another problem is that ground water in will districts may be heavily charged with soluble saits and III too saline for use in irrigation. This is the case in many districts in the borders of the central desert and in the Persian Gulf littoral.

Natural conditions and agricultural practices cannot alone, however, explain the fluctuation in the history of irrigation in Persia. The shifting of centres of political authority which accompanied dynastic changes and demographic changes resulting from invasion and the increase in dead lands because of the sizughter or flight of their inhabitants have also played m part. A breakdown in the control of water, for whatever meeting reasons, was inevitably followed by a decline in prosperity. The decay of Khūzistān, which culminated under the 'Abbāsids, is an Mustration of this. Under the Sasanids, the waters of the Karkha, Diz and Karun had been utilised by an elaborate system of barrages, tunnels, inverted syphons, lifting devices and canals (see below). Cereals, sugar cane, rice and dates were produced in abundance. In the last fifty years or =

of Sasanid rule, irrigation - neglected. Under the rule of the Orthodox Caliphs and the Umayyads, adequate attention was not paid to artificial drainage of the irrigated land, and under the 'Abblishds the province declined-rising water-tables under irrigated land may have been responsible for the attempts of the 'Abbasids to irrigate new lands of poorer quality. Water-logging, alkalinisation and salinisation, and the hazards of flood, all contributed to the decline of the region which occurred in post-Abhasid times (see further R. McC. Adams, Agriculture and urban life in early southwestern from In Science, exxxvi, 3511 [1962], 109-22). Changes in prosperity in other regions brought about by a failure to control irrigation have been, perhaps, less spectacular but none the less important. The decay of irrigation and drainage not only resulted in an increase of waste and unproductive land, but may also have ted to the spread of majaria [see MALARYA], thus contributing to a decline in population and output.

Water utilisation: technical features. Infigation works, plain take-offs, dams [see BAND], weirs, lifting devices, artificial reservoirs and kandis, supplemented by principal and secondary canals, are to be found all over the country; and some are

ancient structures.

(i) Dams. Several large dams existed in Khuzistan in Säsänid times, including the bridge dams at Shushtar and Dizful, built by Shapur I and Shapur II or Ardashir II respectively, the dam on the Djarrahi near Khalafabad, and the dam on the Marun at Arradian (on the last, see H. Gaube, Die südpersische Provinz Arragan/Küh Gilüyek, Vienna 1973, 189-90). They continued in in for varying periods after the fall of the Sasaulds. Repairs and reconstructions were numerous, and the Romano-Sasanid work at Shushtar and Dizful was partially replaced by pointed-arch bridges. The dam at Shushtar, known the Band-i Mizan, bad a length of 1,700 ft. and raised the water to the level of the city of Shushtar, which was situated on a rocky outcrop on **and** east bank of the Karun. The dam was built partly by Roman prisoners of war taken in Shapur I's victory over Valerian in A.D. 260. It had a rubble masonry set in hydraulic mortar; the facing was of large, cut masonry blocks, held in place by both mortar and fron clamps set in lead. It was pierced by numerous sluices for the purpose of releasing water in time of excessive flow. It took three years to build, during which time the Karun River was diverted through two by-pass channels. One of these, the Ab-i Gargar, winds its way south for twenty-tive miles and then rejoins the Karun. When the work of the dam was completed, the entrance to the Ab-i Gargar closed by a second dam, the Kaysar dam. This was made of large stone blocks mortared and clamped together, and six aluices were provided to control the flow of water into the Ab-i Gargar, Part of the bridge at Shushtar and the Band was swept away by floods several times during the 19th century, Muhammad 'All Mirza, when governor of Kirmanshah, undertook repairs to it in the early 19th century (J. M. Kinneir, Geographical memoir of the Persian empire, London 1813, 98-9]. When Curzon visited Shughtar in 1889, there was a gap of over seventy yards in width in the middle of the bridge, which had been swept away by a flood in 1885. The efforts of Nigam al-Saltana, the general of 'Arabistan, to repair it proved abortive (Persia and the Persian question, London 1892, ij. 374-5). A further canal, the Miyan Ab canal, was cut, apparently to divert water through a tunnel made in the face of

the eastle rock in order in irrigate the high-lying lands to the south of the city, the level of the water of which was regulated by dams. As a result of the rupture in the Band-i Mizān and the bridge, the river bed was lowered at the point where it fermerly fed the canal and the land which is was intended to irrigate became derelict (Curzon, op. cit., ii, 376).

The Dizful dam, a replica of the Shushtar dam, was 1,250 ft. long. When Curzon visited Dizful, the dam was in a dilapidated condition, two of its arches having recently failen in (op. cit., ii, 303). After it fell into decay, all local irrigation depended upon rough dams of stone and brush-wood, which were reconstructed after every flood (H. Wulft, The traditional stafts of Persia, Chicago 1967, 248; N. Smith, A history of dams, London 1971, 59, 87, 82; A. K. S. Lambton, Landlord and peasant in

Persia, repr. Oxford 1969, 216).

South of Shushtar, where the Ab-i Diz and the Ab-i Gargar flow into the Ab-i Shutayt, the main channel of the Karun, another Sasanid dam, the Band-i Kir, of which only the name survives, was located. The name is of interest because it suggests that bitumen (Mr) may have been used to make the dam watertight and solid. Another dam == the Åb-i Gargar, called the Pul-i Bulayti, was added to the Shushtar system in Islamic times. This was a power dam; mills were installed in tunnels cut through the rock at each side of the channel, the dam providing the necessary head of water to drive the mill wheels (see Curzon, op. cit., i, 372-4). A third bridge dam was built, also in Sasanid times, the Karkha at Pā-yi Pul. It fell out of use when it burst in 1837. Its remains were men by Sir Aurel Stein in 1938 (Sir Aurel Stein, An archaeological journey to Western fran, in Geogr. J. [October 1938], 327).

At Ahwaz [q.v.], there another great dam (but not a bridge dam), probably over 3,000 ft. long, and about 25 ft. thick. Its remains were to seen until recently. Al-Mulgaddasi describes the dam as being wonderfully constructed from blocks of rock behind which the water held back. He states that the water was divided into three canals, which watered the fields of the estates of the people of the city, and that without the dam Ahwaz would not have been populous and that its canals could not have been used (Absan al-lakāsim, 411; see also Curzoa, op. vii., ii., 347-8). The collapse of the dam in the 9th/13th

century brought ruin to the city.

Numerous storage dams and their remains are to be found in many parts of Persia. Although their overall contribution to irrigation was not as great as that of kanāts, or of the dams in Khūzistān, they were of considerable local importance and enabled land which could not otherwise have been cultivated to become productive. One of the most interesting systems is that on the Kur River in Fars, which has provided irrigation for the Kurbal district to m greater or lesser extent for and 2,000 years. The most famous dam of this complex is the Band-i Amlr, built about 349/960 by the Buyid Adud al-Dawla [q.v.], probably on earlier, possibly Achaemenid, foundations. Prior to its reconstruction, IIII water of the Kur could not be raised to irrigate Upper Kurbāl, Al-Mukaddasi, who wrote soon after the dam was built, and Ibn al-Balkh! [q.v. in Suppl.], who wrote rather under 150 years later, describe the dam in similar terms. The latter states that 'Adud al-Dawla brought engineers and workmen to the place in order to build the dam and spent much money on its construction. The dam was made of

stone set in mortar, reinforced by iron anchors, which were set in lead. Upstream and downstream the river-bed was paved for several miles, and the supply canals extended for over ten miles, serving 300 villages in the Marwdasht plain. Ten water-mills were built close to the dam, the crest of which was wide anough to allow two horsemen abreast to ride across it (al-Mukaddasi, 444; Ibn al-Balkhi, Fārs-nāma, ed. G. Le Strange, London 1921, 151-2; see also G. Le Strange, Description of the province of Fors in Persia at the beginning of the 12th century A.D., London 1912). Upstream from the Band-i Amir there were five other major dams for the irrigation of Lower Kurbal. These included the Ramdiird dam, built on Achaemenid foundations, which was almost as large as the Band-i Amir, and five downstream, the last of which, the Band-i Kaşşār, was only a few miles from Lake Bakhtagan into which the Kur flows (A. Houtum-Schindler, A note on the Kur River in Fars, its sources and dams and the districts it irrigates, in Proc. Royal Geogr. Soc. [1891], 287-91; see also N. Smith, op. est., 83-5, and Kortum, op. oit.). By the 6th/12th century, the Band-i Amlr, the Band-i Kaşşar and the Ramdjird dam had fallen into a state of decay and were repaired by the Saldjuk governor of Fars, the Atabeg Dialal al-Din Cawli Sakaw (Lo Strange, Lands of the Eastern coliphate, 277-8). The Ramdiird dem was again rebuilt towards the end of the 6th/beginaing of the 13th century, and there were several reconstructions after that date (Smith, op. cit., 65).

In the eastern provinces of Persia there were also a number of dams and legigation works on the Oxus or Amu Darya [q.v.] and on other great rivers and lesser streams. Some of these repaired, and others constructed by the Muslims. Sistan - dependent almost wholly upon the control of the water of the Hirmand (Helmund) River [see HILMAND], Zarantii, the capital of the province under the Abbasids, was situated near the original capital of Ram Shahriatan (Abrashahriyar), which according to tradition, had been abandoned when a dam across the Hirmand had burst and the water had been permanently diverted from the Ram Shahristan canal (Le Strange, op. cit., 339-40). From the works of the Muslim geographers, it would appear that Zarandi irrigated by six dams on the Hirmand near where menters Lake Zarab. Some of these may have been of Sasanid origin. The Muslims added various water-wheels in the system. In 785/1383 Zarandl and its irrigation works me destroyed by Timūr, was also the Band-i Rustam on the hillmand River near Bust, the water of which bad served to irrigate all the western lands of Sistan. Failure to repair and maintain the elaborate system of canals and dams on the Hirmand River resulted in much of the land formerly irrigated and drained being converted into reed beds and swamps. The headwaters of the Hirmand and the main stream are at the present day in Afghanistan. After entering Persian Sistan, the river divides into two branches, the Pariyan and the Sistan rivers. The former flows in a northerty direction, and with its tributaries waters northern Sistan. The latter flows through southern and south-western Sistan. Near the Aighan frontier, the Kabak dam diverts water into the Parlyan, while another dam lower down, the Band-i Zahāk, diverts more water for irrigation. The mm of the water of the Hirmand and the construction of new dams has been the subject of bitter controversy between Persia and Afghanistan. The first award of the river waters between them was made in 1872. In 1950

the Halmand River Delta Commission was set up (though subsequently disbanded).

The water of the Murghab River in Khurasan was diverted by numerous dams and canals for irrigation. Al-Istakhri relates that one march south of Marw, its bed was artificially dyked with embankments faced by wooden works which kept the river-bed from changing. Under the Saldiuks, the number of dams and dykes on the Murghab me increased. These were later destroyed by the Mongols and the oasis of Marw converted into a desert swamp, according Hafis Abru (Le Strange, op. cit., 397, 402). He states that after Timur's conquest of Khurasan, various of the amirs and pillars of the state each made a canal leading off from the Murghab, in order to irrigate the land, and that when he was writing, i.e. at the beginning of the 9th/15th century, twenty of these were in existence. He discribes the city being in a flourishing condition (Djughrāfiyā-yi Häfit Abrü, kismat-i rab' i Khurāsān: Harāt, ed. Māyil Harawi, Tehran A.H.S. 1349/1970-1, 34)-

One of the most important periods in mediaeval Persia in the construction of dams appears to have been the likhan period, when, in the late 7th/13th century and early 8th/14th centuries, several dams were constructed. The great achievement of this petind was the construction of a number of arch dams, One at Kibar (Kivar), some 15 miles south of Kumm, is the oldest surviving example of this type of structure m far located. Built in a V-shaped gorge, which parrows about baliway down to a deep gully, the dam is 85 ft. high and 180 ft. long at the crest, the thickness of which is between 15 and 161/a ft. The airface, the radius of curvature of which is 125 ft., is vertical except near the face where there is m slight slope in the downstream direction. The dam has a core of rubble masonry set in mortar (sdraigi) made from lime crushed with the ash of meet desert plant, which makes it hydraulic and results in a strong, hard and highly impervious mortar ideal for dams. The dam has a vertical series of openings on the water-face connected by shalts and galleries to provide passage for the water through the dam walls (though their precise function is uncertain). Two other arch dams, probably also belonging to the likhan period are situated near Tabas, the Shah Abbasi, east-north-east of Tabas, m called because it was repaired in the Salawid period, presumably by Shah 'Abbas I or Shah 'Abbas II, and the Kurlt dam, to the south of Tabas. The latter is remarkable for its height of meet two ft. (H. Goblot, Du nouvenu sur les barrages franiens de l'époque mongole, in Arts ei Manufactures, no. 239 [April 1973], 15-20; idem, Kébar en Iran sanz doule le plus ancien des barragesvoites, in Science-Progrès, no. 3358 (February 1965); idem. Sur quelques barrages anciens et la genées des barrages-voutes, in Revue L'Histoire des Sciences, cabier no. 6; Smith, op. cit., 65-8). Another dam, a large gravity dam at Sawa, was also built in the likhan period. Hamd Allah Mustaws states that it was constructed on the orders of Sijams al-Din Muhammad Şāhib-Diwān [see pluwayn], shaks alрін минаниар) (Nuthat al-hulüb, 221). It situated in a valley south-east of Sawa and east of the point where the Karāčāy (Gāvmāha) joins two streams from Sawa and Awa respectively. Although the limestone rock at less side of the valley was sound (as far as is known), the base of the dam was built on river alluvium consisting of sands and gravel, which go down 90 ft, before bed-rock is reached. Consequently, as soon = the reservoir began to fill, the pressure above the foundations drove the water through the alluvium and the water established a permanent outlet for itself. The dam was abandoned, but the structure survived (Smith, op. cit., 64-5). It is not without interest that a number of dams and irrigation works were constructed about the time in Yünnan by Saad Adjall, who apparently became governor of Yünnan in A.D. 1274 (J. Needham, Science and civilisation in China, 1v/3, Cambridge 1971, 297).

The dating of the gravity dams at Kuhrūd and Kamsar near Käshän and at Farlman and Turük in Khurāsān is uncertain. The Kuhrūd dam is attributed to Shah Abbas and the Kamsar dam to Dalai al-Din b. Muhammad Khaarazm-Shah (Abd al-Rahman Darrabi, Tārikā-i Kāskān, ed. Iradi Aishār, Tehran A.H.S. 1335/1956, 8, 40-1, 42, 43). The Gulistan dam in Khurasan was made by the Timurid Abo Sand httrzå (855-72/1452-67) (Asnād wa mukātabāt-i tärihhi-yi Iran as Timur ta Shah Isma'll, od. 'Abd al-Husayn Nawar, Tehran A.H.S. 1341/1962, 313). The Salami Dam in Khurasan was constructed by Ghiyāth al-Din Kurt (206-25/1306-24) (N. M. Clevenger, Dams in Horasan, some preliminary observations, in East and West, N.S., xix [1969], 393). These dams were still in use in the 1960s, but most of them furnished very little water because their reservoirs

were heavily silted up.

Under the Safawids, there was renewed activity in dam-building and other constructions for irrigation. Shah Tahmasp (930-84/1524-76) attempted to divert the water of the Karun into the Zayanda Rud by a connecting tunnel through the mountain ridge which separates them. The work was abandoned owing, it was said, to the foul atmosphere of the workings. Shāh 'Abbās | (996-1038/1587-1629) revived the project, but abandoned the idea of a tunnel in favour of an open cutting. It is reported that at times he employed 100,000 mm on this undertaking, but the scheme came to naught. Shah 'Abbas II (1052-77/1642-67) made another attempt, in which he was advised by a French engineer named Genest. A dam, 300 ft. long and about 100 ft. high was built across the Karum to divert the water of the river while the channel was cut. Smith thinks that Genest may have bad in mind more than | mere diversion of the river and that he may have hoped to reduce the amount of excavation through the mountains by raising the level of the river. The scheme, however, was also abandoned after 100 ft. of the connecting channel between the two rivers had been cut. The idea - revived during the reign of Rida Shah Pahlawi. Work was begun on the cutting of a tunnel connecting the two rivers. Known as the Kührang tunnel, it was finished in 1953 (Smith, op. cil., 72-3). The increase in the flow of water in the Zayanda Rud which resulted has enabled ____ land to be cultivated in the districts through which the river flows. Shah 'Abbas II also built, on the foundations of an earlier weir, the Khvadio Bridge over the Zāyanda Rūd in Işfahān. It is a combination of a weir with sluice gates and flood arches above these, with a permanent roadway on the top (Wulff, op. cit., 248; Smith, op. cit., 73-4).

(ii) Wells and lifting devices. A variety of lifting devices operated by men and animals to raise water from rivers, streams and wells have been widely used in the past, especially in Khūzistān, the Persian Gulf littoral, Pārs, in the neighbourhood of Islahān, in some districts in castern Persia and on the shores of Lake Urumiyya (Ridh'iyya). They are still used, but have been largely superseded by power-operated wells. Man-operated wells consist of a windless set

over the well with a large leather bag attached to it. Those operated by draught animals worked by one or more draught animals such as oxen, mules and, less frequently, buffaloes, each draught animal having one or more men working with it. The constructing of these devices varies slightly in different regions, but the general principle is the same. Their operation is both laborious and inefficient. A wooden wheal ja set in two brick - stone built pillars, or two heavy upright posts, above the well, connected by wooden scaffold. Two pulleys are me axles attached to the scaffold, over which a main and auxiliary rope run into the well; the wheel end of the main rope is attached to a hook and a ring carrying a wooden cross from which a large leather bag is suspended. This runs out into a narrow spout to which the auxiliary rope is attached. The draught animal is harnessed to the ropes and sets the wheel in motion by walking up and down a runway beginning at the well-head and descending at an angle of about 20 degrees. By this action, the bag is let into the well. When it is full, it is lifted to the surface and empties itself in front of the well into a trough which carries the water into the irrigation channel, In some wells, a big wooden horizontal cog-wheel, geared to a vertical wheel which turns a bucketcarrying wheel set on the same axle in the water is set in motion by an ox mule walking round and round a circular runway made about the well (see further Wulff, op. cit., 256-8, and Lambton, Landlord and peasant, 227-8; and also C. Cahen, Le service de l'irrigation en Iraq au début du XIº siècle, in BEO, xiii [1949-50], 118-19). Curson describes how water was lifted for irrigation from the Kärün above Ahwäz, where the river was confined within banks from 20 to 30 (t. high. | hollowed in the river bank and water was drawn up by means of leather skins and a pulley worked by exen pacing up and down an inclined plane - the top of the bank (op. cit., ii, 356-7). (iii) Cisterns, water tanks and ponds. These are to

be found in regions in which water supplies are scarce and are especially common in districts on the edge of the central desert, though they also to be found elsewhere, notably in Füminät. They are supplied by water from havilts, underground aprings or rain-water. Some are made with slones or bricks and cement and are often of a considerable size. Abd al-Rabim Darräbi states that almost all the villages and hamlets in Käghän had small cistems (istakh); that of Niyūsar was dhar' by 50 dhar' and 2/2 dhar' deep. He describes the purpose of istakhr as

iotlows: "In some hamlets (mardri) the water is less than [the amount required for] a plot of land (karda) for the first rotation when water is due to be let into sown land or orchards. As a result, it takes a long time for the plot to be laundated, because when the quantity of water is small, as soon as it enters the land it sinks in and the plot will not be inundated. Accordingly, water is held back in medistern (istakhr). When the latter is full, it is emptied, or whatever amount is needed for the land is let into the irrigation channel until the desired result is achieved. Or it may be that the water of a hamlet is sufficient for the first rotation period but it is desired to lead the water to a pince of land (dash).

or fields (maxiri') which and distant, and so half or more of the water will be lost in the change between the mouth of the kanki and the land to be trigated, with the result that the plot will not be inundated (unless a greater head of water is first

inundated (unless a greater head of water is first held back in a cistern). Or it may m that willage 870 NÅ³

has [sufficient water] in the first rotation period for three or four pieces of land, and it wishes to divide the water into three or four irrigation channels, some giving more water and some less. A cistern is therefore necessary, so that the requisite amount can be let into each irrigation channel, or so that water from two or three sources be let into different channels and then divided (saridia-paymā'i namā-yanā)" (Tārlā-i Kāhān, 66-7). Hamd Allāh Mustaw-ff describes how small catchpools were made the edge of the cultivated round Tūn to catch rain water which was used for grain cultivation [Nashadal-bahāb, 143-4).

Irrigation practices and water distribution and measurements, Irrigation practices from heavy perennial irrigation, land watered less heavily through the year or parts of the year, to land watered once or twice a through the capture of flash floods or water stored in a cistern. The usual method | irrigation is by inundation; for exceps, trench irrigation is used. In the of rivers, the water is diverted into canals and sub-canals and cross-canals, whence it is led into the fields to be irrigated. The division is made according to established rights of priority, usually (but not always) starting upstream and ending downstream. The water of other sources, if it is prolific. is also divided into various channels and led to different users simultaneously. The division of the water between several users is assured by a variety of mechanical devices, distributors, or runnels with inlets of a fixed size or by the allocation of fixed periods of time. Where water is divided by a weir between a number of villages or users, the size of the orifices at the rim of the welr varies according to the share of the water permanently allocated to the different water is led into individual fields, plots or gardens by breaching the banks of the canals (usually with a spade) for the appropriate length of time.

The rotation period of the water (dawr-i db) normally begins in early October with the start of the agricultural year and is fixed at so-and-so many days. Within that period, many shares, defined in days, hours, or minutes, are allocated to the different districts, villages, fields, or plots of land watered by the source in question. A common way of measuring the unit of time is by a kind of hour-glass, the time-unit being the time it takes for a small copper bowl with a hole me the bottom to fill and sink in another large basin (see further al-Mawardi, Les statuts gouvernementaux, tr. E. Faguan, Algiers 1918, 389-90; E. Stack, Six months in Persia, London 1882, fi, 264 ff.; Lambton, Landlord and peasant, 212-13, 228-20, 408; Wulff, op. cit., 254-6; Darrabi, op. cit., 53-4; B. Montazami, Irrigation in Iran: élèments pour une approache matérialitte, in Zaman, i [1979], 38 (f.), Stack mentions that in some of the villages of Firaydan, the water distribution was regulated in the daytime by the length of a man's shadow and at night by the stars (op. cit., ii, 269).

meticulous and elaborate the organisation of its distribution.

Water laws and water rights. So far as the thanka is concerned, water laws belong to mulamalat as opposed to Woddat and are based on fur/ or custom enshrined in the traditions and given sanction as the practice, or supposed practice, of the Prophet and his companions and their immediate successors and in the case of the Shifa, of the imdons. These practices reflect not only the conditions and needs of Arabia at the time of the Prophet, but also those of other regions into which the Muslims later penetrated. They do not, therefore, present a coherent and uniform basis for a body of water laws, but rather . series of unrelated decisions, sometimes in conflict with each other. In general terms, irrigation was governed in theory by the shart'a, but in practice and in matters of detail local custom prevailed and was extremely varied. In the law books, there are references to irrigation in the books on takat, sustr. khums and kharadi, ik vi al-massat (the revivification of dead lands), harim ("borders"), mushtarakät (things held in common), bay' (sale), makāsib ("earnings"), ghash (usurpation), musara'a [q.v.] (crop-sharing agreements) and musakat [q.v.] (agreements for the sharing of fruit and other trees). The general principles concerning water laws are accepted by both Sunals and Shiffs, but there are differences in matters of detail between them and between the different law schools which, in view of the fact that water laws are based m custom, is not surprising.

(i) The right of thirst (shafe). By virtue of the hadith which states that Muslims are partners in water, fire, and grass, the use of water is considered as common (wubāh) to all men, but it may be approprinted by "occupation" (iårās), e.g. by collecting rain water in a vessel placed outdoors to that end. It cannot, however, be "occupied" until it has ceased to run, i.e. until it is placed in wessel or watertight well or basin (Aghnides, Mohammedan theories of finance, Labore 1961, 515. See also Zayn al-Din 'Alf al-'Amili al-Shahid al-Thani, Rawdat albahiyya fi sharh lumfat al-Dimashkiyya, lith. 1271/ 1854-5, 267). Water in rivers, Adnats, wells and basins which are not water-tight is, therefore, considered to be mubah, even if the rivers, handle, wells and basins should be private property. Everyone is entitled to use such water for drinking purposes for himself and for his animals, provided that the animals do not exhaust the whole supply. The sale of the water of privately-owned rivers, kangis, wells and basins (for drinking purposes) is permitted by some jurists, though all appear to consider it better to give such water than to sell it (Aghnides, op. cit., 516, and sa also Muhammad b. al-Hasan al-Tusi, al-Nikāya fi 'l-fiệk wa'l-fatāwā, ed. Sayyid Muhammad Bakir Sabzawärl, Tehran 1333-41/1954-5, 2 vols., ii, 282). The right of all men to use water is confined to drinking purposes and does not extend to its use for irrigation.

(ii) The right to use irrigation major. According to the Sunni fulable, the water of the great rivers belongs to the Muslims in common (Abd Yusuf, Le liure de Fimpôt foncier, tr. E. Fagnan, Paris 1921, 146) and according to the Shi'l fulable, to the imdm. Their water may be used by anyone for irrigation and power provided its min in this way does not harm the community, and anyone may divert water must be great rivers by means of meanal, unless such diversion is prejudicial to interests already acquired. In the case of the lesser rivers, the water of which is sufficient to irrigate the land along its banks without

871

the construction of dams, anyone may lead off water in a canal to irrigate other land, provided such action not prejudicial to existing interests. If the water of a river cannot wured for krigation without the construction of dams, lands higher up have, according to most authorities, Sunnt and ShIT, a prior right to those situated lower down (cf. al-Mawardl, 386 ff. and Muhammad b. al-Hasan al-Tüsl. al-Nihdya, ii, 283). The Hanafis, me the contrary, hold that lands situated lower down the river have prior right over those situated higher up, while the Malikis lay down that land situated higher up has the prior right of irrigation until the water reaches as high as the ankles, but if the land lower down has been developed earlier and there is a danger of its crops being destroyed, it has a prior right and higher upstream. These various views are reflected in existing practice. As to the minimum of water that may be drawn off, the Prophet is said to have allowed a level as high as the ankle, and this tradition is widely followed. Al-Mawardi, whose exposition is concerned with the practice of water management rather than the theory, holds that the amount varies with the nature of the land, the kind crop, the time of sowing, the season and whether the flow of the river is permanent or intermittent (op. cit., 388; see further Aghnides, 517, Lambton, Landlord and peasant, 210-11).

The right to use water flowing in artificial bods, such as the water of a canal dug by the people of n village, belongs exclusively to the owners of the hed of the canal, and others may not - the water for irrigation. The manner of use is established by the agreement of the co-owners. The construction of mills and bridges, etc., requires the consent of all the co-owners. If mill has been legally built on the stream of a third party, the owner of the stream cannot divert the water except with the permission of the owner of the mill (al-Muhakkik, al-Mukhtaşar al-ndfic, ed. Muhammad, Taki Danishpazhûh, Tehran A.H.S. 1343/1964, 306). The use of the water of wells and artificial reservoirs belongs exclusively those who made them, and others may not use their water for irrigation. The me of the water of springs is also the exclusive right of the owner of the land in which the spring lies. The general view of the Shift fuhaha' appears to be that handle, springs and wells situated in private property, made in dead land with the intention of reclaiming the land, belong to the person or persons who made them and that they can be transmitted by sale Inheritance and can be constituted into walf. There was not, however, unanimity of opinion this. Some, including Muhammad b. al-Hasan al-Tool, maintain that the water of a well, kandt in canal does not become the property of whoever dag the well or made the kanal or canal, and that such actions only give a right of priority in the use of the water.

Transmission and sale of water rights and water sources. Most jurists permit the transmission of water rights and water sources, — far as they are private property. From this, it follows that water rights often become highly fragmented. The jurists also permit the constitution of water rights and water sources, — far as they are on private property, into make. Many kandes and canals and rights to a share of the use of various sources of water have been so constituted. The Yazd region is particularly illustrative of this practice. From the number of shares into which thany of the kandes of Yazd were divided, it would seem that their

ownership was highly fragmented (cf. <u>Didmit al-hhayids</u>, ed. Muhammad Taki Dänlshpazhüh and Iradi Afshär, in Farhang-i Iran-tamin, ix [1345/1966-7], passim). Their constitution into makf prevented further tragmentation.

Dead lands. The revivification of dead lands (ihyā) al-manat) normally involves the irrigation of the land. Thus at-Mawardi states that land to be revivified for cultivation must be irrigated if it is dry, and drained if it is marshy (op. cit., 380, 382; Aghnides, 500-1; m further Zayn al-Din b. 'All al-Amili al-Shahid al-Thani, op. cit., 265-7). Revivification confers ownership, and canals dug to bring water to dead lands belong to those who dug them (al-Mawardi, 389), and wells or kandle made in dead lands in order to revivify them belong to those who made them. If irrigated with 'ushr water, revivified land paid 'usir, and if reclaimed with thurddi water, Marádi (al-Māwardī, 382 ff.). Al-Muhakkik, discussing the conditions for the revivification of dead lands, states that there is no shor's text governing these and that reference is to be had to custom. If the intention is the cultivation of the land, ownership is established either by tabdir, - by bringing water to the land by a water-wheel or some similar method (Shard'is al-islam, ed. 'Abd al-Husayn Muhammad Ali, Nadjal 1389/1969, 4 vols., iii, 275-6). New canals and kanais to bring irrigation water to dead lands are subject to the laws governing karim.

Harim. The ownership of landed property involves also a right over the land which borders it, where this is necessary for the full enjoyment of the property. So far as irrigation is concerned, this is of vital importance in respect of springs, streams, candis and water channels. Accordingly, "borders" are laid down for such forms of property, within which a third party may not undertake new irrigation works, though some jurists lay down that "borders" only exist in land to which no one has a prior right. The extent of the "borders" varies according to the nature of the water source and according to the nature of the soil (al-Mawardi, 390, 392, 395, Abu Yusuf, 152-3, al-Muhakkik, Shara ii, 272-3). Al-Muhakkik permits 1,000 cubits (argh) for a hands if the soil is soft and 500 cubits if it is firm (al-Muhhtagar al-nafit, 306).

Muzara'a and musakat [q.ve.]. The first is a crop-sharing agreement and the second magreement for the exploitation of fruit trees and other trees, under which the two parties each have a share in the proceeds. Agreements of this type were known in pre-Islamic Persia. Under the former, water traditionally regarded as one of the five elements (the other four being land, draught animals, seed and labour) affecting the proportion III which the crop is divided between the two parties to the agreement, the landlord and the peasant. In theory, we share went to each of the five elements, but in practice there was much variation in the shares going to either party, though the ownership or provision of water always played an important part in the division of the crop in the case of irrigated land, Musafat am an agreement made between the owner of a garden and another party, who would undertake to irrigate the trees and who would receive in return a specified share of their fruit. It could also be concluded for trees or plants which did not bear fruit, but the produce of which was capable of exploitation, such as the honna or tea plant. It could also be concluded for newly-planted trees which would not bear fruit for some years. The responsibility for cleaning hands and irrigation channels under a sussers's or MA

musikat varied according to local custom. The digging of wells and canals was normally done at the expense of the landowner. These agreements might written agreements, but were probably often oral agreements based on local custom. They might be for more years. In some quarters there appear to have been a prejudice against long-term agreements. Sayyid Rukn al-Din Muhammad b. Nizām (d. 732/ 1331-2), who constituted much properly-shares in kanats, real estate and landed estates-into augaf in Yazd, laid down that no musden's or musded should be concluded for more than one year (Didmi' alkhayvat, 174). A similar stipulation is made in the grakfeyya of the Shaykh al-Islam Chiyath al-Din Muhammad Kadjadil, dated 782/1380-1 (lVal/fyyayi Kadjadji, in FIZ, xxi [1354/1976], 8).

Taxation. It is difficult to lay down the connection between the provision of irrigation and taxation, because no general principle prevailed. Probably in most districts, tax was assessed on the land (together with its water), though in the case of land watered by the great rivers and more of the lesser rivers, water dues were paid to the state. Apart from the source from which it comes, water is also divided by the jurists into 'ughr water and kharadi water, according to whether it is found in week or kharadi land. There is, however, some difference of opinion among the jurists over the status of the water of the great rivers and the implications of its status for tax purposes (see further al-Maward), 282-3; Aghnides, 359, 366-7). Land reclaimed with "aghr water paid fuskr and with kharādi water, kharādi (see above, s.v. Dead lands). When in the course of time the distinction between 'ushr land and hharddi land became blurred, the distinction between 'water and kharādi water also ceased to be of practical effect. What was crucial in assessing the tax-bearing capacity of the land was not the hypothetical status of the water, but the method by which it was irrigated (cf. al-Mawardi, 315 ff.). Crops irrigated by water carried on the back of a beast or raised by a lifting device paid half-'ughy, while lands watered by river, spring = hand water or rain paid full 'ughe (Abû Yusuf, 82-3, al-Muhakkik, Muhktatar al-nafit, 21). In the later centuries, when tax was often assessed on the crop, not on the same of land, many authorities permitted the deduction of expenses, which included those irrigation, before the kkaradi of the government was reckoned. In some districts, notably Yazd, where the ownership of land and water was often in separate hands, the revenue assessment was based on calculation of the water supply only. In its simplest form, a certain rate was imposed per unit of water (idk, tasht, diur'a saba, saridia). The rate varied from village to village; reassessments were seldom made, but the incidence of taxation might be increased by the imposition of additional quotas. Wells in some districts in southern Persia in the 19th century paid a wheel tax (sar larkhi) (Stack, op. cit., ii, 259). In the case of the reclamation of dead lands, tax concessions related to the nature of the water supply are from time to time recorded. The Ilkhanid Ghazan Khan (694-703/1295-1304), who attempted to bring about a revival of agricultural prosperity, classified dead lands into three groups according to the labour required in irrigation works, and gave there tax concessions for three years (see Landlord and peasant,

Water rights and the religious officials: the settlement of disputes. Water, perhaps because it is closely associated with Sughr and himidi, which are among the bubbl Aliah, generally

speaking came within the purview of the religious officials. The regulation of the water of the Hari Rid in the 8th/14th century is said III have been carried out by the Shaykh al-Islam Nizam al-Din 'Abd al-Rahim Khwafi, and that of the Zavanda Rud in the 11th/17th century is attributed to Shavkh Bahā'i (Bahā' al-Din Muḥammad al-'Amill') (see below). So far, however, me the religious officials gave decisions and issued faturds for the settlement of disputes over water (which were of frequent occurrence), they relied for the execution of these. as they did in decisions over other matters, on the officials of the government. Thus when 'Abd Allah b, Tahir (213-30/828-44) found that there was body of laws on kandis, he assembled the fullahit' of Khurasan and 'Irak (not the 'ummal-i 'urf) to write a book at laws governing kanats [see KANAT]. Similarly, from a letter preserved in the 'Alabat al-kataba, probably written just before or just after the fall of Sandjar in 552/1157, it would appear that the assessment of water rates (kanun-i ab) was the concern of the officials of the religious institution in the person of the local judge (hakim) (Muntadjab al-Din Badic al-Katib Diuwayni, Alabat al-kataba, cd. Muhammad Kazwini and 'Abbas Ihbal, Tehran 1329/1930, 96-7; also Landlord and peasant, 74). An undated letter in the Dastur al-katib of Muhammad b. Hindushah Nakhdjawani, which is dedicated to Sultan Uways b. Shaykh Hasan-i Buzurg (757-77/1356-74), mentions the fatures of the 'ulama' concerning the destruction of a dam - the Mihran Rud at Tabriz. This had been built to divert water to m newly-founded village and had resulted in the river-bed becoming silted up so that flooding took place in Tabriz. The answer to the letter states "Let action be taken in accordance with the fateris of the insins of religion and let these not be transgressed or altered" (ed. A. A. Alizade, i/2, Moscow 1971, 482-3). Whether the letter actually existed or was composed by Muhammad b. Hindûşhāh, it - be taken as a typical example of contemporary practice (as it should be rather than it was). In some cases, royal farmans were issued for the settlement of water disputes-and not necessarily always those of a major nature. A short Jarman, dated Dhu 'l-Ka'da 952/Jan.-Feb. 2546 issued by Shah Tahmasp, regulates dispute water rights between Kharānik and Sultānābād, two villages in Adharbaydian. It orders the peasants and erop-sharers of Kharanik to act towards the peasants of Sultanabad in accordance with the sharf-namada concerning their water rights as fixed by Dialai al-Din Ma'sam Beg Safawl, the mutausallt of the holy shrine (? of Ardabil) (B. G. Martin, Seven Safawid documents from Azarbayjan, in S. M. Stern, ed., Documents from Islamic chanceries, Oxford 1965, 185 ff.). In this case, it would seem likely that one or both of the viliages may have been welf, since Ma'sum Beg, the midswalli, had been called in to regulate their shares, and if they were Salawid aweaf, this would explain why a royal farmin was issued to decide a dispute between two small and unimportant villages. In the case of the great rivers, the decision of water disputes was in the hands of mirab, who was official of the state and those of the 'ummāl-i 'urf (see below).

The upkeep of rivers. The mirāb. The responsibility for the upkeep of the great rivers was vested in the imām. Cleaning or dredging and repair of their banks was carried out by the imām and paid for by the public treasury. If there were no funds available for such work, he could compel the Muslims to give

their services for the purpose. The cleaning and repair of canals from the great rivers leading water to individual villages was the responsibility of the owners of the canals. If they refused to carry out the necessary work, they could be compelled to undertake it, since neglect of their duty might result in injury to the community and might diminish the supply of water to those who had m right to it (Abū Yūsuf, 144, 148; see also N. B. E. Bailie, The land tax of India, according to the Moohummudan law, translated from the Futawa Alumgeeree, London 1873, 49-50). In the provinces, responsibility for the control of the waters of the great rivers was in practice delegated to the provincial governor. With the fragmentation of the caliphate and the rise of local dynasties, this responsibility passed to those who held power locally. There was, therefore, no uniformity of system and information concerning water control and irrigation is patchy. It was presumably the theory that the imdm had the right to compel the Muslims to give their services for the repair and cleaning of the great rivers which gave sanction to the practice of levying corvées for irrigation works, either of a seasonal nature, as in Sistan (though it would appear that in the early centuries an allocation was made on the kharadi for irrigation. works, see Tarikh-i Sistan, ed. Malik al-Shu'ara' Bahar, Tehran A.H.S. 1314/1935-6, 30-1), or of an occasional nature. Thus when 'Izz al-Din Mukaddam made plans to restore prosperity in Harat in 653/ 1237-8 after the depredations of the Mongols, he held a meeting in the Friday mosque and assembled the men of Harat to work in corvées (hashar) on the irrigation channels which had silted up (Isfizāri, Ramfat al-djaundt, ed. Muhammad Kārim Imām, Tehran A.H.S. 1339/1960-2, il, 110-11; cf. also Sayf b. Muhammad b. Yackub al-Harawi, Tarikk-namayi Hardt, Calcutta 1944, 111). Some centuries later, Fadl Allah b. Rüzbihan Khundil (d. 927/1521), while still taking the view that expenditure irrigation works came under the heading of musdisk almuslimin and was therefore a legitimate charge on kkarādi revenue, nevertheless sought to legitimise the raising of special taxes (naud*ib) for such expenditure. He writes, "What is taken in Kh "arazm from the generality of men for the repair of dams on the Oxus - for the building of walls round the kingdom or other such matters of public interest is a debt which must be paid and a claim which is rightly due, and refusal to pay is not permissible; such taxes are not unjust" (Sulüh al-mulüh, B.L. ms. Or. 253 [microfilm copy], 119).

There we from time to time references to special departments in charge of irrigation, but, on the whole, it would seem that their existence was the exception rather than the rule. In western Persia, there appears in have been a dimin-i do in the 4th/ 10th century at the time of the rise of the Buyids. The Tarikh-i Kumm states that when the Glidel's and Daylamis conquered Kumm they abolished the dicin-idb (Hason b. Muhammad b. Hasan al-Kummi, tr. into Persian by Hassen b. 'All b. Hasan b. 'Abd ol-Malik, ed. Diel41 al-Din Tibrani, Tehran A.H.S. 2323/1934, 53). The only Buyid who appears to have been concerned to foster agricultural prosperity and hence to have paid attention to the upkeep of irrigation works was 'Adud al-Dawla (d. 372/982), the builder of the Band-i Amir. Ibn Miskawayh states that he cleaned canals which were silted up, built mills on them, and mended dams (Tadjārib al-umam, ed. L. Caetani, Leiden 1909-17, vi, 509 ff.). About the same time, there was in the eastern provinces an extensive water administration for the Murghan River, which was under the jurisdiction of the rulers of Chardistan. A specially appointed smir was in charge of the upkers of dykes on the river and the regulation of the water supply. He had 10,000 workmen and borse guards under him. Al-Istakhri states that he enjoyed greater respect than the wall (Masalik al-mamalik, 261-2; Le Strange, Lands, 397-8). Under Yacküb b. Layth in Sistân, thore appears to have been a mirab, who was a government official. Cases against him, in the event of his abusing his power, were heard in the diman-i mapilim (Tarihhi Sistin, 266). Under later dynasties, such as the Saldjūķs, Khwārazm-Shāhs, Ilkhāns and Timūrids, control was, no doubt, exercised over the great rivers by the government, though the sources contain very little information mu this subject (see Madima's-yi munsha'át-i 'ahd-i Saldjükiyan wa Kh "āratmshihiyan wa aud'il-i 'ahd-i Mughul, ms., photo-copy in the National Library, Tehran, 80b-81b for a diploma from Il Arslän for the mirdb of Bukhara, and H. Horst, Die Staatsverwaltung des Grosszelfügen und Hörasm-Sahs, Wiesbaden 1964, 137). Mi far, however, as agriculture was fostered by individual rulers, this implied some degree of water control.

Information on the division of the Harl Rud in the 10th/16th century is contained in an essay written by Kasim b. Yusuf al-Harawl, who wrote the Irgida el-rird'a in 921/1515-16. He mentions in this assay an earlier division of part of the river made by the Shaykh ni-Islam Nizam al-Din 'Abd al-Rahim Khraff, who had been entrusted with this matter after complaints of alleged inequalities and illicit diversions 🗃 the water were made to Musica al-Dire Husaya b. Ghiyath ol-Din Mubammad Kart (d. 771) 1369), the local ruler of Harat (Risdla-yi tarlk-i kismat-i db-i kulb, ed. Māyil Harawl, Tehran A.H.S. 1347/1968-9, 12 ff.). This division was apparently revised about me hundred years later in the reign of the Timurid Abu Sand Mirza, and it seems that it in this revision which was followed by the mirabs when Kasim b. Yusuf was writing and which he describes in his essay (ibid., 15). 📰 gives the regulation of the water in each builds or district, and the water rights of the villages and gardens watered by the canals of the bulks and the dues of the mirab, He also records the number of men (nates) to be provided by each bulak, presumably for work on the upkeep of the canals.

Thanks to two late Safawid administrative handbooks and a thmar on the regulation of the water of the Zayanda Rud, attributed to Shaykh Bahan (Bahā' al-Din Muhammad al-'Amill), who died in 1031/1622, we know something of the irrigation system of the Zayanda Rud and the work of the mirab in Şafawid and post-Şafawid times. As in the case of other rivers, the division is based on ancient custom. Traditionally, the water of the Zayanda Rud is supposed to have been regulated by Ardashir b. Babak and there were also, no doubt, various later divisions (cf. Husaya b. Muhammad b. Abi 'l-Rick) Awl, Tardjuma-yi Mahasin İşfahan, ed. Abbas Ikbal, Tehran A.H.S. 1328/1949-50, 48). Shaykh Baha'Ts tamar mentions an earlier allocation of the water. The tandr we in force until 1936, though it is doubtful whether it was in uninterrupted operation from Şafawid times onwards. Under the immar, the water was allocated to the bulkts or districts watered by the river according to a fixed rotation, which varied at different periods of the year, having regard to the cropping needs of each bulkk. Within the bulaks, the water we led off in canals to the village.

MA2

and lands in the buist, each portion of the village lands having the right to the water for a fixed period of time (Lambton, The regulation of the waters of the Zayanda, Rud, in BSOS, ix [1939], 663-73) within rotation period. The mirdb in charge of water was an important official, ranking among the higher officials of the bureaucracy and the court. That he enjoyed such pre-eminence was due in part to the fact that Isfahan we the capital of we empire and the land watered by the Zayanda Rod, or most of it, came under the kidssa administration, which was in charge of the mahall, those districts round Isfahan which were directly administered by the central government and in which were to be found also land and water resources which had been constituted into awaif or which were the private property (khálisa) of the shah. The duty of this mirab was to order the peasants, on the eve of the Naw Ruz, to clean the madis (as the major canals in Işfahân were called), lesser canals (anhār) and channels (djadāwil) which belonged to them, according to established custom. He was to see that the water of the Zayanda Rud reached all the districts round isfahân which had a water right (kakh āba) in turn and according m the share customarily allocated to them from ancient times. The appointment and dismissal of those in charge of the midis (midisaliars) was his responsibility. He was also charged with the decision of disputes and claims concerning the water of the river, though certain disputes of a general nature affecting all the landowners and peasants were referred, according to the royal order, to the wastr of the supreme distan; in such cases, the halantar, mustamft and maxir of Islahan would go with the mirab and the marie of the supreme divanto the districts, examine the madis, canols, channels and runnels and decide the hakk aba of each district on is basis of the diwin registers and settle any claims according to common sense, custom and the practice of former years. In accordance with this practice, many orders and decrees (arkim we shidm) had apparently been issued and had become customary practice. Apart from the customary dues (rusum) which the mihrab received in each district on account of the first water given to wheat (hidh ab) and the water given to wheat when it was nearly ripe (dan db), a small amount (kadri) was allocated to him by the khasse administration (sarkār-i hidspa-i shartfa) in cash and kind, which he received annually (Muhammad Taki Dānishpazhah, Dastir al-mulik-i Mirad Raft'd wa Tadhhirat el-mulük-i Mirad Samt'd, in Tehran University, Rev. Fac. des lattres et sciences humaines, xvi/4 [A.H.S. 1348/1969], 432-3; also Tadhkirat al-mulas, facs, text, tr. and explained by V. Minorsky, London, Leiden 1943, 812-b). The accounts of European travellers who visited the Safavid court also show the mirah to have been important official. Tavernier states that his office was one of the best offices of the court and much sought after, and he who obtained it was obliged to give large presents (Voyages en Perse, Paris 1970, 67, 236). Chardin writes that his empluments amount to 4,000 firmins per annum (Voyages, iv. 100). Mîrza Husayn Khan b. Muhammad Ibrāhīm Tahwildār, writing in 1877, states that the office of mirab and that of balliff (mubdishir) of the royal kanais (kanaudi-i khālisa) existed, but that "at the present time there is no-one (holding these offices). Authority lies with the officials of the bulukat (i.e. the districts watered by the river) and it is not necessary for there to be someone holding these offices as a special charge" (Diughrafigul-yi Isfahan, ed. Manoochihr Sotoodeb, Tehran, A.H.S. 1342/1963-4, 128).

The mirāb in other large cities was also often a person of considerable local importance and influence. Shirāz in the 12th/18th and 13th/19th conturies, there was a hereditary tendency in the office (as there was in many other local offices), the office of mirāb of Shirāz having been held for many generations in the same family (Fārāb, Fārsmanneyi Nāṣirī, lith., 1313/1895-6, 2 vols in one, ii, 74-5).

Apart from the great rivers, water management was carried out by small-scale local efforts. In the case of the lesser rivers, knows and springs, the administration and control of the water was normally in the hands of the users. They might or might not appoint a miráb, who might also have assistants whose duty was to supervise the allocation of the water to the users served by the individual canals. In some districts, a miráb was appointed only when water was abnormally scarce. He and his assistants were paid by dues collected locally or sometimes by a share of the crop (see further Lambton, Landford and peasant, 222 ff.). In arbäbi districts (districts in which large landowners predominated) the miráb was commonly the servant of the arbāb.

Modern developments. Land and water were sensitive issues, and under Rida Shah Pahlawi fundamental changes were not, m the whole, introduced. The administration of rivers and the collection of water dues, the basis and rate of which varied on the different rivers, was under the Department of Irrigation of the Ministry of Agriculture. The civil code, various parts of which promulgated between 1925 and 1935, is largely based, so far = land and water are concerned, upon Shia law. A number of other laws concerning the of water, some based on short practice and custom. others of a more ignovative nature, were passed. Provision for the registration of water rights was made in 1929 and, in 1937, the handn-i fumran of 25 Äbän 1316 (the law for agricultural development) passed. This defined 'unaran as the greatest possible agricultural development by means of, inter alia, the making and repair of faudts, the reclaiming of waste lands, the maintenance of irrigation channels and the drainage of marshes. Although on the statute book, this law was never put into operation because of the opposition some of its provisions were likely to create among those who held land (Lambton, op. cit., 192-3), The law of 29 Urd! Bibl sht 1322 (1943) authorised the establishment of an irrigation institute under the supervision of the Ministry of Agriculture and contained provisions for a widespread control of irrigation by the state. These were put into operation somewhat erratically. A number of dams and barrages planued, and some constructed by the government and by private enterprise, notably at Simnan, Rawansar, Shabankara, Ahu Da<u>sh</u>t and Hamidiyya. Little real progress was made and no hydrographic survey, which was a prerequisite to the officient management of water by **ESS** state, was undertaken (see Lambton, op. cit., 187, 192-3, 196 ff., 225-6). There was also some forcible diversion of water to Tehran from neighbouring villages by Ridl Shāh ('Abd Allāh Mustawft, Sharh-i sindagi-yi man, Tehran A.H.S. 1324-3/1945-6, 3 vols., iii, 528 ff.), After the Second World War, there was heavy investment by the government in irrigation under the various development plans, especially dams, mainly for energy but also for irrigation, umong them the Diz dam (the Rida Shah Kabir dam), the Safid Rud dam (the Muhammad Rida Shah dam) and the Karadi dam (see further H. Bobek, Unterentwickelten Landes after Kultur, Frankfurt am MainBerlin-Bonn 1964). The land reform of 1962 IIII. down special provisions for the transfer of water rights and the upkeep of irrigation works. These provisions were also put into operation somewhat erratically, and there were conflicts of interest between the land reform administration and various ministries, especially the Ministry of Water and Power, which was set up in 1964. A water nationalisation law was passed in September 1968, which attempted to alter the system of the control radically (see further Lambton, The Persian land reform 1962-66, Oxford 1969, 275 ff.; C. Salmanzadeh, Agricultural change and rural society in southern from, Menas Press Ltd. 1980; D. A. Caponera, Water land in Maxiem countries, FAO, Rome 1973, 74 ff.).

Irrigation and society. Although it is difficult to generalise on the subject of irrigation in Persia. some few observations can be made muthe influence which irrigation has had m society. It was possible through irrigation to introduce new crops und to intensity and diversify agriculture. This agricultural specialisation became the basis of the flourishing civilisations which developed at different periods in the history of Persia. But this process was not uniform over the whole country. Generally speaking, the exploitation of water resources on the plateau would seem to have been more intensive than in the periphery or in regions with a concentration of nomadic or semi-nomadic tribes. The early centuries of Islam marked by the growth of cities and towns, round which there was, in many cases, an expanding area of irrigated land, the agricultural surplus of which provisioned the cities and towns. The list of the crops grown in the 3rd/9th and 4th/roth centuries given in the work of the Muslim geographers bears witness to a highly-developed agriculture, which depended itrigation. In the later centuries also, agriculture flourished from time to time, though seldom over the whole of the country at the same time. Periods of expansion alternated with periods of recession, which were the result of natural calamities or political vicissitudes. With the neglect or destruction of irrigation works, land went out of cultivation and the area under grain crops expanded relative to that under cash crops, as appears to have happened in the early period of Mongol domination. Be that as it may, agriculture up to modern times was the major source of the revenue of the state. It was also the basis of the wealth of the ruling classes and of the livelihood of the majority of the population. The well-being of the state and the people was thus dependent upon a well-maintained irrigation system, and prudence, if nothing else, demanded that attention should be given to the upkeep of irrigation. Shar'l law recognises this, and permits the expenditure of kharadi on the upkeep of irrigation works leven if, in practice, funds were often not available, or not made available, and the work was done by corvées). Treatises on the theory of government recognise, in general, that the economic foundation of the state was a flourishing agriculture and that the upkeep of irrigation works was therefore incumbent upon the ruler. The sources do, in fact, frequently mention, in general terms, the efforts of individual rulers and their ministers to spread and foster agriculture, to make kandis and to repair irrigation channels; and they also mention the decay and destruction of irrigation works in time of war and insecurity.

This dependence of the state and society upon agriculture and of agricultural prosperity upon an irrigation system which was inherently fragile had

certain consequences. In the first place, it produced a certain caution towards experiment and change (whether in the political or the economic field) among those whose income and livelihood depended upon agriculture. The maintenance of irrigation works demanded regular - This could only be given in conditions of political security. Canals, if not cleaned, silted up and dykes, if not repaired, were breached by flood-water. If the destruction brought by flash floods and storms was not immediately made good, irrigation water decreased. Similarly, without some degree of political security there was no investment in bands, the digging of which was a highly-skilled operation and the upkeep of which demanded constant attention. There was thus a general tendency to seek security in stable and orderly government backed by coercive force. Secondly, the rotation system of the water, fixed in advance and determined by rules observed by the users. imposed the acceptance of a common discipline. Usurnation and the illicit diversion of water brought strife into the life of the local community and disaster to those who were deprived of their duo turn and share of the water. This, too, led to an appreciation of order, and since the responsibility for the distribution of water, except in the case of the great rivers (which were controlled by the state), rested upon the local community, who appointed their own water officials, it fostered the cohesion of local groups and communities and encouraged local parfleularism.

Drinking water. The right to water for drinking purposes according to the Shari's has been set out above under the right of thirst. The drinking water of villages and towns comes mainly from springs, bandts and wells. In the villages, springs are the main source, and from them water is fetched by the users in skins and earthenware water-pots. In the towns, as for example Islahan, many houses had their own wells from which drinking water was drawn. Large houses in many towns had a storage tank (ab-ander), built of fired bricks and lined with water-proofed mortar (sārādi), in the basement and an open tank (hawd) in the courtyard. These were filled whenever the householder's turn to water from the kandt or other sources came. Their water was used for household purposes but not primarily for drinking. In districts where water was short or brackish, drinking water might be brought from a distance on the backs of animals (af. Curzon's description of the water supply of Bushire, op. cit., ii, 234). Covered cisterns (db-anbdes) are common in towns and villages where water is short, especially on the borders of the central desert. They are also to be found along the roads, sometimes associated with caravansarais. Some have their own springs, but more usually kanal water or rain water is stored in them. Domed circular structures, some 50-70 ft. in diameter, reaching 15-20 ft, or more below the surface of the ground, they are - characteristic feature of local architecture (see Wulff, op. cit., 258-59).

Many, perhaps most, towns on the plateau, especially they grew in size, were supplied by kandis. Hamd Allah Mustawfi records that the water of Kazwin was originally from wells. The first kandi was made, he states, by Hamze b. Llyssaf, who became governor of the town under Mahmud b. Sebiktigin. The water of this kandi reached most of the quarters of the town. Subsequently, a number of other kandis were made to serve various quarters of the town. Bamd Allah lists eight (all of which

were walf) and states that according to the conditions laid down by their founders (w@kifdn), their water was to be used for drinking purposes and for hammans and was not to be let into gardens or cultivated land (Tieth)-i gwride, ed. Ahd al-Husayn Nawa'i, Tehran, A.H.S. 1339/1960, 781). In some places, notably Yezd, bands flow through the houses and the householders have the right to use the water for drinking purposes. Nasir-i Khusraw mentions that ever of the houses in Arradjan also had a kandi running through them (Sefer Nameh, Relation du voyage de Nassiri Khosrau, ed. and ir. C. Schefer, Paris 1881, Persian text 81; Gaube, op. cit., 44). This was also the case in Shushtar ('Abd Allah b. Nür al-Din al-Shashtari, ed. Khan Bahadur Mawlabakhah, Tadhkira-yi Shashtar, Tehran repr. n.d., 10-11).

The provision of drinking water was considered a meritorious action. Many individuals made kandes and constituted them into awhaf for the drinking water of a town m one of its quarters. For example, a wahfiyya, dated 941/1534, constitutes part of the water of the river of Astarabad into a make. The founder (wähif) laid down that the water, when it reached the town, should be let into the houses and eisterns (hawdkā) and hammams and that as soon - one place had taken water, the remainder should be let into the next place, and that in times when water was scarce, no one should use more than was necessary. The founder also stipulated that rice should not be cultivated with the water of the welf, which was to flow into the town (Astarabad-nama, ed. Masth Dhablbl, publications of Farkang-i Iranzamin, no. 12 (1348/1969), 269). Many ab-anbars were also constituted into walf by those who built them. There are also many drinking fountains (sakkā-khāṇa) in the bazaars and streets of the towns similarly constituted into well (cf. 'Abd al-Husaya Sipinta, Tärikķča-yi awķā/-i Isfahān, A.H.S. 1346/1967, 360).

A shortage of drinking water in many villages and towns, especially in southern Persia, was a common occurrence (cf. Gaube, op. cit., 54, 80). Bihbilian, for example, appears to have been short of water in the middle of the 17th century, the people relying on rain-water for two months in winter and spring (ibid., 100). In Dihdasht, snow was brought from nearby mountains to supplement the drinking water supply (ibid., 105). In modern times, with the increase in urbanisation, water shortages have been w serious problem in many towns. In the middle of the 19th century, Ḥādiḍi Mireā Āḥāsī, Mubanımad Shah's first minister, wished to investigate the possibility of sinking wells with a view to assuring the water supply of Tehran, which was then supplied almost entirely by kanais, but nothing came of this (Great Britain, Public Record Office, F.O. 60:115, Sheil to Aberdeen, no. 106, Tehran, 20 September 1845). In recent years, the water supply of Tehran has been supplemented by water stored in reservoirs behind dams rivers flowing from the mountains to the north of the city (see further, Planhoi, op. cit., 45x ff.).

Drinking water in the towns came under the general supervision of the multesth. If water conduits were in a state of disrepair, it was his duty to repair them, or, if there was no money in the public treasury, to order the townspeople to do so. Similarly, if the source of drinking water was fouled, he could order them to rectify the matter (al-Māwardi, op. cit., 524; R. Levy, The social structure of Islam, Cambridge 1957, 337). In modern times, the regulation of the water supply of the towns has been under the munici-

palities, and in recent years there has been canalisation in most of the towns.

7. IRRIGATION IN NORTH APRICA AND MUSLIM SPAIN

Since the purely geographical aspect of the topic of water (amount of rainfall, hydrography, etc.) bas been will be treated in the articles on Muslim Spain or al-Andalus [q.v.], Algeria, Morocco and Tunisla, the present article is limited to a consideration of the supplying of drinking water to the towns and villages, it appears from the mediaeval texts, in addition to a consideration of the customary rules concerning the ownership, use and repartition of water used for irrigating gardens. The topic of modern brigation, one especially involving the construction of large dams begun during the colonial period of North Africa, will not be examined, but a few words will be said about prayers for obtaining rain, since the procedures followed in the Maghrib were neglected in the article istiska.

The works of the mediaeval historians and geographers give hardly any information on the system adopted in the rural areas, but for al-Andalus, there exists a rich geoponic literature [see FILAHA] which has been recently utilised by M=. L. Bolens (Agronomes audalous du Moyen-Age, Geneva and Paris 1980, 144-82 in regard to irrigation; see also Lévi-Provençal, Hist. Esp. mus., iii, 278-82). Following the latter authority, Mark Bolens notes that irrigation in Spain bears the stamp of the Islamic period and that, m particular, a large part of the relevant technical vocabulary is Arabic or modelled - Arabic expressions, with the very characteristic irrigution pattern still remaining in the huerta of Velencia does not stem from the Arabs, as J. Ribera showed (El sistema de riegos en la huerta valenciana no es obra de los drabes, in Discrtaciones y opisculos, Madrid 1928, ii, 309-13).

In regard to the towns and the places of some importance, a geographer like al-Mukaddasi (ed. and tr. Ch. Pellat, Description de l'Occident musulman an IV-X-X-sidele, Algiers 1950) rarely neglects mention the source of the local inhabitants' drinking water (shurb): springs, wells or cisterna in which rain water was collected, and, less frequently, rivers, streams or simple perennial watercourses. Women who did not have either a tank or a private well (equipped with a water-raising apparetus in a more less developed form) had to have recourse to one of these sources for drinking water, lilling there their pitcher, unless some charitable soul had constructed, as a work of piety, public fountain (sabil) in form of a water.

In general, gardens within the urban boundaries were irrigated by means of canals (sakiya, pl. saudķi) led off the watercourses or, when there were only wells, by simple changels leading from basins filled with water by means of nories [see NATORA) or more simple water-raising contrivances [see at's, iii]. It M surprising that al-Mukaddasi, usually so meticulous, does not speak about the installations and arrangements at Fås, remarkable they are. This capital city had indeed not merely single number of springs (Leo Africanus [q.v.], tr. A. Épaulard, i, 204, numbers them at 600, whose water was "distributed for various requirements and led to the houses, places of worship, colleges and hostelries"), but also a river, the Oued (wadi) Fås, where "the Fåsis have taken off water which they need for driving milk, carrying away their rubbish, filling their fountains and basins, and frrigating their gardens. To achieve this end, they undertook considerable construction works, whose ancient date does not allow me to get an exact idea about them" (see R. Le Tourneau, Fàs anant iii protectoral, Casablanca 1949, 232-9). It is a fact that the town has long had a network of water channels, some above ground and some below, which take the water as far as individual houses, as well as drains crossing the various quarters. Inevitably, disputes often took place between the people of Fas and the country-dwellers on the river banks upstream from the town, since the latter had me right theoretically to take off water. There existed a special legal structure to regulate these conflicts, whilst, for the upkeep of these water channels, special workers (the hwildsiyya, from haddis "pipe", pl. hwildes) were placed under the authority of an amin al-ma' alhalse for the drinking water and an amin al-ma' almudăf for the drains (see I. S. Allouche, Un pian éez canalisations de Fès ..., in Hespéris, xviil [1934],

Although the town's population had at its disposal an unusual abundance of water, the water brought into the houses was not generally drinkable. Hence at Fas, as in other Moroccan towns, one used to going around a picturesque class of watercarriers igerraba, pl. of gerrab, from egrba < kirba "water skin"), who attracted attention by their eye-catching appearance, the tinkling of little bells and the copper vessels in which they handed out drinking water from their dripping water skin to thirsty passers-by without asking the slightest return; in order to make a living, they had a regular dientèle to whose homes they delivered drinking water. The installation of a modern water distribution system had reduced the activities of these gryabe, who have now become largely a tourist attraction.

In Spain, Muslim travellers were able to note the Roman aqueducts which brought water from quite considerable distances, but the Arabs in turn did not fail to construct water channels, in particular to bring water from the sierra to the mosque of Cordova. (On underground channels, known in Spain, and especially at Madrid, as well in certain regions of North Africa, in KANAT. ii.)

However, the most original installations, it seems, are in the region of al-Kayrawan, in Byzacena (Tunisia), and attributable not to the Phoenicians or Romans, as has been thought, but to the Arabs, who developed an earlier-existing system by practising, during the four centuries before the Hilâlian invasion (mid-5th/11th century), a real policy for water. We have here in one part water channels open to the sky, and in another, reservoirs meant for "storing up streams of running water and, in some cases, water from certain springs and certain underground water-levels". These reservoirs have a feature two basins, one for decantation, one as a reserve, and sometimes, a third one for drawing water from it (see A. Solignac, Recherches sur les installations hydrauliques de Kairouan et des steppes tunisiennes du VIII au XII siècle (J.-C.), in AIEO Aiger, x [1952], 5-273).

Water gathered up in this fathion was used extensively for irrigation, which has always been the great care of peasants in regions where the scarcity of rain and of perennial running streams has compelled them to make do with unwatered cultivated lands [see pa⁵1] and to lavish all their attention on gardens and orchards outside the towns and villages, where, thanks to a more or less thick network of canals and channels, they ended up by making a real oasis (see e.g. G. Devardun, Marrakech and origines is 1912, Rabat 1959, to ff.; A. Bechraoui, La vie rurale dans les easis de Gabès (Tunisis), Tunis 1950, 69-86).

In general, water is so important in the eyes of the peasant that ownership of it is sometimes independent of that of the soil. Two main ways of acquisition are in effect possible: (a) personal ownership acquired by purchase or inheritance of the piece of land where there is a spring, well, etc., of which the owner and dispose at his own will, subject to his respecting certain rights of use; and (b) collective ownership, in which one part is appropriated to each patch of land which can be irrigated by water belonging to the community. The sale or lease of the estate implicitly includes the disposal of a corresponding part of the water, but the land's can also sell | lease out the land whilst reserving to himself a right of usage which he then dispose of how he likes, compelling the buyer or lessee to obtain by some other the water which he needs.

The customary law which governs the utilisation of the water has very precise provisions which often back the period before the arrival of Islam; indeed, the provisions regarding, in particular, the rights of usage affecting the land owners and the water supply, clearly similar to those of classical Islamie law, which in fact only confirmed those of the customary regulations (see e.g. A. Handteau and A. Letourneux, La Kabylie et las coulumes kabyles, Paris 1893, ii, 249-53, 278-9].

The division of the individual shares | also subject to strict rules, which nevertheless do not always ensure absolute equality between the participants and which do not sufficiently guard against wastage which might well be avoided. The measuring-out is done in various ways. E.g. a copper vessel with a hole pierced in it may be placed in a tank, etc. filled with water; when the vessel itself is full and sinks to the bottom of the tank, a stipulated fraction of the time-share in the water is finished. When the water comes from a basin with vertical sides, one may are a rule whose length is equal to the basin's depth and which is graduated, i.e. it bears notches whose spacing corresponds to given volume of water. Other methods are still in use. When the share of water supply, whose duration and periodicity vary according to the differing regions and, of course, according to the amount of water available, comes to an end, the arrival channel is blocked up with a mere clod of earth, or a rudimentary sluice-valve, under the control of a person responsible, who may be a child (see e.g. E. Laoust, Mots et choses berbires, Paris 1920, 409-38, for the Berbers, whose customs here hardly differ from those of the Arabs).

Given the fact that periods of persistent drought ar from rare and often take on catastrophic proportions when the wells and springs become totally dried up, the people are driven to perform certain number of ceremonles of a sympathetic magical character in the hope of getting rain. The most widespread, with variations, comprises the making of a kind of doll out of the wooden scoop normally used for ladling water and the parading of it round the villages suffering from drought, whilst pronouncing incantations and sprinkling the doll with water. In Berber regions, the ceremony ends with a prayer in which the name of Allah is associated with a personnage who may be an ancient god, one of whose names, telghenta (and vars.) is patently derived from that of the scoop, agienia; the doll is also called taskit unsar, "the rain's bride" with autor possibly the name of a male fertility god (see for Morocco, E. Laoust, op. cit., 205-53), where, in addition, are discussed rites meant to drive away rain, hail, etc.). Numerous other studies have been made of these rites in North Africa in general, in which the mannikin in image carried round the villages bears differing names; see A. Bel, Qualques rites pour obtenir la pluis en temps de sécheresse, in Actes du XIVe Congrès des Orientalistes, Algiera 1905, 49-98; E. Doulté, Marrahech, Paris 1905, 383-90; idem, Magie et religion dans l'Afrique du Nord, Algiers 1909, 584-96; E. Westermarck, Cerémonies and beliefs... in Morocco, 103-16; W. Marçals, Textes arabes de Takrodna, Paris 1925, 197-225.

8. IRRIGATION IN MIN OTTOMAN EMPIRE

The Ottomans followed the detailed provisions of the Islamic law according to the Hanafi school, examplified mainly in the Kitab ikya? al-mamat the kakk al-skuth (see Mawküfäti sharki, ii, Istanbul 1318, 271-22, and Madjalle, 1262-9, 1270-91; and 1224-53 also). The basic notion is that water, like wild vegetation and fire, is mubah, that is, open to the use of the public at large. Seas, large-size lakes, great rivers, and subterranean waters considered to belong absolutely to this category, Everyone is free to make use of these waters so long as no barm is entailed for anyone else. In this case, the individuals had to bear all the necessary labour and expense. But usually the state was responsible for large-scale waterworks on the great rivers. For that purpose it was permitted to make an of public revenues except for sadaka [q.v.]. If the state treasurv was unable to finance such works, which were considered essential | the public good, the state could appoint a superintendent (ságir), who was authorised memploy the local population, if necessary by force, to construct them (Mawkafāti, ii, 220).

Proprietorship was recognised over certain types of waters which were regulated and protected. Mamilik or privately owned waters were distinguished as either nake 'amm, in which the waters remaining after use by the owners were free for public use, and make hides, where the water was exclusively for the of the owners. Shuffa (q.o.), pre-emptive right, is in effect in the second case. The reclamation of waste land was legally recognised for individuals, Muslims or dimmis, who might dig out water-channeis (khark or diadual) or wells, or who might find a spring or drained flooded land. In the Hanafl school, such ownership is established only with the permission of the imdm or sultan, with the condition that the reciamation process be completed within three years. In the Ottoman Empire possession rights were recognised to those who reclaimed waste land without permission, Reclamation projects were given prior approval by the suitan by special diplomas called tomlik-names which recognised proprietary rights on waste land as well as on running water and aprings within the area delimited by the document. A prescribed amount of land, called harim, and surrounding newly-constructed water conduits, springs, or wells, was recognised as the legal property of the mater.

Water in the <u>kharks</u> and <u>kanits</u> [q.e.] was subject to private ownership, and no one could make of it without previous permission of the limit of the case of those waters under joint ownership of number of partners, none of the partners could open new water channels, construct mills, m change the

sequence or direction of water-use without the consent of the other partners. When given, such permission could be revoked at any time. Water was divided between the partners according to the size of their respective land holdings. Partners on the apper reaches of the river were not allowed to dam up the water and thereby cause shortage on the lower reaches. If a dam had to be constructed, water rights were distributed starting at the lower reaches and working upstream from there. The owner of a body of running water had certain rights when it flowed through somebody else's land. The owner of the land was torbidden to obstruct the flow of the water and had to permit the owner of the water to carry out necessary repair work on his land. Hall-i shurb, the right to make use of water at a given interval, could - the subject of inheritance or devise, but could not be either sold, bequeathed, rented, or given away as charity. However, in Ottoman practice me find examples of owners of water, of individuals or of a walf foundation, where the water might be sold for use in irrigation. What the state was concerned about was to prevent speculation in the price of water and to prevent the depriving of those who had habbel shurb in layour of those paying higher prices (Erzerum hanun-namesi, dated 1540, in Barkan, Kanuniar, 70).

In addition to the prescription on water use in Islamic law, the Ottomans continued practices and regulations which they found in the conquered lands and enacted new legislation. These concerned the water supply for cities, water distribution, especially in areas with water shortages, and rice growing, which became major state enterprise involving water use on a large scale. General Ottoman policy regarding water use and water works was determined to a great extent by the Ottoman land tenure system, which left the direct exploitation of agricultural land primarily to the relaya farming small units. The state did not participate directly in large-scale water or land reclamation projects or in agricultural production, except for the water supply in the cities and for rice growing. Such projects were usually initiated and carried out in the form of wast endowments by members of the Ottoman house or of the upper echelons of the ruling class. There government agency responsible for water projects or regulations for water use. The construction of aqueducts and maintenance of water ways was under the supervision of the ser-mitmaran-1 khāssa, head architect in charge of public works. Under his authority, and directly under a magir or superintendent, were the m yolditulari, technicians in

charge of the maintenance of water pipe system in Istanbul.

Rice cultivation as a major irrigation activity. Here one can see how the Ottomans realised large-scale irrigation projects. In rice growing, abundant water supply and maintenance of water courses for constant watering of the rice paddles were crucial, so that the real object of possession or assignment was not so much the land but rather the use of the water. In the surveys, the possession or assignment of the khork > ark or nahr, the channel for irrigation, was granted by the government to individuals = mulk or timir [q.v.]. Often the possession of a Mark determined who would possess a certain land (cl. Kanuniar, ed. Barkan, 12]. Since the water was distributed in limited quantities, the government strictly regulated the amount of sime seed to be planted, and it recorded in the survey books the amount for each khark. Many channels for the terigation of rice paddies, anhar-i čeltůk (čeltík), were named either after the person responsible for their opening or after their possessors. Because of the unusually large consumption of rice, the Ottomans encouraged from the beginning the extension of rice growing, either by establishing direct government control over watercourses, which by granting possession or proprietorship of waste (monetal) lands, particularly in the flooded areas. Official sources conclusively show that rice was widely cultivated in the Maritsa, Mesta (Karasu) and Vardar valleys in the 9th/15th century. The growth of government revenues from rice growing in various regions in the Balkans is shown in Table t based in the mukāļasa [q.v.] registers from this period (see M. Tayyib Gökbilgin, Edirne = Paşe liodsi, Istanbul 1952, 125-53).

The principal rice growing areas in Anatolia and their respective revenues in 1045/1636 are shown in Table 2 (see R. Murphey, The functioning of the Ottoman army under Murad IV, unpubl. dissertation,

Univ. of Chicago 1979).

An Italian of 880/1475[F. Babinger, Die Aufzeichnungen des Genzesen Iacapo de Promonierio-de Campis..., Munich 1957, 65] estimated at 15,000 gold ducats the revenues from rice production. Idris-i Bidlisi (Hasht bidisht, the conquest of Filibe, Murăd I's reign) states that the sultan's share of the rice production in the Maritsa valley amounted to ca. 80,000 gold ducats in the time of Băyezid II. Besides those mentioned above, there were other important rice-growing areas in the Sakarya river valley and its tributaries in the provinces of Khudawendigār, Sultān-önü, Bolu, Ankara and Kütahya. ries (Aydin, Cine, etc.)	198,332
The Bakir river valley (Bergama)	133,333
The Gediz river valley (Demirdii, Adale,	
etc.)	160,000

sources (khudáwendigár wahf defteri, Tapu ve Kadastro Genel Müd., Ankara = 585) prove that already under Orkhan (726-63/1326-62) the Ottoman state was concerned in extending rice-growing in the conquered areas, and either a part an all of the inhabitants of many villages were made teltuhdii, those of rice growers endowed with a special status. From the earliest surviving survey of Albania dated 835/ 1431-2 (Süret-i defter-i sancah-i Arvanid, ed. H. Inakik, Ankara 1954, 3a, 8b, 75, 145), we know that some water arks designed for rice-growing were by that time assigned as timer I the sandjak-beg and to su-bashis. Rice-growing was introduced or extended in the lands conquered by subsequent Ottoman sultans. In his efforts to expand state revenues, Mehemmed II [s.v.] greatly extended rice cultivation in the Balkans and took under the direct control of the central treasury most of the rice-growing lands in Rumeli - well as in Anatolia (see his order about rice-growing made beylik, i.e. stateowned, in Inaluk, Fatih Mehmed'in fermanlars, in Beileten, xliv, 697, doc. no. : dated Sha'ban 883/ October-November 1478, and also the regulation in Kununname-i sulfant ber muceb-i Grf-i Osmani, od. R. Anhegger and H. Inalcik, Ankara 1954, 81-2). Despite his general policy of returning lands seized under his father, Bayazld II did not completely relinquish state control over such rice-growing lands.

In extending the area of rice cultivation, which involved primarily the construction of irrigation works, there were two main methods: state enterprise and private initiative. In order to create state rice fields, the government assigned a group of ordinary re'dyd to a permanent status as khdssa četrik<u>di</u>i (četrikdji), labourers of the sultan on the state's rice fields. In the surveys, they are listed also under the names of kürekdii m ortakdil. Once recorded as *Celtikdis* in the surveys, neither these labourers - their offspring could change their status (see the Ic-II Kanun-ndms, ed. Barkan, 54; Kanun-name, Süleymaniye Library Reisülküttab no. 2004, 24). They are also included under similar groups which served in the mines, in the salt-beds or guardians of the mountain passes in return for exemption from certain taxes, principally the 'amirid-i diminiyya or extraordinary impositions. In other words, they constituted a labour force under the direct control of the state. In the province of Anatolia alone, one-seventh of the population was included III this tax-exempt category. The condition of a fellulege was quite onerous, since apart from the hardships borne by him in irrigating and cultivating the rice, he had to surrender half of his production to the state treasury. The seed was supplied by the state and taken back at the time of harvest. State proprietorship of water channels was considered to be the justification for the exploitation of their labour. This organisation to have reached its final form in a later period in the Ottoman empire, since in the early records labourers in rice cultivation were often state-owned slaves, the khāssa ortabāji. In the eastern provinces, forced labour was imposed upon the refava household to work in the rice fields and repair canals for a fixed number of days every year (usually three or four days, the kanun-names of Divarbokir and Malatya, ed. Barkan 113, 147). This practice, apparently retained from pre-Ottoman times, caused widespread discontent among the retayd, free peasants. Upon the complaint of the Christian redys in the province of Trebisond and in other places against such corvées (salghan), the Ottomans introduced the system of registered čeltik<u>di</u> i or kürek<u>di</u> i 🖿 described above. In need of labour forces for extended rice fields in the marginal lands, as in Cicilia or in the lowlands of the Aegean or Pamphylian plains, the state also tried to use the labour of tribal groups by settling them in the vicinity. In any event, some nomadic groups had already been occupied for some time in growing rice in the flooded lands, and sought to retain this profitable source of income for themselves (see the hanan-name of Sis, ed. Barkan, 202; hānun-nāme, Istanbul University Library no. T.Y. 6941, 78). In Rumeli, some nomadic groups were simply registered as feltükdji (ed. Barkan, 263). Thus the concern of the state in converting flooded lands into rice-growing lields by preparing irrigation canals gave rise to groups whose status was quite different from that of the rural population of the Ottoman Empire in general.

When the conduits or <u>biasts</u> of harnested waters were assigned as times to members of the military class, they were entitled to get a tithe of the rice production. But in addition, many of them, initiating the state system, took half of the rice production when they supplied the seed and other expenses for irrigation. Since this widespread practice often caused abuse of the peasant's labour, and shortages in the imited water supply, the state tried to regulate and control this kind of cultivation.

Also, in cultivation and connected irrigation works were extensively applied in the mawai lands reclaimed by members | | | roling class and wat/ founders, both large and small. The state, granting absolute proprietary rights, encouraged such land reclamation projects, which mostly involved the discovery and harnessing of water sources. In such cases, the kharks were made the property of the individual. But all such projects had to be submitted and approved by the sultan, not only in order to comply with the shor's law, but also for such practical considerations as the protection of the re'dyd against exploitation of their labour and of their water sources. The large-scale arrigation projects initiated by the members of the ruling class in the abandoned flooded areas in the Sakarya river valley - partleularly interesting in this respect (the main source for this is the above-mentioned make-register of Khudawendigar). In such project (see the same register published in part by Barkan in Valuflar Derpisi, ii [1942], 364-5), the promoters proposed and asked the approval of the sultan for constructing a dam on the Sakarya river, and to excavate canals 17,000 dhird's (11.65 km) in length, and estimated that the irrigated land would take 75 mid (approx. 38.5 tons) of seed to plant. The labour was expected to be supplied by the free peasants of the area in exchange for a half-share in the harvest, excluding the tithe due to the simir holders. Cotton and other crops were also expected to be cultivated in the reclaimed land. Apart from the tithe to be paid to the simir holders, and the profit accruing in the re'dya, the promoters promised to undertake the expenses of repairing the caravan highway passing through this should include in and to construct in caravanseral and five fountains. The sultan gave his approval to this project, subject to the willingness of the relained for the area to work on the reclaimed land.

We find numerous examples of such irrigation and land reclamation projects in the Ottoman empire, always made subject to the approval of the sultan, and made conditional on the consent of the local population and fimar holders to co-operate. Such projects, with large potential yields, were almost always proposed and realised as walf endowments. This method was the predominant form of land reclamation and irrigation in the Ottoman Empire. Except for rice cultivation, the state seldom took a direct part in organising such irrigation projects. Such irrigation projects were undertaken more extensively in the period of the rise of the a van and the local dynasties in the 18th century. Under the impact of European commercial expansion during the period, they made efforts to put into cultivation previously unused swampy lands. It was during the Tangimai [q.v.] period that, under the influence of current ideas from Europe, the state became systematically interested in land improvement and in the extension of agriculture. A Council for Agricultural and Industrial Affairs, the Zira'at wa Sana'i' Medilisi, had already been created in 1254/2838. In a questionnaire distributed in 1259/1843, the state attempted m find out the amount of land left out of cultivation due to flooding, and European experts were sent m the Dobrudja, Cyprus, and other parts of the empire, and reports were submitted with suggestions for the improvement of agriculture. The increased European demand for cotton from the Levant during the American Civil War spurred the Ottoman government to introduce broad measures to increase cotton production in the watery plains in Cilicia, the Aegean coasts, and in Macedonia. This development caused shrinkage in rice cultivation in these areas. Apart from the extensive irrigation works in the Konya plain which were open for in 1332/1913, no substantial drainage or arrigation project was accomplished by the state until the Republican period. As late = 1945, the ares of irrigated land in Turkey we limited to 20,000 hectares.

Regulations - water distribution. In Anatolia and Rumeli, where water supply was generally adequate for agriculture for 9-10 months out of the year, fixed regulations for water distribution as in Iran and in the Fertile Crescent were notcommon. In the dry regions of the central and eastern Anatolian plateau, and during the summer months starting from July, certain regulations were worked for the distribution of available water sources among individuals. Such arrangements, stemming from pre-Ottoman times, were particularly common the neighbourhood of large towns where numerous orchards and gardens were to be found. According to the observations of modern geographers, in certain parts of Anatolia where traditional methods survived. the organisation of water distribution was dictated by abortages of water both regionally and seasonally, by the extension of irrigated agriculture, or by aggregation of population (X. de Planhol, De la plaine pamphyllenne www lacs pisidiens, Pacis 1958,

146, 323-8). As to sharing of spring water between several villages, there was usually no formal regulation, unless recurrent disputes forced the government intervene as an arbiter and to work out regulations. Such disputes usually appeared as arguments over the use of pasture lands, and it the kādi's court which was responsible for suttling them in accordance with the sharif rules, as was the with all matters involving water distribution. This explains the lack of universally-applied regulations enacted by the government.

As a general policy, the Ottomans avoided imposing regulations water use, and abolished preexisting taxes and dues on water (see the Admin-name of Malatya, Barkan, 113). In some districts, the Ottomans retained older regulations for distribution. of water, for irrigating gardens and fields, see for water supply to the city. In the province of Karaman, where the Ottomans found the most developed system of water distribution for urban areas, a mir-db or superintendent of water was chosen to supervise the application of these regulations. To distribute water according to the provisions of the phart's regarding the habb-i shurb, right in the use of water, and shuffa, or pre-emptive right, was the mir-db's responsibility. To ensure complete equity, the mir-do appointed, with the approval of the community, several mulawallis who oversaw the distribution of the shares. He was also assisted by shagirds who performed the work during the actual irrigation process. The regulations tried m prevent various abuses, such as taking water out of turn by bribing the mir-ab and others, which reflect the acute competition between the users of water during the summer months. Each user of distributed water paid a fixed fee to the mir-ab (for the rates see the kanan-name published in JESHO, xi/1, 116), who acted as tax-farmer for the government. The revenue deriving from mir-abiyye, together with certain connected dues for Konya, amounted to 90,000 alcas in 907/1501 (see Bayvekalet Arsivi, Tapu no. 40) and to 150,000 akčas in 1046/1626 (see R. Murphey, op. cit.). The function of mir-ab. apparently originally a Persian institution (see Iştakhri, Persian tr. ed. I. Afshar, Tehran 1347, 206-7; Tadhirai al-mulah, ed. V. Minorsky, London 1943. 84), was performed in other parts of Anatolia sometimes under the name of su aghast (see Ewliya Celebi, ii, 397, iii, 29). Ewliyê Celebi made the remark that. if it were not for the su agazs, the populace would have murdered one another. (For the organisation of water use within the village, . X. de Planhol, op. cit., 325-6.)

As to the techniques used in harnessing water, the Anatolian peasant usually used the simple method of channelling water from the rivers through hards or sris, but the methods of drawing up water by means of animal-powered wheels in dildes and small dams were used. (For an interesting example of building dams for irrigation in the Karaman province, see JESHO, xift, 123.)

City water systems. The supply of water to the towns will the second main area of concern for the Ottomans. The Ottoman water system in the towns before \$57/\$453 has not been studied. However, it is known that after the conquest of Istanbul the Ottomans developed quite a sophisticated water system for the city, and applied this system too in other cities in the empire, notably in Jerusalem and Mecca. In Istanbul, the will complex and best-studied example, we into the system consisted collecting in reservoirs bends (Pers. band) the waters from the will hilly areas in the outskirts.

of the city, namely the Khalkall valley and the Beigrad forest, and then bringing this water underground in huge pipes and over aqueducts to high points in the city. Water towers . to terdals were constructed to keep the water at a high level and water depots, maslaks and makesus, distributed the water in different directions. In order to construct and maintain the system, an extensive organisation grew up under the chief architect or kadasa mi marbashi and the superintendent of the water conduit workers or the wyoldjulari sapiri. The construction and maintenance of the water works and ilnanced and organised by awkaf, either of individuals or of sultens. The main water conduits and aqueducts into being to bring water to the complexes surrounding the great mosques which, as we know, served as the nuclei for the development of the city (see ISTANBUL]. The mainstay of this water system was created through efforts under two sultans, Mehemmed II and Süleymän I. In the winter of 861/1456 Mebemmed II gave orders "to bring into the city from the countryside an abundance of water through aqueducts" (Kritovoulos, History of Mehmed the Conqueror, tr. Riggs, Princeton 1954, 105). The Byzantine water works, pipes and aqueducts which had been left to fall into ruin during the last centuries of the empire, were re-discovered and used by the Conqueror to create the first Ottoman water system (see Tursun Beg, The History of Mehemmed the Conqueror, ed. Inalcak and Murphey, Chicago 1978, 55-6). Dalman and Wittek (Der Volens-Aquadukt, 11) maintain that these works were concontrated on those areas of the Khalkall valley closest to the city. The Kirk-Ceshme or forty fountains constructed by the Conqueror at the Valens acqueduct or Boxdoghan-Kemerl received its water from this conduit. The rapid increase in the city's population, first under Bayezid II and then under Silleyman I [see ISTANBUL], together with the construction of major mosques under these sultans, to a search for water sources at a greater distance. It was under Stileyman I that the second major water project was carried out, this time collecting mainly the waters III the Käghldkhäne valley which also had been used for the water supply of Byzantium up until 1204 (Dalman and Wittek, 1-9). Daiman and Wittek (14-15) show that the main aqueducts or sw-Asmeris on this line were the work of the architect Sinan, who built them first in 961/1554 and then second time in 972/1364 after heavy had destroyed them. In constructing their water works, the Ottomans made and of the remains of the Byzantine water conduits and aqueducts as well as employing native Greek experts (a certain master called Kiriz Nicola is mentioned by Selantki, Tavika, 5) among the su yoldiularl. It may be suggested at this point that the Ottomans borrowed from the Roman-Byzantine system some hydrological techniques and, combining them with their own traditions evolved quite a complex organisation to supply water for their huge capital city. Sultan Süleymän's extensive water pipeline brought to the city and to his uswiy-constructed mosque abundant water, which was distributed to a number of see fountains. A report by Sinan himself of Safar 976/August 1568 (Atif Efendi Library, ms. 1734, fols. 256b-261b) gives the following details about the situation at that date. The water newly supplied by both the Käghidkhane and Kirk-Ceshme water pipelines amounted to 81 1446 (one 1446 is traditionally defined as the amount of water passing through a pipe of given dimensions in 24 hours, or approximately

60 m2, see Dahnan Wittek, 20-1). At the time of low water level, out of 95 private and public fountains existing at this date, 54 had been recently constructed. The 95 fountains took up 38 little of the total water supply (in 1945, I. Tanisik found in Istanbul alone are public fountains of Ottoman times). In addition, Istanbul had 15 masled using 5 lule and a samish (one-fourth of a lule), 18 wells using 5 little and 1 masura (one-eighth of a little). The remainder of the water went to the Palaces and gardens of the Sultan and grandees in the city, as well as to the public bath houses. The basic system was expanded upon by succeeding sultans, particularly in connection with newly-constructed mosques (see for an example, Ta'rīkh-i ģjāmi'-i sharīf-i Nar-i 'Othmdni, in TOEM Suppl., Istanbul 1335-7/1917-19, 26-31). They constructed new reservoirs and water lines, extending those already in existence in the two main of Kaglidkhane and Khalkall.

Water sources found and brought to the city through government initiative belonged to the miri walf or state-controlled endowments and were placed under the control of the relevant walf's administration, which was also responsible for meeting repair expenses. Fearing lest the water supply specified for the use of imperial mosques, paleces and public fountains be cut short, miri wall waters were not allowed to be used for any other purpose. Constant inspection to ensure their proper use was carried out by the su yoldinlars, who even had the authority to enter houses for investigation. When a new charitable institution, a mosque, bath or fountain was to be built, its founder was first required to find m water source outside the city. This water was brought to the city by means of a device called kama, that is, the adding of newly-discovered water to the main water conduits of the miri wall. This salma water could be taken from the main conduits only m certain specified points. Upon application, the sultan gave m formal permission for the use of kaims will recognised ownership rights over this water in a special firmin. The shar's principles required that such a procedure be followed. Many wells were dug in order to exploit underground water as a further addition to the city's water supply. Such waters became the property of the individuals who discovered them. Despite the close watch kept over the miri mass waters, there were many instances of diverting of water by individuals for private use. The government therefore closed a strip of land adjacent to the water line to new construction and assigned the populace of twelve villages as guardians and repairers of the water lines outside the city. To meet the water needs of the city population, water from the public fountains was distributed in waterbags by subus = sakkās. The sakkās were organised in two corporations, the area salatars or human water-carriers, and the m sokolari or horse water-carriers, who were in competition with one another.

In repairing and enlarging the water system of Mecca dating from 'Abbāsid times, the Ottomana made use of the organisation which they evolved in Istanbul. They sent a team mexperts to carry out the construction, and using black slaves and others organised a meintenance crew along the lines of the sw yoldjular; organisation of Istanbul.

9. Irrigation in pre-20th century Muslim India

Lakes, tanks, wells and artificial canals have supplemented rain water in the subcontinent since ancient times. With the establishment of the Dihli Sultanate in the beginning of the 7th/13th century, traditional irrigation technology began to undergo a change, owing to the arrival of skilled architects from Central Asia; in particular, the construction of wells with Persian wheels and of large canals provides a clue to the introduction of certain mechanical devices and the progress of civil engineering in India during the 7th/13th and 8th/14th centuries. This section of the article is divided into three parts: the first on lakes and tanks, the second on wells, and the third on artificial canals.

The Turkish conquerors were the first dividers of the water from the land in the districts of innumerable rivers and boundless swamps in Bengal. They built dykes, roads and tanks and, consequent upon it, the reclamation of vast tracts of land possible in Deftaic Bengal. According to Djuzdjani, the dykes made the movement of people and cattle possible during the rainy season, while the water flowing through the channels could be diverted to the paddy fields, in case failure of the monsoon

caused scarcity.

The first lake built by Sultan Shams al-Din Illutmish (607-33/1211-36 [q.v.]) outside the capital city of Dibli was called the Hand-i Sulfani (also Hamp-i Shamsi). The mediaeval Indo-Persian writers mention it as a reservoir constructed for supplying drinking water to the city of Dihli, but Ihn Hattūtā's reference to the cultivation of the seasonal fruits and vegetables at its sides during the summer shows that the water was used for irrigation also. Ibn Battūta also informs us that it was two miles long by half that breadth, 'Isami alludes to the Časkmā-yi āftāb ["sun spring", i.e. the famous Suradi Kund near Dihll) as its source of water. The details furnished by Saltan Firuz-Shah and the compiler of the Sirat-i Firat-Shaki about its repair contain reference to the original channels that were led off from the river Djamuna to the lake. These channels supplemented the rain water which sufficed for the whole year.

Like Iltutmish, his nobles also evinced keen interest in public utility works. Evidence from contemporary epigraphic sources shows that, during his and his successors' reigns, a number of lakes and tanks were constructed in the provinces. In Palwal (in Haryānā State) a tank was excavated 🖮 608/1211. Another inscription found at Bari Khātu (in the District of Nagawr in Radjasthan) mentions the construction of a lake by the officer Mas'id, son of Ahmad Khaldil, in 629/1232. It must have provided relief both to the cultivators and travellers in the torrid

climate of the desert.

Little information is available about the excavation of lakes and tanks in Dihll as well as in provinces during the Khaldil and the Tughlukid periods. Sultan 'Aia' al-Din Khaldji is credited with having taken an interest in developing irrigation in his empire for the progress of agriculture. By the time he occupied the throne of Dihli (695/1296), the Hawd-i Shamsi had silted up and the city had expanded considerably. Therefore, he had the Hami cleared of silt and its embankments repaired. Moreover, he ordered the construction of a new take, larger in area than the Hard-i Shamsi, outside the wall of his new capital of Sil (near Dihll), and this came to be known the Hard-i khāṣṣ. Baranl's reference to the biki-band-i Siri, contained in his account of the construction of the beautiful buildings by Sultan Firûz-Shâh (752-90/1351-88) thereon, tends to suggest that the dam was built with lofty embankments for the storage of rain water in the nearby area. The construction of these royal lakes considerably raised the water level in the area, and thus reduced the depth of the irrigation wells in the manning around.

The Tughlukid period is marked by much improvement in irrigation facilities in the empire. The number of lakes and tanks increased, not only in Dihli but in the provincial towns also. The contemporary Persian epigraphs mention the construction of lakes in Bihār Sharif (Bihār State), Gafh Mukhtaṣar (Distr. Ghārlābād, U.P.) and Manglore (Distr. Sabāranpūr, U.P.). An inscription at Nāgawr informs in that the muēta' (governor), Malik Firūz b. Muḥammad, constructed a large lake in Nāgawr and named it Firūz Sāghar (Hindi zagar "sea").

The lakes constructed in Dihil are important as reflecting the progress being made in civil engineering on the one hand, and the concern of the succeeding sultans in causing to be constructed more beautiful lakes and tanks than those built earlier on the other hand. For instance, Sultan Ghiyath al-Din Tughhik constructed aqueducts over the lake in Tughlukābād, whose traces still be seen. References are also found to 🖿 lakes built during the reigns of Sultan Muhammad b. Tughluk and Sultan Firnz-Shah. The anonymous author of the official history, Strat-i Ftras-Shaht, and hagiographies, mention the famous lakes of Dihll, such as the Hand-i Tughluk-<u>Sh</u>ah, Hawd-i Kutlugh <u>Kh</u>ān, Hawd-i <u>Sh</u>ahzada Fath Khán and Howd-i Shahzada Mubarak Khán. In the provinces, the lakes constructed in Dawlatabad and Hisar Firdra are worth mentioning, Sultan Muhammad b. Tughluk's Hawd, built on a considerable height in the fort of Dawiatabad, can be today. In Hisar Firûza, Sultan Firûz-Shah also had a cistern built in 754/1353 on a raised platform. It was originally constructed for supplying water to the ditch excavated around the fort, but after water from the newly-constructed canals became available, its water was used in the gardens and flower beds inside the fort.

In the 9th/15th century, cisterns appear to have been constructed by the rulers of the regional kingdoms that arose in the wake of Timur's invasion of India (800/1398). The construction of fountains in Diawnpur, Gudiarat and other cities in the plains led to the construction of disterns, me their water, Howing through narrow channels from a height, could make the fountains work. Babur's description of lakes in the Pandjab also testifies | the fact that old lakes were kept under repair, while new were excavated in the new towns. As the itte's assigned by the king to nobles in lieu of cash salary and allowances were hereditary, at least in practice during the pre-Mughal times, the assignoes constructed tanks in their lands for the extension of cultivation and horticulture. For instance, Yusuf b. Mulla Dibakan, the munsif or judge of the pargana of Cawad, in 952/1545 constructed a beautifullypatterned tank in his administrative charge during the reign of Shir Shah Sur.

Later on, the Mughal emperors, and the Dakani

sultans of Bidar, Golkondā, Bidjāpūr and Ahmadnagar, established reservoirs. Allusions to these reservoirs in contemporary inscriptions provide insights into the skill employed in their construction. The Muhammad-Nád, a reservoir built at Bidjāpūr in 1165/1751-2 by Afḍal Khān, is a great feat of engineering. Similarly, the huge tank-like well with rooms was built with the money of Tādj Sultān, the wife of Sultān 'Ādil Shāh in Bidjāpūr. The Pānf-Mahall (water-palace) at Nādrūg and the tank of Mā-Şāhibā at Haydarābād are notable exemples.

In the 12th/18th century, the amirs of Sind and the two rulers Haydar 'All and Tipů Sultân [q.vv.] of Mysore maintained the traditions of the early rulers. Tīpū Sultān took special interest in irrigation questions, building new tanks and repairing old ones. The huge tank built by him in Doradji possesses a huge embankment about 21/2 miles long, and at places is 45 feet high. He also rewarded other people who constructed tanks. The 'amils (revenue collectors) were entrusted with the responsibility of maintaining the tanks in the kingdom. All these lakes and tanks from mediaeval times existed till the beginning of the 20th century, but with the modern expansion of the towns and cities many of them have been filled in and the land used for residential purposes. In South India, however, they still survive and are used as picnic spots.

As for the construction of wells, they are mentioned in our sources either as $idh = ba^2 in = ba^2 oli$. The $ba^2 in$ and $ba^2 oli$ [q.v.] are step-wells, meant for the use of men and animals. Evidence available about the idh is interesting in so far as it reflects on the use of the Persian wheel to lift water from the deep wells in areas around Dihli during the early Sultanats period, indicating, from its comparative costliness, considerable local prosperity. Only fairly opulent farmers could afford the installation of this water-lifting machine.

Sources from the 8th/t4th century refer to the sakiya and the larki set up on the wells that were owned both by the state and by the cultivators. Al-'Umari in his Masalik l-absar was informed by an Indian traveller <u>in Arabia, Sh</u>ay<u>kh</u> Mubatak of Cambay (Gudjardt), at some time in the beginning of Sultan Muhammad b. Tughluk's reign (725-52/1325-51), that people in and around Dihll set up Persian wheels on the wells to water their fields and gardens. The writer refers to the Persian wheels as sawaki, whereas the contemporary Indo-Persian writers uso rather the term čarkh. An interesting anecdote related In the Diawami' al-kalim about Shaykh Nizam al-Din Awliya' suggests the presence of the Persian wheel in Dihli in the preceding century. It tells in that Shaykh Nizām al-Din once came across ■ čarkh set up on a well. The cultivator who was driving the bullocks for lifting water, exhorted the animals, saying age bark, age bark ("speed up, speed up") in a melodious tone. The sound produced by the motion of the wheels and the voice of the peasant had such an effect on the Shaykh that he immediately passed into a state of ecstasy.

The anonymous author of the Siral-i First-Shahi states that carkles were set wells around the newly-constructed Hand-i Shahida-yi Muharak-Shah outside the capital Firlzabad. The Hand was filled with the water lifted from the wells in the summer when the rain water was exhausted. He further informs us that the income from the lake was endowed by Sultan Firiz-Shah for the benefit of the poor. The work also contains references to the buckets (dalws) made of metal (iron) instead of kan

(pitchers or pottery vessels), hanging down the wheel by means of chain of ropes. The Persian term diliab also occurs in the passage, signifying the surface wheel which was used to lift water from the hand. The diliab was used to lift water from the open surface of tanks or rivers, the pitchers or buckets being fixed on the rim of the wheel, which was revolved by the hand.

Later sources reveal that the use of the Persian wheel was quite widespread in North India. Kahir, who flourished during the 9th/15th and the first decades of the 10th/16th century, refers to it in his when he likens the rosary used by the externalists to the garland of vessels attached to a rahal (Hindi equivalent of the Persian wheel). As Kahir lived most of his life in Benares, we may assume that he found the Persian wheel being used in the region of modern eastern Uttar Pradesh.

Like Indo-Persian writers, Shaykh Zayn, the sade or minister of Babur, mentions, the larkh. In 925/1519 when Bäbur crossed the Dihelum river and occupied Bhera (Sargodha District in Pakistan), he found Persian wheels as a common means of irrigation there. The orchards and the sugar-cane and paddy-fields were irrigated with the water of wells lifted thus. Later on, when he occupied the territories of Lähawr, Dipālpār and Sirbind (932/1525-6), he found everywhere the peasants irrigating their fields by means of the Peculan wheel, and he describes its structure thus: "They make two circles of ropes long enough to suit the depth of the well, fix strips of wood between them, and on these fasten pitchers. The ropes with the wood and attached pitchers are put over the well-wheel. At one end of the wheel axie, a second wheel is fixed, and close to it another on an upright axle. This last wheel the bullock turns; its teeth catch in the teeth of the second, that the wheel with the pitchers is turned. A trough is set up where the water empties from the pitchers, and from this the water is conveyed everywhere". Shuykh Zayn says however that in India, other methods of irrigation - used, including leather bucket (daras) lifted out of water by yoked exen, whilst dhekli, based in the lever system, which iii still in use, was most common.

Gradually, use of the Persian wheel seems to have apread everywhere during the Mughal period, but they were especially numerous in the Pangliab, the most prosperous region. Even an average cultivator there could afford to set up a Persian wheel on his well, which had been built of bricks and plastered with lime, despite the expenditure. Mughal historians like Abu 'I-Fadl, Hamid al-Din Lahöri, Yasuf Mirak and Sudian Ra'l Bhandari, mention it as of the commonest means of brigation in North india, but since the turn of the 19th century, it have been generally replaced by tube-wells.

As for the harnessing of rivers for irrigation purposes, the construction of large artificial canals began in the reign of Sultan "Ala" al-Din Khaldit 1695-725/1290-1313) towards the close of the 8th/rath century. Amir Edgaraw refers to a deep and wide canal built by Ghazi Mulik in the territory of Multan when he describes the revolt of the army and people of Multan against the governor Mughultay. Besides this, Ghazi Mulik seems to have constructed canals in Multan and Dipaipor mits. Barant adds that in every territory where Ghazi Mulik served as governor, he constructed canals for the progress of agriculture there. The Inspai-i Makin contains a minian (official document) issued by the governor of Multan, Mahra, in the reign of Firex-Shah, to an

official, Kamāl Tādi, asking the latter to carry the repair work of the old canals. Three canals, Dia-yi Nāṣirudh, Dia-yi Kuṭbudh and Dia-yi Khiḍrudh, are mentioned, and must have been constructed by Chāzī Malik before his accession to the throne in 720/1320.

The credit for constructing a number of canals in the region between the river Sutledi and Dihli goes to Firuz-Shab. First, the vast arid tract of Haryana, where only one crop was raised during the rainy season in a year, attracted the royal attention. In 755/1354, he laid down the foundations of the city of Hisar Firuza (modern Hisar) and then constructed a double system of canals, the headwaters of which were drawn both from the Sutledi and the Dismună rivers. The Sutledi canal, named Dlugh-Khani, flowing through Rupar and Sirhind town, met the Diamună canal called Rădiiwan near the new city of Hisar Firuza, Both of them passed via Karnal. At Hisår Firûzā, they discharged their water through a single channel into the ditch around the city. Yahya Sirbladi supplements Shams-i Sirādj 'Afif when he informs us that the construction of canals started in 756/1355. Besides the Djamuna and Sutledj canals, he mentions another canal out from the Sutledj, the waters of which were conducted up to Dihadihar (a town in Rohtak Distr.), irrigating wast arid tract of 96 sq. miles. In 257/1356, another canal was excavated from the Chaggar river. This flowed past the fort of Sirsuli (town) and reached Harni Kherä. The most important canal we the Djamună canal (later called western Djamună canal) that was also cut from the Djamuna and conducted to the capital city of Firuzabad. Besides, the Salima canal (later Khanpur ka nala) was dug in the Siwallk hills and the waters of Sirsuil and Salima were diverted into it. It flowed past Shahabad town (to the south of Ambala). Like their master, some of Firûz Shah's nobles also appear to have excavated irrigation channels in their ikla's, e.g. the Siral-i Firm Shahi informs us that Khan-i Djahan Makbul planted gardens and constructed canals, serals and barars in his iklat.

All these canals were kept under repair by the later Sultans of Dihll. Though Bābur complains that there were no artificial canals in India, although they could easily be constructed at manufer of places even in the plains, Shaykh Zaya refers to the canal of Fīrūz-Shāh flowing via Dihadihar, as well as the canal in the idpā heid by Dilāwar Khān Lödl's maternal uncle in the foothills of the Pandjāb (Djayswal parganā). Bābur's description of the territorial unit of Candarl also contradicts him, for he found there much running water through channels. We find allusions in the Afrana-yi Shāhan to the thams and canals in Orissa, and these appear to have existed there before the Afghān conquest of the region in o80/1572.

Likewise, the Mughal historians furnish information about the repair of the old and the construction of new cauals. According to Abu 'I-Fadl, flist Shihāb al-Din Ahmad Khān repaired the Firaz-Shāh's [Januma canal, as it bad silved during the early years of Akbar's reign. Later, another officer of Akbar, Nūr al-Din Muḥammad Tarkhān, had the same canal repaired a second time. The reign of Shāb Djahān witnessed the digging of new canals in different territories. Shāh Djahān also increased the length of Firāz-Shāh's Djahān also increased the length of Firāz-Shāh's Djahān also brought its water up to Shāh-Djahānābād (Dihl). This canae to be known both as Nahr-i bihāhāt and the Nahr-i fayd.

886 MÅ³

Shah Djahan's noble, Asalat Khan, built a dam the Karnal stream and made its water flow into a channel so that the land around might be irrigated.

During the same reign, a number of small canals were built in the upper Bāri Dō'āb (Pandjāb), the best-known of which was the Sādā-nāke. It was brought from the Ravi in the hills near Ragipur. It flowed as far as Lāhawr, covering 84 miles. Two other canals were led off from the same point, — to Pathānkot and the other to Batālā. 'Ait Martiān Khān is also credited with the construction of a canal from the Tavi river for watering his gardens at Sodhrā near Wazīrābād in the upper Račna Dō'āb which was 30 miles long. The canals were constructed in the regions of Multān and Sind also during the

In South India as well, the canals seem to have been common means of irrigation since ancient times. Evidence available suggests that brick embankments were built to protect them from inundation. But the general practice in the South was that of water-storage. For instance, there were thousands of canals in Baglana cut from the river, and they supplied water to every village and town during the arth/17th century. Tipú Sultán, however, built a large canal in the tradition of the Muslim rulers of North India. In 1797 he constructed a dam across the Kavari, a few miles west of Sringapatam, with an embankment 70 feet high.

This irrigation system survived till the close of the 19th century, when the modern canal system began. The Persian wheel also became obsolete, owing to the introduction of tube-well technology, so that in the Pandjab mill western Uttar Pradesh

they have almost disappeared.

10. IRRIGATION IN TRANSOXIANA. [see Supplement].

11. ECONOMIC ASPECTS OF MODERN PRESENTION

The use of water for irrigation in agricultural production is widely practised in the cultivated areas of the Muslim world where constraints of low and episodic natural precipitation limit yields on existing new crops or inhibit the introduction of a wider range of crops. Such areas include the desert lands of north Africa, the Arabian Peninsula, Iran, Central Asia and the Indian sub-continent, the semi-arid zones generally lying adjacent to the deserts, the Mediterranean zone and, in South Asia and Asia proper, the dry tropical climatic regions. The greater part of the Muslim world is encompassed by this definition. It should be added that there is scientific evidence that a process of desertification is affecting the semidesert margins over wide areas. In consequence, it is possible that the surface area where irrigation is essential to agriculture is gradually extending, not least in the Sahel of Africa. In all except the dry tropical zones, the use of irrigation permits stabilisation of output of staple winter grain crops by offsetting fluctuations in annual rainfall and allows cultivations of summer vegetable and other cash cropping which would otherwise be difficult or impossible. In the dry tropics, where hot and wet summers alternate with hot but dry winters, irrigation mainly functions as an aid to cultivation in the winter months.

Irrigation has taken on a special significance in recent decades as population growth has tended to accelerate and as the need has increased for states to provide reliable and augmenting food supplies from domestic sources. While some success has been achieved in encouraging greater use of dryland areas under mechanised systems and with new improved seed varieties, most governments have attempted to reduce the growing and adverse imbalance between domestic supply and consumption of foodstuffs through expansion of the area under irrigated cultivation and better we of existing water supplies in traditional areas. Governments have played the major role in a drive common throughout the Muslim territories to increase the volume of irrigation water at the disposal of their agricultural sectors. Irrigation budgets have often dominated financial allocations to agricultural development, especially in countries such = 'Irāk, Iran and Egypt, In the latter country, the continued engineering of the River Nile, culminating with the completion of the Aswan High Dam in 1970, was the main economic preoccupation of the state for much of the modern period. For Trak, too, hydraulic works on the Tigris and Euphrates for flood control, waterstorage and generation of hydro-electric power made a large and important claim 🚃 national resources, beginning with the first financial allocations of the Iraq Development Board in the 1951-2 fiscal year. The second Iranian development plan (1334/1955-5 to 1341/1962)

was above all concerned with the construction of storage dams on the main river systems of the country, including the Diz, Safid Rüd and Karedj structures.

Rapid and expensive adoption of traigation prolects has not always been accomplished with regional co-operation - with a critical appreciation of the appropriateness of irrigation technology borrowed from the industrialised states of the world. Exploitation of the irrigation potential of the Euphrates in the period since the Second World War has brought conflicts between riparian states on the division of waters, as storage facilities in Turkey, Syria and Stak have been constructed without co-ordination. In 2974 and 2975 the flow of the Euphrates at HIR in Trak fell to unprecedented levels (9.02 milliard cubic metres in 1974 and 9.42 milliard cubic metres in 1975] as a result of new water storage reservoirs built in the states upstream. In contrast, close linison was maintained between Egypt and Sudan during the course of the creation of Lake Nasser behind the Aswan High Dam, both to ensure agreement on the division of waters and to provide for the settlement of communities displaced from the lands submerged beneath water level.

A slow response by traditional agricultural areas to the demands of a larger and often higher consuming population led to increasing state intervention is irrigation affairs with perceptible effect from 1952, though particularly from 1958 in Arab countries and from 1962 in Iran. With few exceptions, governments favoured centrally financed and controlled irrigation projects, which demanded imported technology and sophisticated management of land, water and farmers by the national bureaucracy. Irrigation developments in the Muslim world have witnessed damaging failures in selecting techniques of appropriate type by scale and technology. In Iran, the Diz irrigation scheme foundered in part, aince large farming units created to work the area proved unmanageable. The Libyan governmentcontrolled Kufra irrigation scheme in the south of the country, a show-piece designed to demonstrate Libya's ability to utilise oil revenues to set up permanent non-oil assets, is one of the many hightechnology irrigation projects established in the olf-exporting states of the Middle East and north Africa which have out-stripped indigenous economic and technical resources and have added little to the sum of domestic food production.

Sources of irrigation water have changed only insignificantly in recent years. Surface and ground water are the mainstays for irrigation water provision, though a number of richer states, notably Sa⁵adi Arabia and Kuwayt, have made use of desafinised sea water on a very small scale at extremely high cost. Pumping of irrigation water from deep aquifers, of which the Kufra scheme is an example, has increased in importance, though in many cases water extraction is faster than replenishment rates or comes from fossil water reservoirs, with clear implications for the longevity of these sources. Considerable scope remains in the area for the efficient with of existing water resources, rather than the expensive creation of pew ones.

The total area of irrigated land in the Muslim world has grown very slowly, despite large allocations of resources for the construction of reservoirs and Irrigation schemes. In the Middle Eastern heartland of the Muslim world, the proportion of agricultural land under irrigation has remained more or less unchanged at a quarter of the total, Individual states have improved their positions somewhat, above all

Egypt, where the Aswan dam has increased both the total area under irrigation and the area under perennial cropping. Estimates of relative reliance on irrigation for the main Muslim states are shown in Table r, including both traditional and modern systems.

The strength of traditional systems has been much eroded in recent years. Underground water channels, kanát, failadi or káriz, have been generally neglected and many have fallen into disuse. The diesel pump has widely replaced other manual and animal-powered water lifting systems. Meanwhile, the addition of new irrigated areas served by modern systems of water storage has been offset by losses of irrigated land rendered infertile through growing alkalinity and salinity a a result of bad water management, inadequate provision of drainage facilities and inappropriate cropping patterns. Most countries of the arid and semi-arid sone are affected by this problem, though worse than 'Irak, where it is estimated that more land is lost annually through the effects of soil salinity than is reclaimed by developments projects.

Despite the expenditure of considerable funds on, and the economic dedication of governments to the expansion of the irrigated in in the recent past, results expressed in real gains in land under cultivation and crop production have been disappointing in most areas of the Muslim world.

Table r

Percentage of cultivated land under irrigation in the Middle East

Bahrayn	
Cyprus	16
Egypt	100
Iran	20
Grak	50
Jordan	7
Katar (Qatar)	
Kuwayt	100
Lebanon	30
Libya	- 1
Saudi Arabia	80
Syria	10
Turkey	7
United Arab Emirates	100
Yeman (North)	10
Yemen (South)	80

12. ORNAMENTAL MINIS OF WATER IN MUSLIN INDIA

In a land so dependent generally the summer monsoon, where there is few permanent sources of water away from the great rivers and their surminding terrain where the water-table is high, human settlement depends artificial means of conserving water is one rainy. If the next. These means, which apply to the domestic water supply well is to agriculture, have been described in FLAMA, v; for canais see also NAMA. Many of these utilitarian works, however, if frequently ornamented and decorated beyond the call of functionalism, and are consequently described here.

Many water monuments were constructed before the coming of the Muslims, who continued not only their function and form (except for the climination of figural ornament and the introduction of the arch) but also their maintenance through civil or walf funds. The simplest examples are large open reservoirs in and around towns (commonly called "tanks" in India; see Yule and Burnell, Hobson-Johson, s.v., for etymologies; also tal, tala'o, and in the case of Muslim constructions also kend), of all shapes but commonly rectangular, sometimes with masonry surrounds and steps leading well below the average water-level; as the water was used or dried up more steps would be exposed, the shelves being convenient for personal ablutions or for washing clothes; pavilions (kūskk, thatri) may m added mainly for ornament [see further on these, above, 9]. Similar masonry surrounds (ghāl) may be provided in river banks or on artificial lakes caused by damming a valley (e.g. the Anasagar at Adimer, the Pichola at Udaypur [q.v.]). Since open expanses of water cause a perceptible change in the microclimate, buildings might mi sited to take advantage of the cooling effects of evaporation (e.g. Firuz Shah's madresa and other structures on two sides of the Hawa Khass at Dihli [q.v.], Mahmud Shah's palace, the tombs and the mosque at Sarkedi [sec GUDIARAT and HIND, vii. Indo-Muslim architecture]; and many pleasances may be sited in the middle of an artificial tank (e.g. Diahångir's Hiran Minär complex at Shaykhupura, the tombs of Sher Shah and Salim Shah at Sasaram (q.v.), Mughal kiosks at Narnawi [q.v.], the Zafar Mahall in the Hayat Bakhsh garden in the Dibli fort [see plan, Voi. 11, 266 above]; the tombs would have been used as pleasant retreats during the owners' lifetime.

Tanks and artificial lakes fed from constant sources naturally need provision to be made for the escape of surplus water; overflow tunnels and sluices may occasionally be sumptuously decorated, as at Sarkhedi in Gudiarat, but the simpler structures in the local quartzite at Dihli have a monumental beauty of their own, e.g. that on a water-channel off the Nadjafgath canal at Wasirabad, with an included silt (and fish?) trap; those on the band connecting Tugilukābād with 'Adilābād (see plan, Vol. 11, 257 above), whereby the low-lying fields to the south of Tughlukabad could III flooded to I depth of the to create an artificial lake for the defence of the citadel and leaving Ghiyath al-Din's tomb isolated outpost; and, complex, a two-storeyed sluiced dam, called IIII pula, built into south wall of Muhammad b. Tughluk's

Diahānpanāh to regulate the storage of water within the city; analyses, photographs and measured drawing of the these in Yamamoto akii, Delki, iii.

The simple well does not much lend itself to ornamentation, but may form part of a complex, such as Diahängir caused to be constructed at day's-march intervals along the road to Kashmir, of sard's + mosque + well, water from the latter being taken up by čeras [see FILAHA, v] to irrigate a small flowergarden. The step-well (bd'dls [q.v.]), however, is most frequently decorative as well as functional. providing chambers at various levels close to the water's edge to provide cool retreats in summer; e.g. in Dihit the Gandhak ki ba'oll, cs. 630/1233; the circular bā'oli in Firuz Shāh's köllā, ca. 753/1352; and the superb Rājon ki bā'n, inscr. 912/1506; all analysed in Yamamoto et alii, Delki, iii, with photographs and measured drawings. Analogous structures in Gudiarat, called vas, have the entire well covered at surface level; comprehensive study, including other water monuments, in Yasmin Amirali Shariff, Water menuments of Gujarat ..., University of London M. A. Archaeology thesis 1981 (unpublished).

Water was a necessary adjunct to palaces and gardens, and might be provided, when either of these two beside close to a river lake, by a Persian wheel (rakal); a further Persian wheel, or series of wheels, housed in a tower, might be used to raise the water to a greater beight when it was necessary to provide a sufficient head of water to operate fountains. The water was led through palace courtyards and gardens by stone channels, often with intermediate disterns which could be highly ornamental, as that in III I all bagh at Bidar (plan in Yardani, Bidar, 53); in Bīdjāpur, where all the centre of the city was supplied by underground channels from the Cand and Tadi ba'oris, a special water-pavilion, dial-mandis, in the elaborate later 'Adil Shahl style, discharged water from jets into a large stone surrounding tank to make a visual focal point in the city scheme. Under the Mughals, however, the garden was developed more than ever before as me art form [see mustax, il]. The kleal garden shape was a fourfold plan, tahar-bagh (the name car-bagh persists in many Indian towns as the name of a locality even where no traces of gardens remain), in e.g. the garden surrounding Humayun's tomb in Dihli (see plan, Vol. 11, 265, above), where the divisions are marked by water-channels with cisterns at or seats over the intersections; the pattern was followed and augmented in later tomb complexes: notably Akbor's tomb at Sikandra. the tomb of I'timad al-Dawla and the Tadi Mahall [q.v.] at Agra, the tomb of Awrangzib's queen ("Blbī kā maķbara") at Awrangābād, and that of Safdar Diang at Dibil, where the principal channels are often expanded into stone-often marblebasins 3 or 4 m. wide with a central rank of fountains, terminating on the axes in beraddels. Similar gardens exist apart from tombs and palaces, e.g. Râm bâgh, Zahrā bāgh, Wazir Khān kā bāgh, Mihtar Khān kā bāgh, Ačānak bāgh, all at Agra (ASI, iv [1871-2], 104 ff.); in his suggestive [but sometimes nalve) Early garden-palaces of the great Mughals, in Oriental Art, NS, iv/2 [1958], 3-10, R. A. Jairazbhoy proposes the latter m the site of Babur's original čakār-bāgā in India.

Mughal gardens reached their peak of perfection in Kashmir, where at Shrinagar, Akbar's Nashm Bagh, Asaf Khān's Nishāt Bāgh and Djahāngīr's Shālimār took advantage of the copious natural water supply; 'All Mardān Khān's canal from the

Rāwi made possible Shābdjahān's Shālimār at Lähawr. These make use of abside, water-chute, an oblique bed of flat me scalloped marble, and diharnd, cascade, with water flowing in a sheet over a straight edge to fall over a vertical bank of small niches, each intended to hold a small lamp with a shade of coloured glass. Other Mughal gardens are mentioned above s.v. BUSTAN. A curious late Mughal water monument is the Pan čakkl, water-mill, in the shrine of Baba Shah Muzasfar Čishti, a spiritual preceptor of Awrangelb, outside the city walls of Awrangābād: water brought from a distance falls through some 7 m. to operate a small mill, and the water then flows through two large tanks. Mughal water monuments and gardens were much imitated by Hindû rulers in Rādjāsthān. The Sahēliyon kā bagh in Udaypur offers a number of fountains of different designs fed by water under high pressure from one of the city lakes, in more extravagant taste than any Mughai conception. The small palace at Dig, near Mathura, is more refined in its elegant tanks and channels, and water is led in copper pipes over the openings of the buildings in order to flow over screens of Mass grass, to cool and perfume the air passing through.

The devices of water decoration embodied in the gardens are found also in Mughal forts and palaces [see especially MUGHAL, v, a]. These sometimes involved bringing water from considerable distances (e.g. 'All Mardan Khan's canal which supplied the Red Fort at Shahdlahanabad, Dihli, tapped the Diamuna over 100 km. away; see W. E. Baker, Memoranda on the western Junna canal . . . London 1849. Some of the aqueducts involved are themselves works of art). In the Red fort of Shahdjahanabad. the water is further raised m the Shah burdi, from an open pavilion in front of which, with about and djarna, water flows through a marble channel, the Nalu-i bihisht, which not only supplies the Hayat Bakhsh and other gardens but also flows through all the palaces on the east wall (buildings marked c, e, f, g, h in the plan in Vol. 11, 266 above] at m depth of some 15 sm., whose supreme achievement is a shallow basin an an square in the Rang mahail. carved into the shape of an local local flower; this was of one piece of the finest Makrana marble and infaid with semi-precious stones. When the water flows over it the petals of the flower appear to move and ripple (the channels are now normally dry, but the author of this article had the privilege of seeing them in operation at the end of 1942). The Hayat Bakhsh garden has additionally two marble pavilions with diarnas, called Sawan and Bhadon after the first two months of the rainy season in the Hindu calendar, with a fine central tank with scalloped red sandstone borders which again are intended to be barely covered with water m produce a ripple effect. Comparable works in the Agra fort, of the time of Shābdjahāu's additions, include a very deep dbshār outside the Mahall-i khāss and an elegant fountain in 🔤 Muthanman Burdi.

Bridges may be included in ornamental works. One near the tomb of Sikaudar Lodi in Dihil, but of Muglial date, is rather a pleasant spot for strollers to catch the water-cooled breeze than a work of strict necessity for transport, although the Mugliak brought an elegance to bridges of greater functional necessity. Outstanding is the bridge at Diawnpur [g.r.], whose two parts are provided with kiosks with carved marble screens to take advantage of the breezes along the river.

MA' AL-'AYNAYN AL-KALKAMI is the name consistently given in Mauritania and Morocco to the greatest scholar and religious and political leader of the Western Sahara during the latter half of the 19th century. Uncertainty remains as to the significance of his sobriquet Ma' al-'Aynayn, "water of both eyes", but it is not unlike hurrat al-'ayn, "coolness of the eye", Ma' al-'Aynayn was born on the day of the death of his brother, Abu 'l-Fath, and of his paternal grandmother Khadīdja. His father Muhammad Fädil regarded his birth as a blessed consolation at a time of family distress. His mother, Mauna bint al-Ma'lin al-Idiaydibiyya, cherished his many because the infant was her only son at that time; if she were to lose him it would be as grievous to her as the loss of her sight.

r. Life, Muhammad al-Mustafa was the twelfth son of Muhammad Fädil b. Mämin al-Kalkami, the founder of the Fadiliyya farika. This was an offshoot of the Kunta Bakkā'iyya branch of the Kādiriyya order [see KUNTA]. Muhammad Fädil came from the family of the Ahl al-Tālib al-Mukhtār who were centred at Dar al-Salam north of Goumbou on the border between Mali and the Mauritanian Hawd. He was born about 1780, and his Fâdiliyya order was pan-Sull in its aspirations. His ideal envisaged the unification of all other Suff orders by a recognition. of equal worth and by acceptance of his independent counsel. His wird and dhike encouraged a highpitched, shricked and ecstatic repetition of the skahāda, and his religious acts were accompanied by charms, spells, magic numbers and thauniaturgy. The family claimed Shartfian descent from 'All b. Als Talib through Yahya b. Idrīs al-Şaghīr. It also claimed lineal relationship to the Lamtuna [q.v.] who were the aristocracy of the Almoravid Sanhādja.

Muhammad at-Mustafa Ma' at-Aynayn was born on 27th Sha'ban 1246/10th February 1831. He was taught by his father, and as a gifted pupil, he later became a disvoted adherent of the doctrines of the Fadilitys. He was to found his own order, the Yayniyya, but it differed little from the Fadilitys basic principles. His outlook was conservative and eclectic. His book, Ifādat al-rāwi fi anat muḥhāwi, argues the case for a pan-Islamic rapprochement, theological and political, and within and beyond the Suff orders. He followed this path from his earliest years, and it became political obsession towards the end of his life.

When still young he left home. When he was

16 years old he visited Marrakush in order to study, and for some time he lived with the Aghlal on the border of the Hawd. In 1858 he performed his first pilgrimage to Mecca. On his way he paid his respects and requested support from the Moroccan sultan. Mawlay 'Abd al-Rahman, and from the beir to the throne, Sidl Muhammad. He returned to Morocco in 1859, and on his route to the Hawd he stayed at the caravan town of Tinduf. It was then a centre for slave traffic, and was dominated by the Idaw Bilal and the Tadiakant. Ma' al-'Aynayn acquired a reputation for miracles, and he enjoyed the favour of a noted scholar, Sidi Muhammad al-Mukhtär b. A mash al-Diakani. He had access to his library and taught and wrote, but he declined an offer to remain as a teacher in Tindôf. In 1861 he returned to the Hawd. In 1865 or 1867 he left the Hawd definitively on a journey to the Adrar town of Shinkly and to Tiris.

In 1869 his father, Shaykh Muhammad Fädil, died in the Hawd. His legacy was divided between his four principal sons. Ma? al- Aynayn was held in the highest esteem and wielded most political power. After 1873 he chose the barren regions of the Rio de Oro and the Sākiya al-Hamrā' m a permanent headquarters for his growing company of novices (talamidh) whose life style owed much to the example of the Kunta shayhh [q.v.], and their successors. These northern districts of the Western Sahara facilitated closer contact with the Morrocan sultans, who were regularly visited by Ma' al-'Aynuyn and who supplied them with slaves. Meanwhile, he combatted European encroachment on the Atlantic coest of the Sahara. He married into the principal tribal groups of the region and enjoyed wide support from the Awlad Dulay, the 'Arusiyyin, Tadjakant, Awlad Bū Sbā' and Ahl Bārikalla. He dominated the Western Sahara caravan routes, and m power grew so great that, according to his son, Shaykh Muhammad al-Mustafā Murabbih Rabbub, Mawlay al-Hasan (1873-94) entrusted Mas al-'Aynayn with the guarding of the frontier between al-Dakhila (Villa Cisneros) and al-Tarfâya (Cape Juby), sc. almost the entire coast of the former Spanish Sahara. During this period, M2' al-'Aynayn had neither village town. He lived in his tents in the Tiris, al-Karihi, Aswam, al-Djakuba and Tawrik, but, as the pull towards the north increased, he commenced the construction of a silviya at Dar Hamra' in the Sakiya al-Hamra', a fortress, and a small settlement at Maltga in the same region.

After 1896, ties with the Sultanate were particularty close. The growing influence of France to the north and the south strengthened the unity and coordination of political and religious policies. In 1897 Ma' al-'Aynayn was received in triumph by the stripling sultan, Mawlay 'Abd al-'Azlz, who had ascended the throne in 1894. The sultan received the wird of the 'Ayniyya and religious instruction from Ma' al-'Aynayn. Zawiyos were founded in Marrakush, Fás and Sala, and lands and estates were bestowed on the Shaykh and his family. He became an éminence grise at court, and he was feared at court on account of his magic power and his fanatical followers. The 'ulamit' of Fas gave him the title of \$446 [see KUTE. 2. In mysticism]. With financial aid from the sultan, Ma' al-'Aynayn commenced his most ambitious project in 1898. This was the building of a kasaba, *awiya, mosque, library, political and commercial headquarters in the reed beds of Smara on the banks of the Wayn Silwan in the Sakiya al-Hamra?. The site was close to a coute which linked the Wad Nun to the

Adrar and Tiris. It men not far from the port of al-Tarfaya, and the terrain was suitable for pasturage, some agriculture and the planting of date palms.

Smara was, and still is, a complex of low buildings designed in a style which blands the brown dry-stone walling of the Adrar and Tishit with the decadent urban Hispano-Moresque of Morocco, Building stone locally quartied or brought by steamer from Mogador and the Canary Islands. Moroccan stone and architects were employed in the task of constructing a compound to which buildings were annexed. Some were private dwellings for the four wives and many concubines of Ma' al-'Aynayn. Others belonged to his sons or accommodated guests, artisans and talamide. Work commenced on a large mosque and a Ahalma. Space was allowed to house Ma' al-'Aynayn's library of 300 books and his collection of at least 500 manuscripts. Other buildings were store-houses, granaries and arsenals. The design was a compromise between 🔤 desert and the Certain private quarters were hardly than walled enclosures inside which tents were pitched and animals were penned.

The work sum never completed. In 1903 the French declared the Trarza district of south-west Mauritania a French protectorate. In 1905 the Commissaire général français, Xavier Coppolani, was assassinated at Tidlikdia by anti-European Saharans who had the backing of Ma' al-'Aynayn. In 1906, France occupied the Tagant. As Smara was indefensible, Ma' al-'Aynaya withdrew in his hasaba at Tiznit in the Sas. In 1907 he made it the base for his dishad [q.u.], and he appealed to the sultan for maximum assistance. Events worked against mi interests, however. The ineffective Mawlay 'Abd al-'Aziz relinquished the threne to his brother, Mawiay al-Haffz, to whom Mas al-'Aynayn swore alteglance (baysa) in 1907. The latter sultan was anxious to achieve accommodation with the French, so that Ma' al-'Aynayn quickly lost faith in him. In 1910 he arrived in Marrakush with an army of tribesmen of the Anti-Atlas and the Süs. Accompanied by this show of strength, it was alleged that he announced his claim to the throne of Morocco as Mahdi [q.v.] of the hour, but some authorities doubt the historicity of this reported cialm. The religious influence of Mar al-'Aynayn in Morocco was formidable, but it should remembered that he was 79 years old and was approaching senility. His son, Shaykh Muhammad al-Imam, and we brother of Ma' al-'Aynayn, Shaykh Sa'd Abihi (Saad Bāh)-who cooperated with the French-both discount such reports as unfounded. Evidence suggests that Ma' al-'Aynaya's eldost son, his successor (khalifa), Ahmad al-Hiba or Haybe [q.n. in Suppl.], directed the policy of his father. A major reverse took place at Kasbat Tadia. on the agrd June 1910. In September Mar al-'Aynayn retired to Tizalt, and he died there on 29 Shawwall 1328/28 October 1910. His tomb in Titalt has remained a family shrine, Smara had been abandoned and was occupied by a French force under Colonel Mouret in 1923. The dome of its hasaba, the symbol of Ma' al-'Aynayn's authority, was severely damaged, and the library of several hundred books on mystiaism, astronomy and theology was burnt.

According to Muhammad al-Mukhtar al-Susi, Mü' al-'Aynaya married 116 wives. He fathered at least 21 sons and 30 daughters, and some sources give the total number of his offspring as 68. His most noted descendants, them his haulaft', were seven sons by his wife, Maymuna bint Ahmad 'Aliyyun, who was born into a lattered household

among the Barabish of the Hawd. She was the mother of Ahmad al-Hiba (d. 1919), Muhammad al-Mustafá Murabbih Rabbuh (d. 1924), al-Tālib Khiyar, Muhammad al-Imam and Muhammad al-Aghdaf (d. 1072-3). These noted sons, together with brothers from other marriages, continued the family tradition of scholarship and sanctity in the Maghrib and the Sahara. Several of them were poets and authors of weighty works on theological and legal subjects and on the ideas of their father. Some of them cooperated with the Spaniards in the then Spanish Sahara; others became exiles in Morocco and Mauritania or lived a pastoral life in the Hawd. They strove to maintain the influence and status of the family and to combat European domination 📓 the Western Sahara. In the main, they showed solidarity with the Moroccan royal house and followed the example set by M32 al-'Aynayn himself. The extended family represented, and represents, a conservative force in the radically-changing Western Sahara.

2. Character and achievements. The closing vears of the life of Ma' al-'Aynayn, his activities in Morocco and the building of Smara have disproportionately overshadowed the life he led between 1870 and 1890 when he ruled from his palatial tent in the Rio de Oro and the Sakiya al-Hamra' and set down the bulk of writings. In 1887 the captive explorer, Camille Douls, was brought to Maral-tAyunya who subsequently released him. Douls was impressed by the physical staming and awesome appearance of his captor. Due to his miracles, his many marriages and formidable learning he acquired a semi-divine power over the Saharans. He combined the roles of doctor, teacher, arbitrator and avenger with fire. In organising a desert community he put into effect his dream of unitying Islamic sects in pan-Islamic loyalities, as outlined in several of his books. These total some 300 titles. Shaykh Muhammad al-Mustafa Murabbih Rabbuh in his own Kurrat al-faynayn lists 140 titles. He adds, however, that his list is incomplete and that sundry opuscules were not included. Several of these were written as early m 1861 when his father was in Tindul. Forty of his most important works were lithographed in Fas at his own expense. Here is the list of these in it was compiled by B. Lévi-Provençal in his EP article: 1. Adab al-muhhālafa ma'a 'l-yatīm, on the margin of Mufid al-sami, no. 20, 1321; 2. al-Akdas fala l'anfas, commentary on the Warakat of the Imam al-Haramayn, 1320; 3. Dalil al-rifak talá shams al-ittifah, 1321, 3 vols; 4. Dieda of mystical poetry, 1316; 5. Diawab al-muhakkika fi ahhbar al-hhirka, 1302; 6. Kitab Fatik al-rath 'ala ratik al-fath, 1296, and ed. 1939; 7. Hidāyat al-mubladi'ln wa-naf'al almundahîn, urdjûza on nakw, 1322; 8. Hudjdist al-murld fi 'l-d<u>i</u>ahr bi 'l-d<u>h</u>ihr 'ala 'l-marld, 1321; 9. Ibrāz al-la āli 'l-mahnuna fi 'l-asāmi 'l-pāhira wa 'l-mudmara, 1322; 10. Ishde al-farih al-mushtahir ^talā "ismo^t wa-lā laghlarir", 1321; 11. al-<u>Kh</u>alās fi hahihat al-ihhlüş, 1320, 12. al-Kibrit al-ahmar, also printed at Fas in 1324; 13. Kurrat al-faynayn fi Il-halam fela Il-ru'ya fi Il-darayn, 1321, on the margin of no. 10; 14. Ma yata allah bi 'l-hasad, on the margin of no. 36, 1320; 15. Madima' al-durar fi 'l-tawas; ul bi 'l-asmā' wa 'l-āyāt wa 'l-suwar, 1309; 16. al-Mahāsid al-naraniyya, 1306, on the margin of no. 29, 2nd ed. in 1320; 17. Mubzir al-mutashawwif 'ala muntakhab al-laşawwuf, 1314, 2 vols; 18. Mufid al-hādira wa Il-bādiyo bi-shark hādhih al-abyāt al-thomaniya, 1326; 19. Mufid al-rauf 'ald anni mukhdwi, 1309; 20. Mufid al-sami "I-mutakallim fi abkam altoyammum na 'l-mutayammim, 1321; 21. Mughri

According to the Kurral al-'synapa (fol. 72), Ma' al-'Aynaya mastered all the disciplines, language, grammar, syntax, elecution, logic, mathematics, the dating of seasons and feasts, the system of 'Adjami Saharan cryptology, jurisprudence, procedy and medicine (Arabian and Saharan Hassaniyya). Alongside these studies he gained experience in several branches of the occult.

Supernatural power was accepted m part of his personality. Its manifestation could not be separated from his involvement in mundane matters which concerned the day-to-day life of his taldmidh or Saharawis. They sometimes found contradictions between their furf and the Sharf's. Similar problems had been faced by earlier Kunta shaykks and by Shaykh Muhammad al-Māmi (d. 1865) of the Tirls Ahl Bārikaila. The Ahl Bārlkalla of Imirikli were devoted followers of Ma' al-'Aynayn. They were familiar with attempts by Saharan teachers to resolve these question. Shaykh Muhammad al-MamPs book on tribal law and custom, Kilāb al-Bādiya, can be matched, though not surpassed, by opuscules of Mil al-Aynayn, and likewise his mathematical and astrological theories. Pamphiets by the latter tayammum, prayer, fasting, hospitality, divorce and sexology were widely quoted, and several of these were appended to other works and lithographed. A major work, Fātik al-ratē 'alā sātik al-fath, forcefully argues the case for humane treatment of women, slaves, beggars and orphans, and for respect and deference towards kings and sultans.

Supernatural revelation accompanied the study of Arable grammar, phonetics, and proceedy. The Kurat al-^caywaya (fol. 74) records that "when he composed a book about procedy one day he left with his mind preoccupied by certain obscurities. He sat facing metre, and he began to beat the thythm of the metres on the ground using a stick which he held in his hand. While thus engaged a burnt brick appeared before him. He raised it with his stick and discovered a treasure beneath it. He shunned it. It returned the brick to its former position and said, "I do not want it." Then he arose and sat opposite another tree, and God sulightened him in the matter he sought."

At least 30 of Ma' al-'Aynayn's major works are about \$6fism. Na't al-biddydt wa-taussif al-nikdydt, lithographed in Fas and twice published in Cairo, is still widely read in the Sahara and is possibly his

masterpiece. In its pages, Mã' al-'Aynuyn argued that Suft brotherhoods display only trivial divergencies. Drotherhoods were of equal merit and ought to combine. His arguments were carried a stage further in his book Mubrir al-mulaghauroif 'ald muniahhab al-tasaurouf, which is outspokealy pro-Ottoman in its sentiments. To the author, the Ottoman state exhibited pan-Islamic eelecticism and was the last to precede the appearance of the Mahdi who would unite Jews, Christians and Muslims after cataclysmic events.

Mention has been made of the license allowed by the Fadiliyya and the 'Ayniyya for the use of spells and secret scripts for religious purposes. Ma' al-'Aynayn, an avowed thaumaturge, displayed an interest in the occult and paranormal. Those unsympathetic to Ma' al-'Aynayn have dismissed him as a sorcerer posing as a scholar and have argued that mysticism was an example of Suffern in decadence. It is clear from the works which he wrote, for example Madkhab al-makkā/ 'alā da'wat al-hurūf, where prayers are computed by letters of the alphabet, magic squares and numbers worn as amulets, that the system he was highly complex and derived from mediaeval systems invented in the Maghrib. The Hawd is adjacent | Black Africa and has its own tradition of secret scripts. Eleven secret alphabets have been recorded in the Hawd. Some characters in these scripts represent the numerological value, or a graphic deformation of corresponding Arabic letters, or are based on the skuletal forms of complete Arabic words. Other characters and non-Arabic, possibly Lybico-Berber, and are lunette in shape. One Hawd script which is particularly rich in Non-Arabic characters is the al-YasInf alphabet, which relates either to Yasin, its inventor ("Abd Allah b. Yasin the Almoravid?), or to the letters Yasin which open Sûra XXXVI in the Kur'an, Characters from these Hawd scripts appear in several lithographical works of Ma' al-'Aynaya, especially lunette letters. In the Rio de Oro, two of these scripts, the surpderly you and the 'ibraniyya, are known among the Ahl Bärikalia. Like Shayhh Muhammad al-Mami, Ma' al-'Aynayn found it natural to employ such scripts and alphabets for religious purposes.

Over one hundred miracles are attributed to Ma' al-'aynayn in the Kurral al-'gynayn. They range from the rescue of his books and novices from the flooding of the Sakiya al-Hamra' In 1890 to the exorcism of see of his wives; panishment of robbers by lire; and the illumination of a room by his clothing. Certain of these happenings are patterned on miracles attributed to the Prophet. Nonetheless, they are far too varied to be unconnected with the psychic powers of Ma' al-'Aynayn, which were acknowledged even by his most bitter opponents. His powers of psychological persuasion were employed to dominate the minds of the Saharawis and to justil m fanatical zeal in

the 'Ayniyya and its allies.

5. Al-Shinkiti's portrayal. One of the most objective portraits of Mâ' al-'Aynayn towards the end of his life is offered by Ahmad b. 'Amin al-Shinkiti, the author of the Kitāb al-Wasif who passed through Smāra — his way to Mecca and wrote his description, first published in rorr, a year after the death of Mâ' al-'Aynayn. This author confirms that the Sākiya al-'Iamrā' owed its habitations and date groves to Mā' al-'Aynayn. He remarks (pp. 365-6 of the rosā edition) that the latter was learned in the Shari'a, hadith, iafsir and fish, and that he was the only worthy successor to Shaykh Sīdiyya al-Kabīr

(1780-1869). He thought highly of the moral qualities and character of Ma' al-'Aynaya, and speaks glowingly of him.

Bibliography: 1. Atabic sources. There is as yet no comprehensive biography of Shaykh Ma' al-'Aynayn in Arabic, but aspects of his life and career are dealt with in the following works: Abmad b. al-Amin al-Shinkiti, al-Wasti fi tarddiin udabě Skinsti. Calro 1378/1958; Muhammad al-'Akib b. al-Shaykh Sayyid 'All ibn Mayabl, Madima' al-bahrayn 'ald karamat staykhind alshaykk Ma' al-'Aynaya, a.d.; Muhammad al-Imam b. al-Shaykh Ma' al-'Aynayn, al-Dia'sh alrabit fi maghribiyyat Shinkit wa-arabiyyat man bika min murakkab ma-basis, 1938; Muhammad al-Mukhtar al-Susi, al-Ma'sal, iv, Fedala, Morocco 1960, 83-rot; Muhammad al-Mustaft Ma' al-Aynayn, ms. Microfilm no. 171, National Library, Rabat; Muhammad Taki Alfah, Mudhakkir almawarid di-sirat Ma' al-'Aynayn dhi 'l-fawa'id, Fås 1316. - 2. European sources. A most useful source for the life of Shaykh Ma' al-'Aynayn is to be found in B. G. Martin, Muslim brotherhoods in 19th century Africa, Cambridge 1976, 125-51. Other sources which discuss aspects of his life and thought are: J. Caro Baroja, Estudios Saharianos, Madrid 1955, 285-335, Un santón Sahariano y su familia; G. Desiré-Vuillemin, Contribution à l'histoire de la Mauritanie, Dakar 1962, 91-102; C. (H. T. NORKIS)

MA'AD (a.), place of return, a technical in religious and philosophical vocabulary.

The verb 'ada, 'acod's signifies "to return to u place". Al-Diawhari treats it as a synonym of radjota. The action of 'and is the movement whereby one returns to the point of departure: radia's 'ala bad'ihi, = ilā bāfiratīki, either through a continuous progress, a describing a circle for example, or stopping at a certain point and retracing one's steps (cf. Sibawayh, cited by Lai), whence the idea of a return to the origin, to the source. The verb radia a is used in many Kur'anic verses to indicate return to God: "Then He will make you die; then He will make you live; then you will be brought back to Him" (ilayhi turdia'un, 11, 28). This return takes places after the Resurrection. In the 4th verbal form, adda denotes "to recommence, reitorate". This is the sense which it has in the verses where this root is associated with that of radjata, for example (XXX, rt): "God begins (yabda'u) creation; then He repeats it (yuridahu); then you will be brought back to Him". Subsequently, God is qualified by the titles of-Mubdi' and al-Musid. These terms are not reserved for God. The Prophet said: "God loves

MA'AD 893

the nakal incunted on a nakal". He was asked the meaning of nakal. He replies "It is a strong and skilled man who is mubdit and mutth, mounted as a strong and reliable horse which is mubdit and mudd". Abū 'Ubayda explains that the reference is man who volunteers for successive military expeditions and returns ceaselessly to the attack. The welltrained and obedient horse earns the same distinctions. It is the notion of this 4th form which is dominant in the Kurtan: resurrection is a recommencement. Theologians in fact mainly speak of ivida in the sense of a second creation. The idea of return is only implied, to the extent that there must be a return to the point of departure before there can be recommencement. Thus al-Diuwayni (Irskad, Arabic text, 327, ed. J. D. Luciani, Paris 1938) quotes Kur'an, XXXVI, 78-81, from which he concludes: "That which has been brought back into existence (al-mu'ad), is the same as that which has been created for the first time". We leave askle the question as to whether substances only, or both substances and accidents are the objects of Fada. In the Kudb Usul al-din, ed. Istanbul 1928, 232-3. 'Abd al-Kahir al-Baghdadi shows that the return to existence of something which has been annihilated is possible, and he expresses himself in the same terms as those used by al-Djuwayni. Consequently, if i'da is a second creation following death and annihilation, ma'ad is the place reached by

rected persons. But the word ma'ad is used only once in the Kur'an (XXVIIII, 85): "Yes, He who endows you with the gift of Prophecy, it is He who brings you back to a place of return". The term is variously interpreted; some treat it as a synonym of masir (place at which one arrives), as in III, 28: "And towards God is the place of arrival"; for others, it is the equivalent of mardjit (place to which one returns), as in V, 18: "Towards God is your place of return for all"; or it is identified purely and simply as the Next Life (al-akhira). It should however be noted that the term has been understood in a much more concrete sense: it could denote, according to some, Mecca, whither the Prophet was to return, having conquered the town according to God's promise; in a more general sense, it could 🔳 the country where he was born (al-Farrá') or his homeland (Tha lab). Finally, the word mutad has been interpreted in terms of the verse 11, 125: "And when We made the House (sc. the Kasha) = place where one returns (mathaba)"; consequently, mathaba = masad as place of Pilgrimage a hadidi. In fact, al-Kuntubi explains, a large number of pilgrims and visitors make their way each year to the boly places, and moreover, each one, having left them, desires to return there. Ibn Sidab retains the two meanings of Pilgrimage and the Last Life. It may be noted that they conform perfectly, since hadidi is a departure from the home, involving the leaving of country, goods, family, in order to m the House of God, which, an al-Ghazall explains it, prefigures the departure from this earth in order to go to Paradise to see God Himself: seeing the House of God inspires the wish to see the Master of the House. Thus, ma'dd, etymologically linked to i'dde, taken in the symbolic connection hadid:-akkira, meet to refer primarily to the place of return of resurrected persons in the presence God. It iii in this sense that ai-Tahanawi associates it with hagir and batth, the Assembly for the Last Judgment and the Resurrection. He distinguishes between a physical ma^cād (<u>di</u>ismānī), which is the return to life of bodies leaving their tombs,

and a spiritual matad (rahand), which consists of the return of spirits restored to their bodies (s'adat al-armāh ilā abdānikā). There can be as many as five doctrines on this subject. The first affirms only the reality of the physical marad; this, says al-Tahanawi is the approach of the theologians who deay the existence of a rational soul. He is an doubt referring to cortain Hanbalis, of whom Ibn Bajta is an example, for whom the words aufs and rith retained their ancient Semitic sense of vital principle, breath, even blood. Ibn Batta writes "We must believe in the call which Israftl will utter to make the dead rise from their tombe". H. Laoust mentions in a note a passage of Ibn Taymiyya: "Men will rise from their tombs and appear before their Master, without shoes, all naked and uncircumcised. The sun will approach them and they will bathe in their sweat". (La profession for d'Ibn Baffa, 94). In regard to the angel of death. Lanust quotes a passage from the Abldo, vi, attributed to Ibn Hanbal, where it is said "He catches the souls (arms), which are then restored to the bodies in their tembs". This point of view may be related to that of al-Nazrām, as revealed by 'Abd al-Kāhir al-Baghdadi in the Fark bays al-Firek, 145: "The twentieth of these disgraceful doctrines is that which concerns ma'dd, whereby scorpions, snakes, beetles, flies, ravens, dung-heetles, dogs, pigs, wild beasts, insects will be gathered (tuksharu) in the way to Paradise". In fact, these animals do not have a rational soul, but this does not prevent al-Nazzam believing in their madd.

The second doctrine listed by al-Tahanawi that which asserts exclusively the spiritual ma'ad; it is that of the philosophers. It is known that al-Ghazall was opposed to the idea of survival of the rational soul only. Nevertheless, Ibn Sina did attempt to understand in what sense the presence of a sensible human reality in the other life could be philosophically admitted. On this subject, we refer to the thesis of Jean Michot, presented at Louvainla-Neuve in 1981 (still in manuscript) on ma'dd in Avicement thought, where there we to be found minute analyses of the metaphysics and psychology of Ibn Sina, based on numerous texts. But it was not only the philosophers who maintained that man | a spirit of which the body is only a "mould" (kálab). The Muftazili al-Mufammar, although he is counted al-Tahānawi among the adherents of the third doctrine, thought, according to al-Baghdidl, Fark, 154, that "man is something other than this sensible body, something living, something knowing, thing powerful, which is neither at rest, nor in motion, which is not localised anywhere . . . " When asked if he meant that man is in this body, or in Paradise, or in Hell, he replied "I say that he is in the body insofar m he controls it; in Paradise insofar m he enjoys heavenly gifts; in Hall, insofar as be is punished". Al-Nattam also reckoned that man is spirit (ruk), but by spirit he meant "a rarified body which penetrates (mutadāšķā) this compact body, the life (hayat) entangled in this body" (Fark, 135). He is therefore closer me the preceding doctrine,

The third doctrine is that which affirms both the resurrection of the body and of the soul when man is restored to life. It is that which is taught by the Ash'aris as well as al-Ghazali, numerous Sulls and certain Imamis for whom man is "two things", the body which is inanimate (mawāi) and the spirit which is active, endowed with sensibility and with perception; this is the thesis of Hishām b. al-Hakam (Mahālāt al-Islāmsyyin, i, 125; Fark, 68). Al-Tahānawi places among the adherents of this doctrine

those who consider that man is "in reality" (bi 'l-bakika') the rational soul, for it is the latter which bears the responsibility of prescribed acts, which obeys or disobeys, which is rewarded or punished. But this soul is linked to mody; also, "when God wills the gathering together of His creatures, He creates for each of the spirits a body (badan) to which it is linked and in which it acts freely, as was the case here below. But this is not a question of metempsychosis (landsukk), since is a case of return ('and) to the fundamental parts of the body (ilio adjust' askiyya is 'badan), although this is not in itself the first body, as is made clear in the Word of God (IV, 56): "As often as their skins are burned, We shall give them other skins in exchange".

The last two doctrines are that which denies ma's and that which remains in doubt on the subject. Those who dany it are the "physical philosophers" (al-falsis al-fab'iyyan). Galea is mentioned as a representative of the last doctrine. It is clear that the question of ma's is linked to the problem of the nature of man and of the relationship between

the soul and the body.

Among the mystics, the idea of ma'id is connected to that of ascension and return towards God rather than to that of resurrection and re-creation. Al-Tahānawi quotes the Kashf al-ingha: "For the Suffs, the ma'ād, they say, are the universal divine names (asmā'-i hulli-yi ilāhi), Illi the beginning (mabda'), they are the universal names relating to beings in development (asmā'-i hulli-yi hamni)".

The arrival in this world of wieter (sdkh) is accomplished by the route of these second names; his return (sudja!) by the route of the first. This definition relates to the concepts of Ibn 'Arabl, for whom the have two faces, turned towards God (ism al-tankh), the other towards the creatures of which they are the "patrons" (ism al-tankhk). Similarly, the arrival and the return evoke the journey from God (safar 'an Allah) and the fourney towards God (ild 'lldh) which concludes, in the view of Ibn 'Arabl, with the journey into God (if 'lldh). Here we have the most profound conception of ma*td.

Ismā'nī thought also considered ma'ād an ascension and elevation (su'ed, brisk?). A detailed treatment of this subject is to be found in the book by Ibrahlm b. al-Husayn al-Hamidi, entitled Kans almaiad (ed. Mustafa Ghallb, Wiesbaden 1971, ch. 10, 163-205). The concept of ma'dd is here linked in that of the hierarchies which characterise this type of thought. It involves an ascent towards the spheres of the religious path, (al-a/lah al-diniyya), sphere after sphere and from hierarchical degree to hierarchical degree (hadd) as far m the final stage, where the government of the world resides. The conditions for salvation are, along with the affirmation of the divine unity, the recognition of the hadild and of the service (hhidma) which is owed to them, obedience to the Imam. Al-Hamidi quotes al-Mu'ayyad al-Shirāzi: "Every hadd is a paradise for the man whose hadd it is (li-mahd@dihi), if the latter obeys it; it is his punishment, # he disobeys it". Ma'44 is primarily a cosmic process in which the individual ma'dd of the Believers is included. "Thus proceeds the progression (tadarrudi) in the markd until the end of time and of moons" (272). (For details, 🚃 1514Å TLIYYA, IV, 203 b, 204 b.) We limit ourselves to pointing out a curious passage (174), where the different degrees of ascension are compared with the successive stages of gestation, as enumerated in the Kur'an (XXII, 5; XXIII, 14).

The notion all madd is very important in the view of Ibn Sina, not only in terms of the destiny of man after death, but also in terms of his life on earth. In fact, God teaches that He "has prepared for those who obey Him a place of return which gives them good fortune (al-ma'dd al-mus'id, Shifa', 114hiyyat, Calro 1960, ii, 442), which poses the problem of eternal beatitude fibid., 445). But in this world men are in need of regulation: "It is therefore inevitable that the Prophet took important measures which have remained in the form of usages and laws which he established concerning good things useful to them. On this point there is no doubt, the foundation on which everything rests is that men persist in the knowledge of the Creator and of the moved; the suppression of this knowledge was the cause which led to forgetfulness of these matters at the expiration of the century following the [life of the] Prophet". For this reason, it is necessary that the acts prescribed by the Law are repeated and follow one another in time and that "they be, when recourse is made to them, linked with certainty to God and the ma 'da''.

It may be recalled finally that the root 'ada is only used, la religious language, to express a return place from which one does not come again. This is how it differs from the root radio's. In a mystical perspective, Ibn 'Arabi writes most elegantly: "Such is the attainment of lasting beatfude . . And he who has attained it does not come back (lam yardji'), for a return (rudju') to the place of the beginning of the voyage would be impossible once the sails have been unfurled" (Fishibat, iii, 556). This is the doctrine of all Sunnis, in contrast to that of the Rafiell extremists, such as the disciples of Abu Kāmil or <u>Dj</u>ābir b. Yazīd al-<u>Dj</u>u⁴fl, who held belief in the return (radica) of the dead to this world before the Recurrection (Fark, 54, 59). To conclude, it may be noted that the idea of cyclical return, is found expressed by, for example, al-Birani in the Athar (ed. Sachau, Leipzig 1923, 177) in connection with the cycle of the Jubileo (dans Yabil) which recommences every fifty years following seven sabbatical years, is rendered by the word radica. To summarise, the term model brings together the two senses of return and recommencement; return to the source of being which is God, and a second creation which is the Resurrection.

(R. ARRALDEZ)

MA'ADD is a collective name for the northern

Arab tribes (see Dizzirat al-'Arab (vi) = 1, 544b).

According to the standard genealogy, Ma'add was
a son of 'Adnān [g.v.]. His son Nizār [g.v.] had three
sons, Mudar, Iyād and Rabi'a, from the first and
third of whom most of the northern Araba claimed
descent.

Ma'add and his descendants are said to have lived for a time in the neighbourhood of Mecca and to have intermarried with Diurhum [q.v.]. The Ma'add is found in pre-Islamic poets, e.g. in verses of Imru'al-Kays (ed. Ahlwardt, no. 41, 1. 5) and al-Nābigha (ed. Ahlwardt, m. 18, l. 1, 2); but according to Gokdziher (Muh. Stud., l. 90 n., Eng. tr. i, 39 n.), in such verses this may not always be the original reading. The name is also used of some of the tribesmen who had come to settle in Medina towards the end Muhammad's life (who make referred to Mitra and Muhammad's life (who make referred to Thabit, Ma'add if contrasted with the Angar (a.g. in Hishām, 829, 17; further references in Goldziher, op. cit., i, 94 n. Eng. tr. i, 92 n.). Variant

genealogies of accestors of Ma'add are given in Iba Kutayba, Ma'drif (18/34; 30 f./63 f.), Ibn Hishām, Sira (3-7), and al-Mas'ūdī (Murāḍi, iv, 115-18). Muhammad is said to have forbidden the tracing of genealogies beyond Ma'add (ibid., iv, 112, 118 f.). In m kadif Muhammad commended al-Ma'addiyya, which is said to be the rough clothing (or the way of life) of Ma'add (ibn Hanbal, Musaad, i, 43; Lane, Lexicon, s.v. '-d-d, al-libsa al-Ma'addiyya).

Bibliography: given in the article, but see also Tabarl, i, 671 ff.; Ibn al-Kulbl, Diamharat al-nasab, ed. Caskel; Mas'ūdī, Tanbih, index (evidence of genealogical disputes).

(W. MONTCOMERY WATT)

MA'ĀFIR (or AL-MA'ĀFIR), the name of a South Arabian tribe, the genealogy of which is given as Ya'ur b. Mālik b. al-Ḥārith b. Murra b. Udad b. Humaysa' b. 'Amr b. Yashdjib b. 'Arib b. Zayd b. Kahlān b. Saba'; they included among the Himyar.

The name was also given to the territory which the tribe inhabited and this corresponded roughly with the Turkish kadā' of Ta'izziyya and the present Yemen Arab Republic province (kadā') of al-Ḥudiariyya (pronounced locally al-Ḥugariyya), itself part of the administrative area (laua') of Ta'izz. In early and mediaeval times it is described as a mikhlāf. The Yemeni geographer al-Ḥamdānl has a great deal of information on the area of al-Ma'afir and lists the following places in it:

(r) al-Djuwwa (the modern Suk al-Diu'a between Diabal Salw and Diabal Badw) which was ruled by the family of Dhu 'l-Mughallis belonging to the tribe of Hamdan, who had control of the citadel of the town which had to be ascended by a ladder. At a later date it was under the Marranids, descendants of Umayr Dhû Marran, a Anyl of Hamdan, with whom the Prophet was in communication by letter; (2) Diaba' in the plain of the same name between Diabal Şabir and Diabal Dhakhir. In ancient times, Djaba' was the capital of the Ma'afir territory and the residence of the reigning dynasty of the Al al-Karanda; (3) Haraza; (4) Şubâra. Here according to Maslama b. Yûsuf al-Khaywani were the palaces of the Ma'afir, the ruins of which are mentioned by al-Hamdani in Book I of the Ihlil; (5) 'Azaza; (6) al-Dumama; (7) Birdåd, which belongs to Bilåd Sabir and lies between Djabal Sabir and Djabal Habash, which corresponds to Diabal Dhakhir in al-Hamdani; (8) Dizla; (9) al-Ansiyayn; (10) Diabal Şabir; and (rr) Diabal Dhakhir (the modern Habash).

The lands of the Ma'afir therefore lay between the Wadi Nakhla and the Wadi Haraza and included a considerable part of the Ta'izziyya. The Ma'afir, however, did not form a compact body, but, especially in the Diabal Sabir and Dhakhir, were much mixed with members of other tribes. From the earliest times the Ma'afir enjoyed a certain reputation as weavers. The Tubba' As'ad Kāmil, who according to lagend the first to cover the Ka'ba, is said to have hung it with Ma'afirl cloth. Muhammad's body is also said to have been wrapped in Ma'afirl cloth. The tribe has reputation too for saddlemaking.

The history of al-Matafir me be traced far back into the pre-Islamic period. A Sabacan inscription from Sirwah dated about 500 B.C., which records the founding of the great Sabacan kingdom, mentions the tribe of Matafir. We know too that an embassy was sent from the town of Sawwa to the Sabacan king at a later date to make submission to him and to beg

for peace. Sawwi must at this time have been on the side of Macafir and its prince Shamir Dhu Daydan on the side of the Habashat, the enemies of Saba'. In 96/630 the Ma'afir with Dhu Ru'ayn and Hamdan adopted Islam and received a letter from the Prophet Muhammad with detailed instructions regarding their obligations. At quite an early date in their Islamic history, many of the Matalir migrated to Egypt, where with other South Arabians they played an important part in the building-up of the country. A Ma'afirl was, for example, put in charge of the planning of al-Fustat by 'Amr b. al-'As. This migration probably explains the infrequent mention of both the tribe and the area in mediaeval Yemeni historiography. Certainly, the area was controlled by the Ziyadids, the dynasty of Muhammad b. Ziyād centred on Zabid, in the 3rd/9th century. The Zuray'dds in the 6th/12th century reckoned al-Ma'afir m part of their territory, but it was wrested from them by the Mahdids. It must have fallen to the Ayyubid conqueror of the Yemen, Torân-Shâh, the brother of Saladin, who won over Tihâma and the south of the country in the years 569-71/2173-6. The Ayyubids' successors, Rasolids, built military establishments in al-Ma'affr in the 7tb/13th and 8th/14th centuries, and we hear of a rebellion led by the Ma'afiri tribal leader against the Turkish occupation forces of the Yemen in 1028/1618.

(A. GROHMANN - [G. R. SMITH]) AL-MA AFIRI, ABU 'L-HASAN 'ALI B. MUHAMMAD B. ALI B. DIANIL B. SA'D AL-DIN, as Andelusian Mäliki scholar who settled in Jerusalem and died there in 603/1208. Born and educated in Malaka, al-Ma'afiri left his native town early in his life and, like many of his compatriots at the time, travelled east for the dual purpose of performing the pilgrimage and acquiring knowledge. Though the sources mention that al-Ma'affirl did some writing, they not name any of his works. We know of only one extant work, a unique untitled manuscript in his own handwriting, found at present III the Chester Beatty Library, Dublin, and listed in the catalogue (ms. 3016) under the title Biographics of famous women. The manuscript has eleven chapters, of which the first two and the last with biblical figures. The rest of the chapters (now published in Libya-Tunis 1978, ed. 'A'ida al-Tlbl, under the title al-Hada'ih al ghannd' fi ekhbar al-nisa'), which form the main body of the manuscript, deal with post-Islamic women, mainly from the Umayyad period.

Bearing in mind the general paucity of biographical material about women in mediaeval Arabic literature and, in particular, the limited number of works devoted exclusively to them, this manuscript, with its diverse information, colourful anecdotes and copious verse quotations is, without doubt, expecially significant. The overall picture it presents

of the character and status of women in early Islam is unexpectedly refreshing; it is an image of a proud, courageous woman with a keen sense of moral values and a high evaluation of her own worth, a woman who had not as yet succumbed to the disastrous consequences. being segregated from the world of men.

In his manuscript, al-Mafafiri mentions that he spent the year 581/1185-6 in Damascus collecting material for this work, his main source being Abû Muhammad al-Kāsim (d. 600/1203), em of illustrious Damascene historian Ibn 'Asakir. In 583/1187, when Jerusalem - regained from the Crusaders, al-Macafir! must have been among the numerous Muslims who man flocked to the city, for we are told that he was appointed resident preacher of the Aksa Mosque by Sultan Salah ai-Din. Mudilr al-Din al-Ulaymi (el-Uns al-djalli bita'rikh al-Kuds m'l-Khalil, Nadjaf 1968, ii, 135) puts him second on the list of those who preached in the Aksa Mosque after the fath. Al-Ma'afiri spent the rest of his life in Jerusalem, where he became known as al-Hādidi al-Mālaķi. There he schieved fame - scholar and lecturer, and attained a position of wealth and power, but remained none the less devout and given to charitable works. He certainly made a strong impression on the inhabitants of his adopted city, for when he died large numbers followed his cortège. Ibn 'Abd ai-Malik al-Marrākushi (al-Dhayl wa 'l-tahmila, Beirut 1965, v/x, 3x6) relates that "no worthy person was absent from his funeral and even the Christians who were in the church there joined the procession; they threw meet of their garments on his coffin and then began to pass them to each other and to hold them to their faces in the hope of being blessed."

MA'ALTHAYA, MA'ALTHA (Syriac "gate, entrance", Payne Smith, Thesaurus syriacus, col. 2881), modern Malthai, the name given = two villages in the former kada' of Dehök (Duhûk) in the wilayet of Mawail in Ottoman times, now in the Autonomous Region of Dehök in Republican Irak. The second of these two villages was formerly distinguished as Ma'altha al-Nasara "M. of the Christians", but has recently become largely Kurdish and Muslim, like its fellow-village. Mafal<u>th</u>žyž lies 🚃 a small affluent of the Tigris, the Nahr Dehök, 60 km. northwards along the road from Mawsil to Zakhō and at the southern end of the Diabal Abyad. It owes its historic fame to its strategic position as the "entrance" from the plains of northern Trak into the mountains of Kurdistan and the lands south of Lake Van, the modern Turkish vilayet of Hakkari.

Its importance in ancient times is signalled by famous rock-reliefs, carved at 300 m. above the valley a short distance from Ma'althāyā, These comprise four similar panels, each showing twice massyrian emperor, in an attitude of worship and we either side of a procession of gods mounted on beasts. There are no inscriptions, but the reliefs are evidently connected with similar reliefs at Bāwiyān some 45 km. to the north-east of Mawail and to the east of Ma'althāyā, and it mow generally accepted that the ruler responsible was the Sargonid Semnacherib (704-681 B.C.), the reliefs probably dating from the early 680s; the basic publications on them are F.

Thureau-Dangin, Les soulptures rupestres de Maltas, in Revue d'Assyriologie, xxl (1924), 185-97, and W. Bachmann, Felsenreliefs in Assyrien (Bawian, Malthai und Gunduk), Wiss. Veröff, der Deutschen Orient-Gesellschaft, lil, Berlin 1927, repr. 1969, 23-7, Pls. 25-31. It has recently been suggested by J. Reade (following a previous suggestion by R. M. Boehmer), Studies in Assyrian Geography. Part I: Sennackerib and the waters of Ninevek, in Rev. d'Assyriologie, lxxii (1978), 163-6, that the Ma'althaya carvings, with their depicted deities, obviously relate to some important event or project, and are possibly to be connected with the construction of watercourses and canals conveying perennial water to the plain of Nineveh.

Ma'aithāyā early became an important centre of Eastern Christianity, and the birthplace of Narses or Narsai (399-?502), founder 🔳 the Nestorian school of Nisibis, was in the village of 'Ayn Dulbë Ma'althāyā (E. Tisserant, art. Narsai, in Dictionnaire de théologie catholique, xl, cols. 26-30). It was the seat of an episcopal diocese known as either Ma'althaya or as Beth/Ba-Nühadra. The line of Nestorian bishops begins in 410 with Isaac and continues till 1265 with Malkishos, apparently the last, whilst the Jacobite line begins with Zakai at the end of the 6th century and continues until Yubanna Yob in 1284 (J. B. Chabot, ed. and tr., Synodicon orientale, in Notices et estraits, xxxvii, Paris 1902, index s.v.; J. M. Fiey, Assyrie chretienne, Beirut 1965-8, il, 342-53). The Assyrian Christian community and its church in Ma'althaya of Mar Zica must have suffered during the massacres by the Kurds of Christians and Yezidis [q.v.] towards the end of the 19th century, and the village seems to have been abandoned by its Christian community ca. 1905-7, and the service books and manuscripts of the church transferred to Dehok (Fley, op. sit., fl, 675-81).

It had nevertheless been a flourishing place in early Islamic and pre-Mongol times. Al-Baladhurl, 331, records that al-Mila (? Maialia) was one of the places, together with Hadhra, etc., overrun by "Umar's general "Utba b. Farkad al-Sulami in 20/641. The Arabic geographers expatiate on the fertility and agricultural richness of the district of Ma'althaya and Fayshabdr (= originally, Firûzshabûr of Ba Núhadrā, see Fiey, op. cit., ii, 696 ff.). According 🔳 al-Mukaddasī, it was small but rich in gardens, and it had a Friday mosque (hence already a Muslim community) as a tell; its specialities included dairy products, coal, grapes and fruit, hemp seed and flax, and dried, salted meat (al-Mukaddasi, 139, 145; Ibn Hawkai*, 217-18, tr. Kramers and Wiet, 211-12; cf. Le Strange, Londs, 93, 124). For Yakat, iv. 578, Macalthaya was a "little town" (bulaya), but it is possible that this information was already anachronistic by the 7th/13th century.

Ma'althaya's position on the route into Kurdistan gave it a certain rôle in mediaeval Islamic history, and it is mentioned several times by e.g. Ibn al-Athir. It was a centre for local chiefs and for the Khāridil leader Hārun in 266-7/879-81 in their squabbles with the Turkish caliphal governors of Mawsil (ed. Beirut 1385-7/1965-7, vii, 353, 359). In 369/979-80 the Buyid 'Adud al-Dawla [q.v.] launched expedition via this route against the Hakkarl Kurds, and crucified their chiefs along the road from Mawsil to Ma'althaya (viii, 709). In 441/1049-50, during the warfare between the 'Ukaylid ruler of Mawait Mustamid al-Dawla Kirwash b. al-Mukallid and his brother Zaam al-Dawla Abit Milli Baraka, 📖 tormer's Kurdish alties marched 🖿 Ma^cal<u>th</u>āyā and sacked it (ix, 553).

Thereafter, Ma'althäyā sinks into obscurity on the wider stage of history, until it was visited in the 19th century by G. P. Badger (1842-4), the French Consul in Maweil G. Rouet (1845) and A. H. Layard (1846); Badger found there only

20 Assyrian Christian families.

(C. E. Bosworth)

MASAN, Muske, a town of the south of Jordan, lying in lat. 30° 12° N. and long. 35° 44° E. at an altitude of 3,523 ft./1,074 m., and the cheflieu of the governorate which is to the south of the Karak [g.v.] one and to the east of the Wädi 'Araba. The name is said to come from Masan, son of Lot.

The town in surrounded by gardens which form an nasis of the western fringe of the desert plain; to its east are the slopes of the al-Sharat mountain chala of granite and porphyry, which rise to 5,665 ft./ 1,727 m. In Ma'an itself and the neighbourhood are many springs, the nearest of these being 'Ayn al-Dawawl, whose water reaches Ma'an through an underground conduit, whilst a second conduit carries water from 'Ayn al-Diitta as far al-Hammam to the north of Ma'an.

In the prehistoric period there were people in the region, as Palaeolithic remains attest. When nomadism and international trade developed, Ma'an became important meeting-place for communications, through which the leading natural route from southwestern Arabia to Damascus and the porta of Phoenicia passed, i.e. the route for Sabaean trade. A track connected the Gulf of 'Akaba with Ma'an, whence toutes went northwards Moab. The caravan route of al-Nawala went to the west in the direction of Ghazca and northern Egypt, and another track went southeastwards via the Damat al-Djandal in the Babylonia and the Persian Gulf.

The Syrian coute of the Islamic Pilgrimage followed towards Mecca the old Tabūkiyva track, hence twice a year, - the outward and the return journeys, Ma'an was a privileged halt for pilgrims, who could stock up there with provisions. In the 19th century, it became a station on the Hidjaz railway. Its place a crossroads and its abundant water supply have meant that Ma'an has always remained a vigorous ceatre of human sattlement despite innumerable attacks from nomads. It was, as Jaussen, noted 'le rendez-vous des caravanes sortant de l'Arabie". During the 1st millennium B.C., the easis apparently, according to Musil, 244, was centrolled by the powers dominating the great trade routes, and had a South Arabian colony, Sabaean ... Minaean, with a South Arabian governor who watched lest the local chiefs adopt measures hostile to the Sabacan or Minaean ruler; Musil further notes that in the second half of the 8th century B.C., an Assyrian army penetrated beyond Ma'an casis.

Classical sources hardly mention Ma'an, probably because the great international trade was concentrated on the emporism of Petra. In the Byzantine period, Ma'an formed part of the territory of the South Arabian tribe of Diudham [g.v.]. Al-Bakrl, cited by Musil, 247, narrates that Farwa b. 'Amr of Diudham governed Ma'an on behalf of the Byzantine Emperor, but became m Muslim, rallying to the Prophet and presenting him with a white mule; in retaliation, the Byzantines threw him into prison and then killed him by prucifixion.

At the time of the expansion of Islam, Ma'an acquired a certain importance as a strong point of the al-Sharat district in the djund of al-Urdunn, at the eastern end of the road which linked it to the via Petra, the massils of al-Sharat, Sughar, Arībā, al-Kuds and Ramla in a six days' journey. At this time it was inhabited by the Band Umayya and their freedmen, from whom travellers could obtain provisions. In Mamfük times, it became the chef-lien of a niviba and was a lively market for slaves; according to various authors, it formed a manzil (Ibn Khurradádhbih), a manhal (al-Mukaddasi) or a market along the Pilgrimage route. In the 18th century, at the time of the return in the Pilgrimage, the kātib al-hadidi was sent from Ma'ān to Damascus to reassure the inhabitants about the safety of the pilgrims.

The modern town of Ma'an is still made up of two distinct, adjacent entities. To the north, Ma'an al-Saghtra or al-Shāmiyya, sometimes colled al-Maghāra, had in 1910 110 families. To the south, Ma'an al-Kabira or al-Misriyya, also called al-Hidjariyya, had, according to Musil, 180 families. It was also called Ma'an al-Mudiriyya when it became the seat of a governor, who resided in a palace allegedly built by Sultan Sulaymān; there is there a residence for the kaymakām, who in Ottoman times depended in the governor of Bilād al-Shām.

A certain amount of agricultural production has long been a feature of Ma'an, thanks to the oasis's permanent irrigation system; grown there are vegetables and fruit, amongst which are most prized apricots, pomegranates and peaches; dete paims and poptars also grow there. To the southeast of Ma'an, in the sparse wadis of the uncultivated steppe lands, strewn with blocks of lava and basalt, a few acacins (alb) grow, these being known as usum 'ayyash, with their wood used for making various household utensits. This species of tree is not found north of Ma'an.

At present, the town forms the chef-lieu of the governorate of Ma'an, 688 km.* in extent, whose population in 1961 was 47,000, in 1967 58,000, and in 1973 62,000. The town itself with its fired and mud-brick houses, its narrow streets with infrequent and low doorways, its decayed railway station and its airport mane for tourists travelling to Petra, is of no archaeological interest. Its population was estimated in 1912 at 3,000 (Baccher); in 1932 at 3,000 still (Guide Bieu). It was 4,500 in 1956, and in 1973 reached 9,500.

(N. Elisserpy)

al-MA'ÂNÎ wa 'L-BAYÂN, two of the three categories into which, since the time of al-Sakkāki (d. 626/1229), the study of rhetoric has often been divided.

t. In Arabic. The Miftah al-fulum by al-Sakkakt [4.v.], where the two terms appear for the first time. too confusing in its arrangement, and too obscure and at times self-contradictory to be of practical use to most students of rhetoric. It consisted of a section on grammer, a section on system, a section on the 'ilm ai-ma'ani and the 'ilm al-bayan, and two supplements to its ma and section, one on demonstration (istidial), and one on the definition of the formal aspects of poetry and metre and thyme. The section - grammar included a chapter m phonetics and the supplement on the istidial ended with a discussion of the inimitability of the Kur'an. Probably for this reason, the digest of the third section of the Miftah by al-Kazwini (also known the Khatib Dimashk, d. 739/1338), entitled Talkhis al-mifted and, to a lesser extent, its companion volume, the Idah fi 'ulum al-balasha by the scholar, became the standard works on the subject. These two books, both compendia on rhetoric only, received wide circulation and it is through them that the study of the market and the bayer be most profitably approached. The main differences between al-Kazwini and al-Sakkāld have been explained in the article at-KAZWINI; here it should be pointed out that the addition of a section on the badic to replace al-Sakkaki's remarks on the "special methods frequently used for the purpose of embelishing a literary composition" does not go back to al-Kazwini, but Badr al-Din Ibn (d. 686/ 1287) (see Matlab, al-Karwini, 205), whose books were earlier, apparently less successful attempts to present al-Sakkākl's theories in more readable form (see below). Whereas these "embellishments" received no more than a brief and superficial treatment in al-Sakkākī, they soon became in the hands of his followers a separate branch of rhetoric which was raised to the same level as the ma'ani and the baván.

The present article aims at providing a few practical hints by way of introduction to the vast and littleknown literature on the ma'dui and the bayon which is represented chiefly by commentaries and supracommentaries on al-Kazwini's Talkeis. The badi' section cannot be discussed here. This section continues the older tradition of rhetorical studies initiated by Ibn al-Mutazz and Kudama [q.ev.], but does not include those figures of speech, tropes, and stylistic devices which al-Sakkaki and al-Kazwini had already discussed under ma'ani or bayan, e.g. simile, metaphor, analogy, metonymy, epiphrasis (ighāl) and apostrophe (iltifāt) (the last of which is listed by al-Sakkākī both as an "embellishment" and as one of the subjects that come under the matant, see Mifida, 95, 202; see also Matiab, al-Sakkaki, 242-7, 239, 263, for the possible relation between this "embellishment" section and the Kitāb Hadā'ik al-siķr fi daķā'ik al-ski'r by the Persian scholar, Rashid al-Din Wajwaj, d. 578/1182-3). Nor does it include the abtida? [q.v.], the lakhallus [q.v.], the intiha? [q.v.], and the sarihat [q.v.] which al-Kazwini discusses in two supplements (see Mehren, 142-54), though many authors belonging to the older school would have classified them as budi'.

It should be noted, however, that the practice of separating some of these figures from the corpus of the badic dates back at least till the sth/rith century (see S. A. Benebakker, A Fatimid manual for secretaries, in AlUON, xxxvii [1977], 310-12) and may have been initiated by al-Rummani (d. 384/994), though the latter when he speaks of metaphor and simile as part of the balagha [q,v] and not state explicitly that these are not to be considered badi' figures (see al-Rummani, al-Nukat fi i'djas al-Kur'án, in Thaláth rasá'il, ed. M. Khalaf Alláh and M. Z. Salam, Cairo a.d., 70, D. 3-4, and the quotation in Ibn Rashik, al-Umda, ed. M. M. Abd al-Hamid, Cairo 1353/1934, i, 214). It should also be noted that it is not correct to think of the history of rhetorical studies since the time of al-Kazwini as being completely dominated by the system be had introduced; works continuing the older tradition which brought all figures of speech under the heading of badic and devoted a separate chapter to each figure [see BADIC] continued to be written (they were especially popular in North Africa and Spain, see 1bn Khaldun, Mukaddima, III, 292-3 - Ibn Khaldun-Rosenthal, 2nd ed. 1967, iii, 336-8), even though their authors were aware of, and probably influenced by, the new trend represented by the Talkhis (Ibn Khaldun suggests that the Miftah was the basic text). In many respects, the later history of Arabic rhetoric presents essential, but still unanswered,

Finding adequate translations of the terms madeal and bayan is made complicated by the fact that the relation between grammar, logic, and rhetoric, and between literary theory and literary criticism, is not apparent at first sight. Moreover, the borderline separating the disciplines dealing with these two entegories, the 'ilm al-ma'dal and the 'ilm al-bayan, is not always clear. In the Miftah, the definitions overlap, and al-Sakkald himself seems to regard the 'ilm al-bayan as a branch of the 'ilm al-ma'ani (see Miftik, 77, 156-7, and cf. 77, lines 4-3 from bottom; see also Bahā' al-Din al-Subki in Shurak, iii, z61-2 and Matlab, al-Sakkaki, 131-5). It is not surprising that al-Kazwini felt the need to criticise and reword these definitions and rearrange were of the material. Considering the etymology of the term bayan and the definition which al-Kazwini gives of the 'ilm al-bayan as "the science through which one knows how m express one and the same concept in ways which differ as to the degree of clarity achieved in indicating this concept" ([huses] "iles " yu'rafu bihi iradu 'l-ma'nd 'l-mahidi bi-luruhin mukhtalifata fi muduhi 'l-daliiati 'ala)'ki, Talkhis, 🖿 Shurda, Ili, 257 fl.; see Mehren, 18-20, 53-4 SAYAN, i, 1216a bottom) and its association with the faşüka [q.v.] which involves, among other things, avoiding obscurity (tackid) in sentence structure (mapm) and in the relation between statement and theme (intihāl, Talkhīs, 5, 7 = Shurāh, 1, 103 ff., 150; see Mehren, 15-16), the translation "Science of exposition" (Mehren, 20: "Darstellungslehre") seems justified; but if we keeps in mind that the 'ilm albayan deals only with the simile (tashbih) (as an introduction to the discussion of the metaphor), the metaphor (isti'ard) [q.v.], the analogy (tamthil), the metonymy (kindyo) [q.v.] and the allusion, statement by implication (tairid), the translation "Science of figurative expression" more appropriate.

Even more confusing is the term ma'an, since what is is not the study of subjects and themes in poetry (as found in such works as the Kitāb al-

Ma'ani al-kabir of Ibn Kutayba [q.v.] or the Diwan al-Ma'ani of Abu Hilal al-'Askar' [d. ea. 400/1009]), nor a study of lexicography, but essentially a study of those rules of syntax which have a bearing on the theory of functional, appropriate style, or as al Kazwinl puts it, "finding the proper expression to meet what is required in a given situation" (the full definition of the 'ilm al ma'ini in "the science through which one knows the various existing patterns of Arabic speech by means of which it meets the requirements of each situation", [huma] Silm - yufrafu biki ahudlu "lafti "l-sarabiyyi 'llaft bikā yadābiku muktadā 7-hāli); the translation "Semantics of syntax" suggests itself (cf. BAYAK, i, 1156a: "the different kinds of sentence and their use").

The awkwardness of the terms me and and beyon and the difficulty of finding proper definitions for the two disciplines, 'ilm al-ma'ani and 'ilm al-bayan, particularly in their relationship to lexicography and grammar, has not escaped the mediaeval critics (see the interesting observations in Yahyā b. Hamza's Tirdz, i, 8-18), and wonders what determined the choice of these terms. The matani and bayan sections in the Miftah were based respectively on the Dala'il al-i'dins and the Assas al-balagha by 'Abd al-Kähir al-Djurdjani (see AL-piva piani in Suppl.), and it is in these two works that one would first try to find an answer to this question. On p. 64 of the Dala'd, al-Djurdjani makes clear that composition [narm) depends on obeying the rules of syntax (which he briefly enumerates), and on p. 65 he declares that determining a correct or faulty nears always involves a principle of syntax (mathew min ma'ant 'l-nake'. On p. 222, ll. 4-5 of the Asrar (Ritter's tr., 261 bottom) he qualifies the simile as marnan min al-marant, apparently meaning a way of formulating a common syntactic construction. It is possible that al-Sakkāki derived the term from al-Diurdianl's definition of the nasm as essentially a matter of correct syntax, the more so since the chapter on the ma'dni in the Millah immediately follows the section on syntax, so that the 'ilm alma'dat could be seen as an extension of syntax into the realm of rhetoric. It is also possible that be based himself on an earlier model; The term ma'dut #4-na/w appears in the famous discussion between Abu Sand al-Siráfi and Abu Bishr Matta b. Yunus al-Kunna'l which took place in 320/932 (see Ab0, Hayyan al-Tawbidi, al-Mukābasāt, ed. H. al-Sandūbi, Cairo 1347/1929, 80; ident, al-Imiac wa 'i-musanasa, ed. A. Amila and A. al-Zayn, Cairo 1373/1953, i. 121; Yakūt, Irshād, ili, 117; D. S. Margoliouth in JRAS [1905], 122), but seems to be used there for grammar In its widest sense. The Faris (d. 305/1004) in his al-Şāhibi (ed. M. el-Chouemi, Betrut 1383/1964, 179) uses the term ma'ani ai-kalam for the following categories: habar, istikhbir, nmr, nahy, du'a'. talob, 'ard, takdid, tamanul, and ta'adidiub, nearly all of which appear also in the maidal chapters of al-Sakkākī and al-Kazwīni. The term nasm may have been abandoned because it was too general and had to be associated, = al-Diurdjām states clearly on pp. 300-1 of the Dala'il, with the use of the istifara, the kindya, and the temthil as well as other tropes (sarir durab al-madjāz). It should be noted, however, that al-Kazwini (Idah, i, 57-8) and al-Taftāzānī (al-Shark al-mujawwal, 27) quote a definition which gives the term = narrow sense and which was based on al-Diurdiani (cf. Dali'd, 67-9). However that may be. one cannot deny that there is a certain logic in the new arrangement introduced by al-Sakkāki and alKazwini as long in one sees the 'sim al-ma's at in a set of rather strict rules governing the art of correct sentence structure, the purpose of which - to demonstrate that changes in word order almost invariably lead to changes in meaning; the 'lim albayan as an analysis of figurative expressions which, one might argue, the writer is free to use but which, since they are the product of his creativity and often lend clarity and distinction to his style, are by necessity part of any theory of style; and the "lim al-badis as a list of "embellishments" which are not essential criteria of a good style, but which are nevertheless applied quite frequently. It is conceivable that al-Sakkāki and al-Kazwini tried to programme the study of rhetoric in such a way that the reader would become familiar first with the elementary skills of composition, then with the characteristics of literature = a form of art, and finally with some stylistic devices used by accomplished poets and writers. It is true that much of what comes under the heading of 'ilm al-ma'ani is syntax or formal logic: but very often one finds that these statements of rules and principles explain how the speaker ought econvey a certain mood which requires him to emphasise, exaggerate, play on the hearer's imagination, or conform to a given situation by making tagit assumptions about what is known or acceptable to his audience, etc. This unquestionably draws the film al-ma ani into the sphere of thetoric and oratory. The use of the term bayan may reflect the view that metaphors should be used since they me sometimes more effective than terms used in their proper sense. Or the term may have been chosen simply because it was often associated with this aspect of balāgha (see BAYĀN, i, 11148; malso al-Rumraāni, al-Nukat, 79, 1. 12 and cf. A Fatimid manual, 313-29; al-Rummanl speaks of the metaphor as leading to a balaghat bayan not possible if the proper term were used). One could suggest that al-Sakkākī had in mind the formulation of a concept in an unconventional. artful manner (and as such different from the common methods described in the ma'ani chapter) (cf. BAYAN, i, zrr6a bottom; cf. also al-Nukai, 98, ll. 2-25, and A Fatimid manual, 317, 1. 12-318, 1. 11), but - other examples of bayon being used specifically in a term for figurative expressions are known to exist: The terms ma'ant and bayan appear in al-Zamakhshari's (d. 538/1144 [q.v.]) al-Kashshāf and in Fakhr al-Din al-Rāzi's (d. 606/1209 [q.v.]) Nihāyat al-īdjūz fi dirayat al-i'difir. Al-Zamakhsharl made frequent of al-Djurdjani, and al-Razi's Nihayo is actually a digest of al-Djurdlant. But both authors - the terms in too vague a way to justify any conclusions, and, consequently, al-Sakkāki, who knew both the Kashshif and the Nikdya, cannot have derived his definitions from these two books. He speaks however of "scholars" or "leaders" in the "ilm almarked without specifying who they are (Miftsh, 95, 119, 121; see Majlüb, al-Sakkāki, 119-20), and this could of course be taken as indication that he was not the first to introduce ma'dn's as a term for a more or less clearly defined category of rhetorical

How difficult it is to keep the "ilm al-ma'ani and the 'ilm al-bayan completely separated appears from the treatment of the madjaz as part of the chapter on attribution (isnad) in the "want section of the Talkas (10-13 = Sharah, i, 224-72; cf. al-Djurdjani, Asrar, 342-5 = 399-402 of the translation); al-Kazwini discusses sentences such as "The springtime made the herbage come forth" for "God made the herbage come forth" where there is a "trope of the intellect"

(madias akki), i.e. the hearer's realisation that it is the Creator who makes the herbage come forth, while the terms "springtime" and "made [the herbagel come forth" are used in their original tente; and "The springtime made the earth come to life" where there is not only a trope of the intellect in the relation between subject and predicate, but also tropical use of "made [the earth] come to life" for "covered (the earth) with herbage". Al-Kazwini points out that the hearer cannot do without a "frame of reference" (karina) supplied by an element in the context or the result of logical reflection which enables him to understand that the sentences are not to be taken in their literal meaning (see Matlob, al-Karwini, 355-71, for views on this point by al-Kazwini's predecessors and followers; see also Mehren, 30-1, 75-6). However, al-Kazwini gives no further attention in this section = the association that makes it possible to "come to life" in the sense of "come forth", since this is a question that belongs to the 'sim al-bayan. It would be wrong, bowever, to me the 'sim al-bayen as a science that is exclusively concerned with individual words used metaphorically in a certain context (involving, of course, once more a discussion of the karina) and of | associations which make such metaphors acceptable (cf. M1fidb, 157, ll. 3-5); im phrases such as "I see you advancing one foot while at the same time moving backwards with the other", which me intended as analogies (tamthil), the words are used in their original, proper meaning, though the sentence as a whole is used metaphorically to describe somebody who is refuctant to commit himself (Talkhis, 86 -Shurzh, iv, 143 if.; see Mehren, 38-9); and in the metonymy "He has many asbes [around his hearth]" there is no need to attribute a tropical to any term in the sentence in order to conclude that what the speaker wants to say is that the man often prepares meals and therefore must be a generous person who entertains many guests (Talkhis, 92 = Shurth, iv, 256 ff.; mm Mehren, 41-2). Moreover, al-Kazwini considers the istiffed as essentially a form of simile (tathbib) (67 = Shurib, ili, 287 ff.; see Mehren, 53-4; this theory may go back to al-Rummanl, al-Nukat, 79, ll. 5-10, ... Heinrichs, The hand, 14, 41, and Bonebakker, A Fatimid manual, 313-14, and was adopted by al-Sakkāki's contemporary, al-Mutarrizi (d. 610/1213), W Yahya b. Hamza, Tiras, i, 260-1 and Matlab, al-Sakkaki, 275, as well as by al-Sakhāki himself, Miffdh, 157, ll. 22 ff.), and therefore introduces a detailed chapter on the tashbib in the bayen section before dealing with the isti'dra. The me'ani chapter, however, also deals briefly with the simile when it analyses the inversion (\$46) which, if applied to the simile, results in a hyperbole (Talkkis, 27 = Shurab, i, 488-9, and the tashbih maklub chapter in Taihhis, 74 = Shurzh, ili, 407 ff.; see Mehren, 24-5. 68-9). Finally, mentioned earlier, the ma'ass chapter includes figures (e.g. sitsfül, lawshi', ighål, tadhyil, tahmil or ikhrás, talmim and iftirad) which scholars following the older schools would have identified as badd. In making these figures part of the ma'ant chapter, al-Kazwini may have been the first to separate them from the corpus of the badi's (see Matiub, el-Sakkāhī, 138; idem, al-Karwini, 316).

The works by al-Sakkākī and al-Karwīnī and their school cannot stand comparison with the two books by 'Abd al-Kāhīr al-Djurdjānī on which they were based. On the surface, the chapters on the 'ilm al-mar'ani and the 'ilm al-bayan appear as nothing more than digests of al-Djurdjānī, the mar'ani acctions, generally speaking, corresponding to the

Daki'd and the bayen sections to the Assir. Whereas in al-Djurdian! the relation of his theories to the practice of literary criticism is always clear, his followers seem to be interested only in presenting a skeleton of these theories and in finding convenient means of recognising and classifying patterns of syntax and figurative expressions, and in offering concise definitions. It is easy to see that al-Diurdianf's attention to detail, and his method of discussing the same problem in different contexts and handling it from different angles, should have invited attempts to offer his arguments and conclusions in a more convenient form. Still, the foundations laid by al-Diurdiani and his psychological and logical analysis of literature as m work of art were not entirely obscured, and this is no doubt the reason why al-Sakkāki's unsuccessful attempt to subject the two works to a rigid system of classification and al-Kazwini's subsequent effort to make an intelligible, though extremely concise, revision and digest of al-Sakkāki gave rise to me extensive literature of commentaries and supra-commentaries (al-KazwinTs Idah did not go far enough to clarify his Talkits). One admires the critical and profound learning that characterise this literature and its concern to do full justice to every point of view, in spite of much casuistry in the classification of categories and the choice of technical terms, Outstanding examples are the two commentaries on the Talkhir by Sa'd al-Din al-Taftazani (d. 292) 1590), the Shark mulaward and the Shark mukhtasar (see EI', art. AL-TAFTAZANI for other titles used for the same works).

In the prefaces to the Talkits and the Idah, al-Kazwini informs us that he has changed the arrangement of al-Sakkaki's Miftah, had recourse to al-Diurdjani's Dala'il and to his Assar (both quoted in the Talkhis and the Idahi, as well to other texts which he does not specify, and included some of his own ideas. According to Mathub (al-Kancisi, 191-228). he used Abu 'I-Hasan 'All b. 'Abd al-'Azlz al-Diurdiani (d. 392/1001), Abu Hilal al-'Askari, Abu Muhammad 'Abd Allah b. Muhammad al-Khafadit (d. 466/2073) (on al-Khafādil's Sirr ol-jasāba, see rasana, il, 824b-825b), al-Zamakhsharl, Diya' al-Din Ibn al-Athle (d. 637/1239) [q.v.], Ibn Abi 'i-Isha' (d. 654/1256), Badr al-Din Ibn Malik, and be may have used al-Rummani. Other digests of the Mittal which, if we may believe Ibn Khaldun (see the passage quoted above), included a digest of the rhetorical section of the Migical by al-Sakkaki himself, apparently did not meet with the same measure of success. The same al-Taftazani who composed the Shark mujewwal and the Shark muchtasas wrote his own commentary on the Miftdh which survives in manuscript (Sellheim, 307). Badr al-Din Ibn Målik wrote a Misbah fo 'hitisde al-mistah which should not be confused with his Misbak /i 'I-ma'ani wa 1-bayen (Sellheim, 315, 333, correcting Brockelmann). The latter work has been recognised by Ahlwardt (no. 7249, pp. 394b-396a) and Sellhaim (326) independent system of thetoric, though it may have been influenced by the "standardisation" established by al-Sakkakl. Mațlüb (el-Sakkaki, 382) goes farther and finds that the Missidh is no more than a "reduced size copy" of the Miftan, though in his book on al-Kazwini (90-1, cf. also 160, 229) III points out some important differences between the two texts. In addition, Badr al-Din Ibn Malik wrote a book with the title Rawd al-adhhan fl 'ilm al-ma'ant we 'l-bayan which was used by Bahis' al-Din al-Subkl (d. 773/1372) [q.v.] in his 'Ards al-afidb ff

shark talkhir al-miffak (see Sharak, i. 30, 139, 376 and elsewhere) and is preserved in a manuscript in Leiden (see Matiah, al-Kazarai, 92, 684). According to Matiah, it was written before the (second) Mishah and was like its companion volume essentially a digest of the Miffak, the first such text to reach Egypt. The substantial agreement between the Mishah and the Miffak appears clearly from a comparison of the definitions of the mainst and the bayan and, to a lesser extent, from a comparison of the tables of contents. Where the two books show an important difference is in the was of the term badis (see above) and in the detailed treatment which the badis receives in the Mißah (which falls outside the scope of this articial).

Much more interesting as independent study of the 'ilm al-ma'dal and the 'ilm al-bayan than Badr al-Din Ibn Mälik's Misbah is another little-known work, the Tirdx al-mutadammin li-asrār al-balāgļu wa-tuļūm kakā'ik al-i'diās of al-Mu'ayyad bi'llāh Yahyā b. Hamza al-'Alawi (d. 747/1346; see Brockelmann II, 186, S II, 242). A curious aspect of this book is that the author apparently knew neither the two books by al-Diurdiani nor al-Sakkaki's Miftah and that it cannot be precisely determined where he found the quotations from the Mifiah which = much influenced his thinking (see Matlab, al-Sakhākī, 359-60). In the preface (1, 3-4), he acknowledges that he used the Mathal al-sa'ir by [Dlyk' al-Dla] Ibn al-Athir, "the Tibyan by the shayah 'Abd al Rarlm", the Nihayat (al-idjās fi dirayat al-i'djās) by Fakhr al-Din al-Rüzi (which, mentioned earlier, was a compendium of the Dald'il and the Asrde). and the Misbak of Ibn Sirādi (sic) al-Māliki. Matlūb (al-Sakkākī, 358-9) does not seem to be in any doubt that this last work i identical with the Mishah fo 'khtişar al-nuftah of Back al-Din Ibn Malik, and believes that it was from this abridged version of the Miflah that Yahya b. Hamza derived his knowledge of al-Sakkāki. He apparently also feels certain that the work by 'Abd al-Karlm is the Tibyan of 'Abd al-Wähid b. 'Abd al-Karim b. al-Zamlakan! (d. 651/1253; see also Mathib's ed. of this work [Baghdad 1383/1964], 17). Yahya b. Hamza quotes several other important authors, such as Abu 'l-Hasan (Abu 'l-Kāsim?) al-Āmidi (d. 370/980-1), al-Rummānī, Abū Hilāl al-'Askari, al-Mutarrizi, and al-Khafārji, of whose works, however, he may not have had direct knowledge. He must also have been thoroughly familiar with al-Zamakhsharl's Kashshaff la work that gives much attention to the stylistic excellence of the Kur'an and made me of al-Diurdiant), since the Tirax was intended as an introduction the author's lectures the Kastishaf (i, 3). The work has a much wider scope than the works by al-Sakkākl, Badr al-Din Ibu Mālik, and al-Kazwini: Yahya b. Hamza explains his views in great detail and offers copious examples. That the Tirax was not an imitation of any of these earlier texts is clear also from its arrangement: Yahya b. Hamza divides his work into three lengthy "subjects" or chapters (finnin), a series of introductory remarks (i, 8), a chapter dealing with the bayan, the matant, and the badt' (i, 183), and a third chapter dealing with the inimitability of the Kur'an (iii, 213). The second chapter, which interests us here, deals liest with the islifara, the tashbih (which Yahya b. Harnza considers a subject far more complicated than the istifara), the kindya, the tarrid, and the tanthil. Next come two sections qualified as belonging to the "ilm al-ma ant (cf. i, 196), the first of which deals with the semantics (dalālāt) of individual

words and sentences (ii, 9), and the second with matters of style (ii, 22r) as far as these two can be kept apart (cf. ii, 22r-2). The chapter ends with a discussion of the badit (ii, 353).

As noted earlier, there me numerous commentaries on the Talkhis, as well as supra-commentaries and glosses. An authoritative and informative list of many of these, with valuable information on manuscripts, appears in Sellheim, 310-15. A collection of commentaries which comprises not only al-Kazwinl's Iddi and al-Taftazani's Sharh mukhtasar, but also the Maudhib al-fattah of Ibn Ya'kūb al-Maghrib! (wrote 1108/1696; see Brockelmann, S I, 518, m), the Aras al-afrak of Baha' al-Din al-Subki (see abova), and the Haghiya of the Sharh mukhtaşar by Muhammad b. Mubammad 'Arafa al-Dasüki (d. 1230/1815; 🖚 Brockelmann, II, 84, S II, 98 and Majlub, al-Karwini, 592-7) was published in Cairo in 1937 (and earlier in Bûlâk in 1318/1900-1, according to Brockelmann, I, 516, 3a) in four volumes. Mention should also be made of the Shark subild al-djuman ft silm almarant wa "l-bayan by al-Suyūţi (d. 911/1505) [q.v.], a versification of the Talkhis to which the author himself wrote a commentary, and the wellknown commentary on the verses quoted in the Talkhis known as the Marahid altensis fala (or: Il shorh) thawdhid al-talkhis by Abd al-Rabim (or 'Abd al-Rahman' al-'Abbast (d. 963/1556), both of which were printed in several editions (see Brockelmann, I, 296, S I, 319).

The popularity which the system of al-Sakkākī and al-Kazwini has enjoyed to this day is shown by such works as the edition by M. A. Khafadil of al-Kazwini's Iddh, Cairo 1368-70/1949-51, which contains extensive notes - the interpretation of the text and the history of the genre, and by modern works on the ma'dol and the bayan such as the Bughyat al-idah li-talkhi; al-miftah of 'A. al-Sa'idi, Cairo 1380/19607, I four volumes and the Distribit albalagha fi 'l-ma'ani ma'l-bayan wa 'l-badi' by A, al-Häshimi, Cairo 1379/1960, a work intended for school use. Other works are listed by Matlab in his book on al-Kezwini (613-17). A complete survey of literature based directly or indirectly on al-Sakkaki and al-Kazwini remains to be written; it should include such interesting works as the impublished Badi'iyyat al-umyan by Ibn Dlabir (d. 780/1378), a didactic poem based on the badi' section of the Idia with a commentary by Ibn Djabir's friend, al-Ru'ayni (d. 779/1377; see Brockelmann, II, 13, tit, S II, 6, 138), the Badi'iyya of Sall al-Dia al-Hillf (d. around 750/1319; see Brockelmann, II, 159, S II, 199) which lists, among the works consulted by the author, the Mifidh and works based on the Miftak, and badifyyas by other authors that might contain elements of the same tradition.

An excellent summary of the 'dim al-bayan and the "ilm al-badi" is found in Mohren's Rhetorik, Mehren based himself on the Talkhis, the two commentaries by al-Taffāzāni, and the 'Ukad by al-Suyāji. Other texts were known to the author and occasionally used by him (see pp. iv-v and 3-13). Mehren also dealt briefly with the film al-malfini (18-19), but apparently gave up his plans to deal with this discipline in a separate publication (p. v). However, the technical terms in the ma'dul chapters, as far me they pertain to rhetoric, are sometimes the same as those of the bayan which are adequately explained in Mehren; or they are common budt' terms which can be identified in handbooks composed by authors who followed the "older" school, such as the Takrir al-tabbir of fbn Abi 'I-Isha', ed. H. M. Sharaf, Cairo 1383/1983.

Another useful introduction is the article by M. Weisweiler, 'Abdalgahir al-Curcani's Work über die Unnachahmlichkeit des Korans und seine synlaktisch-stillistischen Lehren, in Oriens, xi/x-2 (1958), 77-121, which, though intended as a summary of the Dalabil, can be used as a study of the 'ilm al-ma'ant and thus makes up in a large measure for the omission of this section from Mehren's book.

Bibliography (for more detailed information mexisting editions of Arabic texts listed in the article or in this bibliography, see Brockelmann and the relevant articles in EI1 and EI31; 'Abd al-Kāhir al-Djurdjāni, Dalāil al-i'djās, Cairo 1367/ 1947-8; idem, Asrar al-balagha, ed. Bd.: Verzeichniss der arabischen Handschriften, VI. Bd., Berlin 1894, 363-412 (tables of contents of texts mentioned in this article and of other texts belonging to the same tradition); Brockelmann, I, 294-6, II, 22, 5 1, 515-19, 965, S II, 15-16; A. Matlub, al-Balagha 'ind al-Sakkaki, Baghdad 1384/1964; idem al-Karu-ini wa-shuruh al-talkhis, Baghdad 1387/1967; idem, Musjalahat belaghiyya. Baghdad 1392/1972 (useful summary of the two preceding works); R. Sellbeim, Materialen zur arabischen Literaturgeschichte, Teil I (= Verzeichwiss der orientalischen Handschriften in Deutschland, Bd. xvii, Reihe A; Arabische Handschriften), Wiesbaden 1976; W. Heinrichs, The hand of the Northwind; opinions on metaphor and the early meaning of Istifara in Arabic poetics, in Abh. K.M., Bd. xliv/2, Wiesbaden 1977 (the term istifam with observations on al-Sakkāki's use of (S. A. BONEBAKKER) this term).

2. In Persian. The rhetorical system innovated by al-Sakkākī and his school did not meet with particular attention in the field of Persian rhetoric. One of the few books written in Persian and following his system of devices is contained in the ms. Madills 1866 (cl. Munzawł, Fihrist-i Killibhhana-yi Shara-yi milli, xiii, Tehran 1968, 303-4). It seems, however, that me attempt has been undertaken, so far, to look for a creative adaptation of the above-mentioned system to the exigencies of Persian language and literature. Even one of the latest treatments of this scheme of ideas, the Musalim al-balagia dar tilm-i maided washaydu washadii, by M. Kh. Radia'l, Shīrāz 1962 and 11975, contents itself with illustrating the two rhetorical categories by means of the wellknown Arabic quotations, just complementing them by some Persian examples for clearer reference.

Persian scholars of rhetoric, at all times, were

rhetorical art (sanā'i'). Taese assigned by al-Sakkāki to the third rhetorical category (badī'), as far m they are not simile, metaphor, metonymy, analogy, etc. The basic work dealing with this subject is, however, not the Miflat written by him, but the Hadanik al-silv by Rashid al-Din Watwat (see also the foreword by A. Ikbal to his edition of this work, Tehran 2308 h ah.).

To understand this phenomenon, we have to bear in mind that al-Sakkaki based himself on the study of Kur'anic modes of expression, whereas in Persian literature such a sacrosanct linguistic monument was non-existent, and with it the motive for analogous considerations. Al-Sakkáki himself - a Persian, as was his famous predecessor al-Djurdjani and as were some of his commentators, for instance al-Taftāzāni. They all wrote in Arabic about an essentially Arabic subject, so that whoever wanted to deal with the material, had to have a good knowledge of Arabic. Persian elaborations of the above theory, therefore became quite superfluous. Not surprisingly, a number of manuscripts of the Arabic commentaries and supra-commentaries at present to be found in Persian libraries, (B. REINERT)

MA'ARIF (A.), education, public instruction. The word is the pl. of marrifa "knowledge". The term was already used in mediaeval times to denote the secular subjects of knowledge un culture in general (e.g. in the title of Ibn Kutaybe's Kilab al-Ma'arif), in opposition to the religious sciences (Silèm, pl. of Silm).

I. IN THE OTTOMAN EMPIRE AND THE CENTRAL AND EASTERN ARAB LANDS

It seems that the official use of the term appears for the first time in the Ottoman Empire in 2838. when a school for educating government officials was established in Istanbul and was named Mekleb-i Ma'drif-i 'Adlivye. After that, the term was frequently used in Turkish to indicate aducation. Thus the first governmental body charged with the administration and supervision of the budding system a state schools which was created in 1845 was called Muunbhatt Ma'arif Madilisi, Provisional Council of Education. This was the forerunner of the Ministry of Public Instruction, Matarif-i Umamiyye-i Negareti, established in 1857. It is noteworthy that the first directorate of the new state schools, which had been created in 1839, was called Mekātib-i Rüskdiyye Negarcti and did not include the new term mo'drif, perhaps because it was a department within the Ministry of Pious Foundations under the Shaykh al-Islam. The Ministry of Education was renamed in 1920 by the Kemalists Macarif Vehaldi. In 1933, with the language reform in Turkey, the former Arabic-Ottoman Turkish-sounding term was replaced by a purely Turkish one, and the Ministry was renamed Mills Eğitim Bakanlığı, Ministry of National Education, which has remained the official term, although magrif is still a common word in Turkish for education, along with the neologism egitim.

The use of the word matarif for public education became current in Egypt and Iran in the 19th century, almost certainly under the influence of the Ottoman term. Both in Egypt and in Iran the official use of the term to designate the system of education was avoided for about half a century. When the first Ministry of Education was formed in Egypt in 1837, it was simply called Diwan al-Madaris (Medaris Dimini in Turkish), the Department of Schools. Only since the Khediva Isnia Tis rule mainly interested in rhetorical figures and the 1 (1863-79) was the Ministry of Public Instruction

ma'arif

called nardrat (later, in 1915, wisdrat) al-ma-drif al-tumumiyya. The term ma'arif was universally used for "education" in the Ministries of Education of the Arab successor-states of the Ottoman Empire, and until the mid-1930s, also in Iran. Only after the Egyptian Revolution, at the beginning of the school year 1954-5, was the Ministry of Public Instruction renamed Wisdow al-tarbiva wa 'l-ta'lim. literally "Ministry of Education and Instruction". The Minister of Education explained that the change aimed to emphasise the shift from the static and passive "knowledge" to the dynamic process of education and the teaching of various skills. It may be suggested that additional reasons were behind the decision to do away with the term ma'arif. Although the word is of an Arabic origin, Arabic was less comfortable with it in the seuse of education than Ottoman, and even modern Turkish. The expression da'irat al-ma'arif, for example, has the double meaning of "Department of Education" and "encyclopaedia". The dropping of the old and, from the Arabic point of view, the somewhat clumsy term ma'arif should be also viewed against the background of the Arabisation after the Egyptian revolution of 1952 of the official nomenclature, which had still retained many Turkish terms in the civil administration and in the Army. Following the Egyptian example, the other Arab countries replaced in the fifties the term matarif with tarbiya or tashiya wa-tallim for their Ministries of Education. It further that the word madrif in the sense of education is dying out in Arabic in the non-official usage also.

i. The Ottoman Empire and Turkey

The beginning of modern education in the Ottoman Empire. - Islamic society had traditionally the highest regard for the pursuit of knowledge, "ilm, but education was considered as a religious or communal matter of no concern to the state. Muslim children taught the Kur'an and the basics of religion in the Kur'an schools, the mekteb (Arable maktab or kuttāb [q.v.]). Higher religious studies were given in the madrasa [q.v.] (Turkish pronunciation, medrese). The traditional educational institutions were financed by private donations, but mainly by the wakfs, pious foudations. The religious educational system was entirely within the jurisdiction of the "ulama". The traditional religious education had not changed substantially for centuries and was quite uniform, some local variations notwithstanding. The modernised, state-directed, and at least partially secularised education which was called ma'drif emerged only in the 19th century, although there were some hesitant beginnings in the 18th century. These had been prompted by the Ottoman defeats at the hands of the European powers. The Ottoman government realised that it had to improve the training of its officers and that this could be accomplished only by borrowing European training methods and techniques.

As early as 1734 a school of engineering, Hendese-khāne, was established in Oskildar. This first institution was to be shortlived, but in the last quarter of the 18th century more successful efforts to found military schools were made. After the Ottoman navy was burned by the Russians, the Ottomans established in 1776 a new Imperial Naval Engineering School, Mühendis-khāne-yi Bakri-yi Hümayün. In order to train army artillery officers, an Imperial Land Engineering School, Mühendis-khāne-yi Berri-yi Hümayün was founded in 1794 (or in 1796). These

military schools were staffed largely by French officers, and European textbooks, especially translated for the cadets, were used there.

003

Mahmad 11. - Yet the first real educational beginning in the Ottoman Empire belongs to the reign of Mahmud II (1801-39), who was following the example of Muhammad 'All, Egypt's modernising Pasha, Mahmud's first significant step in the field of education was issuing an edict which stated that "the majority of people lately avoid sending their children to school and prefer to give them to = trade as novices to artisans when they reach the age of five or six because of their ambition is sarn. money immediately. This condition is the cause not only of widespread illiteracy but also of ignorance of religion ... No man henceforth shall prevent his children from attending school until they have reached the age of adulthood . . . ". This edict cannot be considered - a compulsory education law, and it contained nothing to change the traditional aims and structure of elementary education, but it did mark a departure from the past by declaring the direct involvement of the state as such in the education of children. Malumud realised that in order to reform the army, the reactionary forces should be eliminated. Therefore he destroyed the Janissaries in 1826, as Muhammad All had massacred the mamides in 1811. It is no coincidence that the greater part of Mahmud's educational activity took place after that date. It was to be typical of educational development in the Middle East that reform in the school system started from the top, by establishing modern specialised schools to train officers, doctors, engineers and administrators for the army and the civil buresucracy. The higher, specialised schools were unrelated to the traditional educational system; the elementary schools especially saw very little change until the 1908 revolution. Because of this, students of engineering and medicine in the first higher schools had to study such elementary subjects as arithmetic, Turkish grammar and French. Eventually, the higher institutions of learning had to form their own preparatory sections, until the state gradually developed the higher-elementary and secondary stages of the educational system. An impressive number of higher schools were founded during the reign of Mahmud 11. In 1827 Mahmud opened a medical school in Istanbul to train doctors for the army, less than a month after the opening of Muhanunad 'All's medical school in Cairo. The Imperial Music School was inaugurated in 1831. In 1832 the Dierrak-khane, another medical school for the training of surgeous, was founded. In 1834 the Harbiyye, the Military Academy was opened. It was modelled - St. Cyr, and indeed the French influence was dominant at this school. In 1838 -Law School was opened. Among the educational achievements of Mahmud's reign should be mentioned the first students' mission to European capitals, which started in 1834 (according to one source, in 1827), also by following Muhannuad 'Ali of Egypt, who was the first Middle Eastern ruler to adopt his method of training specialists for his army and administration. Another method to raise the educational standards of his army was to establish training units within the military corps (1832).

Toward the end of the reign of Mahmud II, two schools of a new kind were created, the Mekteb-i Machini-i Additye, the so-called Addit (after a title of Mahmud II) School of Science, a school designed specifically to train employees for government offices (1838), and the Mckteb-i Ulims-i Edebitye,

MASĀRIF

School of Literary Sciences, to train translators and interpreters (1839). These schools taught, among other things, modern subjects such as French, geography and mathematics. Mahmud's educational system created mow type of school, the rushdiyye, higher elementary school (from rushd, meaning "adolescence"), which was to throughout the 19th century | important link between the elementary schools and the higher stages. which were somewhat modernised and secularised. although lip-service to religion was always paid. As has already been mentioned, Malumud's reign also initiated the first government offices which were charged with administering and supervising the new schools, the forerunners of the Ministry of Education. One of them was the Medilis-i Umar-i Nafi'a, the Board of Useful Affairs, established in t838, which among other things constructed schools. Another body was the Department of the sugadiyyes, Mekälib-i Rushdiyye Nezdreti (1839), Despite the impressive record of Mahmud's period, one must ramember that the number of students exposed to the see education was severely hampered by lack of teachers and by difficulties of language and terminelogy.

The Tauximat. - The period of the Ottoman Reforms, the Tansimal [q.v.] (1839-76), brought about a real breakthrough in all the spheres of education: organisation, legislation and development. In 1845 the Muwakkas-i Madarif Medilisi, Provisional Board of Education was formed, in the next year it became Mehatib-i "Umumiyya Negareti, Ministry of Public Schools, and was replaced in 1857 by the Ministry of Public Instruction. In 1851 the Society of the Learned, Endjimen-i Danish, was formed with the purpose of sponsoring Ottoman culture and contributing to education. It was active only for a few years and did not accomplish much. In 1868 a Council of State was set up. The Council had five sections, after the French model, of which was in charge of agriculture and public instruction. A Higher Council for general education was formed in 1869 within the Ministry of Education, on which representatives of the non-Muslim communities (millets [q.r.]) also served. Subordinate to this central council, provincial councils were established in each province as part of the local government. During the Tanzimit era, important innovations introduced. For the first time programmes and regulations were issued to all the elementary schools of the enspire (1847). In 1870 similar set of regulations concerning the rushdiyye schools was circulated. In 1846 'Ali and Fu'ad, two of the chief reformers, prepared an ambitious but unrealistic scheme to reorganise the entire educational ladder from the sibyon elementary schools up to the university. With the foundation of the Ministry of Education in 1857, another scheme for the organisation of the school system was prepared, which provided for an elementary school (melach-i sibyan) of grades (ages 7-10), secondary school (slighdigge) of E grades (ages 11-16), from which the graduate could continue in various higher institutions of learning, including the Mülkiyye, a school which was actually founded only in 1859 to prepare civil servants.

In 1286/1869 a comprehensive law or morganisation of the state school system was issued. This time scheme was more thorough than previous attempts aiming in the rationalisation of the school system and integrating all that which had been achieved till that date. The Ottoman Education Law was

inspired by the European legislation of the day, and perhaps also followed the Egyptian Education Law of 1867. The Ottoman law classified schools in the empire into public ("umumiyye) and private (khususiyiyye). The former were graded as elementary (sibyaniyye) higher elementary (rusidiyye), lower secondary (i'dadiyya) and higher secondary (sulfaniyya). At the top there were higher institutions of learning, technical, agricultural, and teacher training, and the state university (Dar al-Filman). Already in 1868 a compulsory education law had been issued, according to which all boys aged 7-11 and all girls aged 6-10 had to go to school. The 1869 law provided for a stbyan school in every village in town quarter, a rughdiyys in towns with 500 or more families, and an i'dddiyye in communities with 1,000 families or more. A sulfaniyye secondary school me to be established in every provincial capital. The actual development of Ottoman education, however, lagged behind this scheme, for lack of funds, teachers and facilities. By 1876 there were only 362 stishdiyyes, and only one sulfaniyya school - opened for a long time to come. As for the University, the first public lectures were held in 1863, but it was soon closed down. In 1870 another attempt to open the Dar al-Flimun was shortlived. Only in 1900 was the university finally organised.

The Tanzimat period began with the promulgation of the famous Khall-i Sharif ("Noble Rescript") of 1839 which proclaimed, at least implicitly, the principles of the equally of all Ottoman subjects, regardless of croed, and which opened the new state schools to non-Muslim children. The Khatt-i Humayan of 1856 made these promises explicit. Generally, the Tangingst period witnessed some genuine attempts to integrate the non-Muslim elements to Ottoman clety, and it was realised that this could best be achieved through education, Midhat Pasha (q.v.), the famous reformer and administrator, established integrated schools while he was the governor of the wilayet of the Danube. The first major breach in religious barriers against mixed education occurred in September 1868 with the establishment of the Lycas of Ghalata-saray, which was to be a conscious copy of the French lycis. The school offered a European-style curriculum in a five-year course and religious education for students of the main Ottomen millets; the Muslim children constituted about one-half of the student body. In its first years, the administration and the staff were mainly French. But in the seventies the French influence decreased and the school became increasingly Turkish in character. Robert College, the Protestant counterpart of Ghalata-saray, had already been in existence since 1863.

The Tangimal period is also to be c edited with the first institutes of teachers' training. The idea of state supervision of the teachers belongs to the time of Mahmud II, but nothing had been done before the Tangimal to train teachers formally; medicise graduates were considered - qualified teachers. The first college of teacher training (dar al-mufallimin) for the riightiyyes was opened in 1848 in Istanbul. The first normal school for girls (das al-mufallimat) was founded in 1870, and by 1908 there were 33 feachers' training institutes throughout the empire.

The Transimal period saw a determined effort to spread education to the provinces. The wilayet Law of 1871 made provisions for provincial educational administration. In 1872 a decree for reform in the elementary schools in the provinces was issued.

Perhaps most important, the organised under-

MA^cĀRIP

taking of female education was original to the Tanglmit. Coeducation was practised in the elementary meldeb, but was impossible in the rilshdiyy. Around 1862, separate schools for girls were established. The educational schema of 1869 provided for the first time for education for girls, where such subjects as sewing and cooking were taught, and the first lemale teachers for girls' trade schools were appointed in 1873.

To sum up, the educational efforts of the Tantimat meant that forms emerged; a network of military and civilian schools developed; ploneer work in the fields of education of girls and teacher training was started; contacts with Europe continued, including consultations with European education experts; student missions were sent; and the Ottoman School in Paris (1857-74) became a centre for the Ottoman students in that city. During the Tantimat, the gap between the secular and the religious in Ottoman society widened considerably.

The Constitutional, Hamidian and Young Turk periods. — The Constitution of 1876 reiterated the principles of compulsory and free primary education and the concept of a contralised and somewhat secularised school system. The state did not interfere with religious education in the elementary schools and in the medress, which remained the province

of the 'wiama'.

Although the long reign of suitan 'Abd al-Hamid II (1876-1909) was a time of despotism and political reaction, the sultan carried on his predecessors' educational activities. He imposed strict cemorship on curricula and textbooks and his spies bedevilled the lives of teachers, students and intellectuals. Yet during his rule the literacy rate tripled, many schools were opened, new types of higher institutions of learning were established and the first modern university in the Muslim world was finally founded (1900). During the period 1879-99 the number of the rushdiyyes rose from 253 to 389. The network of military schools was developed; there were 29 military rásádiyyes in 1897. In accordance with his overall Islamic and Arab policy, 'Abd fil-Hamid II paid more attention to education in the Arab and other Muslim non-Turkish provinces than had been done previously. A typical example of this policy was the "Ashiret Mahtebi, School of the Tribes, which was opened in Beshiktash in 1804 and fasted until 1907. This school trained teachers, officers and administrators from the Arab, Kurdish and Albanian provinces. In 1883 the sultan decreed that every provincial capital should have its own teacher training college. In the same year he imposed an "assistance tax", a share of which was set apart for education. A medical school was opened in Damascus in 1903; it was then transferred to Beirut in 1916, and finally closed down in 1918. The network of military schools was extended, and in 1904 military schools were opened in Damascus, Baghdad, Erzincan, Edime, and Monastir. Law schools were established in 1907 in Konya, Salonika and Baghdad.

'Abd ül-Hamid sponsored the opening of schools of finance (1878), fine arts (1879), commerce (1882), engineering (1884), a school for the blind and deaf (1889), veterinary services (1889), police (1891) and customs (1892). Generally, vocational and technical education was emphasised, and courses to train telegraphic operators and stemploat mechanics were given. The institutions of higher learning developed vigorously under 'Abd ül-Hamid's rule, although the sultan reaffect that these could endanger his régime. Indeed, the first revolutionary group was organised

in the military medical school in 1889. Similar circles were eventually successful in bringing about the 1908 revolution, which ushered in the period of the Young Turks, or the "Second Constitution", which lasted until the collapse of the Ottoman Empire.

The turbulent last ten years of the empire witnessed some basic changes in the approach to education. It can be stated that in this short period the educational system was transformed through modernisation and secularisation, preparing the road for the future Kemalist reforms. Besides the institutional and legal reforms in Turkish education. which will be presently discussed, new concepts about education came to the fore. As N. Berkes has aptly put it: "If the word massif symbolises the era opened by Mahmud II, the term terbiye well represents the Megrutiyet era, and signifies an important improvement over the first." Thus, to the concept of knowledge, the idea of education was now added. This era saw the emergence of the first professional Ottoman pedagogues, such as Sățic al-Husri (who would be later better known as an Arab educator and nationalist). Rida Tewfik, Selim Sirri and Isma'll Hakki, who promoted the publication of psychological and pedagogical literature, While the educational model during the Tanginds was the French system, the educators of the Mashrutiyyet turned to the Anglo-Saxon education system for inspiration.

There were significant beginnings of secularisation. The first teachers' organisations appeared. The struggle between the historial (clerical teacher) and the mirallim (secular teacher) became pronounced in the Young Turk period. The ideologues of the ruling Union and Progress Committee (Ittihād ve Terakhi Djemisyreti [q.o.], headed by Diya' (Ziya) (ökaip, demanded that the state, not the 'ulama', should control and supervise public instruction. As a result of a resolution adopted at its 1916 convention, the Union and Progress Committee transferred the elementary schools, which had been previously under the Ministry of Ewhôf, to the Ministry of Education. The medresses were merely transferred from the Ministry of Ewhôf to another religious authority, the Bâb-1 Meshīkhat, the Department of

the Shaykk al-Islam.

In the legislative field, the 1320/1913 Provisional Law of Elementary Education, the most important law since the Ottoman Education Law of 1286/1869, was promulgated. The law created education committees at the level of districts and sub-districts, thus delegating administrative, linaucial and pedagogical responsibility to local authorities. The law placed all the linaucial burden of maintaining the schools, namely establishing a school, acquiring the land, constructing the building, paying the leachers' salaries and all current expenses, on the people of the countries and districts. This meant in practice that universal elementary aducation could not be achieved for month for the counc.

In the "Second Constitutional" period, progress was achieved in the sphere of women's education. Educational opportunities for women were extended to the secondary school. In 1911 the first is didiyw and in 1913 the first lyate for girls were opened in Istanbul. Trade schools for girls were established, not only for cooking and sewing, but to train nurses and secretaries. In 1915, women were admitted to the University, although in separate classes, to be trained as secondary school teachers. After 1918, women were allowed to work as elementary school teachers.

After the 1908 Revolution, the University was reorganised and the curriculum now included history, philosophy and sociology, which had bean banned under 'Abd ül-Hamid,

Education in the Turkish Republic. - The educational developments in the Turkish Republic in the twenties and thirties are closely linked with the reforms of Mustafa Kemal, the future Kemal Ataturk [q.w.], the first president of the Republic. The Kemalists, committed m they were to drastic cultural change, rightly understood the utmost importance of education for their objects. The revolutionary government in Ankara established its own Ministry of Education in May 1920, while still fighting against the Allied-supported Ottoman government in Istanbul.

The Law of Unification of Instruction (Taubid-Tedrisis) of 1924 ended the century-long dichotomy between secular and religious education in Turkey and created a fully secular and integrated school system. All educational institutions were placed under the control of the Ministry of Education. The medreses, 479 in all, with a total enrollment of 18,000 (only a third of whom were genuine students) were closed down. To provide alternative higher Islamic sducation, the Faculty of Theology was opened at the University of Istanbul and 26 secondary schools for training imdms and khotibs were established. The anti-clerical atmosphere of the period did not encourage the development of these institutions. The Theological Faculty was closed in 1934 and the last imam-katip mektepleri were closed down in 1932-3, after their enrolment had been continuously dwindling. As for the religious education in regular schools, this too was adversely affected by the secularising ethos of the Atatürk era. In 1928 Islam ceased to be the state religion, and the principle of lalcism was accepted. In the same year, the Latin script was adopted for the Turkish language. Ataturk himself went out to the people to teach the new script. In the next year. Arabic and Persian were eliminated from the curriculum. In 1932 religious instruction in the secondary schools was finally stopped. There is no agreement - to when religious instruction in the elementary schools was discontinued; some sources date it as early as 1924, others mention 1928, a date which seems more accurate. It seems that religious instruction was simply phased out, although it continued in many village schools. Toward the end of the forties, the public mood became definitely invourable to the reintroduction of religious instruction in schools. The issue came up in the National Assembly at the end of 1947. In January 1949 the Ministry of Education issued a circular, according which two hours of religious instruction would be given in the fourth and fifth grades of elementary schools to pupils whose parents might ask for it. The coming to power of the Democratic Party in 1950 was a turning-point in 📰 attitude of the government toward religion generally and religious instruction in particular. After 1950, religious education became compulsory for all; parents were required to opt out instead of in as before. At the beginning of the school year of 1956-7, religious instruction was introduced to the middle schools, iunior high schools (orio okuller), as well. In 1951 . new imam-hatip okullari were established. In contradistinction from the early version, these institutions have been successful. Higher religious instruction have we offered in institutes in Istanbul and Konya, but the most important faculty which teaches Islam at the university level is the Faculty

of Theology (Ildhiyat Fahilleri) at Ankara University which was founded in 1949-50.

It is not surprising that, due to the administrative traditions of the Ottoman Empire, which had been influenced by the French model, the Ministry of Education of the Turkish Republic was centralistic from the start. This was also justified in part by the determination of the government to create a unified, modernised and secularised education in a country which was fragmented into numerous regions and tribes and which was far from enjoying linguistic and cultural bomogeneity. Centralistic educational administration was also needed to overcome the indifference or even hostility of the conservative elements, particularly in the countryside, towards the Kemalist Revolution and its educational goals. In 1926 the Ministry of Education was reorganised. The country was divided into twelve regional directorates of education, each being headed by a superintendent of education (madeif emini). directly responsible to the Ministry in Ankara. Since 1949, the organisation of the educational system has been somewhat more flexible, each governor being responsible for the education in his district. He is assisted by an educational council and a director of education, who is more responsive to local needs. In spite of these reforms, the educational system of Turkey, like most countries in the Middle East, is quite centralised, and the state controls the whole educational system pedagogically, administratively and financially. The Ministry of Education is helped by a National Educational Council (Milli Eğitim Surass) which consists of educators and administrators and has wide powers in drawing up educational policies concerning curricula, textbooks and school regulations. The Council meets once every few years. The Tenth Educational Council convened in 1981. The Ministry of Education has a virtual monopoly of textbooks. The government controls higher education as well, and inspects private and minority schools closely. Private institutions have been declining in comparison with state schools. Scores of higher institutes which train students in such fields = economy, commerce, engineering and architecture were nationalised at the beginning of the school year 1971-2 after the important education law no. 1472 had been promulgated. Education in all state schools at all levels is free of charge.

The most difficult task which the education authorities had to face was to raise educational standards and to combat illiteracy in the nation generally and in the countryside in particular. The formal school system was complemented by the Turkish Hearths (Tilek Odjaghl), a network of a kind of clubs founded in 1912 to promote Turkish culture and economic welfare through lectures, publishing books and opening schools. The Turkish Hearths were closed down in 1931 and replaced by a network of People's Houses and People's Rooms (Halkevi and Halkodosi [see KRALKEVI]), community centres established to diffuse Turkish culture and closely associated with the ruling Republican People's Party. Teachers were encouraged by their Ministry to participate in the activities of these centres.

The Ministry of Education devised several programmes to train teachers for the village schools. One of them was to send soldiers of rural origin and having some education on short pedagogical courses. Since 1936, young villagers who had finished primary school were sent on courses of six months to prepare them to teach in their villages. According to the Village Educators' Law of 1937, special centres to train teachers were initiated. In 1940 the law of 1937 was supplemented by the Village Institute Law. Subsequently, the two programmes were united. In addition to his regular teaching assignments, the village educator was expected to teach adults and to help in the social and economic development of the village. The Village Institutes were merged with the regular teacher training colleges in 1954.

All these efforts have produced positive results. and the gap between school attendance rates in villages and in the cities is not nearly as wide as is the case in most Middle Eastern countries. This applies even to education of girls. In the school year 1973-4, for instance, the proportion of girls In state elementary schools in the cities was 46%, while in the villages the percentage was only 3.7% tower. National schooling rates for children between the ages of seven and twelve, who are obliged to go to school according to the compulsory education law, were 90% already in 1672-3, again a much higher rate than in most countries of the region. The school attendance rates have been me the rise in all educational levels. Consequently, literacy rates rose from 19.2% in 1935 (29.3% for men and 9.8% for women) up to 54.57% in 1970 (69% for men and 40% for women). The progress in the education of women is especially impressive. Coeducation has been a principle in Turkish education since 1927; only when there are special circumstances or professional needs are separate schools for girls established.

The basic structure of the Turkish educational ladder is 5-3-3, i.e. primary school (ilhokul) of five grades (ages 7-11) followed by a junior high school or "middle school" (ortnobul) of three grades (ages 12-14) and leading to the secondary or high school, lyele (lise) of three grades (ages 15-17) or a vocational or a trade school. The ilkokul and the ortgokul comprise the two stages of the "basic education" (temel egitim). At the orta level, the student may already start at a teacher training school, which continues four more years at the secondary level. Other courses which last four years after the ortaohel, that is up to the twelfth grade, are the imamhatip ohullars and technicians' schools. In addition to regular schools, there are evening schools for working youth. Special mention should be made of the state schools which teach in foreign languages. These institutions teach the "national" subjects in Turkish, but the language of instruction of all other subjects is English, French or German, according to the particular school.

Despite the impressive achievements, education in Turkey has yet to overcome many serious difficulties. Teachers' status and salaries are quite low. There is considerable shortage of teachers, since the teacher training schools at the secondary and university level do not keep up with the rapid growth of the student population, In 1972-1 the teacher: student ratio was 1:33 in the state primary schools, in the state ortackel 1:43 and in the lise 1:39.7. Another structural weakness of the educational system is the small proportion of students wocational and trade schools at the secondary level, which is well beneath 20% of the secondary school student population. One result of this is that each year, increasing numbers of the lise graduates cannot be admitted to the universities and other higher institutes of learning for lack of space, although the higher educational system is also expanding very quickly.

ii. Egypt

Educational development under Muhammad 'Ali. -The foundations of modern education in Egypt were laid by Muhammad 'All Pasha, the virtually independent viceroy of Egypt from 1805 until 1848. His ambitions were personal and dynastic, yet he was aware that if he was to establish a powerful state, he had to build a modern, European-style army and an efficient administration and economy. This he could accomplish only with Western methods and advice, since education and learning in Egypt, even more than in the centre of the Ottoman Empire, were wholly traditional and were confined to milgious instruction at the kultabs and the madrasas, the most important one being al-Azhar (q.v.). So it happened that although Muhammad 'All had little interest in raising the educational standards of the Egyptian people, his dynamic reign made Egypt the forerunner of modern education in the Arabspeaking world, and a model for the Ottoman Empire, of which Egypt was nominally only an outlying province.

After having destroyed the Mamluks [a.u.] in 1811, Muhammad 'All set out to establish the Nixâm djadid, his new army. For this purpose he started to send student missions to Europe to study various technical subjects, and on the other hand began to found new state schools, bypassing the traditional system of education. France and Frenchinen enjoyed - predominant influence in the modernisation of Egyptian education, at least until the British occupation in 1882. Therefore it is of interest to note that the first student missions, in 1809 and 1819, were sent | Italy (to Leghorn, Milan, Florence and Rome) in order to study military science, shipbuilding, printing and engineering. The foreign language which was taught in the first state school established by Muhammad 'All was Italian. Since about 1820, however, Italian influence was replaced by the French, and a group of French experts and educators gained oratral positions in Muhammad 'All's bureaucracy. The best-known of these was Colonel Sève, who as a convert to Islam became known as Sulayman Pasha. Sève organised the new army and the military schools. Indeed, the next missions were sent, mainly though not exclusively, to France. Thus the first large mission went Paris in 1826, with the famous educator and writer Shaykk Rifa'a Rafi' al-Țahțawi [q.v.] as its imdin and preacher. This mission included other members who later rose to prominence in the educational and administrative service of the Pasha. By the mid-1830s the first Egyptian graduates of the student missions were teaching in Egypt at the professional school and replacing the European teachers and in-

In 1816 Muhammad 'Ali opened a school in the Citadel of Cairo where some 80 students began to study military subjects, arithmetic and Italian. Four years later the school was moved to Aswām. It is significant that the students were some of Mandāks and other boys of Circasslan, Turkish, Albanian and Armenian origin, who were believed in be superior in martial qualities to the native, Arabic-speaking Egyptians. Turkish was the language of instruction.

The beginning of secondary education was also connected with the army. Since the kuttilb schools could not prepare students for the higner schools, a preparatory (tadihīti) school was established in 1825 at Kasr al-'Ayni with 500 students between 6 and 12 years of age. By 1833 the school had 1,200 students. The discipline and organisation at the preparatory

908 MASARIF

atory school, as indeed in the whole of Muhammad 'All's educational system, man military. The students were trained to join the naval, infantry, cavalry and engineering schools which were opened in the 1820s and the 1830s.

The first important institute of higher learning in Egypt the Medical School, opened in 1827 at the hospital of Abū Za'bal, its director for the next 22 years - Clot Boy, another Frenchman, who was in charge of public health and medicine in Egypt. It was again typical that although the Medical School was mainly intended to serve the army, its students were native Egyptians, who had studied at al-Azhar, unlike the students of the military schools properly speaking. Other schools of civilian character were opened in 1829-the School of Agriculture, the School of Pharmaceutics and the Veterinary School, All these schools fell within the jurisdiction of the Department of the Army, diman al-dishadiyya, but already in 1826 a Commission d'Instruction, a consultative body for the new schools was set up

within the divide al-dishadiyya.

The 1830s were the zenith of Muhammad 'All's career. His army became a huge lighting force which won victories and successfully challenged and threatened the Ottoman Empire itself. The growth and development of the army further stimulated the development of the school system. In that decade, the most important schools were founded and patterns for educational organisation and supervision were laid down. An impressive number of specialised, technical and industrial schools were founded. Among them were the short-lived School of Government Administration (1834), the Staff College (1836), the School of Chemistry (1831), School of Minerals (1834) and an industrial workshop (1839). The most important ones were undoubtedly the School of Engineering, Muhandis-khane (1834), and the School of Languages and Translation, Madrasal al-alsun wa 'Flordiams (1835). After a modest and apparently unsuccessful attempt to open a school of engineering in 1820, the Muhandis-khdne at Bulak was opened. The engineering school, modelled after the Coole Polytechnique of Paris, trained engineers and supplied mathematics and science teachers to the secondary and higher schools. The School of Languages me founded by al-Tahtawl and directed by him for many years. The students spent there five or six years studying French, Islamic jurisprudence and mathematics, among other subjects. This institute became an important translation centre, where many textbooks were prepared or translated from European languages.

The 1830s were also the period of laying the foundations for the modernised primary education. Muhammad 'Ali ignored the hutab schools; he actually weakened the traditional system by confiscating the auth foundations which financed it. From 1833 state primary schools (muhiadiyin) were opened in the capital and the provinces, and within three years were over 50 of them. The pupils, who were from 7 to 12 years of age, learned besides the usual religious instruction secular subjects also such as geography and arithmetic. The people were reluctant to send their sons into these schools, which they rightly regarded as an integral part of Muhammad 'All's system of recruitment into the army.

The administration of the schools was separated from the army, but it took some time to reach that decision. Colonel Seve was appointed in 1814 as an inspector general of the schools within the distinct distinctive, but later he had to devote all his time

to his military duties. In 1830 the Consoil supérieur de l'instruction publique, which in Arabic was inaccurately known as modilis shard 'I-makdtib, was established. It was a pedagogical body which was expected to coordinate the schools and the dimin aldishadivys. A committee was formed, and it prepared a comprehensive scheme for education in Egypt, providing for primary schools, two preparatory schools (one in Cairo and the other in Alexandria) and special schools. Finally, in February 1837, a separate department, independent in the diwan ai-dif-Addisyst, and in charge of the schools, was founded. It was called the diman al-maddeis, the Council of Schools, a term which was more correct than the bornbastic French term by which the department became known, Ministère de l'instruction publique. It in true, however, that the divin el-maddeis - the core of the future Ministry of Education. At first, the diwan al-madaris suffered from mismanagement, inefficiency and intrigues. In addition to its pedagogical functions, it was charged with construction (for a time it was called the Council of Schools and Construction) and with the publication of the Official Gazette (al-Waha'i' al-Misriyya). Initially, the dimin al-maddris was divided into three sections: Arabic, Turkish and engineering. The Delta Barrage and the engineering services were also attached to the diam's on account of their dependence on the Minhandis-khane.

The setback to Muhammad 'All's imperialistic ambitions by the Treaty of London in 1840 drastically curtailed the extent of the Egyptian army and caused the breakdown of the school system in the 1840s. In 1841, only | state primary schools remained. The special schools were affected too. The student missions abroad continued, however, and in 1844 a large mission which included several princes (and was called thereafter has hat al-andfal) was sent to France. In 1817, toward the end of Muhammad 'All's reign, a programme to establish popular elementary schools, reformed kultābs, called mahātib al-milla (in contradiction from the government primary schools, the mudiadiyan), was brought forward. It is probable that Ibrahim Pasha, Muhammad 'All's son and successor, took an interest in the project, but his reign was too short to accompilsh much and the reforms in the elementary education had to wait until the accession of Isma'll.

Education under Abbas I (1849-54) and Sasid (1854-63) - Educational development suffered a serious slowdown during the reigns of 'Abbas I and Sand. Although 'Abbas was me more interested than Muhammad 'All in educating the Egyptian people, the training of army officers and bureaucrats continued ou a modest scale. 'Abbās sent some 40 students abroad, this time mainly to central Europe. 'Abbas exiled al-Tahtawi to Khartum to organise an Egyptian school there. On the other hand, he lavoured and promoted 'All Mubarak (q.e.), an able administrator, reformer, and writer, who was to become a key figure in the development of education in the next three decades. Abbits weakened the Council of Schools and the educational system in general, but he was interested in the army and founded in 1849 the clite military school, al-Madrasa alharbiyya al-mafrasa. Of the special schools, only the medical school and the school of engineering rematited.

It is generally agreed that Sa'id's educational policy was erratic, and that he aimed in reversing his predecessor's decisions. Upon his ascession to the vice-regal throne, he abolished the

madāris and closed down all the schools within its jurisdiction. Shaykh ai-Taliţāwi was recalled from the Sudan, whereas 'All Mubārak was sent by the ruler to the Crimean War. Egyptian students were sent to France again. Sa'id's short reign was favourable to the development of foreign and missionary schools; by the end of his reign their number

reached approximately 60.

The period of Isma'll (1863-79) - During Isma'il's reign, educational activity was vigorously renewed under the able direction of European-educated administrators Ibrahlm Adham and 'Ali Pasha Mubarak. For the first time, education in Egypt becoming "public" in the true sense of the word, not limited to the task of training experts and technicians for army and the state machinery. Unlike Muhammad 'All, Isma'll made the kididhs the basis of the elementary education, and the walf funds used to finance them. Immediately after assumming power in 1863, Isma'll reactivated the Council of Schools (diwan al-madaris) which became in 1875 the Ministry of Public Instruction (Nasarat al-ma'arif al-'umdmiyya), with 'Ali Mubarak as Minister. Isma'll gave full support throughout his reign to the initiative of Mubarak and other progressive educators. In November 1867 All Mubarak presented a document which he had prepared with a committee of administrators and notables. This was the Radiab Regulation of 1284, la liket Radjob, which shoed at promoting elementary education by establishing provincial primary schools, which would be under government inspection and would be financed by wak/ and private contributions. The new regulations provided for the first time for a sort of pedagogical supervision of teachers. The curriculum of the elementary schools was in be somewhat modernised. Of course, many reforms remained on paper only for a long time to come, but scores of elementary schools meetheless opened and the principle of state control over all elementary schools was established. Mubărak also put an end to the confusion between civil and military schools and confined the authority of the dium al-madaris to civilian schools, fresing them from their military character. The provisions of the labihat Radiab were complemented by the regulations set down in 1880 by a committee, known as the konnisyon, which provided for three types of schools depending on the size of the community: villages, provincial towns and cities. Provincial authorities were empowered to collect contributions and fees from well-to-do parents and to use wak/s to finance schools.

Ismā'll's reign should be credited with introducing education of girls and teacher training. The only kind of female education before Ismā'll was the School of Midwifery which was founded in 1832. This school recruited its first students from among Sudanese and Ethiopian Negro girls, Egyptian girls being considered too delicate for that kind of work. The first school for girls, ai-Madiasa al-Suyūfiyya, was opened in 1873. In the following year it had 400 students, who studied general subjects as well

sewing and weaving.

The first teacher training school, called Dår al-Ulåm, the House of Sciences, was founded in 1872. It had already started in 1871 as a programme of public lectures for students recruited from al-Azhar to prepare them to become teachers. In the next year, it was organised as a regular teacher training college, where students studied religious and secular subjects.

The period witnessed the reopening of several higher institutions of learning which had been closed down by 'Abbas or Sa'ld and the foundation of new ones. Thus the School of Languages founded in 1835 but closed down in 1850 was reopened = 1868 under the name the School of Administration and Languages and later became the first secular law school in Egypt.

In the 1860s, mumber of trade and vocational schools were opened. Schools of land surveying, accounting, archaeology and hieroglyphics pened in the 1870s, together with preparatory schools. In 1872 the first reforms were introduced at al-Ashar. The missions continued and 175 students were sent, mainly to France. In Isma'll's time there was a tenfold increase in budget expenditure for schools. Owing to Isma'll's "open door" policy toward Europeans, his period was also one of unprecedented boom for the schools of foreigness, missionaries and local religious minorities. About 130 new schools

Beside the activities of the government, there were private societies and groups which worked for the promotion of education, such as the Society of Knowledge (diam'siyal al-ma'siri) formed in 1868, and the falamic Philanthropic Society (al-diam'siya al-hhayriyya al-islamiyya) which to founded in 1878 by the journalist-orator 'Abd Aliah al-Nadim for opening community schools, in order to counterbalance the influence of the missionary schools. Al-Nadim accomplished little, however, because of his involvement in the 'Urabi revolt.

Education under the British occupation the military occupation of Egypt in 1882, the British controlled the entire state machinery, including the Ministry of Education, Educational policy was perhaps the most criticised aspect of the British rule, since it was highly restrictive and conservative, due to financial and political considerations. Lord Cromer, who ruled Egypt from 1883 to 1907, considered the financial recovery of the country in his most urgent goal and spent less than 1% of the budget on education. Previously, almost all the schools were free; now students had to pay tuition fees. This made even the primary education, and certainly the secondary and higher education, élitist in nature. The British made some efforts to improve the kuttābs, turning them in 1916 into elementary (annality) schools, where nothing but religion and the three Rs were taught. The British intentionally hampered the development of secondary and higher education. They regarded the educational system as a means of training a limited number of Egyptian clerks who were to serve in the lower and middle levels of the bureaucracy, and were expected to carry out the instructions of the British policymakers. Cromer conceived higher education = undesirable, since it might lead to political agitation. Therefore the University was opened only in 1908 as a private institution and did not become a state university until 1925, three years after Egypt's formal independence.

Douglas Dunlop, a Scotsman who administered Rgyptian education under Cromer, did it in a rigid, centralistic and unimaginative manner. Strict discipline was imposed both on teachers and pupils. All studies continued to be geared to passing examinations. English was made the language of instruction in history, geography and the natural sciences. Learning by rote continued to be the main method of study. During the British occupation, Egyptian students were sent to study in England only. Whereas before the occupation students travelled to Europe to study mainly technical and industrial subjects, they

MASARIF

studied humanities and the law. This was in accord with the British policy to keep Egypt agricultural, not an industrial country.

Many of the higher institutes of learning were closed down, but a few new ones were opened, such as the School of Police and Administration in 1896, Veterinary School in 1902, a teacher training college for mean in 1904 and a College of Commerce in 1911,

As a gesture to maintain nationalist resentments, Sa'd Zaghlül [q.v.], the future nationalist leader founder of the Wafd party, was appointed Minister of Education in 1906. He enhanced the status of the Arabic language in the school system and exempted many poor children from paying tuition fees.

It is not surprising that the balance-sheet of British educational policy was poor. The illiteracy rate barely changed from 1882 (91.7 per cent) to 1917 (91.3 per cent). In 1914, 230,000 students were enrolled in the huttabs and only 14,000 in the primary schools. High schools of various kinds enrolled some 10,000 students. The number of students in foreign and private schools exceeded by far those enrolled in government schools. There was progress in the education of girls, but the majority of them were in private schools.

Education under the Monarchy 1922-52 — Although Egypt did not gain full sovereignty in 1922, control of internal affairs, including education, passed into Egyptian hands. During the next three decades, the educational system improved but did not free itself as yet from negative aspects of the pre-British and British inheritance, and further suffered from newly-acquired weakness. The Egyptian school system under the monarchy did not reduce illiteracy substantially, and in 1952 it stood at about 80 per cent, and was particularly high in rural areas and among women.

Article 19 of the 1923 constitution guaranteed compulsory and free elementary education; the compulsory education law, passed in 1925, provided for elementary tehools of six years, later reduced to five. In 1925 the Ministry of Education planned to universalize elementary education within 23 years. Although quantitative progress was achieved, with student enrolment rising from 809,000 in 1930 to 1,310,000 in 1950, the goal of bringing all children aged six to twelve to school has not yet been reached even by 1981, when only about three-quarters of the children ill compulsory education age were in school.

The Egyptian elementary school system was fragmented into several types of schools, a fact which was detrimental to the function of nation-building. and it did not provide equality of opportunity. In year 1925-6, elementary schools (madāris awarahyya) were opened to offer free education according to the 1925 law. These schools gave a six-year course (shortened to five years in 1930) and worked usually on a half-day, two-shift basis. The primary schools (maddels iblidd'iyya) charged fees. They had better physical facilities than the elementary schools and their teachers were better trained. Perhaps the most important difference between the two types of schools was that the curriculum of the primary schools alone included a foreign language (usually English), thus making it possible for the pupils to continue their studies secondary and higher education, while the elementary schools were terminal. In 1943 another kind of school was added—the rural elementary school (madrasa awwaliyya rifiyya), and special teacher training colleges were opened for them.

Beside the public schools, al-Azhar provided religious education 🔳 the elementary, secondary and higher level. Finally, there were the private and foreign schools, both religious and lay. In 1942-3 more than 25% of the elementary school pupils and more than 50% of secondary school pupils were in private and foreign schools. Their role was particularly important in the education of girls. The foreign schools were accused of educating their students in languages and cultures alien to Egypt. Private schools were sometimes accused of being more interested in financial profits than in the education of their students. In 1933 and in 1940 laws were passed which imposed stricter supervision of the state over the foreign schools. These schools were instructed to teach Arabic language and the religion of Islam to their Muslim pupils. After the 1956 Suez crisis, all foreign schools were either closed down or nationalised. The relative importance of the private schools had been declining since tultion fees were abolished in the primary schools in 1943 and in the secondary schools in 1951.

It should be noted that the fragmented and deficient nature of the Egyptian school system was criticised by leading educators and administrators such as Tābā Husayn and isma'll al-Kabbani in Egypt and Sati' al-Hussl in 'Isak, and steps were taken to make the system more just and less divisive and to make educational opportunities more accessible to all social classes. The abolition of tuition fees has been mentioned. In 1938 the teaching of English was postponed from the first to the second grade in primary schools to enable children to transfer from elementary to primary schools. Again in 1944, English lessons began only in the third grade. In 1951 a law was passed which aimed at creating a unified elementary school system of six grades. This was given effect, however,

only after the 1952 revolution.

The secondary and higher levels of education developed more quickly than the elementary schools. The number of students in the secondary schools increased from 2,500 in 1913 to 15,000 in 1933 to 122,000 in 1957. This growth created pressures on the university and also created the problem of many unemployed graduates. The familiar weaknesses of the secondary education, such as rote learning and overemphasis an examinations, were not cured. Secondary and higher education were regarded mainly as a means to enter government service. It is not therefore surprising that vocational and technical education were neglected and that their prestige was low.

Higher education also developed and was modernised to some extent. In 1942 the Farok I University (renamed in 1952 the University of Alexandria) was constituted. The Dár al-*Uliam, the old institute which trained Arabic language teachers, became in 1945-6 a part of the Fu-3d I University (since 1952 Cairo University). After earlier efforts to reform al-Azhar (1911), further steps were taken in 1936 in the same direction.

Educational administration in Egypt, as indeed in all the Middle Eastern states, was highly man trained, despite some efforts at decentralisation, especially after 1938, when the country was divided into educational zones. The Ministry of the Interior conducted the elementary schools of the provinces. As in Turkey, a Supreme Education Council meets periodically to discuss broad educational policy.

Developments since the 1952 Revolution — Even the most critical review of the educational policies of the post-1952 régime would admit that the main MAGRIF

weaknesses of the school system have been approached correctly and positively, although the good intentions have not always been realised in the desired time and manner.

The new regime succeeded in establishing a national, united and integrative school system. The basic laws concerning school reform were promulgated in the 1950s. Law no. 210 of 1953 provided for a unified elementary school of six years and a preparatory school of four years, later reduced to three years. Law no. 213 of 1956 established free tuition in all public education below the university level (tuition fees in the universities were abolished in 1963), and also abolished the examinations as a means for proceeding from one grade to another. Law no. 55 of 1957 established the preparatory school as an independent element of the cycle. Law no. 160 of 1958 abolished all foreign schools as such and turned them into private Egyptian schools.

After some experimenting and changes in the 1950s, an educational ladder of 6-3-3 emerged: An elementary school (madrasa ibiddiffyra) of six years, for the ages six to twelve, followed by a preparatory school (madrasa ifddifyra) of three years, and a secondary school (madrasa (fanawiyya) of three years. According to the new curriculum, the teaching of a foreign language was postponed to the prepara-

tory school.

The quantitative development has been fairly rapid. In the school year 1973-4 there were about 4 million pupits in the elementary schools, 2.6 times more than in 1952. The preparatory schools had a million students, three times more than in 1952; the secondary schools had 670,000, an increase of three times; and 334,000 students were enrolled in higher education, an increase of six times for the same period. Owing to the improvement in the implementation of the compulsory education law, illiteracy rate in Egypt has been declining, though an dramatically, from 80% in 1932, to 70.5% in 1960 and 36.5% in 1976. A decision to extend compulsory education to the preparatory school am group has been reached, but has not yet been put into practice.

The most important change in Egypt's school system has been the structural transformation of secondary education from an overwhelming general or academic education towards technical and vocational training. While all the Middle Eastern states are aware of the need to slow down the growth of general secondary education and to train technically skilled manpower, only Egypt has been able actually to realise that ideal. In 1952 only 15% of the secondary school students were enrolled in technical and vocational training. By 1971 the rate reached 52% and has risen to 55% in the early 1980s. Still, technical and vocational education in Egypt has serious problems of quality and status. In the general secondary education, about two-thirds of the students are in the science stream and only one-third in the literary stream, reversing the situation in the pre-revolutionary period.

Egypt has a well-developed system of teacher training for all levels, and all schools will be supplied with qualified teachers in the forseeable future. In some subjects (such as the social sciences) there is already a surplus of teachers, while in others there is a deficit, mainly in modern languages and technical training. Nevertheless, tens of thousands of Egyptian teachers work temporarily or permanently in Arab

and African countries.

Despite the fact that the majority of the secondary school students are channelled to the vocational streams for boys and girls, the pressures on the universities are growing rapidly. The universities are becoming increasingly overcrowded and understuffed, and suffer from insufficient space, libraries and teachers. In order to administer the admittance of secondary school graduates to higher education, all applications are processed centrally through "coordination bureau", which distributes students into the various faculties according to their grades and their preferences. The figures of the academic year 1979-80 are typical: 227,500 students sat for the final secondary school examinations and 133,000 passed. From these, some 80,000 were admitted to the universities, and the other 33,000 proceeded their studies in the various institutes for higher learning.

During the 1970s, considerable afforts at the decentralisation of higher education were made. The universities were granted a measure of independence. Many regional universities were established, some of them new, others as branches of existing

universities.

Between 1961 and 1976 Egypt had, in addition to the Ministry of Education, ministry of Higher Education in charge of the universities, higher institutes, student missions and the like. In 1976 it was amounced that the Ministry of Higher Education would be abolished and its responsibilities would return to the Ministry of Education. It should be pointed out that the Higher Council for the Universities, 2 body which lays down the national policy concerning the universities, has wide powers, and many have rendered the Ministry of Higher Education redundant.

iii. The Arab States of the Middle East

There are marked similarities in the development and the problems of the educational systems of the states of the Ottoman Empire, despite local differences. The most important common features - the Ottoman heritage, the Arabic language and Islam, which is the religion of the overwhelming majority of the people in the region. The traditional Islamic education of the kullab was still widespread towards the end of the Ottoman period. The reforms of the 19th century and the beginning of the 20th century had their impact on the Arab provinces as well. A few modern government schools were opened there, and a small number of their graduates continued their studies in the civil and military institutes of learning in Istanbul. The government schools, however, did not offer education. to the Arab population at large, but admitted mainly children of Turkish army officers and officials, as well as children of provincial notables. After the Young Turk Revolution, the pace of educational reform accelerated in the Arab provinces - well as in Turkey. Many new schools were opened in Trak, Syria, Palestine and Libye. The policy of the new Ottoman government of making Turkish the medium of instruction in the state schools in the Arab provinces clashed with the aspirations of the Arab nationalists, who insisted on the right to teach in Arabic. The Arab nationalists' struggle bore some fruit, especially in 'Irak and Palestine. The Ottoman authorities agreed, as a concession to Arab sentiment, to open some new schools (such as the Arab College in Jerusalem) where Arabic was to III the language of instruction and to allow the **m** of Arabic in the lower secondary schools, except in history and geography lessons. The higher secondary schools, the sulfaniyyes, retained their Turkish character in most cases. Yet the period of reforming the schools in the

912 MAGARIF

Arab provinces in agreement with the Ottoman government was short and was stopped by the First World War.

In the interwar period, most of the Arab successor states of the Ottoman Empire were subject to European domination in varying degrees.

Libya was occupied by Italy from 1911 until 1943. During that period, the educational system was controlled by the Italians, and Italian became the medium of instruction in state schools after the third grade. From 1943 until 1951, when Libya became independent, the British administered the educational system in the Libyan provinces of Tripolitania and Cyrenaica and the Franch controlled the province of Fezzan.

In Palestine, which became a British mandate, the Arab school system was controlled by the Department of Education whose director was always British. There were in the system some Arab inspectors and administrators, but they did not make the educational policy. The British influence on Arab education in Palestine was very strong; the standard of English required for the Palestine Matriculation examination was high, but as a result led to the emergence of an elite of Palestinians with a high level of education and culture.

Transjordan was also placed under a British mandate until 1946, when the state became independent. Unlike other Arab states, Transjordan did not experience political struggles, and the transition from British control to purely Arab administration was smooth. Thus the Jordanian educational system had all the benefits from British assistance and advice without the tensions of other Middle Eastern countries. This possible because of the rudimentary and primitive conditions of the Transjordanian school system at that time.

Trak also was placed under British mandate until 1932, and the school system administered by the British after 1925. However, the country enjoyed a large extent of independence and developed her education in a national spirit, although the school system was influenced by British teaching methods. In the days of the mandate, a British adviser was attached the Ministry of Education but the office was abolished prior to the termination of the mandate. Leading Irakl educators were influenced by British, American and French methods of education.

Under the French mandate following IIII First World War, education in Syria and especially in Lebanon underwent = extremely strong French influence, both in organisation and curriculum. The Ministry of Education in Lebanon was established in 1928 and replaced the High Commissioner's Service de l'Instruction publique, but the Franch advisers could still interfere in the policy of the Ministry of Education. Only after Syria and Lebanon attained their independence, and especially after the withdrawal of the French troops in 1946, were they able to assume full control over their educational systems. In Lebanon, the French character of the educational system was retained; the French educational ladder was not changed with the termination of the mandate, and the Lebanese system is still outstanding in the area in its close resemblance to the French model. Upon the attainment of independence, important decrees meducation were issued, the foremost among them being that Arabic became a compulsory language; that the teaching of national subjects, such = the history of Lebanon and the geography of the Middle East, was made compulsory; and that schools could choose English as a first foreign language instead of French.

On the other hand, Syria changed the nature of her education as soon in the French left. Under the mandate, French advisers had been attached to the Ministry of Education, and in Syria too French influence was spread by the teaching of French in schools and through French private schools. Now all traces of French influence were removed from the educational system, and the teaching of inforcing language was postponed to the intermediary school.

Upon the establishment of the Arab states after the First World War, their governments showed that they were aware of the importance of education a factor in nation-building and as a tool for progress. It was in the interwar period that illiteracy was first faced as a national problem. The first reliable educational statistics in the Arab world date from that period.

Whereas the traditional educational system was considered a religious and communal matter of no concern to the state, now, on the contrary, the new nationalist government education was regarded another agency of the state rather than as an integral part of community life. This feeling was partly justified by the highly centralised nature of the Ministries of Education in all the Arab countries. The Ministry exercises almost unlimited powers over the school system. It determines curricula, acts as a publisher of textbooks, administers public examinations, constructs or supervises the construction of schools, trains, appoints, transfers, promotes and dismisses teachers, and finances all educational activities. According to Ottoman education laws, village communities were responsible for the construction of the school buildings. Nevertheless, the idea of municipal initiative, control, or financing of education has not yet taken root in the Arab world,

There is a marked uniformity in the structure and organisation of the Ministries of Education in the Arab states. The Minister of Education, who is a cabinet member, is assisted by Director-General. The Ministry functions through departments for elementary education, secondary education, vocational and technical training, teacher training, curricula and textbooks, personnel, statistics, etc. The country is divided into education districts, which are identical with the administrative division of the state. In each district there is a bureau of education, which is a miniature copy of the central Ministry in the capital. Generally, the regional directors of aducation have little independence; they are charged with implementing the decrees issued by the Ministry and have to report local problems to the capital.

Most of the school systems in the area are administered by the government. After attaining independence, the Arab states started to impose much stricter control over the numerous private and foreign schools which had been established and flourished under the protection of the European powers. Now the Ministries of Education demanded that the national subjects be taught at the private schools in Arable and by citizens of the host country. The closer inspection of the private schools and progress in the implementation of the free and compulsory education caused the proportion of pupils in private and foreign institutions to decline, especially in the primary stage. Even in Lebanon, the only country in the Middle East where private education is more important than state education, the weight of state education has been growing. Under the French mandate, a state elementary school system emerged; it served mainly the Muslim population, which was less attracted to the private Christian institutions. A state system of public secondary schools started to develop after 1949. Total anabisation of the school system will emphasised as an expression of national sovereignty. Nevertheless, minorities were allowed to use their language in their schools, as demonstrated by the Traki Local Languages Law of 1931 which provided for the use of Kurdish and Turkish as the medium of instruction, with Arabic as a second language, in the regions where these minorities constitute in majority.

The need to train teachers was one of the most urgent tasks facing the Ministries of Education. The teachers in the state schools are government employees. Since they are chronically underpaid and their opportunities of promotion in limited, the teaching profession below the university level does not attract the best was and women, and the social status of the teachers is lower than it was in past generations. Until the 1950s there were multiple ways and levels in which teachers were trained in the Arab world, ranging from courses lower than the secondary school up to two years above the secondary school. In recent years, with the tendency to standardise the educational levels and methods in the Arab world, the most common teacher training college begins after graduation from the preparatory or intermediate school and lasts four or five years. In recent years, with the rapid growth of higher education, the training of teachers for secondary schools is entrusted to the university schools and faculties of education. In the interwar period, all the Arab countries suffered from shortage of trained teachers; only Egypt and Trak came near to self-sufficiency. Recently, this situation has improved considerably, but there is still a shortage of teachers for certain subjects (mostly foreign languages, the sciences and technical training). Generally, the teacher shortage worsens as one goes higher up the educational ladder.

The most formidable problem with which the education authorities have had to cope has been the widespread illiteracy, which reached 80-90 % of the population in most countries of the region in the interwar period. Since adult literacy campaigns have not been efficient in the middle East, the main burden me placed on the elementary schools. Generally speaking, the principle of free elementary education was accepted throughout the Arab world at an early stage. Yet the idea of legislating for compulsory school attendance has been put forward only in the last three decades and has by no means been universally accepted. Lebanon, which is one of the most advanced countries in the region educationally, has no compulsory education law. In several educational laws, references to compulsory education are qualified. Compulsion has applied to those areas where facilities existed (for example, the Transjordanian education regulation of 1939 and the Traki Education Law of 1940).

In the mid-1940s, the proportion of children who were in school from the elementary school age group was still limited. Lebanon had the highest attendance rate of 72.7%, followed by Palestine (Arab education only) 51.6%, Egypt 47.4%, Syria 39.4%. Transjordan 28.0% and 'Irak 20.0%. Since that time, the primary school attendance rates have been improving constantly, in spite of the rapid population growth in the Middle East, which ranges between 2.5% to over 3% annually. According to a survey of all the Arab states (including North Africa) conducted in 1969-70, 60% of the children in primary

school age (between six to twelve years of age in most countries) were in school. That rate increased to 69% in 1974-5. By 1981, 100% attendance rates at the elementary stage (or, in fact, more than 100% in some countries, due to numerous over-age students) have been reached in Jordan, Lebanon and some of the Gulf states, and the rates mining over-where.

Jordan and Kuwayt have already extended by legislation the compulsory education stage to apply also to the intermediate school. Other countries, including Egypt, are contemplating doing the same, but will probably do it officially only after reaching full or nearly full attendance rates at the elementary

Again, the difficulties in bringing all children to school are similar in the Arab countries, although their severity varies from one country to another. It is difficult to provide education for bedouin tribes or for small and remote villages. The realisation of the importance of education was not universal a few decades ago. Parents have been reluctant to send their daughters to school, especially after puberty, as they regarded this as contrary to traditional morality. Until today, the illiteracy rate among women is higher than among men and the percentage of girls who attend school is lower than that among boys; this is particularly true in the countryside. Many parents refrain from letting their children go to school because they need their help in the field, the workshop or m home. This tendency has been strengthened by a widespread feeling that the curricula taught at school - unsatisfactory and irrelevant to the needs of the community. Besides, there are not enough qualified teachers. Another problem is a severe shortage of classrooms, and many classes are lodged in cented rooms. Schools often operate in two m even three daily shifts because of scarcity of space. Many children do not enter school at all, and many pupils fail to graduate. Children who leave school after a few years relapse into functional illiteracy. Of course, some of the shortcomings were in the past caused by lack of funds. This factor has been fundamentally changed in those countries of the region which have large incomes from oil, although it has made its notable impact on education only recently. Yet, generally, some of the above-mentioned difficulties have been alleviated recently, and education in the Arab world has been making a qualitative as well as a quantitative progress. The beginnings of systematic planning of national education by the Arab states, including five-year-plans, belong to the 1960s, and have helped to clarify the problems and to approach them more efficiently.

Although demand for secondary education has been growing rapidly, the elementary school is still terminal for some 70-75% of the pupils in the Arab world. The promotion from the elementary to the secondary (or intermediate) stage is determined by passing external examinations, except in the few countries which have made the intermediate stage compulsory. In the interwar period, access to secondary education was extremely limited. Usually, there were no secondary schools outside the towns, and although there were dormitories attached to a few schools in the cities, the vast majority of mi population which was rural was deprived of post-primary education. Besides, tuition fees were a serious barrier for poor students, although there was some exemptions in the basis of good grades in financial need, By 1950, tuition fees in the state secondary schools had been abolished throughout the Middle East, and in the 1960s the universities, too, became free

944 MACARIE

of charge. The popularity of secondary aducation about be partly ascribed in the fact that it is considered in gateway to higher aducation and then to a government post. Another motivation for study a secondary school in exemption from military nervice or the possibility of service under favourable conditions in some countries.

The weaknesses of the secondary education are well-known, and are in fact an inheritance from the pre-modern period: the overemphasis on rote learning, discipline, examinations, the heavy load of subjects to be taught and frontal lessons. Most of the secondary schools in mi region are not equipped with sufficient libraries, laboratories and playgrounds. Secondary education has been overwhelmingly academic; vocational and technical education have been neglected or even looked upon with disdain, In the recent two decades, official attitudes toward vocational and technical education have been changing, but among the Arab states of the Middle East, only Egypt has accomplished a structural change in secondary education by channelling over half of the students into technical and vocational schools.

In the first of their independence, the aducational ladders in the Middle East differed widely from one Arab state to another. The school system was influenced both by the elements inherited the Ottoman Empire, which on their part had shaped by the French model, and by the example of European mandatory powers. Since the end of the Second World War, the Arab educational systems have well drawing closer to each other, and efforts have been made m coordinate the curricula, the organisation, and the terminology of the educational systems. Egypt has been the object of emulation and has set the example for many reforms, owing to her central position in the Arab world and culture. Thus today the educational ladder # 5-3-3 is the most common pattern in the Arab world, although there have been other variations, such as 🛅 Lebanese pattern, Kuwayi (4-4-4), and firsk (6-3-2). There also differences in the curricula, mainly in the teaching of foreign languages and religious instruction. There is a tendency to postpone the teaching of the foreign language to the intermediate school. Yet in Lebanon, Jordan, 'Irâk and South Yemen, It is taught in the primary school. Sa'udi Arabia and Sudan devote more hours to the teaching of Iglam than other Arab states.

Occasionally, conferences are held to discuss and coordinate educational and cultural policies of the Arab countries. Thus in 1947 a convention was im Lebanon to coordinate methods of teaching Arabic. In 1957 the important Agreement of Arab Cultural Unity was signed by Egypt, Syria and Jordan, and was joined in year later by 'Irak. The agreement called for coordination of the school systems from all the cultural, pedagogical and organisational aspects. Over the years, various inter-Arab conferential and conventions have been held which have dealt with the teaching of civics, textbooks, examination, educational planning, the teaching of the sciences, illiteracy, etc.

Bibliography: The bibliography in the history of education in the Ottoman Empire and its successor states is vast and of greatly varying quality; it is accordingly impossible to try to give anything resembling an exhaustive list. The best sources for the current educational developments in the area are the official reports and publications of the Ministries of Education and reports

and studies prepared by UNESCO and by other regional and international organisations.

2. In North Aprica

A. Tunisia. Since 1840, with the foundation of the École Polytechnique of the Bardo, a trilingual instruction (in Arabic, French and Italian) was provided, shaping the scientific and technical education of the armies of the Bey, ruler of the Regency of Tunis. But it was above all after 1875 that a bilingual and bi-cultural instruction in Arabic and French was available through the founding of the

Şādiki College [q.v.].

With the establishment of the French Protectorate (12 May 1881), public education took shape with the following features: (1) diversity (at primary level, French schools, Franco-Arab ones, modern Kur'anic schools and traditional-type ones; at secondary level, purely French-type lycées and colleges, institutions or classes giving a bilingual "Sādiki" education, and traditional Zaytūna education); (1) French influence (Arabic was treated as a foreign language, except at the Şidiki and other institutions, and all references to the Arab-Islamic national heritage excluded, or largely excluded, from courses given); and (3) a disequilibrium between the schooling of European and Tunisian children (in 1949, 94% of French children in primary education and 12% of Tunisian Muslim ones; admittance of Tunisians to primary education only (in 1953, secondary education comprised 5,661 French children out of a French resident population of 14,500 and 6,682 Tunisian Muslim ones out of a population of ca. 3 millions, the theoretical plan for education of Lucien Paye, the last Director of Public Education under the Protectorate, not having been put into practice).

After independence (20 March 1956) and the proclamation of the Republic of Tunisia (25 July 1957), from 1958 onwards President Habib Bourguiba has tried: (1) to replace the legal chaos and the instructional diversity with a unified system which has its own Tunisian character, Tunisia being a "Republic whose language is Arabic and whose faith is Islam"; and (2) to give public instruction (altallim al-fumions) the character of a national aducation (al-tarbiya al-kaumiyya) adapted to the variety and the evolution of economic, social, technical and cultural needs of the nation, taking into account demographic increase, and aiming ultimately at education for all, opening out on to the external world, and responsive to scientific and technical changes and developments. This was the reform of 1958 ("A new conception of teaching in Tunisia"). After this first period of reform (1958-68), and after a series of interventions, primary teaching has been completely arabised—French being studied a foreign language from the 4th year onwardswhilst in secondary teaching, the humanities, including philosophy, are taught in Arabic. At the level of higher education, a step towards the arabisation of the humanities has already **made**, and there are even fectures at the Medical Faculty of Tunis in Arabic.

With a percentage devoted to it in 1968 of 9% the GNP and in 1980 of at least 8%, and with a third of the state budget, expenditure on education in Tunisia surpasses all that recorded for other countries (1968-9, in the USA and Natherlands, 6.5% of the GNP, and in the Communist countries, between 4 and 6.5%). The goal of universal education is in view. In primary education, there were in 1955-6 209,438 pupils (out of a population of 62, 3.5 million); 1965-6, 717,093; in 1975-6, 920,924; and in 1981-2, 1,071,000 out of a population of 6.5 million). If secondary education students (over 300,000) and those in higher education (more than 30,000) are added, a total of 1,400,000 is reached (about 7 Tunisian in 5 is at school).

However, the problem of quality remains outstanding in the framework of Arab-French bilingualism: in the first place, the process of apprenticeship of the French speaker gives him a privileged place at the outset in acquiring competence in cominunication through language expression (aptitude at varying the message according to psycho-social-cultural conditions) in connection with purely linguistic communication (skill in transmitting a message orally or by means of writing in accordance with the rules of the languages). Hence the option of keeping up Arab-French bilingualism, 25 years after independence, forms part of a project concerning with general culture: (1) primacy for Arabic ("the language which expresses the Tunisian cultural identity and authenticity"); and (2) the opening-up of the educational system on the problems of development defined by the Fifth Plan (1977-81), the aims of educational policy being to favour the development of education, alter the orientation of primary teaching, improve its quality and its impact by developing the child's personality, thereby ensuring for him at one and the same time an intellectual and a manual training (this latter orientated towards the industrial and agricultural techniques built into the teaching), reduce losses of pupils and the inequalities of fortune and fate, and thus facilitate the integration of young people into the economic life of their home districts and regions.

Yet this attachment to French language and culture has always provoked debate between the supporters and opponents of bilingualism simu independence. The problem of arabisation (fairlb) has always stirred up controversy, sometimes violently, and has released religious, political and philosophical passions, as it endeavours to make some people realise their "linguistic, and even cultural, mutilated state". A process of acculturation is felt to be at work here: (1) the French language considered as one which is widely-spread through the world and one which gives access to a culture with a universal, scientific and technological characterpresents itself as a strong rival to Arabic, the bearer of deeply-rooted values, and seen as the language of communication and of liberation; and (2) the two cultures, Arabic and French, express a class antagonism between the comfortably-off classes and the and a confrontation between modernism and traditionalism.

Tunisia, an Arab and Muslim country, is nevertheless trying to realise its authentic genius in the midst of modernity by of a system of unified and general education (a "national" system for the masses and not one of "public education" for MASĀRIF

the élite, since "primary education is a right for everyone, secondary education is a necessity, and higher education meritorious"). Lengths of the stages of education: primary, 6 years; secondary, 7 years (3 years of a common core and then three branches leading to baccalaureates in letters, mathematics and sciences or mathematics and technology); and higher (decentralised: sectors for the basic sciences, the medical and biological sciences and the human and social sciences, totalling in 1981 53 units, sc. Faculties, Schools and Justitutes).

B. Algeria. On the morn of independence (5 July 1952), the educational system inherited from the colonial period (sc. the French system as it existed before 1968) was kept in being, like all the other institutions which men not contrary to national sovereignty. Under the stimulus of a Ministry of National Education, this system slowly evolved and then changed radically after 1970. The slow period of evolution consisted mainly of an adaptation

of the content of syllabuses (concentration of studies on Algeria), the gradual algerianisation of the teaching personnel (accompanied however by a massive appeal for co-operation from other Arab countries) and the arabisation of a certain number of sectors: the first two primary education years in 1966 and then the higher classes, with the preservation of the teaching of a foreign language from the third year onwards, immediate arabisation in secondary and higher education and the opening-up of official channels in the Arabic language.

In 1970 a fairly important change took place. The Ministry of National Education was split up into a Ministry of Primary and Secondary Education and one for Higher Education and Scientific Research. At the side of these two there was set up a Ministry of Basic Education which started to put into effect a parallel system of education, but one completely

arabised.

In 1977-2 higher education was completely reorganised. The essential preoccupations of the Algerian government which lay behind this reform were the following: "to form the type of cadres of which the country has need, a cadre eagaged in the work of socialist reconstruction and filled with the Algerian national personality and the socioeconomic realities of the country. From this follows the new shaping of the subjects of teaching and educational qualifications and their integration within educational frameworks based on job needs defined by the sectors requiring these skills. A student must accordingly be directly operational", The organisation of these subjects of teaching was inspired by what existed in certain western countries and those of the East: IIII substitution in place of annual curriculum structure of a system of semesters, units of teaching (modules) and the consequent institution III continuous control of courses. The application of these reforms got under way only with great difficulty. Moreover, it required the recruiting of a considerable number of assistants, often at the expense of quality. The establishment of courses of instruction in Arabic parallel to and not instead of those already being carried on in French developed extensively in this period. This distinct monolingualism has not been without serious consequences for the cultural unity of the country.

In regard to primary and secondary education, the system was extensively remodelled in 1977 (by the application of law no. 7635 of 16 April 1976). Henceforth it was to be made up of three levels: preparatory, basic and secondary. The basic school, a fairly original concept, had as its aim the providing of a basic education for all, compulsory and lasting nine years (up to the third grade class of the old system). In order to get the system into operation aquickly as possible, the ministry in charge of this sector of education was in 1981 divided into a Ministry of Basic Education and Instruction and Secretaryship of State for Secondary Education.

The lack of personnel at the teaching level has led to the extensive establishing of a grade of elementary (Brevet élémentaire) teachers (instructore) or of a grade a little below this (monitors). This last group made up 41% of teaching personnel in 1965. By 1976 it was only 14.8% and had disappeared totally in 1977. On the other hand, because of the drive towards homogeneity in education, non-state education (secular and confessional) was integrated with public education (Eur'an schools, madrates and theriyas in 1963, private education in 1977). In same year, all the institutions within the

Jurisdiction of the original aducational system, which was dissolved, were integrated in the Ministry

of Primary and Secondary Education.

Other forms of education have also been made possible by other Ministries, who have started "institutes for technology" or institutes for higher studies in order to provide trained personnel for their man needs. A Ministry for Professional Education has been in being since 1981.

The growth of those undergoing education has been rapid and great since 1962, at all levels, as the

following table shows:

Informations statistiques, Ministry of Education, Years 1976-81; Bulletin statistique, no. 11 (1981-2), Ministry of Education and Scientific Research; L'Enseignement supérieur et de la recherche scientifique, Problèmes actuals et perspectives d'avenir, Algiers, OPU 1978; al-Ta'rib fi 'l-Diazd'ir (L'arabisation en Algerie), Ministry of Primary and Secondary Education, Algiers 1975; L'Ecole fondamentale, Algiers, ENET. (A. HADJ-SALAH)

C. Morocco. In its modern form, publiceducation in Morocco dates from the colonial period. During the 44 years of the Protectorate (2922-56), the

	Oct. 1962	1971	1977	1981
Elementary	277,636	2,018,091	2,782,044	3,118,827
Middle and secondary (general and technical)	82,937	236,882	612,229	1,029,884
Higher	2,725	24,334	54-547	78,027

In 13 years (1963-76) the number of schools has almost tripled; In October 1962 there were 2.759 and in 1976 7.798 (classes in practice: 46,529 in 1976 with the Introduction of the double vacation). Teachers in primary and secondary schools from 19,908 in October 1962 to 129,618 in 1981. The same picture obtains in higher education: from 282 teachers, of whom 82 — Algerians, in 1981 there were 9,778, of whom 7,018 were Algerians.

Like most the Third World countries who have recently achieved independence, Algeria had a fairly large number of illiterates (5,947,000 according to the 1966 census, i.e. about 80%). The number of Algerian children not at school was cuisiderable, and the Algerian students registered at the University

of Algiers was not more than 500.

After 20 years, Algeria has certainly accomplished work which, though still unfinished and full of flaws, is nevertheless positive in its results. More than one-third of the state budget goes annually education and training. All children are in the process of being placed in schools despite an unprecedented demographic rise (the population has doubled in 20 years). Twenty-one towns either have or are on the point of getting a university muniversity centre. Two thousand medical doctors are

French authorities progressively installed, at the side of the traditional network of Kur'anic schools and mederses, an assemblage of educational institutions intended to further the "mission civilisatrice" of the metropolitan power whist at the same time respecting the particular genius of Moroccau society, following Marshal Lyautey's intentions. But the concrete results of the colonial educational policy were far removed from this noble ideal. The system of modern education introduced by France into Morocco was essentially élitist and brought into the local context a completely alien culture. This explains why the right to education for all was one of the main demands of the nationalist movement.

The attainment of independence in 1956 was marked by a great popular movement in favour of education. Literacy campaigns sprang up spontaneously all over the country, and the new Minister of Education succeeded in getting into school in October 1956 five times as many children as the Protectorate authorities had accepted in the preceding year. This date accordingly marks the real birth of modern education in Morocco.

Efforts to develop the public education system found their justification in a double conception of education's rôle, seen from one aspect as a funda-

trained each year, together with a good number of engineers and higher technicians.

Bibliography: I. Khenniche, Description du système d'enseignement, in Cahiers du CREA Aiger, no. 4, 1-73; La refonte de l'enseignement supérieur, Ministry of Higher Education and Scientific Research, Algiers, Imprimerie officielle, 1977;

mental right enshrined in the constitution, and from another as a powerful factor making for economic and social progress. This is why education and the training of cadres always had priority in the development plans successively introduced after 1960.

These long-term development objectives were given effect through the choice of four principles for action which guided the Moroccan government's educational policy after independence: making attendment with school available for all children of appropriate age; unifying the different types of schools left behind by the colonial power; the arabisation of curricula and the language of instruction; and the moroccanisation of the body of teachers.

The results obtained after magneter of a century of massive investment in the educational sector are impressive, as the following table of the school envoluments shows:

These figures demonstrate the size of the financial resources devoted by the state to public education—almost 25% of the annual budget—which have enabled the transformation of the embryonic educational network inherited from the Protectorate into a vast and complex system.

The present educational system, whose structure is to m considerable extent modelled on the Franch one, comprises three levels. Primary school lasts for five years and accepts children from the age of seven. This first level is completed by a nationally-organised examination (the cartificate of primary education) which gives access to the following level.

Secondary education is itself divided into two stages. The first four years, forming the first cycle, are common to all pupils. Then at the end of this, specialist educational advisers divide the children, according to their aptitudes and wishes, into differing channels of the second cycle. The fifth year of secondary education offers two options of general education (scientific and literary) and two technical (commercial and industrial studies). In the aixth and seventh years, the choice is nor more varied, with a spread six channels, each one leading to a distinct type of baccalawreate.

Higher education comprises two groups of institutions. In the universities, which are controlled by the Ministry of Education, students - follow the usual groups of studies, such as arts, law, economics, science and medicine. At the side of this channel of classic university education, which go % of students of higher education follow, there exists a complete network of specialised schools and institutes of higher education functioning under the control of different technical government departments and aiming at training engineers and the middle management grades which will work in the public and semi-public sectors. Among the most important of these are the Mohammedia (Muhammadiyya) School of Engineers, the National School of Public Administration, the National Agricultural and Veterinary Institute, the National Institute for Statistics and Applied Economics, the National Institute of Posts and Telecommunications, the Higher Institute of Commerce and Business Administration, etc. There further exists a certain number of pedagogical institutions (regional schools for primary teachers, regional pedagogical centres and teacher training colleges) intended to prepare Moroccan teachers in order to replace foreign mstructors, especially in the scientific disciplines.

Considerable progress had been made towards arabisation. All literary topics are taught in the official language. The arabisation of scientific courses on the way to completion at the primary level, and will be progressively extended to the secondary and higher levels.

From the legal aspect, it should be strested that school attendance is compulsory till the age of 13 and that education is free at all levels. Moreover, over the last 12 years or so, the government has adopted

policy of granting very generous scholarships for the large majority of students of higher education.

Nevertheless, despite these very positive results, the Moroccan education system has for several years gone through a severe crisis of development whose main components can be set out in the form of three paradoxes with interconnected effects. In the first place, despite a great increase in public expenditure on education and in the number of children enzolled in the schools, making primary education general remains a distant ideal because of the population growth (3% per annum). In the second place, a significant share of the resources devoted to the educational system is wasted because of the high rate of those having to repeat courses = abandoning them altogether. Finally, educational planners find themselves faced by a lack of correspondence between the "products" of the educational system and the employment needs of the labour market, above all in the scientific and technological fields.

The sum total of these difficulties which the Moroccan aducational system has come up against, like those of many other young countries of Africa and Asia, has led the authorities in the Ministry of Education to prepare at the present time a long-term reform programme which will allow the Moroccan educational institutions to be better adapted to the needs of a changing society and to enable them to play a more positive rôle in the country's develop-

ment process.

Bibliography: A detailed description of the Protectorate's educational policy is given by the Directorate of Public Education in Morocco in its Bilan 1945-50, Rabat 1950. A more analytical treatment has been made by L. Paye, Enseignment et societé musulmane. Introduction et évolution de l'enseignement moderne au Marce, thèse d'état, Paris, Sorbonne 1957; see also the section on this topic in Ch. A. Julian's Le Marce face any

imperialismes, Paris 1979.

The main research works on Moroccau public education since independence those of A. Motassime, Tendances actuelles de l'enseignement au Maroc et problèmes d'orientation soulaire. Contribution à l'étude des problèmes actuels de Péducation au Maroc, pays du Tiers-Monde, thèse de 3º cycle, Paris 2070; A. Mezouar, Enseignement supériour au Maroc et développement, Mémoire de DES, Casablanca 1977; J. Salmi, Educational crisis and social reproduction: the political economy of schooling in Morocco, Ph.D. thesis, Univ. of Sussex 1981, Various more descriptive articles and studies should also be mentioned, including Montassime, La politique de l'enseignement au Marge de 1957 à 1977, in Maghreb-Machrek, no. 79 (Jan.-March 1978), 29-54; C. Tibi, Politique éducative et financement de l'éducation au Maroc, Institut International de Planification de l'Éducation, Unesco, Parls 1976; A. Baina, Lo système d'enseignement au Maroe, Casablanca 1982; M. Merrouni and M. Souali, Question de l'enseignement au Maroc, in Bull. Economique et Social du Maroc, quadruple no. 143-6 (1982), which has a very complete bibliography. The most useful of the regular publications are Le mouvement éducatif ax Maroc prepared each year by the Ministry of National Education; Attadriss, a twice-yearly educational review published by the École-Normale Supérieure, Rabat; and the cultural chronicle on Morocco which appears each year in the Aunuaire de l'Afrique du Nord, Aix-en-Provence.

(J. SALMI)

3. IN IRAM.

Before the appearance of secular education in Iran, what primary education there was was essentially that in the makiabs or kuitābs [q.u.], where children from the age of six or so learned the rudiments of reading and writing, Islamic religion and some arithmetic. These makiabs, as small-scale, informal, locally-organised institutions, continued to exist in the small towns and villages of Iran till after the Second World War, although after 1925 they had to use Ministry of Education textbooks.

Organised higher education may be said to go back the pre-Islamic medical school and hospital at Diundishapar in Ahwaz [see Gondeshapar], but under Islam, the madratas [q.v.] took over the function of higher religions education, tending, however, in the Safawid period to become exclusively centres for the training of the ShIP clergy, so that by the end of the 19th century, there was virtually awareness in Iran of the modern intellectual and scientific progress of the West, and little attention was paid also to the rich heritage of classical Islamic scientific and secular literary production.

The impetus for the acquisition of modern Western science and technology began to be felt by the leaders of Iran under the Russian threat to the northwestern provinces of Iran early in the 19th century. 'Abbās Mīrzā [q.e.] the enlightened Kādjār crown prince directly concerned with Iran's defence against Russia, and his able minister Mīrzā Buzurg Kā'īm-i Makām [see Kā'īm-i Makām-i Farārān'i], tried to modernise the Iranian army; he told the British envoy James Morier in 1809 that "No pains have been spared to acquire m knowledge of military tactics and theory of fortification which they had gleaned from French and Russian books translated by 'Abbās Mīrzā's order" (see A. K. S. Lambton, Persian society under the Qājārs, in IRCAS, xlviii [1961], 123-19).

Negotiations with the embassy sent by Napoleon under General Gardane in 1807-9 (see R. M. Savory, British and French diplomacy in Persia, 1800-1810, in Iran, 1817-8, x (1972), 31-44) for training the Iranian army included the project of sonding 200 Iranian students to study in France, but this project never materialised. In 1811 and 1815, seven students sere sent to London for training, and this was the first attempt by the state to acquire an element of modern science and learning through sending students abroad.

Modern Western-type of education dates from the establishment of the Dar al-Funds, the term being a rendering of "école polytechnique", in 1851 [see DJAMI'Al. In 1848, Nāsir al-Din Shāh began his reign and immediately appointed Mirza Taki Khan, later called Amir Kabir (q.v. in Suppl.) as his minister. Amir Kabir ushered in many reforms, and prepared a project for the establishment of a modern-type university, mainly to train expects for the array and the higher echelons of the civil service. He started on the necessary building will engaged a number of professors from Austria for it. The university was inaugurated by the Shah in 1851, only a few days after its initiator, Amir Kabir, had fallen from power. The Dar al-Funda was a combination of a military college and a secular university. Branches of study comprised infantry, cavalry and artillery sciences; medicine, physical sciences, mathematics, pharmaenlogy, cartography, history, geography, and the Porsian, Arabic, French and Russian languages. In addition to the Austrian professors who were engaged for six years, a number of European experts already in the service of the Iranian government were

assigned to teaching poets, as well as a number of native Iranian scholars.

For the first year, 130 students were enrolled. Studies were free, and students were given a free nid-day meal and two uniforms per year. It had a theatre and a model factory attached to it, and was well-equipped with laboratories. Although the Amir Kabir was executed soon after the opening of the Dâr al-Funia, it continued its work. Amir Kabir's reforms, and particularly his founding the Dâr al-Funia, were not applauded by the powerful Muslim clergy, but as he had linked it with the needs of national defence, it was difficult for them to oppose it (see F. Adamiyyát, Amir Kabir Irán, Tehran 1348/1969).

The Austrian professors wrote many textbooks in their respective fields, and these translated into Persian; thus not only was modern science introduced into Iran, but also, the foundations for modern Persian scientific terminology were laid.

The Dar al-Funda was a landmark in the history of Iranian education, both the first organised attempt to introduce modern science and technology and also as the first attempt by the state to responsibility for public education. For over forty years its work was responsible for the education of an elite class of intellectuals who were in no small measure responsible for the establishment of constitutional monarchy in 1906 (see F. Adamiyydt, Fikt-i daidi, Tehran 1340/1961).

Nășir ai-Din Shâh became increasingly suspicious of the new fearning, and education stagnated in the later part of his long reign. In 1855, the Ministry of Science (Wizārai-i 'Ulâm) was created. In 1858, 42 students were min to France to study in various scientific fields. In 1871 a modern school with European teachers was established in Tabriz.

In the last decade of the 19th century, two colleges of higher education were established which later became faculties of Tehran University. One the College of Political Sciences, primarily intended for the education of future diplomats, and the other was the College of Agriculture, with training at secondary school and university level. With the creation of the Society for Promotion of National Education, many philanthropically-inclined citizens were encouraged to endow and start their own private schools on modern lines.

The reformist movement which had started early in the reign of Nāṣir al-Din Shāh was fully conscious of the inadequacy of the traditional maktab-madeasa type of education, and worked towards the adoption of modern Western-type of education. Mirzā Malkam Khān [q.v.] was the first to propose a national system of education, similar to the French one of primary, secondary and university stages (see Ādamiyyāt, op. cit.). Others, man nationalist and anticierical, tike Mirzā Faṭh ʿAli Ākhund-zāda [q.v.], Mirzā Āṭā Khān Kirmāni [q.v.] and Tāilbov, demanded a secular system of education.

The constitutional period, beginning in 1906, inaugurated a period of upheaval for tran, with the re-imposition of despotic Kādjār rule, pressures from outside powers during the First World War years and finally the downfall of the Kādjārs [see MASHRUTTYYA and KĀDJĀR], yet a great deal was done for education between 1908 and 1925.

In 1910 the Madilis passed the administrative Law of Education which established the Ministry of Education (Wisdent-i Ma'ārif wa Awļdf wa Ṣanā'i'-i Mustapraja), whose responsibilities included also, as its name implied, pious andowments and the fine arts.

Responsibility for public education was assigned to this Ministry. In 1911 the Fundamental Law of Education made the Ministry responsible for the provision of basic education for all children aged from 7 to 13 years of age. This law also recognised three stages of education: primary, secondary and higher stages. Private schools were recognised, but they all had to carry out the curriculum ratified by the Ministry of Education. Corporal punishment was banned in \$\text{Ministry of Education.}\$ Csee further on the provisions of these laws, Issa Sadiq, Modern Persia and her educational system, New York 1932).

In 1918 the Central Teachers' College was established for training secondary school teachers. A number of French teachers were engaged to teach modern sciences, and eminent Iranian scholars came to be associated with this college, later called the Higher National Teachers' College. When the University of Tehran was established in 1935, this College was incorporated into the University to form its faculties of Arts and Sciences. In 1921 the School of Law was established and a number of European teachers engaged to teach modern jurisprodence. In 1922 a law ratified by the Madilis establishing the Supreme Council of Education, which was the legislative and supervisory body with regard to all matters pertaining to education. Thus with the education acts of 1910, 1911 and 1922, the foundations were laid for a national system of education.

With the advent of Ridā Shāh Pahlavi [q.v.], Minister of War in 1921, prime minister in 1923 and voted as Shāh by the Constitutional Assembly which deposed the Kādjār dynasty in 1925, a new era began in the history of Iran, one marked by unification of the country under a strong central government, economic progress, the first steps towards emancipation of women, m resurgence of Iranian nationalism and further progress in education.

The need for trained people in higher education prompted the new Shah to introduce a law into the Madilia authorising the Ministry of Education to send least students abroad every year for higher education; the first group left for France in 1928 Scholars sent abread under this law provided the future universities with the bulk of their teachers and manned important posts of state. At the same time, the government engaged a number of foreign professors to teach at centres of higher aducation.

In 1934 an important step was taken to provide teachers for primary schools. A law was ratified by the Madjiis establishing teachers' colleges, and also making provisions for the employment, promotion and retirement of teachers and civil servants. By 1939 there were thirty such colleges in operation.

The University of Tehran was established by law in 1934 and inaugurated in 1935 [see nimeta]. Almost all the faculties were already in existence; the new law brought them under unified administration. The law also approved the budget for extensive new buildings.

In 1936, Ridà Shall decreed the emancipation of women, and a consequence of this was that, hitherto barred from higher education, they found access to educational facilities at all levels.

In 1939, secondary school organisation changed. Until then, the secondary school was divided into two stages or "cycles" of three years each. The first cycle was general in nature, and the second one provided education in the arts

and seitmets: As there was a terminal examination at the end of the first cycle (at the age of 16) and certificate was issued at that point, more than 50% of students terminated their studies then or went into a trade er vocational school. With the new system, the secondary school was divided into structure of 5 + 1 years, with specialisation at the sixth year. This had an adverse effect the subsequent development of education, however, in that it turned students away from vocational schools towards a university education, and consequently produced a surfeit of applicants for university education.

Technical and vocational education had all along been the responsibility of various departments of state who trained the experts whom they needed. The Ministry of Education—called since the early 1930s the Wisarat-i Farkang (farkang — both education and culture)—did have its own vocational schools which students could enter at the age of 16 after the first cycle of secondary school, but the number of these schools was inadequate.

The whole system of education was highly contralised, with all important decisions taken in Tehran. However, when Ridā Shāh abdicated in 1941, a national system of education had been firmly established. The most remarkable achievement was porhaps the fact that, under him, girls came to enjoy

the same right to education m boys.

Under Muhammad Ridā Shāh Pahlavī [q.v.] there was an enormous growth in all fields of education. Whereas there were 285,000 students in primary schools in 1941, the figure rose to 4,708,000 in 1976. Secondary school enrolment rose from 25,000 to 2,357,000, and university enrolment from 3,367 to 154,000 in the period. The increase in educational expenditure was from 154 million rials in 1941 to 260 billion rials in 1976. In addition, in 1970 there were some 50,000 Iranian students studying at foreign universities, mainly in the United States and Western Europe.

In 1943 a law ratified by the Malilis made the University of Tehran autonomous. Between 1949 and 1950, new universities were established in Tabeliz Shirlz, Ahwaz, Isfaban and Mashhad. In 1956, Pahlavi University was established in Shiraz, in 1957 the National University opened in Tehran, and in 1962 the Aryamihr Technological University was inaugurated in Tehran. By 1964, eleven new institutions of higher education had been established.

In 1963, the law establishing the Literacy Corps or "Army of Knowledge" [Sipāā-i Dānigh] was ratified. According to this law, young men of military age, with secondary school certificate, could choose undergo four months of training as primary school teachers and afterwards teach for 20 months in remote rural areas, this being regarded as in lieu of military service. Between 1963 and 1969, some 1.3 million chitdren and adults had been taught by the Literacy Corps in 22,000 villages.

In 1964 the whole system of primary and secondary schools was reorganised. The primary school was alfotted 5 years, the "guidance" school 3 years after the primary school and the last four years of secondary school could be devoted to specialised studies relevant I the university course which the student planned to follow. Alternative vocational and technical schools were provided after the primary school and after the three years of "guidance" school, this system marking I considerable improvement over the previous one.

In 1968 a new Ministry of Science and Higher

Education was created to deal with ever expanding higher education. The min Ministry authorised the establishment of private colleges of higher education, but the experiment was not ill successful one, and all the private colleges were nationalised in 1974. Also in 1974, education at all levels was declared free by the Shah.

The abnormal growth of secondary education had created a large number of applicants for university places. Notwithstanding the fast expansion of higher educational facilities, only a fraction of the applicants could find places. The accumulating number of young people whose levels of aspiration had been thereby raised, but could not be satisfied, was another factor responsible for the discontent that led to the 1979 Revolution in Iran, but the consequent closure in effect of the universities as potential centres of resistance, and the relegation again of woman to un inferior status under the Khumayaii régime have diminished rather than enhanced educational opportunities.

(MARRUD SANA'I) MA'ARRAT MAŞRÎN or MIŞRÎN, a small town in North Syria flat. 36° or' N., long. 36° 40' E.). It is 40 km. to the north of Macarrat al-Nutnian [q.v.], 50 km. south-west of Aleppo or Halab [q.n.] and 12 km. north-west of Sarmin. It owes its importance to its position between the districts of the Rūdi, the Diazr and the Diabal al-Summāk and formerly served as the market for this region which the road from Halab to Armanaz traverses. a route used in the Middle Ages by the Turkomans. Its role has devolved today on Idlib. The land, aithough poorly watered, has never lacked agricultural resources; in the Middle Ages there were already fig. olive and pistachio trees as well as summit, which was exported to the tanneries; lentils were also cultivated there. In former times, the town was protected by wall which today has disappeared, and there were five mosques.

As the chul-lieu of a militys of the muldjage of Halab, situated in the district of the Diazr, Ma'arrat Masriu had 3,000 inhabitants in 1930 and 5,000 = 1945, and came under the kada' of Idlib.

The name of the town is often given in the form Ma'arrat Migrin, but it is also called Ma'arrat Nasrin, which some authorities, such as al-Mukaddasi and Abu 'I-Fidā', connect with the name of Kinnagrin [q.v.], the diund of which the town formed part, just as Ma'arrat al-Nu'mān [q.v.] was sometimes designated Ma'arrat Hims by an allusion to the diund to which it belonged. In the Syriac manuscripts of the 8th century, this town, situated in the kūra of Antākiya [q.v.], is called Ma'arrat Meşrên; the monastery of Bêth Mari Kānūn was there. In the chroniclets of the Crusades, one encounters the form Megaret Basrin or Meguret Mesrin. In Isainbert's Guide (714), one reads Maarrat Moucerim.

History. In the year 16/537, after having defeated a large Byzantine army drawn up between Halab

and Mafarrat Maşrin, Abû 'Ubayda [q.v.] conquered this town, which surrended on the same conditions as Halab [q.v.]. In the 'Abbasid period, under the caliphate of al-Mutawakkil (d. 147/861), 'Amr b. Hawbar, originally from Ma'ratha al-Buraydiyya, a locality near Ma'arrat al-Nu'man, held the office of governor of Ma'arrat Masrin. A century later, in 357/068, profiting from the unstable situation in Halab after the death of Sayt al-Dawla, Nicephorus Phocas conguered the town and had more than 1,000 inhabitants deported to the bildd al-Rum. After the Arabo-Byzantine truce of Safar 359/end of 969-beginning of 970, the town was part of the territory governed by Karghuwayh. At the time of his expedition against Halab, in 425/1024, Salih b. Mirdas, chief of the Banú Kilâb, sent one of his amirs, Abū Mansūr Sulaymān b. Tawk, to attack Mafarrat Masrin; the place was captured and its commander taken prisoner. In 454/1062, a short time before the death of Musica al-Dawla Thimal, the Byzantines succeeded in making themselves masters of the town by trickery. Asad al-Dawla Atiyya succeeded his brother in Halab but, in 457/ 1065, his nephew Mahmud b. Nesr, with the help of the Kilabis, was successful in turning out his uncle and setting himself up in his place. However, some discontented Kilabis helped Atiyya to attack Macarrat Mayrin in 458/1066 and recapture it from his nephew. In 490/oud of 1097 the Franks besieged Antākiya, where the Saldjūkid governor Yaghl-Siyān resisted them. During the siege, the Franks went in Safar 491/January 1098 to pillage some of the towns of the Diazz and notably Macarrat Masrin. în Djumâdă II 491/June 2008, Anțâkiya was taken; Yaghi Siyan escaped, but he fell from his horse at Armanaz, not far from Ma'arrat Massin and, mortally wounded, he is said I have been killed by some Armenian woodcutters who carried his head to Bohemond.

After having taken Härim [q.v.] in Shaban 492/July 1098, Raimond Pilet, with a detachment of the army of the Comte de Saint-Gilles, crossed the Rūdi and captured the town, which was integrated into the Frankish defences to the east of the Orontes, When Baldwin of Edessa had been taken prisoner, the Frankish garrisons were attacked in 497/1104 in the district of al-Diazr by the inhabitants of al-Fufa, Sarmin and Materrat Massin, who inflicted heavy losses on them and drove them out of the region. Ridwan of Halab received a good reception and occupied the town, which were to play the role of frontier-post (thaghr) for the Muslims. In 505/1111-12 the population of Ma'arrat Masrin came into conflict with the Shiff Ismafills, who were numerous in the district; two years later, in Dhu 'l-Ka'da 509/ April 1114, m group of Isma'llis recruited in Ma'arrat Masrin, Afāmiya [q.v.] and Ma'arrat al-Nu'mān, tried to attack Shayzar during Easter, but were repulsed by the Banu Munkidh.

In 514/1120 Tughtakin and lightzi, lords of Halab, arrived 10 besiege the Franks who had withdrawn to Ma'arrat Masrin; when Baldwin proceeded to the rescue of the Crusaders, the antagonists reached a peace agreement granting the Westerners a certain number of places, including Kafartab, al-Bara [q.v.] and Ma'arrat Masrin, whence the Franks could keep a watch on the Turkomans. The Frankish fief of al-Atharib extended as far as Ma'arrat Masrin at that time. In Radjab 520/August 1126, when Ak Sunkur al-Burauki [q.v.], governor of Mawyil, invaded the territory of Sarmin, he found the Franks camping in front of him near the cisterns [hand] of Ma'arrat

Maşrin; they retreated several days later to their territory because of their lack of provisions.

For several years, the region of the Diazr was to witness the constant passage of Crusaders and Muslims. In 324/1250, 'Imād al-Din Zangi, having become slabeg of Mawyil after the assassination of Ak Sunkur, profited from the conflict which broke out between Alice of Antākiya, widow of Bohemond, and her own father Baldwin II, to attack the outlying parts of Athārib and Ma'arrat Maṣrin, which he captured for a while from the Franks. In 527/1134, the amir Sawār, lieutenant of Zangi in Halab, undertook a plundering expedition against the Diazr and the citadel of Zardanā; he surprised the Franks near Hārim, invaded the territories of Ma'arrat Maṣrin and Ma'arrat al-Nu'mān, and returned to Halab loaded with booty.

In 57t/1175, Salah al-Din, in order to bring the Isma'lli Hash'shivyla to reason, mounted a punitive expedition against their territories of Sarmin, Bia'arrat Masrin and the Diabal al-Summak whose inhabitants he massacred; he then entrusted to Shibab al-Din al-Harimi, his maternal nucle, the district of Hamát [q.v.], which me rich in fortresses.

In the Ayyühid period, Ma'arrat Masrin often changed masters; in Diumādā I 619/July x222, al-Malik al-Şālih, son of al-Malik al-Şāhir Chūzī, acquired the territories of Shughr and Bakas, Rūgi and Ma'arrat Masrin, which ho was to exchange later, around 624/1227, for some places situated to the north-west of Halab, such as 'Ayntāb (q.r.) and Rāwandān. In 637-8/1240, the region was devastatod by the Khwārazmians (see Khwārazmians).

In the modern period, the town seems only rarely to have been visited by traveliers. The consul J.-B. Rousseau speaks of it in 1874 in his description of the pashailk of Halab. At the end of the 19th century, Jullien says of Masarrat Masrin that it was a large village situated in the midst of fields of secame and olive-trees in a rich plain, whose great fertility,

before 1914, was praised by Garrett.

MA'ARRAT AL-NUMÂN, chef-lieu of a \$a dd? of North Syria comprising the southern half of the Diabat Zawiya, which consists of the

southern part of the Belus massif with numerous villages. Ma'arrat al-Nu'mân, famous as the birthplace of the blind poet al-Ma'arri [q.v.], is situated at about 500 m. altitude, in lat. 35° 36' N. and long. 36' 40' E. Falling within northern Phoenicia, two days' journey to the outh of Halab or Aleppo (70 km.), it is situated on the eastern fringe of a massif rich III archaeological remains. From west to east, we have Ecoene limestones which provide cut stone, cretaceous marl, and, about 12 km. to the east, Piccene basalts which, to the south, take the form of a flow which traverses the Djahal Zawiya as far as the Orontes.

There is m running water in the vicinity, and the inhabitants have to collect rain water in cisterns. The contributions of rainfall and wells have allowed a rich agriculture without irrigation since antiquity. According to Ibn Djubayr, it used to take two days to cross the area covered by gardens which stretched all around the town. This land was, in the Ayyubid period, one of the most fertile and rich in the world. To the west of Macarret al-Nueman, since classical times there has been cultivation of olive trees and vineyards; near the town, in the gardens, grow pistachio and almond trees, while to the east, stretch fields of cereals (corn and barley). The region produces three essential commodities; corn, clives and raisins for immediate export, which leads to "rectirring concentrations in great masses of these specialised

products" (Tchalenko, Villages, i, 98).

If one accepts the identification of Macarrat al-Numan with Ara, the existence of a human settlement on the site of the present town vary near to Tell Marmas dates back to the first millenium B.C. In fact, Ara is mentioned in the Assyrian texts among the conquests of the empire in 738 B.C. There is no doubt that it is the same town which appears under the name Arra as one of the Graeco-Roman cities of the Antonine itinerary which is identifiable with the Megara of Strabo and which becomes Marra in the Latin chroniclers of the Middle Ages, while the Western historians of the Crusades call it La Marre or La Maire. According to the Arab authors, the form Musarrat al-Nusman designated in the Umayyad period a town and a district situated in the fourth climate and belonging to the diand of Hims; then, from the time of Harim al-Rashid, it was incorporated in that of Kinnastin [q,v.]. This is why the geographer Iba Khurradadhbih (d. before 172/885) considers this region as one of the 'Autistia [q.c.]. According to al-Baladhuri (d. ca. 279/892) and al-Yu'kubi (d. ca. 278/891) and repeated by I'm Batthta (756/1353) and Khalil al-Zahirl (672/2465) (2nbda), the town was at one time called Dhat al-Kusar "the town of palaces", al-Dinashki speaks of Dhat Kasrayo, 'the one with two palares''.

The second part of the name of the town, according to al-Baladhuri, repeated by al-Marawi, is taken from a Companion of the Prophet, al-Numan b. Bashir al-Ansari [q.v.], who, in the caliphate of Mudawiya, was governor of Küha and the region of hims and whose son died in Marara; on the death of Yazid, the governor of Marara is said to have been Numan b. Bashir, who himself died in 65/664. There is another redition according to which this second name is taken from al-Numan b. 'Add al-Sațir, oi the Band Tanüki family who lived in the town and the region.

Ma'arrat al-Nu'man, since its establishment, has been an important crossroads and active economic centre. The town is situated on the north-south axis, which, from Kurus at the foot of the Taurus, goes as far as Palestine possing via Halab, Hamat, Hims

and Dimashk. This route passes along the foot of the eastern slope of the Diabal Zāwiya and skirts the plain which stretches to the east. A road also passes it which links Hamāt with Anṭākiya, and halfway between the latter and Ma'arra is Rūdjiyya (Chastel Ruge) in the Rūdji district which screens Antioch to the south. An important road goes westwards from Ma'arra via al-Hass and al-Bāra, most over the Djabal Zāwiya, then most the Orontes at Djisr al-Shughr before reaching Lādhikiyya [q,w].

To the south, one goes by Matarrat al-Numan to Kafar Tab, from where one can reach Afamiya or Shayzar, It should be noted that the old Halab-Hims route that al-Ya'kübl followed in the 3rd/9th centary did not pass by Mafarrat, al-Nufman but via Tell Mannas, several kilometres to the east of the present road, and yet the Antonine itinerary gives the Arra-Epiphania (Hamāt) route. A well-articulated road network linked the agricultural villages of the east with Masarrat al-Nusman. This town was not only a resting stage, but also a centre of exchange between the mountain and the plain, and it served as a great collecting centre of agricultural products; in 340/951 it was already a prosperous town. As the key to Hamat, Mafarrat al-Nufman was to be, under the Middle Ages, the first objective to be attained by any adversary, coming from the north-west, north or north-east, while to any master of Hamat it constituted an advance defence. In the Ottoman period, the economic importance of the town was emphasized by the fact that the sandjak of Macarrat al-Nucman had its own fiscal regulation; taxes were paid on merchandise in transit, animals and produce transported from the villages to the town, the badi fee [q.v.]. In 1913, there was a French school in this town. At the present time, Ma'arrat al-Nu'man preserves its role as a craft and commercial centre which is emphasised by the coming-and-going of trucks, agricultural machines, buses and taxis as well as the appearance of its main street, which is dominated by garages, workshops for mechanical repairs, cafés and restau-

Demographic growth in the 20th century has followed that of the country as a whole, From 5,250 inhabitants in 1932, the population me to 9,140 in

1945, to reach 20,000 in 1970.

History. In 16/637, the army of Abū 'Ubayda [q.v.] occupied Ma'arra-Hims; those of the inhabitants who were not converted were forced to pay the ditre and hisradi [q.vr.]. In Radiah 101/February 720, the pious caliph 'Umar b. 'Abd al-'Azīz was buriod in Dayr Sam'an in al-Naklra to the south-west of Ma'arra. It is in this village that there lived the Sull Yahyā al-Maghribi whom Saladin visited. This was a place of pitgrimage frequented in the 7th/13th century.

In 207/822, 'Abd Alläh b. Tähir, nominated by the caliph al-Ma'min m governor of Syria where he succeeded his tather, fought the rebel Nast b. Shabath and, on this occasion, destroyed the fortifications of Ma'arrat al-Nu'man and other fortresses such as

those of al-Kafr and Hundly.

In a90/903, the Karāmita [q.v.], under the command of the Sāblo af Khāl, devastated the region of Hims, Hamāt, Salāmiyya and Ma'arrat al-Nu'mān. They killed many people there and took captive women and children. In 323/936-7, some Banū Kilāb nomads penetrated into Syria from Nadid; when they drew near to Ma'arrat al-Nu'mān, Mu'ādh b. Sa'ki, commander of this place, went to meet them, but was taken prisoner al-Burāghihi (whose location is unknown) with a part of his

army; he only released later by Abu 'l-'Abbūs Ahmad b. Sasid, a Kilābi commander of Halab.

In 332/943-4 al-Husayn b. Saffd, uncle of Sayf :d-Dawia, drove out of Halab Abu 'l-'Abbas b. Safid and the Kilabi Yanis al-Mu'nisi, and passed by Macarrat al-Nusmān on his way to Ḥims, while Yanis fled to Egypt. In Shawwal 333/May-June 945, the Ikhshidid governor of Egypt left Damascus and marched against Sayf al-Dawla; be seized Matarrat al-Nu man and appointed Mu adh b. Sa d = governor for the second time, but he me killed shortly after by Sayf al-Dawla at the Battle of Kinnasrln. In 348/959 the Karamita were numerous in the region of Masarrat al-Nusman, and the 'Ukaylid governor Shabib b. Diarir headed a band of these insurgents and marched on Dimashk. At the end of 357/end of 968, Nicephorus Phocas conquered Ma'arrat al-Nu'man, destroyed the Great Mosque and damaged a large part of its ramparts. At the beginning of 358/969, a peace treaty was signed and the town was one of those which had to pay tribute to the Byzantines, but the latter did not have sufficient troops to enforce the agreement. Abu 'l-Mafali, son of Sayf al-Dawla, recaptured Mafarra.

In 358/969, at the time when the Byzantines withdrew from the Halab region, Abu 'I-Ma'all came to Ma'arrat al-Nu'inān, whose governor delivered the Ahuba in his name. In October of the same year, on the return of the Byzantines, Abu 'I-Ma'all fell back on Ma'arrat al-Nu'inān, where he received reinforcements, provisious and fodder. He appointed as his licutenant there Zuhayr, a ghulfm of his father, and went on to Huns. On his return, Zuhayr refused to open the gates of the town to the Hamdanid prince, who decided to use force; finally, his licutenant

secured amin.

When in Dhu I-Hididla 358/October 969, Karghawayb seized power in Idalab, Zuhayr, the governor of Ma'arrat al-Nu'man, allied himself with the Hamdanid Sayf al-Dawla and took part in the campaign against Halab. But as some as the Byzantine Peter Stratopedarcus, whom Kamal al-Din ibn al-Athir calls al-Turbāzī, came to help Karghawayh, Abu 'l-Ma'all abandoned the siege of Halab and withdrew with Zuhayr to al-Khunasira and Ma'arrat al-Nu'man. In 364/975 Said al-Dawla Abu 'l-Maioli came, with the aid of the Bank Kilab, to besiege Zubayr in his town, and broke in by the Hunak gate: driven back from the town. Abu 'I-Ma'all burned the Hims gate, and finally, Zuhayr gave himself up and was executed. In Shawwal 366/May-June 977, the castle of Masarrat al-Nu'man was pillaged.

An expedition of the Fatimids against Halah in 386/996 was held in check, but the Egyptians succeeded in extending their authority as far as Maarrat al-Nu⁴mûn. In fact, Rummäh, a mamikk of Sayf al-Dawia who governed the place, had revolted against his master Abu 'l-Fada'il Sa'id al-Dawia, prince of Halab, and had appealed to Mangutakin, a Turkish leader in the service of the Fatimids, to relieve him from the pressure exerted by the Aleppine forces. It seems that following an agreement with the Fatimids, Luftu', the atabeg of Halab, had recovered Mafarra. In 393/1003 the district of Mafarrat ai-Nu'man was attacked by Lu'lu', who had seized power in Halab in the preceding year; he dismantled the fortresses situated in this territory and in that of Ridi in order to prevent his adversaries from using them against him.

In the middle of the 5th/xxth century, after the appearance of the Mirdasids in the political scene with the capture of Halab in 2024, Ma'arrat al-

Nu'man was to change hands several times. In 434/ 1045-3 the Hamdanid Nasir al-Dawla confronted the Mirdasid Thimal, master of Halab, and took possession of Ma'arrat al-Nu'man. In 452/1060 Thimal, in the course of me expedition against his nephew Mahmud, stayed in the town whose inhabitants had to suffer the enemy occupation. Five years later, after entering Halab, Mahmud the Mirdasid, sent Hārôn, ■ Turkish leader, to capture Macarra. On 17 Shawwal 458/10 September 1066, Haran penetrated into the town with more than 2,000 men. comprising Turks. Daylami, Kurds and men from the al-Awdi tribe. They had established their camp outside the walls in front of the gate where public prayer was performed. These troops want disciplined, and respected the olive groves and vineyards, only taking water for their beasts without paying. They left the town to help Mahmūd in his struggle against the Kilabis.

Some Turks from the Byzantine territory advanced in 462/1070, under the command of Sundak, against Halab; they went as far in the Dlazr and devastated the territories of Masarrat al-Nusman, Kafar Tah, Hamat, Hims and Rafautyya. Shortly after, the Saldjükids made their appearance in North Syria. In 472/1079-80, Tutush, brother of the suitan Malik Shah, made the inhabitants of Sarmin and Masarrat al-Nusman, whose eastern villages he plundered, pay large sums.

In 478/1085, Ma'arra belonged to the 'Ukayiids; at the beginning of Rabl' II/August, Sulaymān b. Kutlumush who, the preceding year had seized Antākiya, took it from them. In 485/1092 Yaghi Siyān received from Tutush a certain number of places in 1846', including Ma'arrat al-Nu'mān. Three years later, Ridwān, the Saldlūkid prince of Halab, gave the town and its territory to Sukmān b. Artuk; in the following year, Djarrāh al-Dawla, Ridwān's alabeg, having quarrelled with the latter, seized

Matarrat al-Nutman.

The strategic position of this place was also to interest the Crusaders. In the vicinity of the town, to the west, troops could be concentrated, under the protection of the forts of Tell Mannas and Kafr Ruma to the east and Kafar Tab which, on the south, also served in defend the approach from Afamiya and to attack Shayzar on the Orontes. In 491/1098 Raymond of Saint Gilles decided to attack Macarrat al-Nu^cmān = leaving Antākiya, supported by the Christians of the region, but he me driven back. At the end of November a fresh attack was led by Robert of Flanders, In order to capture Ma'arrat al-Nu'man, the Crusaders used a wooden castle on wheels surpassing the height of the town walls as better to attack the enemy who, to break the force of the missiles, covered the walls with bags of hay and cotton. Raimond Pilet's sappers succeeded in making a breach in the wall. Not having a very large army, Bohemond negotiated an bonourable surrender, proposing to save lives. The town surrendered on 14 Muharram 492/11 December 1098. At Christmas 1098, Raymond of Saint Gilles left Mafarrat al-Nufman to establish himself at Chastel Ruge, and Bohemond also went there after appointing the bishop of al-Bara in authority over this place. At the beginning of January 1099, while the princes were organising the expedition against Jerusalem from Chastel Ruge, the more impoverished elements of the Frankish army, who wanted to to go Jerusalem without delay, rebelled, and, despite the protestations of the bishop of al-Bara, set about sacking the town and demolishing the camparts. Raymond of Saint Gilles returned, gathered his men and abandoned Mafarra, which he evacuated on 17 Safar 492/13 January 1099, barefoot, as leader of the Pilgrimage. In 496/1103, Ridwan of Halab reconquered the lost fortresses and, the following year, he occupied Ma'arrat al-Nu'man, which the Franks were forced to abandon temporarily. In 505/1111, Mawdud, atabeg of Mawsil, and Tughtakin, stabeg of Dimashk, allied against Halab, and marched to Ma'arrat al-Nu^cmān, whose region was at that time peopled by numbers of the Assassina [see Al-HAMBINITYA]. On 23 Rabi II 509/15 September 1115, Bursuk of Mawail was defeated by Roger of Antioch at the Battle of Tall Danith, to the north of Ma'arrat al-Nu^cman, on the road from the Euphrates to the Mediterranean. Two years later, after the assassination of Lu'lu' at Halab, the Franks controlled the roads linking this town with Dimashk, In 513/1119 Baldwin 11 marched on Ma'arrat al-Nu'man, and in the following year, Ridwan concluded a treaty with the Franks of Antioch according to which Ma'arrat al-Nu'man, the Diazr situated to the north of the town, Kafar Tab, al-Hara and part of the Diabal al-Summak reverted to the Franks. Several years later (519/1125) there is mentioned the escape of an important group of Muslim prisoners from the citadel of Ma^carra.

At the beginning of Diumādā I 529/end of April 1135, Zangi captured Mafarrat al-Nu'mān and drove the Franks out of the citadel; he re-established on their lands the Muslims who could show their title deeds, and for those who had lost them he checked the payment of therapi in the land registers before restoring their lands. The following year, at the beginning of Sha'bān/mid-April, the Basileus John II Commenus traversed the territory of Mafarrat al-Nu'mān, without attacking it, and proceeded swiftly towards Shayzar which he besieged in vain.

During the great earthquake of 552/1157, of which Hamat was the epicentre, Ma'arrat al-Nu'man was seriously damaged; Nûr al-Din visited it in Ramadan 552/October 1757. In this prince's time, this town was situated on the southern border of the Halab region and the customs dues (muhas) on merchandise were paid there. Nûr al-Din founded a dovecot there, a resting-stage for the pigeon post between Hamat and Halab, which was to be integrated into the system of the Mamlük air-borne post before being suppressed at the beginning of the 15th century.

In 574/1178, certain villages of the kars of Matarra were given in ihis by Saladin to the amir Shams al-Din Ihn al-Mukaddam. In the Ayyubid period, Matarrat al-Nu man, due to its position on the border of the territories of Halab and Hamat, changed hands more than ten times in less than m century.

In 548/1188 Saladin went from Halab to Macarrat ai-Nu^emän in order to go on pilgrimage to the <u>Sh</u>ay<u>kh</u> Abū Zakariyya' al-Maghribi, who lived ____ the tomb of the Caliph 'Umar b. 'Abd al-'Aziz. In 587/1191, al-Malik al-Muzaffar Taki al-Din 'Umar seized Ma'arra to the detriment of Muzaffar al-Din, and died shortly afterwards. Two years later it was given by al-Malik al-Zāhir Ghāzī to al-Mansûr Muhammad. In 596/1200. lbn al-Mukaddam was in possession of Afamiya, Kafar Tab and 25 places in the district of Ma'arrat al-Numan. The following year, during a campaign agains: Hamat, al-Malik al-Zahir Ghazi sacked the surrounding area and plundered the town, which sporadically formed part of his domains. In 598/1202 an agreement was reached between al-Malik al-'Adll, sultan of Egypt, al-Malik al-Zāhir of Halab and alMalik al-Mansur Muhammad, who received Ma'arrat al-Nu'man. This town is situated to the north of Shayzar, Afamiya and Kafar Tab, three possessions of al-Malik al-Zahir, the amir of Halab, whose forces, together with Bedouin allies, pillaged the territory of Ma'arra from time to time.

in 604/1207-8, the governor of the town was Murshid b. Shilm b. al-Muhadhdhib, vassal of al-Malik al-Zahir. In 617/1220, this town belonged, with the agreement of the Sultan al-Afdal, to al-Malik al-Masir Kilidi Arskan [q.v.], tord of Hamit. In 620/1223, al-Malik al-Mu'azzam 'Isa, prince of Dimashk, attacked Ma'arrat al-Nu'man, whose governor fled, leaving the task of negotiating to the notables, who included the father of the historian lbn Waşil. Al-Malik al-Mu'azzam nominated an administrator.

In the decade which followed, the town and disputed between al-Aşlıraf Müsä of Damascus and al-Mugaffar II Mahmud of Hamat. The latter reconstructed the citadel of Mafarrat al-Nufman in 631) 1233. In 635/1238, on the death of al-Malik al-Kāmil in Cairo, Malarra and its citadel were seized by al-Matik al-Nasir Yüsuf of Halab after a short siege assisted by mangonels. Expelled by Cingiz Khan (q.v.), the Kh "Arazmians crossed the Euphrates in 638/1240 and entered Syria, passed to the south of Halab via Diabbul and Sarmin, and plundered the region as far as Ma'errat al-Nu'man, governed at that time by al-Malik al-Mansur, After Baybars' victory at 'Ayn Dialut [q.v.], the sultan al-Malik al-Muzaffar Kutuz [q.v.] in 658/1259 handed over to al-Malik al-Mansur the towns of Bartin and Mararrat al-Numan, which had been taken from him by the amir of Halab. From this time onwards except for short periods, the town and its region was to remain in the hands of the princes of Hamat; Abu 'I-Fida', an Ayyobid prince, geographer and historian, also received them in 1810's from the sultan Muhammad b. Kala'un in 710/1310; but three years later he was forced to cade them to the ruler of Halab, This is why, in 7:6/1316, he gave up to the sultan as a donation in the proper official style, the town and castle, which did not prevent him from ceding the town to Muhammad b. "Isa at the end of the year.

Under the Mamlûks, at the beginning of 742/1341, the principality of Hamât was suppressed; the province belonged from then onwards to the ruler of Egypt, and the district of Ma'arrat al-Nu'mân constituted a milispe of this province. After the Battle of Mardi Dâbik (922/1516) the town became Ottoman; in 924/1518 it was on the northern border of the province of Dimashk. A century later, the traveler Pietro della Valle (ii, 136) passed by Ma'arrat al-Nu'mân, where he found a prince of the Ottoman dynasty.

In the 17th century, Ma'arra situated on the southern border of the pashalls of Halab and the northern border of that of Dimashle, where the road from Balis passes to the Mediterranean, crossing the Orontes at Disr al-Shughr.

Therenot describes Ma'arra in 1658 as "poor town commanded by a 'sangiac'", and says that it is surrounded by walls (Voyage, vi, 703; Suite du Voyage, ili, 97-8). Franz Ferdinand von Troilo, a German traveller in the middle of the 17th century, found in the town "two fine inns, one dilapidated, the other in quite a good state" (Reise Beschreibung, Dreaden 1676, 458). It is in this period that an Arab family sottled there coming from the region of Konya, ac. the al-'Azm family who, in the second half of the 17th century, were to set out on a political career which was to be prolonged into modern times. About

1650, two of its members, Käsim and Ibrāhīm, reached Dinashk, then went on to Hamat and Matarrat al-Nu'man, Ibrahlm, a djundi, served in the Ottoman army, settled in Ma'arra and was put in charge of organising the defence of the town against the attacks of the Turkomans. His son, Isma'll Pasha b. al-'Aşın al-Nu'mani, was born in Ma'arra in 1070/1659-60, where he occupied himself with agriculture, and in the town of his birth became a sufficiently important figure to be nominated governor of Dimashk, on 23 Djumādā II 1137/g March 1725 (being removed = the end of Diumādā i 1143/December 1730). In this period, Pococke, who visited Ma'arra, describes it as a poor town with an independent agha who was paying a tribute to the Porte and levying taxes on travellers (A description ..., ii, 145-6). Isma'll had two sons, As'ad Pasha and Sa'd al-Din. The first was born in 1117/1705, and was first mutasailim in Hamat and Ma'arrat al-Nu'man and then governor of Dimashk in 1156/1743. In the 18th century the city, like Hims and Hamat, was one of the lifetime grants (mālikāns) of the pasks of Damascus, who held it from the sultan and who himself sub-let it to an agha. In Radiab 1135/October 1771, 'Uthinaa Pasha al-Kurdil, governor of Damascus from 1760, was removed, and lost the malikana of Mafarra, which Muhammad Pasha al-'Aşın then received,

In the middle of the 19th century, Ma'armt al-Na'mān me the most northerly locality of the paskalls of Dimashk; it was a sandjat governed by a mutasarrij, then it became a kaid? of the tiwd' of Haiab and, in 1823, the residence of a ka'im-makām. According Sachau, who visited it in 1879, the town had about 400 houses, and led an easy life in the midst of a well-cultivated region. On the other hand, Max van Berchem, a few years later, saw only "a large, miserable-looking village . . . in a well-cultivated plain." In 1913, one of the rare telegraphic offices of Syria made Ma'arrat al-Nu'mān the link between Hamāt and Halab.

From the time of the establishment of the French mandate in the Levant, this town became an active centre of resistance by the Syrian nationalists. In 1930, the Mawall shapherd tribes held much of the lands through which one had to pass between Ma'arrat al-Nu'mān and Halab. Since 1965 the town has benefited from the economic, industrial and agricultural development of the Hamāi-Himp zone.

Monuments. The town of Ma'arrat al-Nu'man has protected by a wall which was often attacked and damaged, and then repaired; it had seven gates like many cities of the East: Bab Halab, al-Bab al-Kabir, Bab Shlith, Bab al-Djinan, Bab Hunak, Bab Hims and Bab Kadha'. Defence was also assured by mediaeval fortress of circular plan called al-Kalfa, built on a mound serving as its foundation and dominating the countryside to the north-west of Ma'arra. It was situated at the entrance of "the great ravine which, from al-Bara, traverses the eastern side of the tain, followed by the road which linked the inland plains of the east with the valley of the Orontes" (Tchalenko, iii, 123). After the Crusaders' attacks, it was restored by Zangl in the 6th/rath century. A dovecote (burdi al-hamam) set m by Nur al-Din in the 6th/12th century linked Hamat and Helab by means of travelling pigeons until the beginning of the oth/15th century.

The Great Mosque of Ma'arrat al-Nu'man occupies the site of an ancient temple which had given way to a church which was turned into a mosque after the arrival of the Muslims. Built on a height in the middle of the city, it was reached by 13 steps; 8x-

tensive re-use of ancient remains bears witness to the antiquity of the sanctuary, whose roof is flat. In the courtyard, two klosks are supported by shafts of ancient columns; the cupola which protects the ablutions basin and its fountain rests on ten ancient columns, and the drum which provides a passage between the decagon of the ground plan and the circle of the cupola, is pierced by semi-circular bays. The square minaret of the Great Mosque, and of the most beautiful in Syria, bears on its west face the signature of the architect Kähir b, 'All b, Känit al-Sarmani, who in 595/1199 built the town's Shafi'll madrasa. Creswell attributed this date to the construction of this monument. Herzfeld, stressing the strict relation which exists between the decoration and construction of this five-storeyed minaret and that of Halab, built between 483/1090 and 487/2094, dated it from 550/1155 at the latest. There is every reason to believe that Nur al-Din had it repaired after the great earthquake of 552/1157. Later, this minaret, after the quake of 565/1170, was to undergo other damage and to m repaired in 595/1199 by the architect of the Shafi'l madrata.

Some sake of very ancient origin surround the Great Mosque, and in the city there was still some remains of covered, vaulted streets like Jerusalem. At the time of his visit to Ma'arrat al-Nu'man, Nāsir-i Khusraw saw an ancient column to cubits high with an inscription in non-Arabic characters which was regarded as a talisman, as at Hims and Antākiya, protecting the town from scorpions.

According to Albert of Aix, quoted by Cl. Cahen (La Syrie du Nord, 162, n. 5) there was in the period of the Crusades, in the southern part of the town, a church of St. Andrew, of which me foundations still survive. According to Syriac texts, there was also a Monophysite monastery, whose location is uncertain. There in the town and its environs a large number of sculpted arch-stones in basalt originating from ancient Christian tombs.

To the south of the Great Mosque is situated a Shiff's medease, whose foundation is sometimes attributed to Nür al-Din. Following a sculpted inscription on the lowest course of the arch of the doorway, it was built in 595/1119 in the reign of the Ayyubid prince of Hamat al-Malik al-Mansur Abu 'l-Mafali Muhammad by Abu'l-Fawacis Nadia. The building also bears the signature of the architect Kähir b. 'All b. Kanit. This madvasa is entered on the east side by a doorway with a trefoiled arch opening on the vestibule covered by a pyramidal cupola on pendentives. In its axis, facing an oblong court, there is a very large from, at present encroached upon by dwellings. On the south, the prayer hall opens in the courtyard by three doors; the minnio, a large niche, is preceded by a cupola on pendentives creating a zone passing from the hexadecagon to the circle of the cupola. On the north side, some rooms **—** laid out and, at a north-east angle, is placed the tomb of the founder surmounted by a cupola.

Also at Ma'arrat al-Nu'man should be noted a ghan of the Ottoman period which lies to the south of the Great Mosque in the eastern part of the town. It is a great, square kidn in cut stone with huge stables and a small mosque in the middle of the courtyard. An inscription above the fine southern doorway, dated 974/1566-7, informs us that this building is due to the generosity of Murad Celebi, defterdur of Anatolia (d. 981/1573-4). A second inscription at the vaulted north entrance is a poetic text giving in a chronogram the date 1166/1752-3, presumably the time of As'ad Pasha al-'Azm.

There are many places of pilgrimage or oratories in Ma'arrat al-Nu'man: the Makam Nabi Allah Yashe' b. Nun, often cited as a diann' or mashhad, is situated outside the south walls of the town. The tomb of Yusha' (Joshua) is probably on the site of ancient pre-Islamic sanctuary. Yākūt says that this is not the tomb of Yusha', which is actually in the vicinity of Nabulus. An inscription of to lines dated 604/1207 recalls, in the bay above the door, that this place of prayer was reconstructed on the order of al-Malik al-Zāhir al-Ghāzī while Murshid b. Sallm II. al-Muhadhdhib governed Mafarrat al-Numan. The ground plan of this small-scale making is little different from that of a madrasa with its rectangular court, its deep into facing the entrance and the north and south faces occupied by | funerary chamber and prayer hall. Above the entrance arch rises an octagonal minaret with a small cupola supported at the top by four columns. The modern mausoleum of the illustrious blind poet, Abu 'l-'Alà al-Matarri [q.v.], where there is a part of his epitaph on a stele fragment in stone, is situated in the town.

In the vicinity of Bab Shith, there is the tomb of Seth, third son of Adam, who spent part of his life in Syria. The tomb of Abd Alikh b. Ammar b. Yāsir, grandson of ■ Companion of the Prophet, is mentioned in Ma'arrat al-Nu'man by al-Baladhuri, and again by Ibn Battûta and Yâkût, There was also mashhad of Yusuf which was restored by al-Mailic

al-Zähir Ghäzl.

A short distance to the east of Matarret al-Nutman. at Dayr Naklra, identified with the Dayr Sam'an of this district, is the tomb of the callph 'Umar b. 'Abd al-'Azlz, in a small enclosure. The earliest author, according to J. and D. Sourdel, to mention this site is Ibn Wasil (d. 697/2298). Şalah al-Dîn went there on pilgrimage in 584/rr88 and visited there the Shaykh Abu Zakariyya Yahya b. Mansûr al-Maghribl, who lived in this place and was buried behind the sepulchre of the Umayyad sovereign. This was a place of pligrimage frequented from the Ayyūbid period.

In 1953, Tchelenko remarked on the subject of Matarrat al-Nutman: "Due to its situation as much as to its urban character and the importance of its mediaeval monuments, this site demands a special study, like several other small towns situated on

the edge of the massif."

AL-MA'ARRI, ABU 'L'ALA' ARMAD B. 'ABD ALLAH B. SULAYMAN, famous Arabic poet and prose author of the late 'Abbasid period, was born in 363/973 in Ma'arrat al-Nu'man (q.v.), a town between Aleppo and Hums in the northern part of Syria, where he also was to die in 449/1058. The Bann Sulayman, his forefathers, belonged to the notable families of Matarra. As Shaffel "uland", they held the office of kads, which post was for the first time successfully claimed by a grandfather of Abu 'l-Ala''s grandfather. In addition, some of the Banû Sulayman are mentioned as rather good poets (further information in Imad al-Din al-Isfahani, Kharidat albaşe wa-djaridat al-'aşr, ii (part = Syria), ed. Shukri Faysal, Damascus 1959, where a genealogical table may be found in the editor's Kutaddima, based on al-Isfahan, op.cil., ii, 49 and Ibn al-'Adlm, al-Instf. 483-511)-

Having been afflicted by smallpox at an early age, Abu 'l-'Ala' lost his eyesight; "When I was four years old, there was m decree of fate about me, so that I could not discern a full-grown cause from a tender young camel, recently born" (see his correspondence with Abu Nasr b. Abl Smran, the Das 'Idu st, in Yakut, Udabas, i, 198, cf. D. S. Margoliouth, Abu 'l-'Ala al-Ma'arri's correspondence on vegetarianism, in JRAS [1902], 317). This defect was, however, than compensated by his extraordinarily retentive memory, which in later biographical collections was to reach fabulous dimensions. Ibn al-Adim [q.v.], who is otherwise very reliable, inserted in his monograph concerning Abu 'I-'Ala' a "Chapter about deep understanding, natural ability, quick and brilliant memory, shining thought and penetrating insight in connection with Abu 'l-'Alas" (al-Insaf, 551-64). That Abu 'l-'Ala' started his career as a poet at the early age of II = 12 years need not surprise us in view of, for instance, similar statements which concern youthful poetry by al-Mutanabbl [a.v.], cl. R. Blachère, Abou 3-Tayyib al-Motanabbi, un poète arabe, Paris 1935, 27. Abu 'l-'Ala' completed his religious, linguistic and literary education, in that he read the text materials required, under supervision of different thaykks, in the first instance those at Ma'arra and Aleppo. Among his teachers were, according to Ibn al-Kiftl, Inbah, in Tarif al-hudama', 30, "companions from the circle of Ibn Khālawayh [q.v.]", known as one of the participants in the literary reunions at Sayf al-Dawla's court in Aloppo. This grammarian and expert on Eur'an readings died in 370/980-1, when Abu 'l-'Ala' was still very young. None the less, we find Abu 3-5Ala2 regretting Ibn Khalawayh's loss to Aleppo in rather strong terms: "Would that God might protect Aleppo, because that town, after Abu 'Abd Allah b. Khālawayh's death, ceased to wear any ornament, neither spangle bracelet; thus it was found to be far removed from adab" (Risalas al-Ghufran, 518, ct. 548-9). Among his teachers should further be mentioned Muhammad b. 'Abd Allah b. Sa'd, who was a rdariya of al-Mutanabbi's poetry, ibn al-'Adim mentions (al-Insaf, 515) how Abu 'l-'Ala', at one time reading al-Mutanabbi's Diwan under his supervision, corrected Ibn Sa'd's rindya. By comparing the passage concerned with that found in a manuscript from 'Irak, Abu 'l-'Ala"s correction was proved to be justified. From this incident we may conclude that Abu 'l-'Ala' had already at an early age some acquaintance with the poetry of al-Mutanabbi, for whom he was to entertain great admiration at a more advanced age.

Regarding the next phase of Abu 'l-'Alas's life, up till his journey to Baghdad, Arabic historians express two different opinions. Some historians suppose the poet to have travelled to some other cities apart from his Baghdad journey. They would have him visit Antioch and Syrian Tripoli in that he might profit from the local libraries. According to Ibn al-Kiftl, Inbah, in Tarif, 30, 100 other historians following him, the poet on his way to Tripoli made halt not far from al-Läghikiyya (Latakia), at Dayr. al-Farûs, a monastery so called in memory of Jesus's shroud (Greek: popog, see Ibn al-Kifti, loc. eit., n. t). There he listened to monk discussing Hellenic philosophy, producing in mind certain doubts which could afterwards III recognised in his poetry, Some other historians however, are of a different opinion. For example, Ibn al-'Adlm is one of those who deny the poet was under the influence of any religiou but Islam. As far as Antioch is concerned, Ibn al-Adlm bases his argument on the political situation In Syria: during all Abu 'l-'Ala"s life-time Antioch lay inside the Byzantine frontiers, From the expulsion of the Muslims by Byzantine authorities from that town, Ibn al-\(^1\)Adim inters that "It is neither conceivable that a library should have existed there nor a librarian, as much \(\boldsymbol{\omega}\) that town is inconceivable for somebody to travel to in order there to pursue knowledge" (al-Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\(^1\)Ins\

#Abu 'l-'Ald' al-Ma'arri, in BEO, 2 [1943-4], 123-4). The poems of the first half of Aby "I-'Alan's life were collected in his Distan, which was called Salt al-sand ("The first spark of the tinder"). Here and there in this collection. I poet's reactions to contemporaneous political developments in Syria may be found. About that time, the dynasty of the Hamdanicls [q.v.], with Aleppo for their centre of authority, began to lose much of its power, which having attnined its utmost degree in Say! al-Dawla's days, under his successors gradually was to vanish, finally making place for another line of andrs, the Mirdasids (see S. Zakkar, The emirate of Aleppo 1004-1094, Beirut 1971). Meanwhile, the relative independence of the northern Syrian territory was increasingly threatened from the north by a renewed access of Byzantine military power and from the south by the appearance for the first time of the Fatimids [q.v.]. At the same time, there was hardly any support to be expected from the Büyid amirs and their nominal overloads, the Abbasid caliphs in Baghdad. During the reign of the successors of Sayl al-Dawia, in particular Said al-Dawla and Safid al-Dawla, the Fatimid imams began trying to extend their influence from Egypt into northern Syria. Especially at the time Safid al-Dawla started his rule, Aleppo came to be the object of several prolonged but futile sieges (Ibn al-'Adim, Zubdat al-balab min ta'rikh Halab, Damascus 1951, i, #85-ga). Abu 'l-'Ala' took a keen interest in these developments, as is apparent from at least four laudatory poems found in his collection, the Sagt al-saud. In these poems, important personalities from either party at war are the subjects of his praise. Thus he culogises one Bandjūtakln, who was = Fāṭimid general, in his poem with thyme-word dhimamu (Shurah Sakt, ii, 602), while in two other poems of his (the one with rhyma himyaru, Shurah Salf, Ili, 1087, and the other with thyme wisaln, op. eit., kil, 1046] a certain Abu 'l-Hasan 'Ali b. al-Husayn, one of the Banu 'l-Maghribi (q.v.) is lauded. The latter had originally acted as a katio and wasis in the Hamdânids' service, but having betrayed his masters he filled the Fatimid post of financial and administrative superintendent of the army (mudabhir al-diayah), trying to conquer Aloppo for the Fatimid cause. On the other hand, it is interesting to note that Sand al-Dawla, too, who only with great difficulty stood his ground in Aleppo, can be found as a mamdab in Abu 'l-'Aia''s poetry. In the rabil of a hasida, even his name is mentioned, though in a rather allusive way, "(10) The came's kept asking me, upon which I answered, saying, Our destination will be Sa9d [however, the man excepted, sa9d also means "fortunate"]. Thereupon the owie's came to be their good omen" (from the poem with thyme mdld, Shurth Salf, I, 25). All these laudatory passages are, however, rather curious, because they do not fit the image given by Abu 'I-'Alâ' himself in the Preface to his Dimán (Sharāā Saḥī i, 10), where he says, "I have not knocked so as to be heard at the doors of great lords, whitst reciting my poetry, no more did I praise with a view to acquiring m reward". This contrast between explicit intention and real practice may be explained by the assumption that the poet in such cases had been pressed to compose this sort of poetry against his will (cf. Ibn al-'Adim, Bughyat al-lalab, f. 215al.

It was in 395/1004-5 that Abu 'l-'Ala' had = sustain the painful blow of the death of his father, Abû Muhammad 'Abd Aliah b. Sulayman, who had been the first one to teach him. This date given by "Imad al-Dîn, Kharidat al-kaşr, li, 5 and lbn al-'Adim, al-Insaf, 493, should be preferred to the mindicated by Yakût, Udaba', i, 163, who erroneously mentions 377/987-8, which year is correspondingly given by the majority of Western biographers (about the chronology, see 'A'isha 'Abd al-Rahman "Bint al-Shati", in Abu 'l-'Ald' al-Ma'arri, Cairo 2965, 66-75). Reacting to his father's decease, the poet composed an elaborate elegy (rhyme 'l-dadiwi, Shurdh Salf, it, 907), in which we find him praising his father's poetical talents in glowing terms: "[26] master of rhymes! How much did their obedience to your wishes contrive, that in your view eloquent Arabs hardly surpass the level of stammering barbarians!" Three years after this event Abu 'l-Ala? is reported to have left Ma'arra in order to settle at Barbdad, where, however, he was to stay for merely one-and-a-half years. The poet himself pointed out what motive was prompting him to travel to Baghdad, for in his letters it is explicitly mentioned that nothing more than the libraries in that place excited his interest (Margollouth, Letters 40 and 44, cf. Risālat al-Ghujeān, 147, 187). From his Subj al-rand we may know the poet to have been in touch with several personalities employed in Baghdad libraries. One of these was Abu Mansur Muhammad b. 'All, who was a custodian in the Där al-film (q.v.), and for whom Abu "I-Ala" composed a long kasida (rhyme 'l-khaffu, Shurük Sakf, iv. 1646). Another librarian and scholar - Abu Abmad Abd al-Salam al-Başri, "who had been entrusted with the supervision of Dar al-kutub at Baghdad" (Ta'rik) Baghdad, xi, 57-8), and to whom Ahu 'l-'Ala' having returned to Mafarra was to address a poem (thyme arbus, Shuruh Sakt, iv, 1527) in which he ventilates his melancholy remembrance of Baghdad and mentions their weekly conversations on Fridays. About both these librarians, see Laoust, La vie et ... philosophis ..., 129. Despite the benefit be might have reaped from a prolonged stay at Baghdad, it was not long before the poet again took his departure. It seems that he got into trouble financially, which need not suprise us in view of his unwillingness to compose laudatory poems for the Baghdad nobility, in which aspect he shows himself quite different from, for instance, al-Mutanabbi, Another reason why he did not stay any longer in Baghdld is given by Abu 'I-'Ala' himself, in addition to the one already mentioned. In a haride (rhyme bi-Tahrita, Shuruh Sah), iv, 1634) addressed to Abu 'l-Kāsim 'Alī b. al-Muhassin al-Tanükhl, of the well-known author of Nizhwar al-muhadara (see Yakut, Udaba', v, 302-9, vi, 251-67, cf. Brockelmann, S I, 252), the poet later on explains his uneasy position in one poetical line, "[36] There were two reasons which caused me to leave you: a mother whom I have not been able to meet after all, and money reduced to the amount of unclessaess."

Apart from these explanations explicitly given for his premature departure, some other events are mentioned by the Arabic historians, which also might have induced him to leave Baghdad. Thus an incident is reported to have happened in the literary salou of an important 'Alawi shorly, al-Murtada, brother of the Shiff poet al-Radi (Brockelmann, 1, 404, S 1, 704, and 1, 82, ■ 1, 132). Having expressed some strong criticisms of al-Mutanabbl's poetry, al-Murtadā had been the target III m concealed but none the less a very severe attack from Abu 'l-'Alfa', who a fanatical admirer of el-Mutanabbi. As a result, al-Murtada had him dragged by his feet out of the salon (for details, see Margoliouth, Letters, p. XXVII, and 'Abd al-Rahman, Abs 'l-'Ald', 108). On the other hand, some late authors, among whom Ibn Kathir (q.v.) in al-Biddyn, xii, 73 (sub anno 449), report him to have been expelled from Baghdad by the local fukakā2. The poet is said to have aroused their anger by asking critical questions concerning the application of certain rules of fight. For an evaluation of this, it seems, rather anecdotal report, see Laoust, La vie et la philosophia . . ., 128, and 'Abd al-Rahman, Abu 'l-'Ald', 115-16.

In Ramadan 400/1010, Abu 'l-'Ala' began his return journey, but having come home he found his mother already dead. His Diada contains two elegies (rhyme iblalu, Shurüh Sahi, Iv, 1725, and rhyme hamami, iv, 1453), in which he gives expression to his feelings of sorrow: the announcement of her death was a terrible blow; he would have preferred to precede her into death, but now the only consolation left is for him finally to be buried near her tomb. He is hoping to meet her again on the final day of resurrection, which is, however, yet far away. Then, in his Risālas written just after his leaving Baghdad he declares his intention to seclude himself completely from association with other human beings and mastay in his house for ever: "to remain in the city even though the inhabitants fled through fear of the Greeks" (Margoliouth, Letters, 42 (= VII) and 43 (= VIII)). From that moment he was to acquire the sobriquet Rake al-makbisaye, "the twofold prisoner" (sc. of his blindness and his house),

This self-imposed confinement was only once to broken in the period after Baghdad, because of a chance event which in 417/1026-7 occurred in his native town. At that time, Aleppo and its districts were ruled by Salih b. Mirdas, who as a leader of the tribe of Kilab became the founder of the Mirdasid dynasty. Şālih's warir al-sayf we 'l-kalam, the Christian Tādhurus b. al-Ḥasan, by his strong policy produced tensions between the Christian and Muslim (actions of the population in Aleppo and the surrounding region, and these tensions provoked in Ma'arra the following outburst of violence. On a Friday a woman entered the town's congregational mosque complaining about a molestation suffered at the hands of the Christian owner of a winehouse, where in addition to wine the enjoyment of fair ladies used to be offered. Thereupon all those present in the mosque, the kadi and notables excepted, ran out so it to pillage and destroy the house concerned. At the instigation of his wasts, Salih had a number of the notables imprisoned, among whom - Abu 'i-Madid, a brother of the post. Abu 'l-'Ala' allowed himself to be persuaded to intercede for his fellow-townsmen with Salib, not without success. We find this chain of events recalled in several poems not contained in Salt al-sand, this collection being finished and closed. but in the second collection of poems, the Lurim ma Id yalasm. When recalling this incident, it is evident

that the poet strongly endorses the action of his fellow-townsmen,

- "[1] On Friday, woman who was already with child (djāmi*) came to the congregational mosque (djāmi*) to recount her case to the witnesses in town.
- [2] Supposing they ill not risen to help her upon her outery, I would rather imagine that God's heaven might pour down fiery coals" (Lunim, ed. Zand, i, 335/Bombay, 138, rhymo ama-hi).

As regards his successful mediation, the poet remains so humble, that he is heard giving God all the credit, "[3] I did not even make my contribution as big as mosquito's wing, but God did cover them with a wing of His grace" (Luxum, ed. Zand, fi, 234, ed. Bombay, 220, thyune handali).

A detailed historic report of these events be found in Ibn el-'AdIm, Zublat al-halab, i, 232-4, and idem, al-Insal, 566-8. What happened in Ma'arra and the poet's reaction to it make it already evident that Abu 'l-'Alā' did not totally seclude himself. On the contrary, his house became the goal of frequent visits by vasirs, scholars and pupils, whilst at the same time he kept up an extensive correspondence in prose by way of his Riadlas. However, his poetical correspondence such as is found in his first collection of the Sahf al-sand probably belongs to the pre-Baghdad period. From those with whom the poet was in contact, the following personalities may be mentioned:

(i) The governor of Aleppo, appointed by the Pățimids, Abū Shuājā' Fātik b. 'Abd Aliāh al-Rūmi 'Azīz al-Dawla (reigned from 407/1016-7 till 413/1022-3, see Ibn al-'Adīm, Znbāat al-halab, i, 213 ff.). He paid a visit to Abu 'l-'Alā' in order to discuss with the poet an invitation from the Fāṭimid imām al-Hākim for Abu 'l-'Alā' to go Il Cairo, but the poet finally decided against the suggested stay in Egypt (see al-Insāf, 570-4, 577-8).

(2) Abu 'l-içasim al-Maghribl, who was a son of Abu 'l-Hasan al-Maghribl, the Hamdanid Addio mentioned above. In 400/1009-10, at the time when al-Hākim had almost all members of the al-Maghribl family executed, Abu 'l-Kāsim succeeded in escaping the massacre. After many peregrinations he was finally appointed a wasir in Mayyāfāriklu. He was the addressee of several Risālas (i.e. Margoliouth. Letters, numbers 1, II and XXI) written by Abu 'l-'Ala', who finally dedicated an elegiac poem to him on the occasion of his death (see Landm, ed. Zand, ii, 434/Bombay, 346, rhyme 'l-dirhayah).

(3) Abû Naşr Ahmad b. Yüsuf al-Munăzi, both m poet and m watir appointed by the ruler of Mayyāfārikin [cf. Ibn Khallikan, 58, ed. Ibṣān ʿAbbās, i, 143-5, no. 59). When visiting Abu 'l-ʿAlā', this warir is reported to have asked him some rather critical questions regarding his ascetic way of life (Ibu al-Kift), Inbāh, in Taʿrif, 63).

(4) Abu "I-Fadl Muhammad b. "Abd al-Wâhid al-Baghdâd", who as a warir and ambassador sent by the "Abbāsid caiiph, al-Kā²im bi-amr Allāh [q.v.] ≡ the Zirid prince al-Mu'izz b. Bādīs [q.v.] in Tunis passed al-Ma'arra on his westward journey. Having visited Abu "I-ʿAlā' there, he continued his journey by stages, so as ≡ settle finally in al-Andalus (Ṣafadī, al-Wāfī, iv, Wiesbaden 1959, 70-1; cf. Ihn al-ʿAdīm, al-Inṣāf, 563 and H. R. Idris, in berbirie orientale sous less Ziridas, Paris 1962, i, 191-3).

Among Abu 'l-Fadl's school of pupils should be reckened Ibn al-Sid al-Batalyawsi, who in the Muslim West was to write an excellent commentary on Abu "i-"Ala" a Sald al-mud (for al-Batalyawsi, see Brockei-

mann, I, 427, S I, 753).

(5) Abu Zakariyê Yahya b. al-Khatib al-Tibrisi (Brockelmann, I, 279, II I, 492), who was for some years Abu 'I-falā's pupil and is reported to have been a professor at the madrasa Nijāmijya in hisafter years. He also composed a commentary on the Saèt al-and. It II interesting to note that in this commentary of his, another, lost commentary by Abu 'I-falā' himself, called Paw' al-Saḥt, has been incorporated.

(6) Abu 'I-Makārim 'Abd al-Wāriţh b. Muḥammad al-Abharī is reported to have read as a pupil under the supervision of Abu 'I-'Alā' in the works of the master for a period of four years (Ibn al-'Adlim, al-Inṣāf, 320). To the tradition of this scholar a third commentary existing to this day can be traced. This commentary called Dirām al-Sahī, was written in the Muslim East, at Samarkand, by Şadr al-Afādil al-Kāṣiṇ b. al-Ḥusayn al-Kh*hrazmī (see Shuruh Sahī, i, x8, for al-Kh*hrazmī's chain of tradition, and in general, Brockelmann, I, 255, SI, 452-3, for all the different commentaries preserved).

For further names of these who came into contact with Abu 'l-'Ala', see the two different chapters by Ibn al-'Adim, the one "Treating of those who read under Abu 'l-'Ala''s supervision and transmitted on his authority, i.e. 'uland', udabd' and traditionists from Ma'arra and from outside" and the other "About the great respect he is held in by kings, caliphs,

amirs and udairs" (al-Insaf, 517, 565).

Finally, in his old age the poet came into touch with a few scholars with Isma'll sympathies. Thus in 438/1047 the well-known Persian poet and proseauthor Nāsir-i Khusraw passed through Matarra oa his journey which would eventually lead him to the Fățimid imam al-Mustanșir. În the account il his travels (Sefer Nameh, ed. Ch. Schefer, text xo, tr. 35-6), he gives a rather curious Impression of what he heard about Abu 'l-'Ala': that III was very rich, and that all the inhabitants of Macarra were his servants, whilst he himself led a thoroughly ascetic in keeping a constant fast and practising vigils. Thus it appears that the poet had imposed upon himself a life of ascetic poverty, although he was the owner of at least some sort of property in or near Matarra. This and the meets be was held in by the local population—the more so because of the importance of the Bana Sulayman as one of Midistinguished tamilies in town-may explain the position of influence ascribed to him by Nasir-i Khusraw.

Some ten years later Abu 'l-'Ala' had a much more serious, though indirect, intellectual immin in his fairly extensive correspondence with an important Isma'llt propagandist, the Da'l 'I-da'di Abû Naşr b. Abi 'Imran al-Mu'ayyad fi 'l-Din. About 448/1057, by order of the Fatimid al-Mustansir, al-Mu'ayyad undertook a mission to North Syria in order to rally its local rulers against the Saldink Turks recently come to power in Baghdad (see Diwan al-Mulayyad fi 'I-Din, da'i 'I-du'at, ed. Muhammad Kāmil Husayn, Cairo 1949, editor's muhaddima, 40, 64). Whilst carrying out his appointed mission, the Day 'I-du'di started a correspondence with Abu 'I-'Ala' by pretending to seek guidance in pursuance of a poeticallydefined way of life given by Abn 'l-'Ala'. In Luram, ed. Zand, i, 232, ed. Bombay, 64, thyme 'l-sald'ibi, the poet advises a practical ascetic way of life. There Abu 'l-'Ala' rejects the eating of fish, meat, milk, and honey, in the same time declaring himself to possess some esoteric knowledge which should remain concealed. The resulting exchange of letters was

finally stopped as a senseless business by al-Mu'ayyad. The latter in his last Risals made it clear that indeed, Ahu 'l-'Ala' at no time whatsoever might be expected to give any details concerning the esoteric knowledge he claimed (see Margoliouth, Abu 'I-'Ala' al-Ma'arri's correspondence un pegetarianism). It un happened that Abu 'l-'Ala' died in 449/1058 just after this correspondence, and therefore it need not surprise us that some Arabic historians try to find evidence for a connection between the correspondence just mentioned and the poet's decease. For instance, Ibn al-Habbāriyya [q.v.] in his (lost) book Fulk alma'ani (apud Yākūt, Udabā', i, 194) says that he committed suicide order thereby to avoid being deported by command of the Dali, who intended, the author suggests, to punish the poet for his heretical ideas. Most historians, however, agree that the poet died from natural causes, and this opinion finds strong corroboration in a report which mentions that the physician Ibn Butlän [q.v.] **----** in attendance at Abu "1-"Ala"s death-bed. In his very last moments, the poet asked a member of his family present to get pen and writing-paper, m that he could dictate to him something. But in doing this, Abu 'l-'Ala' committed, against normal expectation, some errors in his dictation. Thereupon Iba Butlan declared the end to be at hand, "Abu 'l-'Ala' is dead already" (Ibn al-Klifti, Inhah, in Ta'rif, 65). In many passages of his poetry, the poet had shown that he regarded procreation as a sin, and that he preferred universal annihilation as the best hope for humanity. He therefore never married, and is said to have desired that the following verse should be inscribed on his grave: "This wrong was by my father done to me, but never by me to anyone". A great deal of Abu 'l-'Ala"s work is supposed to have been lost in a result of the Crusades, which caused much devastation III Syria, at Macarra included (cf. Ibn al-Kiftl, Inbah, in Tairly, 49). A list of all his works, either lost or still remaining, can be found in Moustapha Saleh, Liste des œuvres I'Abu 'l-'Ala', in BEO, xxiii (1970), 275. From those still existing, the following works may be mentioned in chronological order, as far as possible.

r. The Sabt al-rand contains inter alia laudatory poems, some of which have been mentioned above. In this Diada the poet often follows the tripartité division of the classical hasida into nasib, rabil and madib, but occasionally he rejects the nasib eliminates it completely. In this respect, however, he cannot compared with the poet Abû Nuwâs [q.v.], whose rejection of it is at the same time a turning towards the description of wine. In the case of the ascatic Abu 'l-'Alà', the drinking of wine and firs description is disapproved of, water being preferred.

When the poet does accept the narib, he often its elegiac character by a description of cooling turtle doves. The murmuring note of these doves, who seem to regret a chick once lost long ago, is often compared with the poet's yearning after m unattainable and far-off loved one. In describing all this, the poet ruminates on the way in which the sound of cooing moves him to profound thoughts. In few other masibs, the poet (being blind) is asking his travelling-companions to trace a distant flash of lightning in the land of the beloved, but when sleeping me himself can discorn her deceitful phantom visiting him. The rabil in his kayidas is usually most elaborate: one may find all sorts of descriptions, will emaciated camels tired by long travelling, the mirage; among the animals found in the desert, are mentioned the antelope, sand-grouse, ostrich and chamelson. His

preference for description of the night is so couspicuous that some commentaries try to connect this with the poet's blindness. For some further thoughts on the rabil and the development in his description of the journey in general, see also P. Smoor, The theme of travel in Maiarri's early poems, in The challenge of the Middle East, Asasterdam 1982. Regarding the independent form of the ghazal [q,v,], Abu 'l-'Ala' had little interest in it. Further, whenever he does practise it, he appears to feel himself obliged to do m as technical exercise in a certain geare only (cf. Taha Husayn, Tadidid dhikra Abi 'l-'All', Cairo 1963, 201, as against 'Abd al-Rahman. Abu 'l-'Aia', 40 ff., who sees ■ as ■ compensation for the poet being deprived of the enjoyments of life). The madth [q.v.] as final part of the sasida often shows extravagant eulogy of the mamdule, m that the poet later regretted this in the Preface to his Diada, "All sorts of hyperbolic description found with me as being related at first sight to a human being, while at the same time in accordance with the attributes of God, He is exalted, should essentially be applied to Him alone" (Shurth Sahl, i. to). In the Said al-rand Abu 'l-'Ala' collected together examples of what might also be conceived as another form of the hasida, so, the elegy composed in praise of a dead person (ritha), marthiya), ... mentioned above. In certain very sententious lines in Abu 'l-'Ala''s ritha's we may discern the origins of that pessimistic tone later m often to be encountered in the Luram. (For the influence of al-Mutanabbl's ritha's on those composed by Abu 'l-'Ala', see Taba Husayn, Ma'a 'l-Mutanabbi, Cairo 1962, 203-14). The poetry in Sahl al-rand is characterised by its rich ornamentation, and many special figures of style can be discerned; besides quite frequent forms of paronomasia (djinds, tadinis) we find also the figure of "double entendre" (tourise). In applying the latter figure of style the poet shows a superior virtuosity, of which examples be found in S. A. Bonebakker, Some early definitions of the Tauriya, The Hague 1966, 32-3, 56.

A group of 31 poems in Salt al-sand has been put together under the collective title Dir'typht ("Armour poems"). These poems are marked by the description of me or more coats of mail, the usual themes in the lastda like rahil and madil being eliminated, while only the nasib may be found in a merely subordinate position in few cases (see P. Smoor, Armour description me an independent theme the work of al-Mafarts, in Actes du 8ms Congrès de PUnion Européenne des Arabisants et Islamisants, Aix-en-Provence 1978, 289-303).

Next to the peculiarity of their content, these poems also interesting for their form. A major part of them has been composed in the form of a dialogue put in the mouth of somebody who is in some way related to a sult of armour. For discussion of this aspect, see P. J. Cachia, The dramatic monologues of al-Ma'arri, in JAL, i (1970), 129-36. From among the great number of editions of the Satt al-sand, only two may be mentioned here. Shurik Salt al-sand, vols. Cairo 1945, is a critical edition of the Diving. each being provided with the previouslymentioned commentaries by al-Tibrizi, al-Batalyawsi al-Ka Arazmi. Further, there exist several editions of the Diwin's text together with a mentary by Abû Ya'kûb Yûsuf al-Khuwayyi (lived in the 6th/zzth century, Brockelmann, I, 289 S I, 507), called Tanwie Sakt al-sand, of which the best edition | Balak 1286/1868-9.

2. The Luxum mā lā yakam is a second collection

of postry composed in the period after the post's stay at Baghdad. This collection was much less popufar in the Muslim world than Soet al-sand, both because of its unconventional form and contents. The title means "Committing one's self to what is not obligatory" or "The salf-imposed compulsion", relating to a peculiarity of rhyme [see LUECH MA LA YALZAM], For his poetry in the Luxum, Abu 'l-'Ala' was using a much more difficult form, a double-thyme instead of the normally prescribed monorhyme. The post thus created an innovation in the existing rules of rhyme [see KAPAVA], and his method of rhyming in later books of Arabic theorists to be treated under the generic name of illians. The contents of the Luzum and described by the poet himself in his Preface as a glorification of God, an admonition for the forgetful and an awakening of the negligent, a warning against the World's derision of God. The poet further declares that be does want to follow the normally-prescribed themes, stating that "poets aim at embellishing their words by means of lies". In saying this, he has in view the poots' descriptions of their beloved ones in the ghazaf and mash, their horses and camels in the rebil, and of wine, for instance in the Mameiyya [q.u.]. He points out the utterly false pretensions of poets who, leading a quite comfortable life, none the less pretend to have to make exhausting expeditions through the desert. In contrast, Abu 'l-'Ala' states his poetry to be a searching for veracity and piety, and he therefore thinks himself unable to comply with the accepted conventions in the existing "normal" poetry. On these grounds he finally concludes his poetry in Lussim to be weak (Lussim, Cairo 1959, 3, 47-8). From Abu 'l-'Ala''s words we may infer that he wishes to consider his work in Lucium in the first instance as a collection of poetry, though it be "weak"; at any rate he does not explicitly state his poetry to be a more or less systematic arrangement of philosophical ideas, nor is it so. Notwithstanding the evident absence of such a system. there was in various places in the Lucim certainly be found many opinions which do not always or do not at all lit into the orthodox Islamic system (see TEN AL-KALÂM]. We see the post sometimes professing a certain dogma, then doubting it elsewhere in the Luxum. Though he is a monotheist, he does not show strong belief in God's Word as revealed through prophecy. About resurrection and retribution he seems full of doubts. At the same time, he often appears to attach great value to the use of reason in an imfailing guide in human life (on such opinions of his, see the translation and analyses of quite a number of relevant poems and fragments of poems in R. A. Nicholson, Studies im Islamic postry, Cambridge 1921, ch, ii, "The meditations of Matarri"). In view of this, Arabic historians have pronounced unfavourably on the poet's orthodoxy. Thus Ihn al-Diawzl, Ibn al-Kifti and Sibt b. al-Diawzi each quote with more or less approval a report from an historian contemporary with Abu 'l-'Ala', Ghars al-Ni'ma Muhammad (Brockelmann, S I, 217), was of the wellknown kātib Hilāl al-Şābi' [q.e.]. This says that the post just after his death had been seen in a dream being tormented by two vipers, whilst the following interpretation given: "This is al-bla'ard, the heretic" (given in Tavif al-kudamā, 26, 56, 152). On the other hand, some Arabic biographers and historians endeavoured to clear him from charges of unorthodoxy, such as Ibn al-Adim in his monograph on Abu 'l-'Ala', al-Insaf we 'l-laharri fi daf' al-zulm ma 'l-tadiarri 'un Abi 'l-'Ala' al-Ma'arri

("Fair treatment and selection of the best in defending Abu "I-fAla" against unjustified attacks"). Ibn al-Adim, as a historian, is distinguished for his exactness in making inquiries about Abu 'i-'Ala, which he did two centuries after the poet's death by contacting descendants of those in Ma'arra who had been in touch with him, and also by availing himself of local historical sources, all this not without

frequently giving isnads and titles.

In the West the Luminiyyat, i.e. the poems contained in Lucius, became widely known = a result of A. von Kremer's now rather obsolete study, Usber die philosophischen Gedichte des Abul 'ala Ma'arry, in SB Ak. Wien, Phil.-hist. Claste, cavii, 6, 1889). A more recent treatment of the poet's philosophy as it appears from a number of passages in Luxum is found in Laouat, La vie et la philosophie d'Abu-l-'Ala' al-Ma'arri, in BEO, x (1943-4), 119-56. In the lines cited, Laoust supposes an influence of certain ideas effectically elaborated and found at the outset of the philosophical and religious school of thought of the Baţiniyya [q.v.], which was to be adhered to by both the Karmatis [q.v.], and the Fățimid Ismăfliyya [q.v.]. În the second half of Abu 'l-'Ala"s lifetime, the Fatimids had finally extended their authority over northern Syria. That there was discontent about their rule, however, would appear from certain lines in the Luxumryydt. A study published in the East is Taha Husayn, Dhibra Abi 'L'Ald', Cairo 1914 and later edns., where in last part another interesting analysis is given of the poet's philosophical ideas as reflected in the Lucium. Many quotations from the Lucium have been made an of in a psychologically-based biography, Abu 'l-'Ala' al-Ma'arri, by 'A'isha 'Abd al-Rahman "Bint al-Shati".

Editions of the Larem; a partial ed, by Ibrahlm al-Abyari, Lunim má lá yalzam, Cairo 1378/1959; vol. i has appeared so far (i.e. rue Lustimiyyát 📾 far as the rhyme in 64"). Among the complete editions of Luxun, the best ones are the lithograph Bombay 2303/2885-6, which contains a faithful reflection of a manuscript text accompanied by seem elucidating notes in its margin, and that of 'Azlz 2and, Cairo 1891-5, 2 vols. A very restricted number of Lunimiyyat supplied with a commentary by Ibn al-SId al-Batalyawsi have been edited: Shark al-muhtar min Luxumiyyat Abi 'l-'Ala', critical ed. Hamid 'Abd al-Madild, Cairo 1970; vol. i has appeared so

3. Zadir al-nabik ("Driving away the barker"), is found in the survey of Abu 'l-'Ala"s works as given by various Arabic biographers. In this book the poet apparently defended himself against orthodox attacks on some lines in his Lucius. Extracts from this lost book have been published, in Zadiv alnabih, muktajajāt, critical ed. Amdjad ai-Tarāblusi, Damascus 1385/1905. See for the harmonising method used in explaining certain controversial verses, S. M. Stern, Some noteworthy manuscripts of poems of Abu 'l-'Ala' al-Ma'arri, in Oriens, vil (1954), 342 ff.

4. Al-fusül va 'l-ghāyāt fī tamdītā Allāh wa 'lmand'is ("Chapters and endings about giorification of God, and admonitions). Abu "l-"Ala" began composing this work | rhymed prose before his journey to Barbdad, only completing it after his return to Ma'arra (Yāķūt, Udobā', i, 180). This work contains a great number of short strophes, which the poet has in each case concluded with an ending = end-rhyme (ghays), we that the book in its totality if found to contain a number of chapters (fupil), every one of which contains strophes with their endings always in one particular letter.

Thus me gets Faşl ehâyaruh hamza, faşl ehâyatuh bā2 and m on, following the order of the Arabic alphabet. A major part of this work is lost, only its first djur' having been discovered in 1918-19 in a not quite complete version, to be edited much later by Mahmud Hasan Zanāti, Cairo 1356/1938, in a critical edition. The book holds among various other subjects thoughts about God: His omnipotence, justice, goodness and eternity, in addition to and contrasting with a sharp observation of the inescapable changes of fate which dominate man in his ordinary deily life. The idea of God is frequently seen as connected with unavoidable predestination and eternal retribution, which in its turn exhorts man to practise asceticism. The use of rhymed prose, the warnings against impending judgement and the caths applied now and again by way of confirmation, may all be considered a why later historians supposed this book to be an emulation of the Kur'an; the author allegedly aimed, in writing it, at excelling the Kur'an in its o'dias [q.v.]. In this context, some late historians who apparently never saw the Fural with their own eyes are even found altering its title to al-Fusal we 'l-ghayat me- (or fi) muhādhāt (or mu'dradat) al-suwar 🚃 "l-āyāt (i.e. "Chapters and endings and/about the emulation of suras and verses"); thus al-Bakharsī, al-Badiq, al-Dhahabi and Hadidii Khalifa. For an exhaustive study of the work itself, the opinions of Arabic historians and more recent studies in East and West, see A. Fischer, "Der Koran" des Abu 'l-Ald' al-Mafarri, in Verhandlungen der Sächtischen Ah. der Wissenschaften, Phil.-hist. Klasse, xciv (Leipzig 1942), a, For a supposed coherence between the internal rhyme in a strophe and its contents, see R. Hartmann, Zu dem hitāb al-fuşūl = "l-ghāyāt des Abu "l-sAlā" al-Mesarrī, in Abh. Pr. Ak. W., Phil.-hist. Klasse (Berlin 1944), 2. Some philosophical thoughts in the Fugil have been discussed and associated with Epicureau philosophy by Taha Husayn, Ma's Abi 'l-'Ala' fi sidjnih, Cairo 1963, oh. ix.

5. Rusa'il Abl 'l-'Ala' al-Matarri, the brief letters written by Abu 'l-'Ala' on several occasions and addressed to various members of his family and acquaintances (see the biography above). The letters have been composed in a very flowery style, overdone with proverbs, rhymod prose and illustrative There exist two editions of the Rasavil, the first by Shahla 'Atiya, Beyrouth 1894, and a second one, with English translation preceded by a Preface containing the biography and a discussion of part of the works, by D. S. Margoliouth, The Letters of Abu 'l-'Aid', Oxford 1898. Further, a critical edition of Letter XXX (Margoliouth's numbering) has been prepared by Ihsan Abbas, Risāla fī lataiyai Abi 'All b. Abi 'l-Ridjal fi woladik Abi 'l-Ashar, Cairo

n.d., but later than 1945.

6. Risālas al-Şāhil wa 'l-shāhidi ("Letter of m horse and mule"), which among other works lost was addressed to Abû Shudjû' Fâtik 'Aziz al-Dawla, the governor of Aleppo, on behalf of the Fatimid imams (see above). This supposedly lost Risale has recently been discovered in Morocco and subsequently edited with a critical apparatus and introduction, by 'Asian 'Abd al-Rahman "Bint al-Shāṭi''' (Cairo 1975). Abu 'l-'Ala' completed this voluminous Risdia in about 411/1021, Le. the year of al-Hākim's disappearance, when the imam al-Zāhir acceded to the throne in Egypt (cf. op. cit., 553 where the author qualifies the latter m amir al-mu'minin). Another important development, reported upon in the Risdla, occurred in 408/1017-18, when 'Azlz al-Dawia ordered Sălih b. Mirdăs, a Bedouin leader and afterwards founder of the Mirdisid dynasty, that he should bring his (i.e. Salil)'s) mother inside the walls of Aleppo (Risdial al-Sahil, 520, cl. 1bn al-'Adim, Zubdat al-halab, i. 218). This move was meant to reassure the inhabitants of Aleppo, in view of rumours about a threatening Byzantine attack. The tension caused among the population in North Syria is a theme in the Ristia, in which Abu 'l-'Ala' gradually introduces a number of animals who, being gifted with speech, give among other things their opinion on the political situation in Syria under 'Aziz al-Dawla's reign. A direct reason for the composition of the Ritals a problem of taxation. There was a question of land owned by members of Abu "I-sAla"s family, for the use of which they would owe a certain amount as taxation due to the bays al-mail [q.v.] in Aleppo. At their request, Abu 7-fAla' is writing his letter in order to ask for the annulment of the amount imposed, considering that the land concerned is a waterless tract, giving only a small yield. Then Abu 'l-'Ala' describes a mule, al-Shabidi, which, blindfolded, is drawing water in order continually fill a distern, without, however, profiting from its own labour so as to quench its thirst. Such being its condition, the mule is described as grumbling at first, but then it starts talking. While thus introducing the first of his speaking animals, Abu 'l-'Ala' explicitly bases himself on quotations from the Kurban (XXVII, 18, 23), where an ant in the valley of ants and a hoopoe are described as talking, with Sulayman understanding their utterance. On the other hand, Abu 'l-'Ala' elsewhere in his Risāla compares favourably 'Azīz al-Dawla with Sulayman, both of them adhering to the same qualities of wisdom and understanding. Next to the mule, a number of different animals appear on the scene of action, among these a borse, a camel and a fox. The name wants the horse to convey a complaint to 'Aziz al-Dawla about the mule's hard life, but the horse, referring to its noble forefathers, haughtily reluses this mission. In the second instance, the camel declares himself prepared to convey the mule's complaint. The mule being erudite, at first intended to cast its complaint in a poetical form, but with respect to the cantel it drops its original plan for a reason which reflects Abn 'l-'Ala"s own attitude towards poetry, "I do not like being described with the image of human beings bringing poetry with them, in order to aim at some profit. . . (R. al-Sāhal, 219). Instead of this, the mule then wants the carnel to convey strange tidings, which have me meaning directly evident in hearing them, although in reality they have a second reoteric meaning" (los. cit.). The message appears to consist of sorts of riddles involving words with two different meanings (cf. the tauripu in Abu "1-'Alas's poetry). When finally the fox arrives on the scene, the situation alters; a vague clamour is suddenly heard from the nearby town, and at the imple's request the fox undertakes to make a reconnaissance. Then the clamour heard is explained by a suddenly-developing panic among the population of Syrie in view of an impending Byzantine military expedition. Abn ')-'Alā' now begins to make frequent aliusions to various political developments of the contemporary period. He mentions, for example, the joint-rule of Basil II Bulgaroctonus and his brother Constantine VIII. He further speculates on the settlement of the succession within the line of the

Macedonian dynasty, In view of this, and being aware of the fact that the elder brother remained without children, whereas Constantine had only three daughters, the author wonders whether the Byzantines will deem it suitable to appoint woman as their Empress (R. al-Şākü, 578-80, 606-7). In his Risāla, Abu "I-"Alā" semm somewhat to ridicule the governor of Aleppo, who is continually designated with honorific formulae after his name, such as "May God prolong him for ever" or "May God give him a great victory". With some hamorous feeling, the author mentions a group of slightly more than 30 slaves (ghilmān), who either had been bought at some time by 'Aziz al-Dawla from the Byzantine emperor or had been granted by the latter. The exact number of these slaves, and then their circumcision as enjoined by the Fatimid governor, me respectively compared with the number of 'arads ('arad here meaning "last metrical foot of the first half-verse") formally given by Arabic prosodists, and with the reduction (hadhf) of metrical feet (R. al-Sähil, 691-2).

Finally in his Risala, Abn 'l-'Ala' has somebody make a remark on the exceptional dexterity of "Aziz al-Dawla, who is able, whilst horseriding, to handle two swords at a time; but then it is remarked upon much more wonderful that this prince was once seen reading in the Kikib al-Arad by al-Khalil b. Ahmad [q.v.], see R. al-Şāhil, 706. It is on behalf of this particular interest shown by 'Azīz al-Dawla that Abu 'l-'Ala' pretends to introduce many sayings relating to the principles of metrics. Besides a great display of erudite learning in technical terms for various phenomena in metrics and rhyme, one also finds in the Risdle many quotations of poetry which in some way frequently contain descriptions of animals. Such a display of learning and the poetical lines quoted, though originally composed via association, often tend to interfere with the smooth and logical development of events in the Risdla. The same phenomenon can be found in the Risdlat al-Ghufrán which - composed at a later date. On the other hand, the R. al-Ghufran is distinguished from its predecessor, the R. al-Sahil, by much greater amount of irony and derision at its protagonist, who is Ibn al-Karib-as compared with 'Azlz al-Dawla in the first Risala—and also by its greater interest shown in religious questions. For further details, P. Smoor, Enigmatic allusion and double meaning in Matarri's newly-discovered Letter of a Horse and Mule, in JAL, xii (1981), xiil (t98a).

7. Risākat al-Ghufrān was composed about 424/ ro33 during the reign of the second Mirdasid prince Nasr b. Salih Shibl al-Dawla (R. al-Ghufran 450, cf. 256). The Risala is a reply to a much smaller Risala addressed to Abu 'l-'Ala' by a certain 'All b. Manşür b. Tālib al-Halabi Dawkhala, also known as Ibu al-Kārib, who was a traditionist and grammarian. In his Risālo, Ibn al-Kārth is complaining of his old age and its concomitant infirmities, at the time suggesting to Abu 'I-'Ala' that some sort of support is always welcome. Apart from this, Ibn al-Kārih gives a show of his knowledge and orthodoxy in mentioning a number of posts and scholars whom he accuses of being sindles [q.v.]. In his reply Abu "i-'Ala' ironically imagines his aged correspondent as having died in the meantime. Then he supposes him, after ■ rather uneasy reckoning at the Day of Resurrection, to have passed the entrance to the Gardens of Paradise. In those Gardens Ibn al-Karih is described as meeting many a poet or scholar whose previous sins when least expected have been forgiven (cf. the meaning of Risila's title "Letter of Forgiveness"). While travelling in the Hereafter, Ibn al-Kārih is able to pay a visit to Hell, where he is having discussions with the devil, Iblis [a.v.] the poet Bashshār b. Burd [a.v.], marked out as a heretic. Among the general aspects of the R. al-Ghufrān some may be mentioned here. First, the delights of Paradise are based upon a realistic and literal interpretation of the pronouncements given in Kur'ān and Tradition. For example, where it says in the Kur'ān (LVI, 35 ft.), "We have made them grow up new and made them virgins, loving and of equal age, for those on the right...", Abu 'l-'Alā' is found having them grow like fruits of the trees in Paradise (R. al-Ghufrān, 287-8).

Another remarkable aspect of the Risala is the idea of compensation granted for any harm suffered previous in earthly life, this compensation being extended to both human beings and animals. To the latter belongs for example a wild ass, killed and skinned by a hunter during its existence on earth. Thereafter its bide was used for the fabrication of a wellbucket, of which in their turn pious men took advantage for their fakara (198). Thus there appear to exist in Paradise two completely different categories: first the material of Paradise, represented by the virgins promised in the Kur'an, and by animals for the purpose of hunting, both of these destined to increase the joys of the blessed; and in the second place there exist human beings and animals destined to enfoy themselves in all eternity on account of their earthly sufferings. As concerns Ibn al-Kārih, the ironical attitude of Abu 'l-'Ala' is very evident, where 🖿 describing the formal act of Ibn al-Kāriā's tomba being testified by official witnesses in a mosque at Aleppo and the subsequent rejoicing in Heaven (517-22). For a comparison between the R. al-Ghu/rān and Dante's La Divina Commedia, see the now rather obsolete study by Miguel A. Palacios, La Escatología Musulmana en la Divina Comedia, Madrid 1919; further, 'Alisha 'Abd al-Rahman, al-Ghufran, Cairo 1954, which also discusses the comparison of the Risdle with Ibn Shuhayd [q.v.] and his Risdlet al-Tavábi* na'l-tavábi*, and is of general importance as an excellent study of the R. al-Ghufeán, Among the European studies there should be mentioned I. Kratschkovsky, Zur Entstehung und Komposition Abū "l-"Alā"s Risālat al-ghufrān, in Islamica, 1 (1925), 344-56; M.-S. Melssa, Le Message du Pardon, Paris 1932; and R. Blachère, Ibn al-Qarih et la gentse de l'Epitre du pardon d'Al-Masarel, in REI (1941-5), t-15.

Éditions: R. A. Nicholson prepared an incomplete edition and translation in several articles: JRAS (1900), 637-720; (1902), 75-101, 337-62, 813-47. The best edition is Rizālat al-Ghafrān li-Abi 'l-Alā' al-Ma'arrī wa-ma'a-hā Rizālat Ibn al-Kāriḥ miftāh fahmi-hā, 3rd ed. Cairo 1963 and later ones, by 'Ārisha 'Abd al-Raḥmān "Bint al-Ṣhāṭi".

8. Risalet al-Mala'ika is especially concerned with questions on the morphology and etymology of certain Arabic words. Thus in the Mukaddima of this Risala (ed. I. Kračkovskiy, Leningrad 1932), Il reply is indirectly given to questions regarding the morphological reduction of certain words and names found in the Kur'an and hadith. In this manner, Abu 'l-'Ala', who is himself the protagonist in this Risala, is heard propounding several questions to the Angel of Death relating to all possible morphological schemes to which can be reduced words like malak and 'Arra'll. By this method Abu 'l-'Ala' describes himself as successful in his attempt at postponing

the moment of his own death for one hour, the angel being bewildered by such complicated problems. Further questions are concerned with the reduction of words relating to the grave and the Hereafter: its recompense and retribution and the pleasures of Paradise, the latter inducing the protagonist to deal with words like hummathra, sundus and istablak thereby following the same playful method. The succeeding part has only partially been edited by Sallm al-Djundl, Risalat al-Mala'ika, Damascus 1944, 55 ff., the remainder of this ms. being lost, In this additional part, as far as it is at present known from the edition, thirteen problems and dealt with in a more serious and direct way. In general, the Risāla's Muhaddima reminds and of the R. al-Chufran, though the latter is much watersive. It should further be noticed that Paradise in the R. al-Malabiha appears to be very quiet and in conformity with the rules of orthodoxy, while in the R. al-Ghufran it is less orthodox, with ironical passages and the tranquility of Paradise disturbed by revelling, discussing and even violently quarrelling posts and scholars.

9. Mulhd '1-rabil ("What is scattered on the road") is a very short work which was always to remain well-known after Abu 'l-'Ala"s poetry. Especially in the Muslim West, it has frequently been the object of attempts at emulation (mu'drada). The titles of, and some short quotations from, such entulations are given in Hasan Husni 'Abd al-Wahhāb. Mu'draddt al-maghariba li-Multd 'l-sabil, in Tafrif. 455-7. For the edition of a complete musarade of Abu 'l-'Ala''s Mulad 'l-sabil, - the one composed by Ibn al-Abbar, in Şalâh al-Din al-Munadidiid, Rasa'il wamusas.-3-. Beirut 1963, 33-79. The Mulka 'I-sabil consists of tiny paragraphs containing rhymed prose, which alternate with other paragraphs containing some poetical lines, with, however, the restriction that each paragraph of rhymed prose is more or less identical with the subsequent paragraph of poetry far as its contents are concerned. These contents are of a very orthodox nature and no break can as yet be discerned with traditional morality and literary tradition. The editor Hasan Husal 'Abd al-Wahhab, Mulhā 'l-sabīl, Damascus 1330/1912, 3, observes some similarity to the pre-Islamic orators, such as Kuss b. Sāfida [q.t.]. On the other hand, Kračkovskiy in Abu-l-'Ala al-Ma'arri. If ulka-s-sabil, Petrograd 1915, repr. in Isbrannye socinening ("Collected works"), Moscow 1956, ii, 183 ff., has pointed out that some influence of the poetry of Abb 'I-'Atahiya [q.v.] might be traced. Because of the simplicity of the language used, Mulka 'I-sabil might have been composed by the author in his youth. In contrast to this opinion, 'Abd al-Wahhab suggests it may be a work of the poet's old age, in which he is shown to revert to the original religious principles (cf. Kračkovskiy, Isbrannye sodineniya, ii, 186).

Finally, let us consider the author's surviving commentaries existing up till now on the Dississ

of other poets.

7. Mu'din Ahmad is a commentary on the complete Divin of al-Mutanabhl, which Ahu 'l-'Alā' probably wrote in the prime of his life. This rather simple commentary, of which so far == edition is available, has been discussed by Kračkovskiy, who also gives some examples from the Arabic text of this commentary, in Al-Mutanabhl i Ahū-l-'Alā, Patrografi 1910 = Isbranaye sočineniya, il, 63-115.

 al-Ldmi^c al-'Astri = al-Thibbil al-'Artri is a very extensive and as yet unedited commentary = a great number = verses selected from al-Mutanab3. "Abath al-walld, a commentary weress selected from the Diwin of the poet al-Buhturi [q.v.], owes its existence to the fact that a manuscript containing al-Buhturi's poetry was sent from Aleppo to Abu 'l-'Alâ' in Ma'arra, in order that he should correct and criticise its text if necessary [Ibn al-'Adin, al-Insef, 544]. It is available in the critical edition of Muhammad 'Abd Alāh al-Madani, Medina 1355! 1936. However, a far better edition is the one recently prepared by Nhdiya 'Ali al-Dawla, 'Abath al-walld ft' l-halām 'alā shi'r Abi 'Ubādā al-Walld b. 'Ubayā al-Buḥturi, Damascus 1938.

4. Dhikrif Habib, was a commentary werses selected from the Diadn of Habib b. Aws Abū Tammām [see Abū Tammām]. Though it is lost as an independent work, it has in survived because Tibrīzi incorporated it in his own commentary on Abū Tammām's poetry; Diadn Abī Tammām biskark al-Khaṭib al-Tibrīzi, critical ed. by M. 'Abduh 'Azzām, Cairo 1964, 25-6 of the editor's muhaddima.

Abu 'l-'Alā' made a commentary on the poetry of a contemporary of his, the amb and eulogist of the Mirdasids, Ibn Abi Husayna, who also chanced to be inhabitant of Ma'arra. This commentary was remain partial only, for the amb survived Abu 'l-'Alā' and only died in 457/1065 (on him see further usa hal Haslaa). Abu 'l-'Alā''s commentary is incorporated in the Dimin libn Abi Husayna, critical ed. by As'ad Taias, Damascus 1375/1956, where incidentally p. 373 can be found the elegy which in reclied at Abu 'l-'Alā''s grave by Ibn Abi Husayna, one among many other poets who are all reported to have recited their respective mathiyas on this occasion.

Bibliography: A compilation of biographical source materials taken from historical sources is Ta'rif al-hudamit' bi-Abi 'l-'Ala', Cairo 1384/1965, taşwir of the edn. Cairo 1944. (P. SMOOR) MA'ATHIR AL-UMARA', the name of a celebrated Persian collection of blographies of Muslim Indian commanders from the reign of the Mughal Emperor Akbar (963-1014/1556-1605) till the time of its author, Şamşām al-Dawie Mīr 'Abd al-Razzāk Shāh-Nawāz Khān Awrangābādi (1111-21/1700-58). Born at Lahore, he soon settled in the Deccan in the service of the first Nigam of Haydarabad (q.v.), Nigam al-Mulk Aşaf-Djah, and filled offices in Berar [q.v.] and then as Diwis m chief minister of the Decean. His policy in the latter post ained at checking the growing influences in that state of the French Marquis de Bussy, but army discontent led to his fall in 1170/1757 and his murder in the following year.

The Ma'athir al-amara' was conceived on an extended scale and was unfinished at the author's death, hence completed by his me Mir 'Abd al-Hayy from notes will fragments left by Shih-Nawaz Khān. The text of 'Abd al-Hayy's recension was published in the Bibliotheca hadica series, ed. Maulavi 'Abdur-Rahim and Maulavi Ashraf 'Ahi, 3 vols. Calcutta 1888-92, and an linglish tr. made by II. Beveridge and Baini Prasad, Calcutta 1972. The whole work has been much used for the many studies which have recently appeared on the Mughal nobility and landholding class.

Bibliography: Storey, i, 1094-1100.

MA'BAD a, 'Ass Allan s. 'Ukaya al-DJUHA-NI, early representative of Kadari ideas, executed after the insurrection of Ibn al-Ash'ath

[q.v.], in 83/703.

He was probably born about 20/640 m even earlier. He had contacts with Mu'awiya (41-60/661-80), and 'Abd al-Malik appreciated him to such an extent that he sent him man ambassador to Byzantium and entrusted him with the education of his son Sa⁹id al-Khayr. According to a rather detailed, but perhaps fictitious report he played a certain political role as early as 38/658, during the negotiations between Abū Mūsā al-Agh'arī and 'Amr b. al-'As at Dumat al-Djandal after the Battle of Siffin. His reputation was based on his juridical competence. Traces of his faturds can still be found in our sources. In his an of precedents he obviously did not differentiate between prophetic tradition and the summa of the caliphs; he referred to decisions of Mu'awiya (an attitude which later jurists were completely unable to understand), and some of his hadities go back to 'Uthman (reigned 23-44/635-56) whom he may still have met personally. Although probably born in Kūia, he did not appreciate the juridical tradition connected with 'All (if it existed already at his time); his father, a companion of the Prophet. had already attracted the attention of his Kufan neighbours by his 'Uthmani leanings. We do not know why and when, in spite of his favoured position at the court of 'Abd al-Malik, he joined the ranks of Ibn al-Ash'ath. He was captured at Mecca, together with his brother Sa'ld, and evidently executed by order of the caliph himself, at Damascus.

Later tradition tended to explain his fate by his Kadarl convictions, But this must we have been his primary motive. We do not have any detailed information about his thinking; he was not a theoretician like his younger contemporary al-Hasan al-Başri [q.v.], Much of our material results from a damnatio memoriae which was initiated by predestinarian circles. But this was a slow process which did not begin before 110/729, when al-Hasan ai-Başrî had died, and was only finished in the second half of the second century when the Kadariyya [q.u.] as a whole was boycotted by the majority of the ald al-hadith. A decisive moment for the development was apparently the Kadari take-over under Yazid III in 126/744; anti-Kadari groups in Syria as well as in Başra then discovered Ma'bad = a bad example of a doctrinarian who had tried to push through his ideas by means of a revolution. According to them, he had been "the first who talked about badar in Başra". Later on, not earlier than 130/748, this statement was modified by the assertion that he had taken over his ideas from a Christian a a Magian convert among the Asawira by the most of Súsan or Susnôva (also other forms me given). The persons responsible for this campaign are to be found In the predestinarian wing of the school of al-Hasan al-Başrî (e.g. Yûnus b. 'Ubayd, died 139/756 or 140/757; 'Abd Allah b. 'Awn, died 151/768). They wanted to detract the attention from the fact that their master himself had been close to Kadari theories. For them, the decisive point was that al-Hasan al-Başti, in contract to Ma'bad al-Djuhani, had not drawn any political consequences out of them.

Bibliography: A detailed "biography" is given by Ibn 'Asākir in the unedited part of his Ta'rīkh Dimashk, but there are lots of other (normally short and biassed) reports. The material available up to now has been used in J. van Ess, Ma'bad al-Guhani, in Islamusissenschaftliche Abhandlungen Fritz Meier zum sezhsigsten Gebuststag, Wiesbaden 1974, 49 ff. Cf. also W. M. Watt, The

formative period of Islamic thought, Edinburgh 1973 index s.n.; Redwan Sayed, Die Revolte des Ibn al-Affat und die Koranleser, Freiburg 1977, 360 and passim. (J. van Ess)

MATRAD s. WAHB, AND 'ABRAD, one of the great singers and composers in Umayyad times, was born in Medina 🔤 died at Damascus in 125/743 or 126/744. Being the son of a negro, he was an 'abd and later on became mowle of one of the Makhzum families, serving them _____ of their cattle. Like many other oriental musicians, he is said to have been led to music by a dream, and he took music lessons from Sabib Khāthir and Nashit. He soon made a name for himself in Medina and followed invitations to sing at Mecca, where Ibn Suraydi set the fashion. Here he carried off the prize at a tournament of song organised by Ibn Safwan al-Akbar (d. 73/602). Ma'bad sang at the courts of the caliphs al-Walld b. 'Abd al-Malik and Yazid b. 'Abd al-Malik. After the death of Ibn Surayti (ca. 108/720), he reached the zenith of his career as a number of the literary and artistic circle of the prince al-Walld b. Yazld. When the latter became callph in 125/743, he invited the old singer to Damascus. Marbad, already weakened in health, feil ill and died in the palace after having suffered from partial paralysis. The caliph himself accompanied the bier to the palace boundaries.

Macbad, one of the "four great singers" in early Islam, was the leading musician of Medinan school of music. As to his way of composing songs, his own description has been handed down: "I back my mount, beat the rhythm with the wand (hadib) on the saddle and chant the verse until the melody comes right (Aching, i, 40). He preferred "heavy" (thatil) rhythms, abounding in floriture. Several of his songs became known under specific names, like al-mudum or al-hussia ("cities, fortresses") alluding to places conquered by Kutayba h. Muslim [q.v.], or Kutaylát, three songs on verses by al-A'sha on a girl called Kutayla. His songs (viz. song texts) collected by his pupil Yūnus al-Kātib in his K. fi 'I-Aghani and, later on, now with indications on melody (tartha) and chythm (that), by Ishak al-Mawsiii in his books K. Aghani Mashad and K. Akhbar Mashad wa-Ibn Suraydi umsaghduihimd. Abu 'I-Faradi al-Işbahāni made use of these sources in his K. al-Aghéni, together with other monographical collections of Ma'bad's songs (ibid.', iii, 105), including a Diamic ghind' Mathed transmitted by al-Hishāmi.

He seems to have educated numerous singing girls and singers. Among his best-known pupils figure Ibn Alsha, Malik b. Abi 'I-Samb and the songstresses Sallams and Hababa. Through his pupils Hakam al-Wadi, Dahman, Ash'ab and Siyat he influenced the early Baghdad musical style. Ishak al-Mawsill (d. 235/850) considered him to be "a consummate singer" having "a talent superior to all his rivals". and he took Ma'bad's songs as models of "pure Arab" music. Al-Hasan b. Abmad al-Kātib (early 5th/21th) century) counted them among the perfect melodies and therefore, contrary to normal practice, not any more allowed to 📰 altered by embellishments. From his lifetime onwards, Masbad figures in Arabic poetry (al-Bubturl, Abu Tammam and others) as the musician par excellence.

(fi. G. FARMER • [E. NEUBAUER])

MA*BAR, the name given by the Arobs in mediaeval times to the eastern shores of the Indian Decean, an area corresponding closely, but not exactly, to the Coronandel coast (the latter name from the Tamil Colamendalam, "the realm of the Cholas", indicating the area formerly ruled by the Tamil Chola **Adjös from their capital at Tandjävür (Tanjore); hence the alternative Arabo-Persian name, Barr al-Şaliyan or Şhaliyan (Tibbetts, op. att. in Bibl., 466), "the coast of the Cholas").

In Arabic, the term mathar signifies a passage or crossing point, In its application to Coromandel this has been widely interpreted as being a reference to the part played by the coast in the crossing between India and Ceylon or Sri Lanka; thus the Madras glossary (439) states that Ma'bar "means the crossing over, that is from Madura to Ceylon". An alternative explanation is offered by Yule, who was of the opinion that Macbar derived its name from being "in that age the coast most frequented by travellers from Arabia and the Gulf" (Marco Polo, ii, 332, m 1). If, as is generally accepted, the region of Mathar lay to the east of Cape Comorin (Ar. Kumhard), then Yule's explanation must be considered less satisfactory than that offered by the Madras glossary. Coromandel was, in fact, somewhat off the main routes followed by mediaeval Arab shipping. Research into contamporaneous Arab navigational texts indicates that ocean-going vessels generally touched at Malabar [q.v.] rather than Ma'bar (Tibbetts, op. cit., Detailed short of Ludia and the Bay of Bengal); in any crossing Iron Malabar to Southeast Asia, these vessuls would have passed around Dondra Head (Ar. Ra's Dannie), the southernmost point of Sri Lanka, thus avoiding Mathar altogether unless specifically destined for that area or for Bengal (see, however, Wassaf's definition of Ma'bar (below), which includes a substantial part of the southern Malabar coast). The compilers of Hobson fobson (526) suggest = an alternative that "Mathar" may simply be an attempt to give meaning in Arabic to a local South Indian name; however, no suggestion is made as to a possible Dravidian etymology. A fourth possible explanation is that the "crossing" referred to was that from the well-known Arabian Sea to the less familiar Tuht al-Rib (i.e. "beneath the wind", the Bay of Bengal and the seas of Southeast Asia). a region where Arab mercantile power, supreme to the west of Cape Contorin, met with serious competition from Indian and Chinese vessels (in this context, note the descriptions of Marbar offered by Yakut and Wassaf, see below).

According to Yule, the carliest application of the term Ma'bar to the Coronandel coast occurs in 'Abd al-Latif's short description of Egypt (al-Ifdda wa'lifibbr fi 'l-umbr al-mushdhada wa'l-haseddith almu'ayana bi-ard Misr; see Do Sacy, in Bibl., 3rl, a study written ca. 600/1203, when the Chola rddia Kulotturga III still ruled over the eastern Deccan, thosom-fobson, 526 (Coromandel in still renowned for its mat-weaving industry, mentioned in this passage, see P. R. Nambiar, op. cit. in Bibl., passim),

Mediaeval Arab scholarship in unclear to the exact extent of Ma'bar. According to the geographer Yakūt, "Ma'bar is the extremity of the land of Hind, then come the cities of China, in first of these is Java" quoted in Nalnar, op. cit. in Bibl., 53. In his Tazdjiya: al-amaûr wa-tadiriya: al-athar (700/1300), the historian 'Abd Allah Wassaf states that Ma'bar extends in length from Kulam [4.0.] (Quilon) to Niläwar (Nellore), nearly 300 paranangs (i.e. 1,800 km.) along the sea-coast (in fact, the distance is nearer 1,200 km. (tr. in Elliot and Dowson, iii, 32)

In his <u>Diann'</u> al-landrigh (710f1310), Rashid al-Din repeats Wassaf's description of Ma'bar almost word-for-word, but elaborates somewhat in the products of the region, mentioning silken stuffs, aromatic roots and large pearls (tr. in ibid., i. 69). According to Abu 'l-Fidà, Kiláb Tahwīm al-buldān (ca. 731f1330), Ma'bar is the third iblim of Hind, beginning at about three or four days journey to the east of Kawlam (Quiton), the first locality in Ma'bar being Râs Kumhāri (Cape Comorin) (tr. in Nainar, op. cit., 55).

Abu 'I-Fida's description of the geographical extent. of Ma'bar corresponds alosely to the Coromandel coast than that offered by Wassaf and Rashid al-Din, and indeed, after Abu 'l Fida's time the term Ma*bar seems to have become increasingly associated with the coast of South India east of Cape Cornorin rather than east of Quilon; nevertheless, Macbar, in this truncated form, may not be considered synonymous with Coromandel. The latter is defined by Hobson-Jobson (256-8) as "the Northern Tamil Country, or ... the eastern coast of the Peniusula of India from Point Calimers northwards to the mouth of the Kistau, sometimes to Orissa"; thus Machan extended south of Coromandel to include the shoreline of the Palk Straits and the Gulf of Manner.

The term Ma'bar, although originally an exclusively Arab designation, gained considerable currency beyond the confines of the Muslim world; thus Marco Polo (co. 692/1292) writes at some length concerning "the great province of Maabar which is styled India the Greater; it is best of all the Indies and is on the mainland" (Yule, Marco Polo, il. 331- In a letter also dating from 692/1292, or possibly one year later, John of Monte Corvino describes in some depth "Upper India, which is called Maebar, in the territory of St. Thomas" (Yule, Cathay and the may thither, iii, 58-70). Mashar is mentioned in the Chinese Annals as one 🔛 🔤 foreign kingdoms. which sent tribute to Kubilay Khon [q.v.] in 667/1268 (Ynle, Masco Polo, ii, 337). Although no mention of Mashar occurs in the Ying-put sheng-lun of Ma Huan [q.v.], Ma-pa-erh was certainly well-known to the Chinese during Ming times, and is listed in Feng Ch'eng-chun's Hsi-yu ti-ming (see Bibl.).

Until the beginning of the 8th/14th century, relations between Ma®ar and the Muslim world were generally limited to peaceful Arab trading contacts. The historian and poet Amir Khusraw, who was attached in the court of the Khaldil Sultans at Dihil, celebrates the advances of the Muslim armies in the northern Deceau (cs. 710/1310) and adds that "there

the arrow of any holy warrior had not yet reached" (tr. in Elliot and Dowson, ili, 85-6).

During the first half of the 7th/13th century, however, the powerful Chola Kingdom which had dommated the south-eastern Deccan for over four centuries, entered a period of final decline. In ca. 678/1279, Radjendra IV, the last Chola monarch, fell from power; his territories were divided between two rival Hindu kingdoms based on Madurai and Mysore (Basham, op. cit., in Bibl., 76). In 708/1308 the third Khaldji sultan, 'Ala' al-Din, having defeated the invading Mongols, telt able to turn to the military conquest of the Deccan. Under the capable generalship of Mälik Käfür, the Muslim armies subjugated the Yadava rulers of Devagiri and the Kākatīva rujers of Warangal; in 710/1310 Kāfūr broke through to the southern Deccan, and for the first time Muslim armies were able to despoil the great Hindu temples of Ma'bar. It was as a direct consequence of this victory that Ibn Battūta, who visited the Deccan in or about 739/1338, found the Dravidians of Machar under the rule of a Muslim sultanate with its capital at Madural (Gibb, op. cit. in Bibl., 26x-5).

The success of Muslim arms in the southern Deccan was nevertheless to be shortlived. Within a few years of Mālik Kāfūr's invasion, the independent Hindu kingdom of Vidjayanagar was established in 731/1336. Ma'bar passed under the control of the radjus of Vidiayanagar in 772/1370 (Thapar, op. cit. in Bibl., l, 325); under a succession of Hindu rulers, the region was to maintain its independence from the Muslim north until the equally short-lived conquest of the Mughal emperor Awrangzih (q.v.) in the late 11th/16th

century.

(A. D. W. FOREES) AL-MA'BARI, SHAYER ZAYN AL-DIN B. 'ABD At-'Aziz B. ZAYN AL-DIN B. 'ALI B. AHMAD, the author of Tubfal al-mudfakidin fi bate shudi al-Purtukdityyin, is said to have lived in Ponani, Malabar District (Kerala, India) during the rule of the 'Adil Shah 'All (965-88/1558-80), his patron, to whom he dedicated the book. The date of his birth or death is not known, but he wrote the work

ea. 985/1577. The Tub/at al-mudichidin deals with the geography of Southern India, and gives account of Islam in Malabar and the Portuguese campaigns in India. It has an introduction and four chapters. The first chapter deals with the merits and necessity of dishad [q.e.]; the second gives an account of the first appearance of Islam in Malabar [q.v.]; the third with the strange usages and customs of the Hindu inhabitants of Malabar, and the fourth is an historical account of the Portuguese campaigns from the time of their first arrival in Malabar in 1498 A.D. up to 1583. This work, in the opinion of S. M. H. Nainar, might be different from the work of the same name from which Firishta took extracts, but this needs further careful investigation (See Tubjot al-mudidhidin, tr., Introd., 7).

The author was inspired to write the book for reasons given by him in his Preface; after the spread of Islam in Malabar the Mushims had "disregarded the favours of Allah" and "sinned and set up feuds among themselves." So Allah "empowered over them the people of Purtukhl from among the Afrandi", who oppressed them for eighty years until the condition of the Muslims reached "the worst consequences of decay, poverty and humiliation." But neither they nor the resourceful rulers and the rich Muslims of Malabar cared to "ropel the misfortune" or "declare a holy war" against the Portuguese. Hence, the author says, he "compiled this narrative with a view to inspire in the faithful the desire of fighting the worshippers of the Cross; for a boly war with them is an obligatory duty, because they invaded the territories inhabited by the Muslims ..." (Nainar, tr., 12-13). Obviously, the author book from a religio-political point of view to exhort the Muslims of Malabar to a holy war against the Portuguese. His style is "very simple and direct without rhetorical ornament, yet is not free from the affection of ornate style ... common with most theologians who had steeped their minds in the Qur'an and Traditions" (Nainar, Introd., 7-8).

(S. MAQBUL ANMAD) MABEYN (A. ma bayn "what is between"), in the organisation of the Ottoman palace, the intermediate appartments lying between the inner courts of the Saray and the Harem, a place where only the sultan, the cunuchs and the womenfolk could penetrate and where the corps of select pages known as mdbeyndiis, an élite group from amongst the forty khois odalis, wruted on the monarch for such intimate services as dressing and shaving him (SOO KNASS ODA).

Till the end of the 11th/17th century, the Mabeyndils were headed by the Silabdar Agha = Swordbearer, as chief page. But under Ahmed III (1115-43/x703-30) there was a re-organisation of the palace service, involving the decline of the white curuchs' influence, elevation of the Silahdar Agha's position

and depression to some extent of the Mabsyndiis, henceforth regarded as inferior to the principal pages of the Khars Oda or Privy Chambor. Hence there were now three grades of pages there: (1) the Blčakil Eshis or Superior Aghas (so-called because they wore ■ gilded or silverplated dagger, blick, in their belts); (2) the Mabeyndis; and (3) the Inferior Agkas, with no special designation. Writers from the later 18th and 19th conturies, such as the Ottoman historian 'Ata' and the European D'Ohsson, mention several specific offices hold by the principal ones of twelve Mabeyndiss (thus numbered by D'Ohsson), headed by the Bash Cukadar or Hoad Valet, the Sier Katibi or Confidential Specetary (both still highly influential because of their close contacts with the sultan), the Sarlhel Bashl or Chief Turbanlolder, the Kahredii Bashi or Chief Collee-maker, etc.

(C. E. Bosworth)

MADAGASCAR, with its 627,000 km² the third largest island in the world, after New Guinea (785,000 km²) and Borneo (733,000 km²). Its area is slightly greater than that of France 350,880 km²), of Belgium (30,000 km²) and of Holland (33,000 km²) combined. The large African Island is oriented from north-north-east to south-south-west, measuring 1,600 km at its greatest length and 580 km at its greatest width, with a coastal perimeter of 5,000 km. It has a population in excess of 8 million inhabitants which is increasing at

fairly rapid rate (3.2 %).

Although the Conoros (see KUMR) are entirely Muslim, Madagascar's Muslim population is confined to the north-west coastal region and the south-east, where the descendants of the first Muslims III arrive on the island remain. However, archaeological studies have shown that the Muslims of the Indian Ocean were the transporters of the initial African population, and were responsible for trade between the Great Island and the rest of the world from the 10th to the 18th century. In the 19th century, Indian Muslims engaging in commerce settled in their turn.

In the religious sphere, Maiagasy Islam has always tended to be absorbed by the traditional religion, to such an extent that continual contributions are necessary for the maintenance of Muslim establishments. Most curiously, in the south-east of the island a tradition of Arabic-Maiagasy manu-

script writing is perpetuated.

The island has been known by the names of al-Kum by the Arabs; Bukini (literally, the place where there are (ni) Buki) by the Bantus of neighbouring East Airica; Islo of St. Laurence by the Portuguese who discovered it in 1706 in the feast-day of this saint, ro August; and finally Madagasses, according to the narrative of Marco Polo. The unvocalised spelling has given rise to the play on words diastrat al-kamar "island of the Moon" which was employed by Portuguese historians in the roth and 17th centuries and which apparently survived until the end of the 19th century among the seafarers of Southern Arabia.

The name of Kunir seems to figure for the first time in the Kitāb Sūrai al-ard of Muhammad b. Mūsā al-Kh "årazmī (d. 220/835 or 230/845), in the context of the famous "mountain of Kumr" (diabal al-Kumr) which was believed to be the source of the Nile. But the interpretation as Diabal al-Kamas "mountain of the moon" ancient as early as the 9th century, since it is encountered in the opposity of Ptolemy, whom the majority of Arab geographers and al-Kh-arazmi in particular took as their model, The mountain known as that of Kumr or the Moon mentioned by all the Muslim geographers who have described East Africa. It is totally different from the homographic term Kumr, which in the 17th century, - Trimingham has shown, signifies the Great Island, but also the neighbouring archipelage of the Comoros, which alone has retained this name to the present day.

In his study on the K'ouen-loven et les anciennes natigations interocéaniques dans les Mers du Sud (in 1A, xiii-xiv [1919]), Ferrand suggested an association with the name of the Kmers and that of the E K'un-lun of the Chinese texts, a daring sociation, even though these Chinese texts by no means ignorant of Africa. More interesting for our purposes would seem to be the comparison, by the same Ferrand, of Wak-wak [4,v.] with massaka.

The term Buki, which denotes Malagasy in Swabili, and Bukini, Madagascar, have been andaciously linked with Bugi (people of the Celebes) by J. C. Hébert. In Madagascar, the term appears in literature for the first time in 1613, in the writing of the

Portuguese Father Luis Mariano.

The current name of Madagascar is revealed to us in the account of Marco Polo under the form Madeigascar (cf. The book of Ser Marco Polo, ed. H. Yule, revised and corrected H. Cordier, il, 411 ft.). As was demonstrated by Yule a long time ago, Marco Polo did not visit Madagascar, spoke of it only through hearsay and presented under this heading certain information relating to the neighbouring East African coast. In this sense, the question may be regarded as settled. As Ferrand already indicated in studying afresh this chapter of Marco Polo, Madeigascar is without doubt a slightly incorrect compound of the Zangbar type, to be amended to Madeigascar-bar, denoting "land of the Malagasy" in the same way that the former has the sense of "land of Zang = the Zangs" (cf. Trois stymologies malgaches, in Mémoires Soc. de Ling. de Paris, xiii [1905-6]). This reconstruction is based on the following facts: in the previously mentioned account, Father Luis Mariano tells of a kingdom in the south-east of Madagascar which he calls Mitacassi, Matacaci, Matacasi (or Matakasi). Three years later, in 1616, Father Almeida, travelling in the same region, also mentions a kingdom of Matacausi. In his Relation published in 1651 by Morisot (Relations véritables et curieuses III l'iste de Madagazoar et du Brésil, 10, 49, 99, 124, 127, 134), Cauche refets to a province called Madegachs and known by others - Madegusse, whose inhabitants he calls Malegasses and Malicgasses. He also employs the term Madaguscarois, but in | broader sense of the inhabitants of the entire island. Flacourt (Histoire de la grande isle Madagascar, 2662, 1) says: "The Island of Sainct-Laurens is called Madagascar by the geographers, Madeease by the inhabitants of the land, Monuthias by Ptolemy, Cerne by Pliny . . ., but its true name is Madecase". Later writers have all been inspired to a greater or lesser extent by the work of Flacourt; therefore, there is no purpose in employing their testimony. These variant readings may reduced to two: Madagasi and Malagasi

which correspond exactly to the two major categories of dialect: dialects with voiced dental (d) and dialects with liquid dental (l). It is the latter form that has prevailed throughout the island, sometimes with the shilland Malagdai, semetimes with the frieative Malagdai. Both are puresytones. In addition, the modern collequial language frequently employs the althreviated form gazy and even gasa. These observations seem to justify the interpretation proposed above for the name of Madagascar which we owe to Marco Pole.

The doublet Malagási-Madagási, Madagási-Madagási remains obscure. According to the morphology of the language, it may represent a compound mala or mada gási which resembles nothing known, since in consists of the voiced form mada-gási, or of the unvoiced form noted by the Portuguese mala-kási. Furthermore, it is not known whether this is a western indenesian construction in a Bantu construction. Whatever the case may be, it is likely that here we have a foreign tribal name, the origin of which, eastern or western, cannot currently be explained by reference to the ancient and modern language.

The account of the Periplus of the Erythmean Sen, probably written by a Greek of Alexandria in the 3rd century A.D., describes a voyage along the eastern coast of Africa as far as the port of Rapta. Madagascar seems to be unknown to the author of the Periplus, and it is probable that it was still uninhabited. Indonesian and African migrations seem to have populated the island only in the 2nd or 3rd cen-

turies of the Hidira, at the earliest.

In about the yem 945, the island of Kanbalu, probably situated in the archipelago of the Comoros, was the object of invasions by marine pirates possibly based on Madagascar. The book of The marcels of India by Buzurg b. Shabriyar, a Persian of Ramhurmus, states in fact: "Ilm Lakis tells me that he has the people of the Wak-wak perform amazing things. It is thus that in 334/945-6, they came upon them in a thousand ships and fought them with the utmost vigour, without however achieving their end, since Kanhain is surrounded by a strong defensive wall around which stretches the waterfilled estnary of the sca, so that Kanbalii is at the centre of this estuary like a fortified citadel. When people of the Walt-Walt subsequently came ashore there, they asked them why they had come specifically there and not obswhere. They replied that this was because among them there were to be found products sought after in their country and in China, such as Ivory, tortoise shell, panther bides and ambergris, and because they were seeking out the Zandj, on account of the case with which they endured slavery and on account of their physical strength. They said that they had come from a distance of one year's sailing, that they had pillaged islands situated six days' journey time from Kaubald and had taken possession of a certain number of villages and towns of Solida of the Zandi, to say nothing of others which they did not know. If these people spoke the truth and if their account was accurate, this would confirm what Ibn Lakis said of the islands of the Wak-wak: that they are situated opposite China". Today there is a consensus that these pirates were Indonesians based in Madagascar who pillaged the Comoros and the coast of the Zandi.

Among the Arab geographers, the first detailed mention of the island of Kour-Madagascar is supplied by the Kitāb Kunhat al-muhlāk fi 'khtirāk al-āfak

(1154) of al-Sharif al-Idrist, who sometimes includes the large African island in the land of the Zandi. "The inhabitants of the islands of Zabag = Sumatra," he says in the seventh section of the first chapter, "come to the land of the Zandi III large and small ships, and they use it for the sale of their merchandisc, seeing that they understand one another's language" (B.N. ms. 2221, fol. 20 a, I, 15; the editor of the Book of Roger, Naples-Roine, i, 1930, 51. reads al-Rănadi în place of al-Zâhadi; ef. Index of the Muridi, s.v. Zabadi). This passage is very important, because it shows that in the 12th century contacts were maintained between the east and the west of the Indian Ocean and that mutual comprehension was practised by the Indonesians settled in Madagascar on the one hand, and those natives of Indonesia on the other

In his Mudjam, completed in 1224, Yikût merely says (iv. 174): "al-Kumr is an island in the middle of the sea of the Zandi which contains is island larger than it. It comprises a large number of towns and kingdoms. Each king makes war on the other. On the shores are found amber and the leaf al-kumāri (sic). This is a perfume; it is also called betal leaf. Wax is also obtained from it." The Kitab al-Musklarion of the same author contains identical information borrowed from the Musklario (od. Wüstenleid, 358); but the latter text has, more corrootly, "the

leai al-kumrl".

Ibu Said (7th/13th century [q.v.]) wrote a geographical treatise, of which the Bibliothèque Nationale of Paris possesses, under no. 2434, a copy once belonging to Abu 'l-Fida' and dating from 714/1314-15. This treatise contains an interesting association between the Asiatic peoples and the people of Kunr, which Ferrand summarises thus: "The Kunn, who have given their name to the mountain of this situated in eastern Africa, are brothers of the Chinese. They dwelt originally with the Chinese in the eastern regions of the world. that is to say, in the interior of the continent of Asia. Discord having broken out between them, the latter drove the Kunir towards the islands. After a certain period of time, with dissension erupting among the Kumr who had emigrated to the islands, the king and his family emigrated again, made their way to the large island of Kumr Madagascar and the king established himself in a town of this large island called Kumriyya. These femor, having arrived on the large island, grew in number and proliferated in the various capitals of the island in question; but new dissensions provoked a new exodus and a large number of them departed to settle in the south, at the commencement of the inhabited territory, along the mountain range which bears their name." (Perrand, Relation de voyages, ii, 316 ff.).

A contemporary of Ibn Sa^cid, Ibn al-Mudjāwir al-Shaybhni of Damascus, wrote bis Ta^rih al-Mustabsir in ca. 1230 (B.N. ms. 6021). In the 23 folios which the author devotes to the history of Adea, there is mention in folio 72 a-b of voyages by the Kuntt from their country of origin to Adea and, in particular, in 620/1228, from Madagascar to the coast of Africa and to Adea (cf. JA, xiii [1919], 469-83).

The following authors al-Dimashki (ca. 725/1325), al-Nuwayri (d. 732/1332), Abu 'l-Fidia' (1273-1331), Ibu ihhakibu (ca. (175) and al-Makrizi (1365-1442) tell us nothing of substance about the island of Kunz. The towns which some of them place on the great African island are in fact situated in Ceylon or further east, or are unidentifiable (cf. Ferrand,

Besides mentioning numerous towns, at-Dimashki tells of the presence on Kunn of the famous rulks bird. This bird, which has haunted the legends of the Arabs of the Indian Ocean, is probably the appyornis, a giant flightless bird which was exterminated by the Madagascans ca. 1500.

In the 9th/13th century, the information supplied by Arab geographers is reliable. This no longer consists of learned treatises or compilations, but of "route-maps" written by navigators, the most eminent being Ibn Madiid and Sulayman al-Mahri [q.vv.]. Ferrand was the first to draw attention to the importance of these documents in the Bibliothèque Nationale of Paris, and he published them in fecsimile without French translation; before him, this nautical data was known only from a secondhand Turkish text, the Mudit of Sayyid 'All, Today, for Ibn Mådlid, we me fortunate in having at our disposal the interpretation by Shumovski relating to another manuscript, that of Lenlagrad, and the cartographical analysis of the navigators' documentation made by Grosset-Grange.

While admitting the interest of the nautical instructions of Ibn Madjid, Ferrand recognised that the information given by Sulayman al-Mahrl was more precise, In fact, in his Umdo Mahriyya, in chapter iv, which deals with the topography of the islands and the maritime routes along their coasts (cf. Instructions nautiques et routiers arabes et partugais, it, fol. 22 a), the following is stated: "We begin with the island of Kumr because it is a large island which stretches along the coast of the Zandi and of Sufala. Its northern extremity is called al-Milh (= Cape of Amber); it is situated at it isba's from Na'sh (αβγδ of the Great Bear = 8° 37' south approximately; | latitude approximately 11° 57'). Its southern extremity which is called Higfa (= Cape Sainte-Marie?) is at 3 isba's from Na'sh (= 21° 37' south, true latitude approx. 25° 38'), according to some, at r isbas from Nassh (= 24° 51' south), according to others. This last latitude is the man exact. There is a difference of opinion [on the direction] of maritime routes along its coasts, because this island is far removed from inhabited land. As regards the direction of route on its eastern coasts, there are two opinions: according to some, a course should be set to south-west-one-quarter west, according to others, to south-west. There is a third opinion which recommends a course set to west, from one extremity of the island to the other. This last opinion is that of the ancient [masters of navigation]. In my view, adds Sulayman al-Mahrl, it is possible that the route could be to west-south-west, to southwest-one quarter west, to south-west, and in yet another direction, for two reasons: the first is that this is a large island, it has a long coastline and the route is equally long. The second reason is that the above-mentioned routes have not been verified, on account of the small number of journeys which have been made to this island and the insufficient nautical data provided by those who have travelled there. Masters of navigation (mutallim) of the Zandi have told - that the course on the eastern coast, from Rås al-Milh as far as the place where Na'sh is at 8 isba's (= 13' 30' south), is to the south, and from this place to the southern extremity of the islands, to south-one-quarter-south-west. On the western coast, from Ras al-Milh in the place where Na'sh is at 6 isba's (= 16' 44'), the coast is entirely safe; from 6 isba's to its southern extremity, there is a rikk ("bank" or ,,shoal") of a length of some

Relations de voyages, it, index, s.w. Komer and Komr). | 2 sams (6 hours) sailing-time or more, as far = the coustal area. Between the Island of Kumr and the coast [of East Africa] there are four large inhabited islands, close together, which are frequented by the peoples of the Zandi. The first of these islands is Angazidya (- Grand Comoro). It is at rr isba's and one-quarter from Nacsh (- approx. 9° south: Mroni, the capital of Grand Comoro is m exactly 11º 40' south), Between R and the coast [of East Africa), there are 16 sams (= 48 hours) of travelling. The second, Mulall (known to us as the island of Mohell), is at at isba's from Na'sh (- 8° 37' south, true latitude approx. (2° 20'); the third, Dumuni (capital of the island of Aujouan), which is at to isbats from Naish (- 8° 37' south, true latitude 12° (5') is to the east of Mulall; the fourth, Mawutu (currently the island of Mayotte), is at 10 isbe's and one-half from Natsh (= 9° 25' south, true latitude 12° 46' 55"). To the east of these islands, lies a large reef of rocks, at about # sams (= zz hours) of travelling, called "Ayn al-Bahr ("eye" or "source of the sea"). The ports of the western coast of Kumr are: Langani (at 15° 17' south), Sa'da (true latitude approx. 13° 54') and Manzaladii (currently the bay of Mahadzamba, of which the western extremity is at a true latitude of approx, 15° 12'). Those of the eastern coast are: Bandar Banl Isma'll (on the same latitude - Langani on the western coast) and Bimārūh (currently Vohemar, at 15° 21' 15"). All these ports are dangerous [for shipping], with the exception of Langani. Note that between Ras al-Milh and the coast of the Zandi there are 50 zams (= 150 hours) of travelling, and that at 20 sams (= im hours) of travelling to the east of Ras al-Milh lies an inhabited island called Munawwara (one of the southern Maldives?). To the southeast of Kumr, tie numerous islands called Tirrakhā (the Mascareignes group?); they are at re tapes (= 36 hours) of travelling from the island. of Kumr."

In his Kitab al-Minkadi al-fakkir (fol. 73 b of same manuscript), Sulaymān al-Mahrf provides a second description of the island of Kumr which does not differ from the foregoing. Four pages previously, in fol. 7x b, the same author mentions some other ports of the island of Kumr with their latitude calculated according to the elevation of the Great Bear: Island of Munawwara at 11 isba's; Bandar Isma'll or Bani isma'll, m the eastern coast and Lulangani or Langani, on the western coast, at soa's; Birmaruh, on the eastern coast, Anâmil, on the western coast, at | isba's; the island amber (distiral al-lanbar), on the custern coast, and Bandar al-Nüb on the western coast, at 8 isba's; Noshim (?), on the eastern coast, and Malawin (?), on the western coast, # 7 isba's; Manakara, on the eastern coast (true latitude 22" 08' 30") and Bandar (al-) Shuban (port of the shoals), at 6 isba's; Bandar Haduda, on the eastern coast, and Bandar Kuri, on western coast, = g isba's; Wabaya (?) (according to the Turkish text of Sayyid 'All; this name is illegible in ms. 2559), on the eastern coast, and Bandar Hit (or Hayt), on the western coast, at 3 isba's; Bandar Hadûda (sie), on the eastern coast, no name known on the western coast at this latitude, at 2 isbats; and Bandar Kûs (or Kaws), the eastern coast, and the bay of Karl, on the western coast, at 1 isba*.

A number of these ports, including Sa'da, Manzaladit and Bimarch bave been rediscovered and have bean subjected to archeological studies. Those of the north-west were also known through an oral tradition,

assembled in Madagascar itself by Commandant

Guillain (Vérin, 1975, 89-91).

In the light of recently discovered data, the settlement of Madagascar may be summarised in follows. Between 700 and 1000, Indonesians and Africans created through biological and cultural cross-breeding the proto-Malagasy civilisation in the north of Madagascar and, no doubt also, in the archipelago of the Comoros (especially at Mayotte).

From this period onward, Muslim seafarers of the Persian Gulf and the Hadramawt took part in migrations and a commerce. In particular, they taught navigation to the Sawahil peoples of the east coast of Africa, as a result of which Bantu migrations were extended to the islands. The Muslims established after the 10th century contacts between Sirāf and Şuhār on the one hand, and the Malagasy Comoran ports to the other. A green ceramic, called Sasano-Islamic, has been discovered at Irodo, in the far north of Madagascar, a site dated to the 10th century by the RC 14 test.

Between the rath and 14th centuries, Muslim establishments irequented by the latter proliferated, especially at Bemanevika, Ambariotelo and Mahilaka. The ceramics imported then were of the sgraffiato type, very similar to that of Takhti-Sulayman. The first stone-built mosques appeared at this time, well as stone-built bouses, fortifications and well-shafts. At the turn of the 14th century, the influence of the Hadramawt became perceptible, corresponding no doubt to the monopoly control of the gold trade in the region by the Mahdali.

The 14th and 15th centuries constituted a golden age for the Muslim settlements in Madagascar. The towns of Vohernar, Sa'da, Langāni (Manzaladji) and Kingāni were particularly prosperous. They imported fabrics, pearls and Arab and Chinese ceramics. They exported rice, livestock, and chlorite slate.

At the end of the 15th century, the Portuguese invaded the Malagasy coasts. They sacked Kingáni, Sa'da and Langáni. Despite certain vicissitudes, the Muslim settlements of Madagascar were never to be subjected to the Portuguese crown. Progressively, commerce developed with other foreign nationals: French, English, Dutch and even Danish.

In the 16th century, the slave trade became important. Settlements controlled by Malagasy sovereigns, mostly Sakalava, but enlivened by nativeborn immigrant Muslims, became intensely prosperous. African slaves were imported to Madagascar to cultivate the crops of Sakalava farmers; but, at the same time, Madagascans taken prisoner in the course of internal wars were exported to the Mascareignes (Filliot). In the 17th century, Langani declined, but commercial activity continued at Boeny. Vohemar was prosperous at this time, but I too declined in the 18th century. In the second half of the 18th century, Boeny was supplanted by Majungs which, together with Nosy Be, has remained a major commercial centre until the present day. Indian Muslims settled in Madagascar in the 19th century in the course of trade missions to Majunga and Nosi Be.

Malagasy Islam is active among the Antakarana and the new converts (moridy/murid), especially following the conversion of Tsimiaro in 1843.

In the south-east, certain of the Antambahoaka and Antaimoro, possessors of sorabe (Arabico-Malagasy manuscripts) still respect the authority of Islam, while also practising Malagasy customs.

Finally, still among the Madagascans of old stock,

there should be counted the descendants of the former inhabitants of the Muslim trading-stations of the north-west called Antalaotse. Among them live some Makos, more recent arrivals from Africa and many of them converted. These various Malagasy Muslim groups may be numbered around 100,000. They live in the coastal towns, but also in the urban settlements of central and western Madagascar, the descendants of Indian Muslim immigrants. 15% of these Indians are Sunnis; some of these Sunnis have introduced a ceramic type from Sind which has gradually replaced the local Malagasy pottery of the north.

Among the Shiff Indians, predominant are the Boborás [q.v.], the most numerous (about 5,000); the Khôdjas [q.v.] of whom some 2,500 arrived shortly after 1900 with Amode Khôdja by way of Majunga, but whose most active centre is at Morondava; and finally, the Agha-Khânites [see Activa Aman] (2,500), who arrived on 1885 and are linked to remarkably structured international organisation.

Among the foreign Muslims of Madagascar, there
a number of Somalis and Yemenis who have settled since the colonial period, and 25,000 Comorans
who live mostly in the north-west, but no longer dwell
in Majunga, which they evacuated following the
tragic events of December 1976.

The inhabitants of Madagascar all speak Indonesian language modified by a Bantu substratum. Vérin, Kottak and Gorlin (1968) have acknowledged three groups of dialects, giving a separate place to the group of the north, apparently isolated in ancient times than the centre-east and west-south groups.

In the article on Madagascar in EP, Ferrand clearly showed the lexical contribution of African in Malagasy languages. There is an old Bantu stock which could emanate from the language ancestral to Comoran and Swahili, but also from more recent borrowings from Swahili, at the time when, in the 15th century, this language was commonly spoken in the Muslim coastal settlements.

The basic vocabulary of Malagasy is 90% Indonesian, but in addition to Bantu expressions, there exist some words of Sanskrit origin; scholars are divided to whether this Sanskrit lexical stock was brought to the island by the original Indonesian immigrants, or was absorbed through later contect with Indian civilisations.

Certain words of Arabic origin have made their way into Malagasy through the intermediary of Swahili (e.g. sokany, Ar. sukkān "rudder"). But others have been introduced directly through borrowing.

Among these borrowings from Arabic me the following:

- 1. Some commercial terms, e.g. minana (minan) "scales", but also the of days of the week, described by Ferrand in the following terms: alatsinainy, talata, alarobia, alakamisy, zoma, asabotsy, alahady (Ar. al-thnayni, al-thalatha, al-arbita' al-hamis, al-dium'a, al-sabt, al-ahad). It will be noted that the Arabic definite article has been retained for Monday, Wednesday, Thursday, Saturday and Sunday and omitted for Tuesday and Friday. The of the days are given here in Merina dialect; the forms of the other dialects show only minor phonetic variations.
- 2. The series of the twelve months in the dialect of the Merina and that of some other tribes reproduce the Arabic names of the twelve signs of the Zodiac: alahamada, adaoro, adizaoaza, asorotany, alahasaiy,

asambola, adimizana, alakarabo, alakasoy, adizady, adalo and alakotsy, where the following are recognised without difficulty: al-hand, al-flaur, al-djauză', al-sarajin, al-aiad, al-sanbula, al-mizăn, al-flaură, al-flaur, al-djady, al-adio and al-hūl. A fairly large number of tribes are aware of the Merina system, but stilt use names of months of Sanskrit origin which will be considered below.

3. The names of the 28 days of the month (the south-eastern Madagascurs at least formerly had a year of 336 days) which have been preserved for us by Fiacourt (Histoire, 1061, 174), recall those of the 28 Arab unar mansions (see ANWA) and MANAZUL). In Madagascar, to avoid the fragmentation of mansions, corresponding to the different signs of the 20diac, 3 mansions have been allotted to the 1st, 4th, 7th and roth signs, and 2 to each of the II others.

Signs of the Zadiac	Lunar mansions	
I. Alahamady (ol-Ḥamal)	z. Asharotainy 2. Alabotaint 3. Azoriza	al-Sharatan al-Butayn al-Thurayy
II. Adnore		
(al- <u>Th</u> awr)	4. Adabara 5. Alahaka	al-Dabarûn al-Hak'a
III. Adizsoza	-	
(al- <u>D</u> jawzā ²)	6. Alahana 7. Azira	al-Han'a al-Dhirà'
IV. Ascrotany	\$1 Part 1	2-7-12-12
(al-Sarațân)	8. Amasara	al-Nathra
	g. Ataraly	nl-Ţarf
	ro, Alizaba	al-Djabha,
		etc.

The Arabic of the lunar marsions have these become the names of the 28 days of the Malagasy month. When mentioned in conjunction with a day of the week, they take the place of the day of the week, which the Arabico-Malagasy texts very rarely indicate by a figure. This method already to have fallen jute disuse in the current language, and is hardly ever employed except in witchcraft.

4. Shikili (dialectal variants sikily, sikidy: Ar. shaki "figure") is the divinatory art. It has as its object the finding of remedies and is practised throughout the island, with minor variations, between one tribe and another; sikidy, to use the form generally employed, is a direct derivation from the 'film al-rami' "science of said", or Arab generally (cf. the Kitāb al-Fasi fi ușil 'ilm al-rami of the shayêt Muhammad al-Zanlti, Cairo lith. n.d.).

Although today it constitutes nothing more than a precious relic, Arabico-Malagasy remains an essential element of the patrimony of the Great Island. The manuscripts which exist emanate from the regions of Vohipeno and Fort-Dauphin. The most ancient are stored

Bibliothèque Nationale of Paris, but some also exist in various European countries (Norway especially), and naturally enough in the Malagasy Academy, as well as in the region of Vohipeno (south-east).

At the beginning of the 19th century, the king Andrianampoinimerina invited some Antaimoro soothsayers to the court of Tananarive, including the enument Andrianahazonoro. Arabico-Malagasy was thus held in high regard in Iuerina until the beginning of the reign of Radama I. The latter subsequently had the Latin alphabet adopted for the writing of Malagasy.

The enterprise of adapting the Arabic alphabet to the transcription of Malagasy was both deficate and difficult; it has however been successfully achieved under satisfactory conditions. The Malagasy phonemes b, d, f, h, l, m, nr, r, s, have been transcribed by their Arabic equivalent; d is represented by a subpointed >. The other phonemes are rendered thus: Malagasy g by E ii guttural by E and sometimes by ¿; the group its also by ¿; the phonemes de and te, in the English drive and travel (they are pronounced further back in the non-Merina dialects), generally by ,, sometimes by a with a taxarin (for example antrends y "date-paim" is rendered by in and only the context indicates whether , should be read dr or ir; Malagasy i, by sub-pointed ; the phoneme is, by Arabic 5; Malagasy v, by ,, وشيات is also pronounced v; Arabic وشيات ramadán, Malagasy ramava; Malagasy s by pronounced s: ut sasa "small child"; the phoneme ds, by and in modern Arabico-Malagasy sometimes by i. The non-Semitic Islamised peoples who have adopted the Arabic alphabet and have found it necessary to transcribe the occlusive b, have resorted to various notations. The Malays have rendered it by J. The Persians, and following their example, certain Muslims of the Comoro archipelago, by 4; the Swahilis of East Africa by . The Malagasias adopted an unexpected solution; until the 18th century they rendered \$ by ., meaning .. surmounting by a vertical tashdid, then by ... Unlike in Malay, each letter is vocalised, which facilitates the reading of Arabico-Malagasy texts, in spite of graphical variants which are too numerous to be mentioned here.

The Arabico-Malagasy alphabet formerly used over a fairly wide geographical area; it is currently employed only the south-eastern coast, where great many natives were still using it at the end of the 19th century. The Malagasy Muslims of the northwest and west rather employ the Arabico-Comoran or Arabico-Swahili alphabets. The latter represents by a 1r identical to the Malagasy 1r, but this form is current only in the island of Anjouan. The dialect of this island possesses a 3, the transcription by g of the 4 of Persian and Turkish. The other Arabic letters at 2, 2, 3, 3, 3, 5, 3, more encountered in Malagasy except in mentions of Arabic words and they are pronounced respectively s, h, h, ds, 1, s, r, z, and h.

Ferrand did a great deal of work on the Arabico-Malagasy manuscripts; his researches have been pursued by Gautier, Julien, Mondain, Faublée, Ramiandrasoa, Munthe and especially Dez, who has recently completed a vocabulary with which he intends to decipher and transcribe, with the aid of F. Vire, B.N. ms. 36.

Madagascar, having integrated harmoniously in its civilisation African, Indonesian, Arab and European elements, today practises in the context of its international relations in policy of worldwide contacts. In this manner, the Great Island maintains close relationships with numerous Arab and Muslim countries.

Al-MADÂTN, "the cities" (pl. of al-madisa), the Arabic translation of the Aramaic Māhōzē or Medīnāthā referring to the Sāsānid metropolis on the Tigris about mulles southeast of Baghdād where several adjacent cities connected by a floating bridge stretched along both banks of the river. This was the imperial administrative capital, the winter residence of the king, the home of the Jewish Exilarch and the seat of the Nestorian Catholikos. Among the mixed population of Aramaears, Persians, Greeks, and Syrians were Jews, Christians and Zeroastrians. The residential, industrial and commercial zones of the metropolis were interspersed with palaces, villas, parks, gardens, ceremonial buildings, monuments,

and large open areas. Although tradition names seven cities, there were really four or five main population centres in the late Sasanid period. The oldest city on the east bank was Ctesiphon, founded by the Parthians in the 1st century B.C. and called "the old city" (al-madina al-'alika) by the Arabs. The old royal residence called "the White Palace" (Kase al-abyad) was here and this city was a local administrative centre. Next to it, the sprawling, unwalled residential district of Aspanbur grew up in the late Sasanid period, with its great teremonial hall (Indu Kisril), palace complex, bath, treasury, possibly a mint, game preserve and stables. About three miles away, Khusraw I founded the city of Veh Antiokh-i Khusraw in 540 A.D., where he resettled the captives taken from Antioch in Syria. Called al-Rúmiyya by the Arabs, this town had its own hippodrome and bath, was a local administrative centre and had a population

On the west bank stood the round, walled city of Veh-Ardashlr founded by Ardashlr I in cs. 230 A.D. and called Behrash by the Arabs, Mahoza by Jews and Köhhë by Christians. This city mainly commercial and industrial, a local administrative centre west of the Tigris with its own mint, and the location of the cathedral church of the Catholikos. Heavily populated by wealthy Jews, it was also the residence of the Exilarch. Parts of this city had been abandoned by ill 6th century. Sabât, about three miles south of Veh-Ardashlr guarding the bridge will Nahr al-Malik where it met the Tigris, is sometimes included in the metropolitan area.

of 30,000 in the late 6th century.

When al-Madā'in fell to the Arabs in Safar 16/
March 637, the Sāsānid royal family, nobles, and
army had fled. Some soldiers were captured there,
along with huge amounts of booty from the royal
treasures. The peuple in the White Palace made
peace with Sa'd b. Abi Wakka's for the payment of
tribute (gfirya), which terms were extended to the
rest of the population, while the people of al-Rūmiyya
made their own peace terms. Sa'd occupied the
White Palace and quartered his army in empty
houses. When the soldiers settled in permanent
quarters at Kūfa, they took the doors from their
houses in al-Mādā'in with them.

The native population of al-Mādā'in was fairly stable immediately after the conquest. There were Persian notables (dalāķin) there in 3/657. The Exilarch and Catholikos remained there and by the Interest/early 8th century it was also a Manichaean contre. The main change was the replacement of the Sasanid upper classes by a small Muslim Arab garrison posted from Kūfa (300 horsemen in 43/663, 1,000 in 76/695) and led by Kūfan notables (askvā/), the tribal leaders of Azd and prominent early Muslims (buyātāt al-nīs) who married local women at first and acquired local land. Their Friday mosque was in Madinat al-'Arīka.

In the early Islamic period, al-Madå'in considered the key to the Küfan territory because it controlled the main road to the east and served as the administrative centre for the Diyilla region (ard Diukha) under the governor of Küfa. Salmān al-Farist, who died there in the caliphate of 'Uthmān (23-35/644-56), was an early amir. Eudhayfa b. II Yamān, the first fiscal agent there under 'Umar, established the tax rates for and Diukhā and died at al-Madā'in in 36/657. However, early Muslim governors at al-Madā'in often combined the responsibilities for war, worthip and finance, and resided in the White Palace. Al-Madina al-'Atlia was also a mint for post-reform Umayyad dirhams.

Because of their Küfan connections, the Muslims of al-Mada'in appear consistently as pro-falid and anti-Khāridii. Sa'd b. Mas'ad, 'All's governor 36-40/656-660 secured the city against the Khawaridi in 37/657. In 41/661 al-Hasan b. 'All retreated there and stayed in the White Palace before coming to terms with Murawiya. In 43/664 the governor, Simak, prevented the Khawaridi of al-Mustawrad from crossing to the eastern city from Behrasir. The Muslims of al-Mada'in supported the 'Alids in the second fittigs. and in 65/684 Sa'd b. Hudhayfa, m oarly sadi there, joined the "Penitents" of Sulayman b. Surad with 170 Shi'is from Kufa who had settled in al-Mada'in. The Shifts of al-Mada'in suffered the consequences. of their partisanship later when the Azāriķa Khawāridi sacked the city = 68/687 and massacred the Muslim population. The city also occupied by Shabib in 76/696. By the 2nd/8th century, the Shiffs of al-Mad5'in extremists (ghuldt). The Harithiyya sect which believed that whoever knew the Imam could do as he liked was founded there and supported the 'Alid rising of 126/744. The extremist ishākiyya sect me there in the 4th/10th century.

Although al-Mansur (136-58/754-75) stayed briefly at al-Rümiyya, where Abū Muslim was in 137/754. killed, al-Mada'in declined in political and commercial importance after the foundation of Baghdad in 145/762. Most of the population, the Catholikos and the Exilarch moved to Baghdad. The White Palace was partially demolished by al-Mansur, and although he ordered it to be rebuilt in 158/775, it remained ruined. Its demolition was completed by al-Muktaff (289-95/902-8) in ca. 290/903, and the materials used to build the Tâdi palace at Baghdad, By the 3rd/9th century, al-Mada'ln's importance was more agricultural and the position of kadi there tended to be combined with that of Baghdad and other places, although the tombs of Salman near the Iwan and of Hughayla near the river had been built at Aspanbur by then. By the 4th/zoth century, al-Rûmiyya was deserted, but the rest of the town on the east bank was a flourishing suburb of Baghdad, with brick buildings, markets and two Friday mosques, while there was a large fire temple on the west bank.

There was still a small town on the east bank in the 6th/12th and 7th/13th centuries. The office of \$\hat{a}\hat{a}\hat{a}\text{ was held by local people and the tomb of Salmān was visited annually on 13 \$\hat{b}\hat{a}\text{ ban by Shinil barbers of Baghdad and on variable dates by \$\hat{b}\hat{1}\text{ is.} There was a village of Imāmī \$\hat{b}\hat{a}\text{ farmers on the west bank and coins found at Tell Baruda confirm settlement at Behrasir as late as the 7th/13th century. Behrasir remained a small \$\hat{b}\hat{1}\text{ fown in the 8th/14th and 9th/15th centuries.}

The tomb of Salman was rebuilt by the Ottoman sultan Murad IV (2032-49/1623-40) and restored in 1904-5. The village of Salman Pak has grown up around the tomb in the modern period, with khāns for Shiff pilgrims who often stop there when visiting

the other Trak! shrines.

On 22-3 November 1915, in the battle of Ctesiphon, the Turks defeated the Anglo-Indian army of General Townshend, stopping its advance towards Baghdad at a line east of the ruins of the Iwan.

Bibliography: The main sources for the topography of al-Mada'in are Procopius, Wars, ii. 14; Ya Wibl, K. al-Buldan, 321; Tabarl, i. 898, 959-60, 819, ii, 982; Dinawari, 70-1, 163, 376; Karwini, Athar al-bildd, ed. Wüstenfeld, 303; and Yakut, Buldan, i, 768, iv, 446-7. Modern historical and topographical studies begin with the review of Arabic sources and European traveler's accounts by Father Anastase the Carmelite, Sulwän al-asrä fi Iwan Kisra, in al-Mashrib, v (1902), 673-81, 240-6, 780-6, 834-40 and M. Streck, Die alte Landschaft Babylonien nach den arabischen Geographen, Leiden 1900-1, il. 246-79, followed by his Seleucia und Ktesiphon, in Der Alte Orient, xvi (1917), then by E. Herzfeld and F. Sarre, Archaeologische Reise im Euphrat- und Tigris Gebiet, fi, Berlin 1920, 47-76, and by E. Meyer, Seleukia und Ktesiphon, in Mitteilungen der Deutschen Orient-Gesellschaft, Ixvil (April 1929), 1-27. J. Obermeyer, Die Laudschaft Babylonien im Zeitalter des Talmuds und des Gaonats, Frankfurt 2. M. 1929, 161-77, contributed information on the jews of the city. The most important recent treatments are those by J. M. Floy, Topographie chrétienne de Mahose, in L'Orient Syrian, xii (1967), 397-420; idem, Topography of al-Mada'in, in Samer, axiii (1967), 3:38; and by 5. A. al-'Alf, al-Mada'in fi 'I-majadir al-'arabiyya, in Sumer, axiii (1967), 47-65; partially translated into English as Al-Mada'in and its surrounding area in Arabic literary sources, in Mesopotamia, ill-ly (1968-9), 417-39.

The results of the first real archaeological excavations at this site may be found in O. Reuther, Die Ausgrabungen der deutschen Ktesiphon-Expedition im Winter, 1926-9, Berlin 1930; idem, The German executations . Clasiphon, in Antiquity, iil (1929), 434-51; E. Kuhnel and F. Wachtsmuth, Die Ausgrabungen der zweiten Ktesiphon-Expedition (Winter 1931/34), Berlin 1933; J. Upton, The Expedition to Ctesiphon 1931-39, in Bulletin of the Metropolitan Museum of Art, xxvii (Aug. 1932), 288-97; and J. H. Schmidt, L'expédition de Cifsiphon 1931-31, in Syria, xv (1934), 1-23. The recent work of the Italians m published in the journal Mesopotamia, starting in 1966, and there is a summary of the work by the 'Irakis in T. Madhium, al-Mada'in (Tisfan) 1970-1971, in Sumer, xxvii (2972), 229-46. The results of the Italian expeditions have been summarised by A. Invernizzi, Tan years' research in the Al-Mada'in area; Soleucia and Clesiphon, in Sumar, mxii (1976). [M. STRECK - [M. MORORY]]

AL-MADA'INI, 'ALI S. MUHAMNAD IN 'ABD Attan B. Asi Saye, Asu 'L-Hasan, early Arabic historian, was born, according to his own information, in 135/752 (Fileist, 100). Little is known about his life. He was a client of Samura b. Habib b. 'Abd Shares b. 'Abd Manaf, i.e. of the Companion 'Abd al-Rahman b. Samura [q.v.]; according to Fibrist, tor, al-Madā'ini dedicated a monograph to him. Al-Madavini, who was in Başra in 153/770 (see al-Dializ, al-Bayan wa 'l-tabyin, ii, Cairo 1367/1948, 93), later went to al-Mada'in and Baghdad at an unknown date. It is also unknown whether his wishe originated from a stay in al-Madasin or whether such a stay was derived from an already-existing wishes. The same nisba is in any case also carried by 'Utba b. 'Abd Aliah, grandson of 'Abd al-Rahman b. Samura (Yāķūt, i, 644). Al-Madā'inī is explicitly said to have been a pupil of the Mutazill Mutammar b. 'Abbād al-Sulami (d. 215/830) of Başra, who fived in Baglidad (see Ibn al-Murtada, Tabaját al-Murtasila, Beirut 1961, 54); elsewhere (ibid., 140) he is counted among the people of Kûfa. It is indeed possible that he stayed also in this city, because are a great number of Küfan people among his informants. He found a friend and patron in the musician and scholar Ishak b. Ibrahim al-Mawsill (d. 235/850 [q.v.]), in whose house he is said to have died. The data on the year of his death in Bashdad vary; 215/830, 224/839, 225/840, 228/843 (Fibrist, 100 al-Tabari, iii, 1330; al-Mas'ūdi, Murddi, vii, 287, -| 2973; Yākūt, Udabā', v, 309 fl.; Ta'rthh Baghddd. xii, 55). Since he is said to have died over 90 years old, as Yākūt (iv, 215) still mentions him for the year 226/841, and since his great historical work on the caliphs (see below) is said to have treated of the reign of al-Murtasim (218-27/833-42), the year 228/843 seems the most probable (see G. Rotter, Zur Überlieferung einiger historischer Werke Mada?init in Taharls Annalen, in Oriens, xxiii-xxiv [1970-x], 104).

Al-Mada'ini, a highly productive scholar with many-sided interests, wrote more than 200 works (see Fibrist, 101-4; Yakat, Udaba, v, 312-8; Y. al-Talsh, al-Khafib al-Baghdddi, mu'arrigh Bughddd wumuhaddithukd, Damascus 1364/1945, index; P. Sbath. Choix de livres qui se trouvaient dans les bibliothèques d'Alep (au XIIIº siècle), in Mémoires de l'Institut d'Égypte, xllx, Cairo 1946, index). Au important part of his works deals with historical subjects, reaching from the origins of Islam until his own days. In treating the genealogy of the Kuraysh, pre-Islamic items are brought together with Islamic ones. He is concerned not only with the maghast of the Prophet, but also with his settlements, sermons, peace treaties, envoys and correspondence. The events during the period of the four rightly-guided caliphs have his interest no less than the history of the Umayyads and the 'Abbesids, the conquests as well as the marriages of the ashraf. He wrote about the akhbar of poets and singers, dealt with geographical items like al-Madina and mountains and valleys in its neighbourhood, but also with (famous) fools, traitors, with coinage and exchange of money, with miserliness and jealousy, with animals in general and horses in particular. Only two works, the Kitab al-Murdifat min Kuraysh and the Kitāb al-Ta'āzī (two druz's) (see below) have come down to us as separate manuscripts.

To Muslim scholars, al-Mada'ini was a great and extremely reliable specialist in the akhbar. On the one hand, this me be deduced from their opinion about him. Ahmad b. al-Härith al-Kharraz (see below) for instance transmitted that scholars considered al-Mada'ini as the authority on Khurasan, Hind and Fars (Fibrist, 93, 1, 23). According to al-Marzubani (Nur al-habas al-mukhtasar min al-Muktabas, Beirut 1384/1964, 182 ff.), "He who aspires to [knowledge off the akhbar al-Islam should keep to al-Mada'int's works". Abū Zakariyyā' al-Azdī (Ta'rīkh Mauryil, Cairo 1967, 25) considered him an authority in the field of the history of the Prophet and the athbar of the Arabs, while al-Khatib al-Baghdadi (Tarrikh Baghdad, xii, 55) adds: "... also [in the field of, their genealogy, the futile, the magain and the transmission of poetry". On the other hand, the high esteem in which al-Madd'inf's ocuvro was held may be seen from the quotations in the works of many Muslim scholars. Appearing with his kunya, maba, ism or Ibn Abi Sayf, al-Mada'ini's name is in the earlier period mostly mentioned in connection with an isnad, later together with the respective booktitle, 'Abd al-Kädir al-Baghdädl (d. 1093/1682) is of the last authors to quote him in his Khizinat al-adab. Muslim scholars were interested not only in al-Mada in s historical works, but also in his books on adab, geography, zoology and poetry. For further information, Badrl Muhammad Fahd, Shaykh al-akhbariyyin Abu 'l-Hasan al-Mada'ini, Nadjaf 1975, 141 ff.

While al-Mada'ini was an historian by interest, his working method was that of muhaddit: from works or accounts of others he chose those parts which seemed appropriate to him, and with those building-stones of varying size he composed his book. These selected pieces of information are sometimes preceded by isads which go back to eye-witnesses or contemporaries of the event in question, sometimes by isads which contain only his immediate source and eventually its authority or transmitter. This procedure is certainly to might extent pos-

tulated already by the working method of his source; in opposition to Abū Mikhnaf for instance, 'Awana b. al-Hakam $[q,\tau]$ hardly ever gives is needs which go back to the account of an eye-witness. Sometimes isuads even fail altogether, and this again may depend on the nature of the man at our disposal in which al-Mada'ini is quoted. Even in passages where at-Madaint summarises the accounts of several authorities (see al-Tabari, ii, 1236, 1286, 1308, iii, 38), or In an adab work like the Kitab al-Ta'dzi, the style of giving information does not change; there is only the detailed rendering of the events without commentary. Not the subtle saying or the polished turn of speech seems to be important, but the historical framework in which the words quoted min uttered. Al-Mas'udf pertinently compares al-Mada'inl with the latter's contemporary al-Djahiz when mentioning al-Djāḥiz's death (Murūdi, viii, 33 l. - § 3146); "Among the transmitters (rupul) and scholars no one has written more books than he (al-Djahiz). To be sure, al-Madă'ini too has written very much, but he limits himself to reproducing what he has heard, while the works of al-Djabiz-notwithstanding their wellknown [dogmatic] deviations—illuminate the mind for the reader!,"

The variety of al-Mada'inl's interests brings about the fact that he refers to a considerably larger group of authorities than Abu Mikhnaf, the historian of the preceding generation with whom he may be compared in that their working methods show resemblances. But when describing events which are interrelated through causality, he apparently relies on a smaller number of authorities. He then depends on works of, among others, 'Awana b. al-Hakam, Abū Mikhaaf, Aba Bakr al-Hudhall (Sulma b. Abd Allah d. 159/775 at var., see Ibn Hadjar, Takdhib alinhdhib, Haydarâbād 1325-7, xii, 45), al-Mubārak b. Fadāla (d. 164/780, see ibid., x, 28 ff.), Hammād ■. Salama (d. 167/783, see tôid., ili, 11-6), Abu 'I-Yakzān (see GAS, i, 266 ff.; for the list of his works, see Fibrist, 94), al-Mufaddal al-Dabbi and "Ali Mudjähid. But, as is shown—among other things by the descriptions of interrelated events, he also makes use of earlier works by authorities who have not yet become renowned to us as historians.

As direct transmitters of al-Madā'inI's works are mentioned Ahmad b. al-Ḥāriṭḥ al-Kharrāz al-Kūfi (who is said to have heard the reading of all the books of al-Madā'inī, see Yāḥūt, Udabā', i, 407 ff.), Abū Bakr Ahmad b. Abi Khayṭhama (who is reported to have learnt from bim all about the ayyām al-nās, see ibid., 128 ff.), and al-Ḥāriṭḥ b. Abī Usāna (ibid.). Al-Balāḍhurī [q.v.], 'Umar b. Shabba [q.v.], Khallfa b. Khayyā; [see ibn khayyāṭ al-'uṣpurī] and Ishāk b. Ibrāhīm al-Mawsilī [q.v.] also prove to be his direct transmitters.

In the quotations from al-Mada'inl's works there are parallel passages which are nevertheless divergent from one another. In order to explain this it should be kept in mind that, during his long life as a scholar, al-Mada'ini certainly revised and completed his earlier works in later years, and that they have been transmitted as such. The material is overlapping, due to the fact that he wrote monographs m individual persons (like for instance the Kitab Akabar al-[ladidiadi b. Yasuf) or on separate subjects like for instance the Kitāb al-Ta'ast, in which al-Hadidjādi b. Yūsuf is also taken into account), as well as compendia (like the Kitāb Akhbār alkhulafa' al-kabir). It is possible that al-Mada'ini himself is responsible for the different forms and lengths with which material appears in the various passages (see also Rotter, op. cit., 127 ft.). Attention should further be paid as to whether the quetations under consideration in introduced with anna, for this always indicates that the wording has been revised or summarised (see U. Sezgin, Abū Miḥnaf,

Leiden 1971, 92),

The two works which have been preserved are: Kitāb al-Murdifāt min Kuraysh, ed. 'Abd al-Salām Hārun, in Nawādis al-mahhtūjāt, i, Cairo 2051, 57-80, and Kitab al-Ta'dal, ed. by lbtlsam Marhun al-Şaffar and Badri Muhammad Fahd, Nadial 1391/1971. A great number of quotations from the latter work and also found in the Kildb al-Ta'dri of al-Mubarrad (d. 286/899), ed. Muhammad Dibādil, Damascus 1396/1976 (see Index), so that those parts which have not been preserved in the manuscript of al-Mada'ini's work can be reconstructed. In the two diggs's which have come down to us, the author imads and refers to ca. | authorities (a few transmitters, other scholars and mainly persons who can be traced in al-Tabari's Tarright), mostly just for one quotation. From a comparison with al-Muharrad's work, it becomes clear that al-Mada'ini compiled from abundant historical material about the way in which the caliphs, prominent and learned ment sought consolation, for themselves or for others, for the death of a close relative or friend; poems, philosophical in lexicographic explanations are hardly found. One aspect of al-Mada'inf's working method, throwing at the time some light on the great number of his works, becomes clear. Since he mentions several times people like al-Ifadidiadi b. Yosuf, lyas b. Mu'awiya and Muhammad b. Sirin, it may rightly assumed that this material was also to be found in the monographs which he wrote on these men. The description of the epidemics of the plague certainly also found in the Akhode al-1d-an (see below) quoted by al-Mubarrad.

Al-Mada'inI's works quoted by later authors, with named titles, include: K. al-Faradi ba'd al-shiddo (A. Wiener, in Isl., iv [1913], 276); K. (al-Khatm 100) 'I-rusul (1bm Hadjar, Isaba, il, 205, 264, 764, iii. 1018); K. al-Samir (al-Tanukhi, Faragi, ii, 174); K. al-Djaudbāt (K. al-Aghāni, Cairo 1927, xvi, 176; al-Hamdani, Mukhtasar K. al-Buldan, 39-40); K. Abbbar Thakif (Ibn Hadjar, Isaba, iii, 1258); K. al-Nisa' al-mishisat (al-Baghdadl, Khisana, i, 479-80, iv, 166-7, = ? al-Namāhih wa 'l-nawāshis, ibid., i, 10, 84, and al-Huarl, Dhayl Zake al-adab, Cairo 1353, 283-5, - ? K. al-Nisā' al-favārih, la Khizāna, i, 408); K. Ummahāt al-khulafā' (Ibn Abi 'l-Hadīd, Skerh Nahdi al-balagha, Cuiro 1368/1959 ff., xi, 69); K. al-Ahdath (ibid., xi, 44-6; Ibn Ma'sum, al-Daradial al-rafifa, Nadjaf 1381/1962, 6-8); K. al-Djamal (Ibn Abi 'l-Hadld, Shark, i, 253, 256, vi, 215, ix, 113, x15, \$17; Ibn 'Abd Rabbih, al-'Ibd al-farld, iv, 328 ff.; al-Tabari, cf. Rotter, op. cit., 115 ff.; U. Sezgin, Abd Mihnef, to2 ff.); K. Siffin (Ibn Abi 'l-Hadid, Shark, ii, 246, 268, vi. 134-6); K. al-Khawarid (ibid., ii, 271-2); K. Akhbar al-bilat (wa 'l-akrād) (al-Masfudi, Murudi, il, 70; Ibn Makula, Ihmal, Haydarābād 1962 fl., iv, 198); K. Zakan Iyās (b. Mu'ātriya) (al-Maydanl, Madima' al-amthal, i, 120); Navadir alkudat (al-Tawbidi, al-Basabie, ii, 700-t, and 795-5?); Akhbar Zufar b. al-Harith (Yakut, Iv, 369; al-Baladhuri, Ansab, v, 303-4); Akhbar al-fatan (al-Mubarrad, in K. al-Ta'asi, 209, and also in ibid., 211, 216, 218, perhaps further 210 [from al-Madifin], also in al-Tanükhi, Faradi, i, 187, ch. vi, according to Wiener, op. est., 278]; Ibn Taghribirdl, Cairo, i, 313; Khalifa b. Khayyat, Tabrida, Nadiaf 1965, 471; al-Dhahabl, Tabrikh al-Islam, il, Calro 1368,

383; other citations in al-Mubarrad, op. cit., 209 n.); al-Mahá'id (Ibn 'Abd al-Barr, Isti'ab, Cairo 1358/1939, ii, 197; Ibn Hadjar, Isābs, i. 535); K. al-Mugharribin (al-Baghdöd), Khisāns, i, 10, ii, 109).

Other quotations refer probably to the following works: Asmā' man kutila min al-Tālibiyyin (al-Isfahānī, Makātal, often through Ahmad b. al-Hārith al-Kharraz, işfahānī, Maḥātil, index); K. Aḥḥbār Ziyad b. Abihi (al-Zubaye b. Bakkar, Muwaffakiyyat, 304-6; Tabari, ii, 25-6; Ibn Abd al-Barr, Istifab, i, 198); K. Akhbar al-khulafa' al-kabir (Yākūt, ii. 319, iii, 499; Aghāni, vii, 2 ff.; Iba Abi 'l-Hadld, ii, 25); K. Adab al-sulfan (al-Tawhidi, Başa'ir, iv, 294-5); K. Maktal 'Uthman (see U. Sezgin, Aba Miknaf, 51, 102; Ibn Abi 'l-Hadid, x, 6-7); K. al-Gharat (1bn Abi 'l-Hadid, ii, 114 f.; cf. al-Thakaff, al-Gharat, Tehran 1395, 418 f.); K. Bant Nadiiya wa-Khirrit b. Rashid wa-Mashala b. Hubayra (al-Thakafi, 332 (f.); K. Khulab 'All (Ibn Abi 'l-Hadid, vi, 136); K. Abd Allah II. Amir al-Hadrami (al-Thakall, 373-412 - Ibn Abl 'l-Hadid, iv. 34-53; see U. Sezgin, Abi Mignaf, 56); K. Mardi Rahit (al-Buladhurl, Ansab, v, 131, 137, 144; Ibn 'Abd al-Barr, Ish'sb, üi, 525); Akhode al-Nadidiādi [b. Yüsuf] wa-wafdtiki (al-Zubay: b. Bakkar, Muuo/fakiyyat, 103, 108, 475); K. Khabar al-Başra wa-futühiká (with a subtitle Wildyal al-Mughira b. Shuba, fragment in Acheni, xvi, 91, 95-6; Yahût, iv, 833, 845, 971; Rotter, op. cit., 124 fl.); K. Akhodr Abi 'I-Aswad al-Du'ali (Aghani, xii, 298, 309-10, 311-8, 322, 323-5, 328-9, 330-1, 334; Ibn Riftl, Inbah al-rundt. L 16; Hustl, Phayl, 167-8; al-Azell, Ta'rikh Mawsil, 167); K. al-Awd'il (al-'Askari, K. al-Awd'il, index). Al-Ralkashandi's Subh al-a'sid contains many quo-

Al-Kalkashandi's Subh al-a'ska contains many quotations which are referred partly to al-Mada'ini, partly to a certain Muhammad b. 'Umar al-Mada'ini, and to the latter's (?) K. al-Kalam wa 'I-dawāi. It is, however, probable that in all cases 'All b. Mu-

hammad al-Mada'in! is meant.

MADANIYYA, a branch of the Shadhiliyva [d.v.] Safi order named after Muhammad b. Hasan b. Hamzs Zaffir al-Madani (1194-Diumādā I 1263/ 1780 - April-May 1847), who was originally a muhaddam [q.v.] of Mawlay Abit Ahmad al-'Arhl al-Darkāwi [see DARĶĀWA]. From 1240/1824-5 al-Madani presented himself as independent and of a jarika [q.v.] in his own right ('Abd al-hadir Zaki, al-Nasha al-taliyya si awrād al-<u>Shādh</u>iliyya, Calro 1321/1903-4, 233) white retaining the essentials of Shādhill teaching and liturgical practice (see Muhammad Ahmad Sayyid Ahmad, al-Anwar el-dhahabiyya li 'l-farika al-Shādkiliyya, Alexandria n.d., passim). By that time, he had settled in the Tripolitanian town of Misrata, where 🖿 died and where his shrine may be visited today.

Under his and successor Muhammad (Sha'bān

1244 - 2 Radiab 1321/February 1829 - 24 September 1903) the order spread in Tripolitania, Cyrenaica, Pazzán, Tunisia, Egypt (Alexandria, Cairo and Suez) and the Hidjaz (Zaki, 239). In 1289, Muhammad went to Istanbul upon the request of Mahmad Nadim Pasha [q.v.], the former wall of Tripoli who had then become Grand Vizier. In this city al-Madani was introduced to the future Sultan 'Abd al-Hamid, who was initiated by him into his tartea. Later, from 1203/1876 onwards al-Madani took up permanent residence in Istanbul. For a period of about thirty years he acted as an adviser to Sultan Abd al-Hamid II, whose accession to the throne he had correctly predicted and who believed strongly his magical powers and skills ([Ibeahim al-Muway-Shī], Mā Hunālika, Cairo 1896, 200). The Sultan built al-Madani a tekke [g.v.] in Beshikţāsh where he himself occasionally attended dhihr [q.v.] sessions. In this tekke, al-Madani was buried following his death in 1903.

On the Sultan's behalf, he communicated with Ahmad 'Urabi [q.r.] during the events leading up to the British occupation of Egypt in 1882 (cf. A. Schölch, Ägypten den Ägyptern! Die politische und gesellschaftliche Krise der Jahre 1879-1882 in Agypten, Zürich-Freiburg-im-Br. 1973, 214, 350, n. 99). In 1898, he was instrumental in the appointment of Khayr al-Dfn Pasha [q.v.] to the office of Grand Vizler. His closeness to the Sultan seems to have been envied by another advisor of the Sultan, the head of the Rifa'iyya order, Abu 'l-Huda al-Sayvadi, According to this shayks, who sought to discredit al-Madani whenever the occasion presented itself, al-Madani's father had been the son of a renegade Jew from Thessaloniki (al-Muwaylih), 203. See also C. Snouck Hurgronje, Perspreide Geschriften, in. 158 ff.; Wall al-Din Yakan, al-Ma'lum wa 'l-madihul, i, Cairo 1921, 100 l.; Riffat al-Djawhari, Djannat el-Sabra': Sima am Wahat Amun, Cairo 1946, 98).

The Sultan seems to have supported the Madaniyya in the presumption that it would reverse the growth of the Sanusiyya order [q.v.] as well as counter European influence in North Africa (cf. E. de Remzi, Nosioni sull'Islâm con speciale riguardo alle Tripelitania, Tripoli 1918, 89). Here, w major role was played by Muhammad's brother Hamza, who, from Tripolitania and with Ottoman support, directed agitation against the French in Tunisia (G. Charmes, La Tunisia in Tripolitaine, Paris 1883, 275-7, 392).

After Muhammad Zāfir's death, a dispute about the succession as head of the order were between his brother Hamza and his son Ibrāhim, who had already been acting as his father's deputy for several years. The dispute was settled when, following intervention by the Sultan, Ibrāhūn was duly installed his father's khalifa (Zaki, 244), By then, however, several branches of the Madantyya had emerged in Egypt (al-Háshimiyya, al-Marzükiyya al-Shādhiliyya, and al-Kādiriyya al-Madaniyya) and in the Middle East (al-Yashrutiyya, and al-Fāsiyya). These had reduced the order's membership, while the adusiyas in Tunisia and Algeria had become completely autonomous (Remzi, 90). In addition, Ibrāhīm lost control over the zāwiyas in Tripolitania and Cyrenaica in consequence of the Italian occupation of Libya in 1912. In these territories, Muhammad b. Muhammad Zāfir (d. 1917), who was Ibrāhīm's brother, was subsequently recognised as the local head of the Madaniyya. This left Ibrāhim with control over the tekke in Istanbul and the Hidjaz unly (Remzi, 89). From the last decade of the 19th century, the number of Madaniyya Mariyas steadily declined: in Tripolitania, e.g., the number of assistant decreased from more than 12 in the 1880s to about 9 in 1918 and to 7, all in the town of Misrata, in 1925 (L. Massignon, Annuaire du monde musulman, Paris 1925, 97).

Today, the original Madaniyya seems to be limited to Egypt, where it is under the direction of a grandson of the order's founder. Its followers are encountered mainly in the coastal area between Sidi al-Barrani, where this grandson lives, and Alexandria. Active lodges existed (in 1981) in both of these towns, in the towns of Marsa Matrüh and Burdi al-'Arab, and in the oasis of Siwa.

Bibliography: No comprehensive study of the history of the Madaniyya order exists, and the data at present available concerning Muhammad b. Muhammad's role at the court in Istanbul are few and imprecise. A study of the order's history based upon the Istanbul archives could remedy this situation. In addition to the references given in the article, see Ahmad b. Husayn al-Nā²ib al-'Awsī al-Anṣārī, al-Manhal al-'a<u>dh</u>b fī ta¹rī<u>hh</u> Tarāblus al-<u>Gh</u>arb, Istanbul 1317/1899-1900; al-Ḥasan b. Muhammad b. Muhammad b. Hasan b. Hamza Zafir al-Madani, al-Nur al-sațis wa 'l-burhan alkāṭi*, Istanbul 1301/1883-4 (also published as an appendix to Muhammad Ahmad b. 'Abd Allah al-Madani, al-Silsila al-<u>dh</u>ahabiyya fi 'l-tawassul bi 'l-sāda al-Skādhiliyya, Cairo n.d.) is basically a manual setting out the fundamentals of Shadhill mystical method and practice. (F. DE JONG)

AL-MADD WA 'L-DJAZR (A.), literally "the ebb and flow", the meet given by the Arabs to the phenomenon of the tide, which they explained by following the various theories inherited from the classical world; the latter assert in the main that the tide possesses a universal character resulting from the moon's having a stronger influence than the sun over the mass of the Ocean's waters. The classical writers reached this conclusion after having studied the accounts of their great navigators such as Pytheas and Nearchus, Also, Theophrastus (327-287 B.C.), relying in the work of Nearchus, says that in the islands of the Indian Ocean one can see from out at sea trees whose branches are under water at high tide, while their roots - dry at low tide; as for the origin of the tides, he seems to attribute I to the action of the winds. Archimedes and Posidonius, for their part, maintained, as did al-Kindi later on, that the surface of the seas was spherical and that the centre of this sphere was the centre of the earth. On the other hand, Eratosthenes, in order to explain

the intensity of the marine currents, especially in straits, asserted that the seas had variable levels which were due, like the tides in the Ocean, to the height of the moon: when it rises and sets, the flow begins, and when it passes by the upper or lower meridian of the observation place, it ends. It was also observed that the height of the tides depended on the position of the sun and moon on the ecliptic (opposition, conjunction, quadratures) and on the position of the observation place (Seleucus, Hipparchus).

However, the classical author who most interested in these problems is Posidonius of Apamea (135-50 B.C.), who arrived at a series of generally exact conclusions after having studied the authors mentioned above and having listened to the accounts of the sailors of Cadiz. His opinions were adopted by Pliny, Seneca and Cicero. On the other hand, Pomponius Mela (ca. 42-5 B.C.), if he clearly accepted the moon's influence, also presented two other hypotheses: for him, the tides were the result of the earth's breathing (which is also asserted by Brunetto Latini, d. 1295) or of the cavities in it (cf. R. Almagià, La conoscensa del fenomeno delle mares nell'antichità, in AIHS, axviii [1949], 893, and La dottrina della marea nell'antichità classica e nel medio evo, in Memorie della Reale Acced, dei

Linesi (1904]).

It is hard to know to what extent the Arabs were aware of these theories, for we do not know the chain of possible transmitters. In any case, we find in Arabic texts an echo and development of certain doctrines sketched in antiquity. Also, Ibn Khurradadhbih (230/844) gives quite a fair explanation of the phenomenon, and al-Kindi (d. 256/870) wrote a Risălat al-Madd wa 'l-djass (cf. E. Wiedemann, Al-Kindis Schrift über Ebbe und Flut, in Annalen der that which, bearing the same title, was studied and translated by the author of the present article (in Mem. de la Real Acad. de Buenas Letras de Barcelone, xlii [1971-3], 135-222; a résumé of this Rissile, Barceiona 1957). The explanations given by Abd Maishar al-Balkhī (d. 272/886) in his Kilöb al-Madkhal ild film ahkām al-nudjum (translated into Latin as Introductorium in astronomiam) are interesting as having rapidly become known to Christian authors, Also, for example, the text attributed provisionally by R. C. Dales (see Isis, lvii [1966], 455-74) to Robert Grosseteste, is, in the order and arrangement of the ideas and despite the mention of al-Bitrudii which it contains (see 459, 460, etc.), in large part derived from Abu Ma'shar, as can be appreciated by comparing it with the Introductorium (see 461, 462, 465, 466, 467 of Dales and the resumes of L. Martinez Martin, art. cited, passim).

For Abe Ma shar, the tides depend on the movemont of the stars and are due to the "attraction" of the moon; the waters of the flow come up boiling from the sea bed, which explains why they are warmer than those of the ebb; he analyses the inequality of the ebb and flow in the two hemispheres and establishes eight distinct causes for it, of which some very reasonable ones are of an astronomical or topo-

graphical nature.

As for al-Mas'odl (d. 345/956), he sometimes follows the Introductorium in his Murudi al-dhahab (i, 244-35 = \$\$ 259-69) and presents all kinds of theories, of which some are purely para-scientific; In the Tanbik (French tr. Carra III Vaux, 104-5), he states that there are ____ authors for whom the tide is due to an angel who produces the ebb and flow by

plunging his foot or his fingers into the mand withdrawing them. For their part, the RasPil of the Ikhwan al-Şafa' attribute m tides to the heating of the rocks in the sea bed by the moon's rays. Ibn Rushd (d. 595/1198), in the Expositio media of the Meteors (cf. Aristotle, Omnia opera. Averroes' Commentary, vi, Venice 2560, 29-30) seems to have been influenced by the theory of Eratosthones relating to the straits, for he says that the waters flow into the Ocean from the seas higher than I and it flows into the lower seas; meanwhile, in the latter, the waters are set in motion by the winds which arise in their midst because of the moon's heat, and flow towards the Ocean in an upward movement, while the Ocean sinks.

We know that the establishment of harbours is presented for the first time in a graphic and systernatic manner in the Atlas catalan of 1375 (see D. Gernez, Les indications relatives oux martes dans les anciens livres de mer, in AIHS, xxviil [1949], 671-91). but in some earlier Arabic texts, particularly those which concern the Indian Ocean, some passages figure which allow us to state that the phenomenon known and put to good use by sailors; also, for example, in | 17 and p. 46, n. 2 of the Relation de la Chine et de l'Inde (851), ed.-French tr. J. Sauvaget, Paris 1948 (in the rest of the world, cf. | spud Duhem, in SM, ili, 20; Needham, in Science and civilization in China, iv/2 [1965], 227, 410). In the Islamic world, A. Mez (Renoiseance, Spanish tr. esp. 553; Eng. tr., 466) following al-Mukaddasi (Alson el-ta-\$431m, 124-5) remarks the existence in Basra (in 375) 985) of mills operated by the tide, which is not astonishing if one takes account of the height of the town at the head of the Persian Gulf, a thousand years ago when the alluvial deposits had still not made it distant from the coast (cf. Ibn Hawkal, Surat alard, French tr. Kramers-Wiet, i. 229; al-Dimashki, Cosmographic, French tr. Mehren, 223; Pellat, Milieu. 16-7). Al-Mukaddosi says, in fact, "The flow constitutes a miracle and an advantage for the inhabitants. of Basra. The water inundates it twice a day, rises into the canals, waters the gardens and helps the boats reach their anchorage. The ebb is equally useful, for it operates the mills situated at the mouth of the water courses". The tidal mills of this type (which must not be confused with other of a similar name, but functionally very different; cf. Mez, loc. cit.; F. M. Feldhaus, Die Technik, Munich 1965, 1297, etc. and related terms; Wiedemann, Uber Schiffmühlen, in Geschichtsblatter für Technik, Industrie und Gewerbe, iv [1917], 25; al-IdrIsl, ed. Dozy-de Goeje, 236, 237, 263, etc.) are the precursors of those = be found in the 11th century in Venice, in the 12th in France (cf. H. Goblot, Premières recherches, concoed text ca. 1977) and whose origin may go back to the Atlantic littoral of Islamic Spain (coasts of Huelva?), where harbours were established with a two to three hour tidal cycle, the title reaching a height as acceptable, if not higher, than that which could achieved at Başra in the 4th/toth century. With regard to this, one should take account of the rather confused text ■ which Abu 1-Fidā (Taḥwim, ed. Paris 1840, 26-7), copying al-Idrisi, notes the value of the establishment of harbours similar

that which has been cited.

Tidal mills appear to have been known on the coasts of Islamic Spain, and it is from there that they must have proceeded, following the estuaries, as far as the North Atlantic (cf. Goblot, op. cit.; W. E. Minchlaton), However, the rare evidence which we have been able to find on this type of mill does not allow us at present to elucidate this question with certainty. We can nevertheless mention the early presence (well before the r7th century) of these mills in Lequeitic (cf. José A. Garcia Diego, Don Padro Bernardo Villarcal de Berriz, in Revista de obras publicas, August 1971), and probably in other places on the Basque coast which we know of indirectly, but from information of the same author, at Errotatziki, Busturia, Basacaklo, Orio and Plencia.

Bibliography: Given in the article.

(L. MARTÍNEZ MARTÍN)

MADDAH (Turkish meddah), - Arabic word which means "panegyrist"; the term was used by the Ottoman Turks as a synonym of blssn-kh-an (Arabic 8455) and shehname-hhudn to designate the professional story-tellers of the urban milieux; it was used in the same way by the Persians, but more rarely; in for the Arabs, they used it, in a fairly late period, to designate the "begging singers of the streets" (see Köprülüzäde M. Fu'ad, Meddāļilar, in Türkiyyait Medimil'asi, i (1925), 11-12). In North Africa, however, the moddah is a kind of "religious minstrel who goes to festivals to sing the praises of saints and of God, and holy war, and who is accompanied on the tambourine and flute" (Dozy, Suppliment, s.v.); he is also the heir of the hass [q.v.], who at a late date tours the country and cities, recounting heroic legends and stories drawn from the répertoire of the story-tellers of the Middle Ages, sometimes alded today by bands, and which are sketched out very often without any connection with the subject of the story. The activity of the meddah, his technique and his sources, would merit being made the object of thorough research.

In an early stage of the evolution of their act, the Turkish meddahs or hissa-kirdas derived their themes either from episodes of the Iranian epic, the Shidhudma (whence their name of shehndma-khwan) and the historico-legendary works relating the acts and deeds of the champions of Islam such as Hamza, 'All, Abu Muslim, Battal, or the first Turkish conquerors of the land of Rûm, such = Dānishmend Ghāzī. From the 11th/17th century onwards, the term meddan begins to take on a more specific meaning to designate the teller of realistic accounts drawn either from old, classic collections such - the Thousand and one nights, or from popular stories, or else inspired by scenes from the everyday life of the cities of the empire. The teller of edifying stories on religious and heroic themes, called hissa-khwan or shekname-khwan for preference, retains the monopoly of the epic-romantic narration in the urban milicux, sometimes in simple sessions of declaiming. However, Ewliyā Čelebi, when he describes (Seyāḥat-nāme, i. 525) the procession of the guilds in Istanbul, mentions the meddals and kissa-kh-ans under the same rubric, as numbering eighty; it can be deduced that in the 11th/17th century, the two terms were still synonymous and the artist could perform both kinds of narration. It is only from the 18th century onwards that the meddals specialise and more in the parration of entertaining narratives - realistic themes, and these supplant, at least in oral tradition, the heroic themes. The public audition sessions of this latter type survived until the second half of the 19th century; a document of 23 January 1864 informs us that at this date, in . Uskudar café (on outskirts of Istanbul) "reader" of narratives drawn from the Shek-name used to find an interested audience (see Metin And, Gelencksel Türk tiyatrosu, Ankara 1969, 69-70).

Numerous texts have come down to us of great

heroic narratives of the chivalrous romance types of the Western Middle Ages; some, such as the 'A star-Mama [see 'ANTAR, STRAT], or the deeds of Abû Muslim and Baţṭāl [q.vv.], ____ translated or adapted from Arabo-Persian literature; the others, such as the Danishmend-name were composed by Turkish authors; they attest, by their style and subdivision into chapters presented as auditory sessions on successive evenings (see I. Mélikoff, La Geste Melik Danismend, ii, Paris 1960, 18 and passim) that, from the earliest centuries of Turkish written literature, these works were not written only for the ludividual reading of the educated, but also constituted the narrative repertoire of the klssskhwans exercising their art before a collective auditence.

As for the collections of realistic narratives, not a large number are extant and they are not of an early date. They are of two kinds: some, abridged texts of oral narration, sometimes written by the story-tellers themselves with a certain pedantry of style, to be offered to the sovereigns or dignitaries, and to be read individually by an elite public; the others appear as outlines to serve as an aid to the memory of the story-tellers themselves. The oldest of the collections of realistic narratives go back to the roth/r6th century, and, for the most part, they remain unpublished.

Of the poet Dienani (d. Muharram 1004/September 1595) there has down to us a collection entitled Boddy's al-differ, composed after 998/1569 as an offering for Murad III. Information on the biography and work of this poet, gathered by Köprülüzäde (oblinad., 22 ff.) informs us that his collection of realistic and fabulous stories had been used by a meddit of the court nicknamed Eglendie to divert the soveverign during narration sessions. A copy dated 1039/1629-30 has been preserved Cambridge University Library (Browne, Supplementary hand-list..., Cambridge 1922, no. 1553/6, Or. 680/8).

The work of Dienani contains accounts of very varied themes: scenes from everyday life, "true life" adventures of his contemporaries with diffus or vampires, accounts of journeys combined with themes of popular stories and legends. The author is, very often, anxious to inform us of the origin of his narratives and to mention his informants; on the whole, he drew largely m oral tradition. One of the narratives (fols. 970-203a) is the oldest version of a hikdye [see BIRAYA, iii] III which the author of the present article has collected, under the title of Yarais Makmud, three versions of the Apiks of Eastern Anatoliz (see P. N. Boratav, Halk hihdyeleri ve halk hikayenliği, Ankara 1946, 19, 160-1). Two narratives of the collection (fols. 15a-17a and 19a-23a) warrants of stories inventoried in the international catalogue (A. Aarne and S. Thompson, The types of the folk tale [= AzTh], Helsinki 1964, nos. 1510 and 938) and in the Turkish catalogue (W. Eberhard and Boratav, Typen türkischer Volksmarchen [- ITV], Wiesbaden 1953, nos. 278 and

In the same manuscript (fols. 1912-218b) inserted the collection of certain Naghmi (or Naghami?) who was a contemporary of Selfm II (1566-74); the compilation of his work would then be earlier than if of Djenåni's collection (cf. fol. 1922-b of the ms.). His narratives present the same characteristics as those of Djenåni; he says, in his introduction, that he has compiled his texts from the stories related in the evenings among friends. He has divided them into three chapters: (1) stories

about sovereigns and viziers; (2) anecdotes about poets; and (3) adventures with beautiful women.

From the tith/17th century we possess the texts, always in an abridged form, of a whole cycle of narratives, relating the adventures, in turn gallant and fantastic, of the bourgeois of Istanbul: people of various trades, courtiers, men of independent means, slaves, ladies of all categories and morals. At times, the sultan himself intervenes to arrange things to the satisfaction of the listeners-and readers-by chastising the wicked and rewarding the good. The composition of a series of these small novels of manners is attributed to the poet TER Ahmed Čelebi, a courtier of Murad IV (see Köprülüzāde, op. laud., 31 fl.). Four of these texts have come down to us: Lajā'if-nāme, entitled Khanājerli Khānim in a slightly altered version, with the names changed, Kunli Bekiash and Sansar Musiafa; there are lithographed editions-and, later on, printed ones-of the first three; a manuscript of the Sansar Musjafé is preserved in the Istanbul University Library, no. 1208. It is to be noted that in the texts of these narrative works the story-teller himself is involved in the adventure; he is the principal character of Kanli Bektāsh; and in all cases he is invited by the Pādīshāh "to relate the adventure by word of mouth". This particular characteristic of this genre is already attested by certain compilers of the 10th/16th century. Two other narratives with the same characteristic, Dievri Čelebi and Tayyartade, of which we possess printed editions, belong themselves to the narrative cycle of the reign of Murad IV (see Boratav, op. land., 122 ff.; Ö. Nutku, Meddahler ve meddah kihdyeleri, Ankara 1976, 99).

Other collections remaining unpublished, which were probably compiled as an aid to the memory for the an of meddahs sometimes by the story-tellers themselves-deserve mention: from the 18th century, Kişsa-yi <u>Di</u>elâl u <u>Di</u>emâl (ci. the narrative of the same title analysed by Nutku, op. laud., 93, 100, 202, 110, 111, 129-30, 187-90), composed by Sheykh Mustafā Dāq, of 194 leaves (Brit. Mus. Or. 11309; copy mutilated at the beginning and end).—Khānāfe (or 'Aftle?) Khanim sergureshti, of 107 leaves, composed in 1192/1778 (Brit. Mus. Ot. 7303).-A collection of 53 leaves (Brit. Mas. Rieu, Add. 10,003), of which a large part is occupied by the adventures of Mehmed Agha and Ferah-Dil; the copy was made at Izmir in 1223/1808; with reference to a session of narration in Cairo at which the hero of the narrative was present, the author mentions the names of two meddahs of Istanbul, Kehle Mehmed and Shekerdji Sälih; furthermore, the latter is also known as a famous story-teller of the 18th century (see Nutku, op. land., 34-5), which leads us to think that the compilation of the work goes back to this period.

A manuscript of the 18th century, preserved in Istanbul University Library (T.Y. 10. 6758), and entitled Medimá'a-yi femā'id, a collection of disordered texts (poems, medicinal recipes, a short acount of Ottoman history in verse, maxims) is of particular interest for the study of the tradition

of the meddahs. For the first time, Metin And has briefly analysed the part concerning our subject (op. land., 74-5); he has reproduced the list of the names of 16 meddahs and the titles of 56 narratives in which they figure. A deeper analysis of this document has been carried out by Nutku (op. land., 101-2). The latter also published in his work (179-223) the 13 narrative texts inserted in the manuscript, the only ones, of the 56 titles constituting the outlines of medday narrations; there are brief notes on the names of people and places, m well as essential facts in the unravelling of the action. These texts too, are, on the whole, conceived and written - aid to the memory of storytellers. The compiler also indicated, for a certain number of narratives, the names of famous meddahs of the period whom he had heard telling the tales in question. There should be added to this list of the 18th century a text which has come down to m in a French version, from the narration of a Turkish meddah of the reign of Ahmed III, reproduced in Joseph-Pierre Aguès Méry's book, Constantinopie et la Mer Noire, Paris 1855; Nutku (225-33) has provided a Turkish retranslation.

Among the narratives of the x8th century, of the lexts reproduced under the numbers x to x3 in Nutku's work (179-223), several are adaptations of popular tales with the narrative scenarios of the moddibs. Also, no. x is a variant of the tale type AaTh 681 (TTV 134); nos. 5, 6, 9, 10 and x2 are, respectively, to be compared with tale types AaTh 910 (TTV 325, motifs x-3), AaTh 882 (TTV 272 and 272iv; a version of this tale is to be found in M. Nicolas and A. Flamain, Conless de Turquie, Paris 1977, 62-7), AaTh x510 (TTV 278). TTV 299 and TTV 270.

For the two centuries following, we possess texts collected by the orientalists Georg Jacob, Ignaz Kuros, Friedrich Giese and Herman Paulus (see Bibl.), and more recently, those recorded on tape by Turkish researchers (see Nutku, 297-391). There also we find examples of the adaptation of popular stories to the narration of meddābs; in Nutku's work; no. 17 is a variant of tale type AaTh 88r (TTV 195) and no. 21 is to be compared with AaTh 882 (TTV 272, 272iv). No. 17 is, furthermore, attested in an altered text in hisāve form by 'Ashīk 'Ah' Itzet Özkan (see Boratav, in Turcica, i [1969], 114-20).

The narrative technique of the moddits followed a parallel evolution to that of the themes. Gradually as realistic themes supplanted heroic themes, the narration was enriched by dramatic elements; the actor was substituted for the story-teller; he embodied the deeds, by miming and, by changes in the intonation of his voice, the various people of his narratives; and indirect speech gave way to direct speech animated by dialogues. It is this other aspect of the art of the meddits which has interested specialists in the history of the theatre as much as the researchers on the narrative genre.

According to the testimony of literary and iconographic sources, as well as of direct observers, the meddah used to perform his art in a public place (in a cafe usually), and used to install himself on a platform, at m higher level than his audience; he held in his hand a cane which he used for making a noise; a napkin placed on the shoulder was used to obtain, by its application to the mouth at the desired time, the various effects of vocal intonation of the person imitated. The meddak began and exceed his narration with dedicatory formulas which contained, essentially, excuses for the situation in which the listeners might be vexed by the fortuitous resemblance of

names of people of places, or by too during subject matter.

The later medials of the beginning of our century attempted to enlarge their repertoire by drawing on themes in the popular novels of contemporary authors (see Boratav, 100 seruda Türk halk edebiyats, istanhul 1978, 79). Some modern novellsts and journalist chroniclers, for their part, (Ahmed Rasim, Hüseyin Rahmi, Erctimend Ekrem and Burhan Felek, to cite only a few names) owed much to the procedures and narrative style of the medials (see Boratav, Halk hikdysleri..., Ankara 1946, 81 ff., 121 ff.; idem, Folklor ve edebiyat, il, Ankara 1945, 130 ff., 163).

(P. N. BORATAV)

AL-MADHARA'I, name of m family of high officials and revenue officers, originating from 'Irâk, who held important positions in Egypt and Syria between z65/879 and 335/946. The nisbs is derived from a village Mädharäya, in the neighbourhood of Wäsit (see al-Sam'ant, Kitâb al-Ansāb, fol. 499a; Yākūt, Mu'djam, iv, 381.

"All b. Ahmad al-Madhara" became guzir of the Tülünid Khumarawayh (270-82/884-96), kept this function under Diaysii b. Khumarawayh and was küled on the same day as this Tülünid in 283/897.

Already during the last years of the Tûlûnid régime, Abû Zunbûr al-Husayn b. Abmad al-Mâdharû'i, in his quality of director of finances in Syria, had taken up relations with the 'Abbâsids. After their victory over the Tûlûnids in 192/904, he was nominated director of finances of figypt, where he replaced his nephew Abu 'l-Tayyib Ahmad b. 'All al-Mûdharû'i (d. 303/915). Because of his close reintions with Baghdad, Abû Zunbûr, and soon also other members of his family, became involved in the fight for power between the mair 'All b. 'lså [q.v.] and the Banu 'l-Furât [see IBN AL-FURÂT], in which the Mâdharû'la were always on the side of the opponents of the Banu 'l-Furât. Therefore, during the second vizierate of 'All b. 'lså (301-4/913-16) Abû Zunbûr became

director of finances in Syria and his nephew Abb Bakr Muhammad b. 'All b. Ahmad director in Egypt. The change of the vizierate in Baghdād in 304/916 caused the Mādharā'is to be deposed and imprisoned; Abū Zunbūr was brought to Baghdād. Towards the end of 306/May 919 he became again director of finances in Egypt, but in 310/922 he became again by his friend 'All b. 'Isâ. In the next year, Ibn al-Furât summoned him to Baghdād and imposed on him and his family a penalty of 5,000,000 dirhams. In 313/926 Abū Zunbūr was again in al-Furât as director of finances of Egypt and Syria. In applicable ha director of finances of Egypt and Syria. In applicable ha director of finances of Egypt and Syria.

317/929 he died there. Abū Zunbūr's nephew Abū Bakr Muḥammad b. 'All II. Ahmad al-Mādhara'i (258-345/871-956) came In 272/885 to Egypt, where his father appointed him deputy director of finances. After the murder of his father in 283/890, Abû Bakt Muhammad became virler of the Tülünid Härün b. Khumarawayh, and after the fall of the Tollands in 292/905, he and many of his followers were brought to Baghdad. He remained there until 301/913, when in all honour he returned to Egypt as director of finances. The sources available do not indicate any reason why in 304/916 he returned to private life; he remained in al-Fustat and apparently devoted himself to the administration and increase of the enormous fortune of the family. in 328/930 Abū Bakr Muhammad again took charge of finances in Egypt and kept his function until the death of his friend the governor Takin in 322/933. The Madharads remained in the end victorious during the subsequent struggles with Muhammad b. Takin. When in 322/934 Abu 'i-Fath al-Fadi, member of the Ibn at Furat family, was nominated vizier by the caliph al-Radi, he appointed Muhammad b. Tughdi al-Ikhshid [see ikhshidles] as governor of Egypt. The latter tried to reach a friendly agreement with the Madhara'l, but Abo Bakr Muhammad rejected the proposal and offered resistance. His troops, however, went over to the Ikhshid, who in Ramadan 323/August 936 was able enter al-Fustat without fighting. Abu Bakt Muhammad went into hiding until Abu 'l-Fath ai-Fadi b. ai-Furat came to al-Fustat and arrested the Madharan. He was forced to disgorge great parts of his wealth and the Ikhshid put him in prison until the death of Ibn al-Furāt in 327/939. After his release, Abū Bakr Muhammad soon attained honour and influence again. Under the young Abu 'l-Kāsim Unudjur b. al-Ikhshid he held the de facto position of regent, but was overthrown and put into prison in 335/946 during a rebellion plotted by Abu 1-Fadl Djaffar b. al-Purāt, A year later he was set free by Kâfûr [q.v.] and retired into private life. He died in al-Fusțăț on 11 <u>Sh</u>awwâl 345/16 January 957, having been a devout Muslim who, between 301/913. and 322/938, performed the pilgrimage yearly and was lavish in distributing favours to the inhabitants. of the Holy Cities. With him died the last important

representative of the Mādharā'is.

MADHHEDJ, a large tribal group, now inhabiting in the main the areas of Dhamar and Radas
in the modern Yemen Arab Republic. The traditional
genealogy, given by e.g. Ibu Durayd, Ishibib, ed.

Wüstenfeld, 237 ff., and by Yākūt, Beirut 1374-6/ 1955-7, v, 89, is from Malik b. Udad b. Zayd b. Yashdjub b. 'Arīb b. Zayd b. Kahlan b. Saba' b. Vashdjub b. Ya'rub b. Kahtan. The numerous component baba'il of Madhhidi are listed in full by al-Malik al-Ashraf 'Umar, Turfat al-ashab fi marrifat al-ansão, ed. K. V. Zettersteen, Damascus 1949, 9: those most frequently encountered in South Arabian history are 'Ans, Balharith b. Ka'b, Djanb, Suda' and Sinhan, and butter of these kebd'il include also Namir and 'Abs.

Madhbidi appear in pre-Islamic South Arabian inscriptions in maham (see A. Jamme, Sabaean inscriptions from Mahram Bilgts (Marib), Baltimore 1962, 316, 372). In the year 519 contingents of the tribe accompanied the Himyarite king Maidikarib Yaftur = an expedition into central Arabia, and in 521 they were amongst the tribes nominally influenced by Judaism and sent by Dhit Nuwis [q.v.] against the Christian centre of Nadirán.

The tribal lands of Madhhidi in early times are said by al-Bakrl to have been situated near a certain place called Tardi "on the road to Yemen" (see Mudgam, Cairo 1364-71/1945-51, 309). In the period just before the rise of Islam they participated, together with their sister tribes Khath'am and Murad (4.00) in warfare against 'Amir b. Şa'şa'a, which included a famous "day", much hymned in old poetry, at Fayl al-Rib (see al-Bakri, iii, 1038). Towards the end of Muhammad's mission in Medina, when he was extending his control over the outlying parts of Arabia, the Prophet utilised Mālik b. Murāra of the component group Ruhā' of Madhhidi as an envoy to the south-western tribes; and in ea. 10/632 he confirmed Parwa b. Musayk of Murad as Muslim governor over the tribes of Murad, Madhhidi and Zubayd (Ibn Hisham, 950-:: Wellhausen, Skizzen und Forarbeiten, vi. 🛅 (f.).

The role of Madhhidi in the early Islamic conquests considerable. They formed an element of the army which invaded Egypt, setting in Fustat, and their leaders were represented in the malcontents who came to Medina and besieged and killed 'Uthman. In the micr of Kufa, they me amongst Yernen! tribes m settle, together with Himyar, Hamdan, Azd and Kinda, and their associated tribe Murad had there a diabbana, perhaps here a large, open-air praying area, used as a tribal rallying-ground [see AL-KOPA]. Subsequently, they showed themselves in the forefront of pro-CAlld and anti-Umayyad movements. At Sittin, Madhhidi and Hamdan placed themselves under the leadership of Mälik al-Ashtar [q.v.] of the kabila Nakhai of Madhhidi; they fought valiantly as part of 'Ubayd Aliah b. Abl Bakra's "Army of destruction" in Afghanistan in 79/698 (see C. E. Bosworth, in Isl., I [1973], 277 ff.); and they took part in the revolt of the old Arab tribal aristocracy shortly afterwards under Ibn al-Ash ath [q.o.]. They do not, however, seem to have produced any poets of great significance.

In the post-classical period, those elements of Madhhidi or their saba'il who had remained behind in south-western Arabia played a part in the tortuous politics and military events of the region. For example, contingents of the tribe mill in the aid of the Zuray'id Saba' II. Abi 'I-Su'0d in his successful struggle against another member of the family, 'All b. Muhammad, im ca. 531/2136. In 545/2252 also, Madhhidj, and particularly Disub, joined the Zaydī forces of the Imam Ahmad b. Sulaymān against the Hatimi family of Yam controlling the Şan'a' A long series of hostilities ensued, after which

the Zaydis and their Madhbidi allies were repelled from San'a' and 🔤 latter, after a personal appeal to them in Dhamar by Hatim b. Ahmad, swing round to the Hatimi side against the Zaydis. Dianh were also prominent in relieving the Mahdid siege of Zuray'id Aden, begun in 561/1165. The Zuray'id leader, Hatim b. All, having resisted the siege for seven years, journeyed to San'a' to enlist the support of "All b. Hatim, the me of Hatim b. Ahmad, whose family of Yam, it will be recalled, controlled the area. They too were Isma'fils, ... the Zuray'ids. 'All h. Hatim agreed to help break the siege of Aden. but only, he stipulated, with the assistance of Dianb from Dhamar, The Zuray'id, Hatim b. 'All won over Dianb, so that an alliance of his troops, those of All b. Hatim from San⁴² and those of Djanb descended on Aden and were able to drive away the Mahdids, killing many. At this stage Dianb returned home, much to the disappointment of 'All b. Hatim, who appears to have had territorial designs on Mahdid land in Tihâma,

MADI (a.) "preterite", a technical term of Arabic grammar used to denote the verbal form devoted to the expression of past time; its counterpart is muddri' [q.w.], the term denoting the author verbal form "resembling" (the noun) and devoted to the expression of the present and future (hidir, musiali-

The majority of Arab grammarians define the verb as a word which indicates the matching (istiran) of a happening (hadath) with a time (saman). Already Sibawayh considered (Kitāb, i, 11-12) that the verb is formed to demonstrate that a happening has taken place (waḥa'a) in time which has gone past (maḍā) or that it will take place in time which has not yet gone past (lam yamdi). In regard to the past, one of the earliest definitions is that of al-Zadidiādji (K. at-Idak, 87): "an occurrence in the past is we which has been completed (inhadda) and which has involved at least two distinct periods of time, one in which it had existence (wudjida) and me in which gets information about it (khubbira 'anhu)". Ibn Ya'lsh sets forth the same idea (Sharh al-Mufassal, vil, 4): "an occurrence in the past is one that no longer has existence (fudima) after it did in fact exist, and whose affirmation (ibbbs) takes place at a time posterior to its existence"

However, the Arab grammatians very was saw that the magic was not used solely to express = occurrence in the past, and al-Astarabadhi (Sharb al-Kāfiya, ii, 225) enumerates the different cases when this verbal form expresses a time different from the past. First of all, the midif can express the future, viz. in a request (talab) by means of a prayer (duta) or an order (amr), and in the expression of future happenings by determining (&af') their occurrence (muhii), for in these two cases, the speaker positively desires the taking place of the occurrence, and it is as if it had already taken place and was past; in the reply to an oath (kasam), unless it is negated by ld or in; in the expression of a condition (skeet), if it is preceded by in; and in a circumstantial clause, if it is preceded by md = "so long as". The madi can express either the past or the future when it follows the particle e- of equivalence (istima") in an alternative; the relatives hey humd and kullama in a phrase comprising two parts; mparticle of urging (tohdid) in an incitement; and the relative pronoun alladki at the outset of a phraso comprising two parts, because in all these cases, there is a number (raliba) of a condition. Finally, in an enunciatory (insha'i) speech utterance or a productive (Ikd'i) one, the madi has the value of a present; thus, for example, in bifu, the act of seiling is realised (yahşulu) in the present (hall) by means of this word which brings it into existence (mildid lake), whereas with abifu, the act of selling is realised by another word.

From the morphological point of view, the Arab grammarians consider that the form of the madi is "based" (mabni) according to the vowel a or the vowel a in the third person, and according to the absence

of the vowel in the other persons,

Bibliography: G.Troupeau, La notion du temps chet Sibawayhi, in Comptes rendus du GLECS, ix (1962), 44-6; H. Fleisch, Iraité de philologie arabe, ii, 201-6. (G. TROUPEAU)

MADII, MADH (A.), the normal technical terms in Arabic and other Islamic literatures for the genre of panegyric poetry, the individual poem being usually referred to as undaha (pl. madili) madiha (pl. madili). The author himself is called middle or, as considered professionally, maddle. The root itself is sometimes used without technical connotations, as also are commonly the various other roots signifying "preiso"; h-m-d, m-dj-d, h-r-s, th-m-y, ter-m/y, etc.

I. In Arabic literature.

As both an independent unit and a component of the kasida [q.v.], the genre has been so widespread in Arabic literature at all times that only a few poets prided themselves on not writing in it at all, or as rarely as possible, e.g. Abu 'l-'Atāhiya and al-Ma'arrī, Some, like al-Mutanabbi, were panegyrists before all else. The high proportion of panegyric in Arabic poetry has been one of the major obstacles to full appreciation of the latter by the average Western reader, who tends traditionally to be concerned with criteria of "sincerity", "criticism of life" and "seriousness of purpose". Such a tack of sympathy ignores the fact that virtually all pre-modern Arabic poetry had to be written, for socio-economic reasons. under patronage or to commission. "Political" panegyrics are still written in most Arabic-speaking countries.

The somewhat exiguous and sporadic written tradition of Arabic poetic criticism is usually more preoccupied with biography, exegesis, prosody and tropes than with genres in any Western sense, But most discussions of poetry refer in the category of madile, and a few attempt to distinguish it from other genres, particularly its counterparts: fakhri mufakkara, personal or group boasting; rithal marthiya/marthdi, elegy or lament; and hidia?, poetry of insult or abuse (see the relevant articles for each). The last is more or less the converse of madily, while the other two may naturally contain elements of panegyric. In the case of the elegy, this is almost invariably so: some fe.g. the celebrated and courageous elegy by Abu 'I-Hasan al-Anbart on the executed Büyid vizier Abū Ţāhir) are virtually pure madily, though it is usually obvious that the subject is deceased, and a note of sincere regret is often present, as in that particular instance. Special types of madily are numerous, two of the most common being poems of excuse or apology, and poems celebrating victories or other happy events (see also below).

Besides individuals, a panegyric might be addressed to a land, a city or a group. By no means all such poems were expected to produce immediate or direct material benefits: some expressed simple gratitude, some were addressed to a recipient with fine poetic taste of his own, and some were produced as an inescapable duty of one of pensioner status. When a panegyric did not produce an expected result, it would tometimes be followed up by an appendix (which some critics, again, would classify a special type of "reminder panegyric"). According to period and circumstances, the panegyrist might declaim his own poem, or might deputies a talented rāwl to do so; or it might simply be received and read by (or to) the subject himself (ni-mandail).

The madily is usually (and was expected to be) exaggerated in statement and style. However, according to Kudama (see Bibl.), only personal and "moral" qualities might be praised; and all these (in men) are subsumed under the categories of intelligence, courage, justice and "modesty" ("iffa). (It should be noted that the relatively rare poems in praise of women are classified by Kudama as "erotic"!) Al-'Askari (see Bibl.) is in general agreement with Kudama, but Ibn Rashik (see Bibl.) would allow praise of physical attributes and of ancestry and "association" as well. Another corrective to excessively gross exaggeration is the generally agreed condition that the primary qualities praised should be appropriate to rank and function-courage in a military man, justice in a Judge, and so on. On this basis. Kudama would even regard the madib as potentially applicable to vagabonds and bandits for the good qualities necessarily inherent in their styles of life.

With all this, the madily tends in practice to a stereotyped homogeneity, so much so that some panegyrists (e.g. al-Buhturi on several occasions) had no difficulty in offering the poem to a second or further patron, where the original reception was inadequate or relations had become strained in the meantime. Some panegyries (as well as elegies) were obviously "prewritten" for general contingencies.

Taha Husayu (and others: see Bibl. under pseudo-Kudama) have argued that the above critical posture towards the madik clearly derives from Greek sources, particularly Aristotle. This position, however, must be made as exaggerated: what influence there was can only have been—as with philosophical and scientific ideas—remote and indirect.

Bibliography: As indicated, most Arabic works of literary criticism do not really discuss genres as such, and the Western studies have tended to follow suit. The following are the essential items: Abu 'l-'Abbās Ahmad Thaflab, Kand'id al-shift, ed. C. Schianarelli, in Procs. of the VIIIth Intern. Congr. of Orientalists, lift (Semitics), fasc. 1, Leiden 1891, 173-114, also ed. M. A. Khafādii, Cairo 1367/1948, and R. Abd al-Tawwab, Cairo 1386/1966; Kudāma b. Djafar, Nakd al-shift, Constantinople 1302/1885, also ed. S. A. Bonebakker, Leiden 1956; (Pseudo-) Kudāma, Nahd al-nathr, ed. T. Husayn, etc., with valuable introduction, Cairo 1352/1933; Abū Hilāl al-'Askari, Kitáb al-Sindiatayn, Constantinople 1320/1902; idem, Diwan al-mafant, Cairo 1352/1933; Ibn Rashlis, al-'Umda st sina'at al-zhi'r wa-nakdihi, Calro 1344/1925, also ed. M. M. 'Ahd al-Hamid, Calro 1383/1963; Ibn Khaldin, Muhaddima, tr. Rosenthal, see General Index under 'poetry', passin; J. Benchelkh, Podique arabe, Paris 1975; A. Trabulsi, La critiquo pottique des Arabes, Damascus 1955.

[G. M. Wickens]

2. In Persian

It appears from the written records that survive—chronicles, official correspondence, and narrative poetry and prose—that formal, conventional praise (madh, sidiyish, thand) of rulers and their chief officials was mervasive feature of Islamic Irandan court life from its inception. The most-highly-developed vehicle for madh was the panegyric ode, or hasida-yi madha, a genre that was already fully articulated by the time of Rüdaki. Indeed, Rüdaki's joint panegyric of the Samanid ruler Nast b. Ahmud and the Saffārid amir Abū Dja'lar is both the earliest example we have of a complete hasida-yi madha and me work of considerable stylistic maturity.

The Persian hasida-yi madiha shares similarities of theme and sensibility with the Arabic caliphal panegyrics of the 'Abbāsid period (see S. Spert, Islamic kingship and Arabic panegyric poery in the early 9th century, in IAL, vili (1977), 20-35), but its thematic surreture is many predictable and uniformly

ordered.

The opening portion of the kastda, called variously the nasib, taskbib or taghazzul, presents pleasing images that are usually drawn from a conventional repertory-the arrival of spring (non-rela) or, less commonly, autumn (militeda) in the palace garden; the lover's complaint; carousal. Yet many hasfides celebrate particular occasions, such as the departure of the inpnarch on a hunt or a campaign, or his successful return from one, or the birth of a son or the receipt of a gift, and when they do, the occasion provides the governing metaphor of the masth. The opening portion concludes with a line or two of transition that shifts the focus of the poem to the person of the patron (mamdile), whose name and title are mentioned—either fully or in part—in a line called the guefredh or takhallus which marks the formal boundary between the opening section and the panegyric proper (madia). While the images of the nasib have, in the majority of instances, a narrative or metaphorical unity, those of the madth do not. They present the mamadah in a series of stereotyped poses drawn from the spheres of activity special to his office. For the monarch (sulidu, amir, ridh), the mandak of preference throughout most of Iran's history, these were the court-in both its formal and informal aspects—the hunt, and the battlefield. Thus in any given kasida-yi madihu, the monarch will appear, in no particular order, as the chosen of God, a fearsome and heroic warrior, superb huntsman, the unfailing refuge of the weak and needy, a cheerful reveller, and, of course, a generous patron of poets.

In keeping with the stereotyped and iconic quality of these images, the metaphors employed in the madib are richty hyperbolic. As a warrier, the mandib can put Rustam and Islandivia, the paramount heroes of the Iranian national epic, to flight, and terrify the forces of nature. As a menarch, he is served by the rulers of the great empires of the world—the haysar of Rûm, the lipal of Hind, the hades of Turkistan and the fagifur of Cin. As a patron, his generosity outdoes that of Hatim Tan,

and even that of nature; and - on.

The final section of the poem is the du'd', or prayer, but there is usually a bridge passage between madis and du'd' in which the poet addresses himself directly to his patron, either to plead for reward to boast of his skill, or both. The du'd' itself is quite brief, no that the or three bayes. As its name suggests, it is prayer for the enduring, indeed, the perpetual, prosperity and rule of the monarch and his court. This prayer is expressed in language that elevates the monarch above the sphere of the mortal to that of the semi-divine. He is identified with the enduring processes of nature, which undergo change, but not decline. "So long many rate comes every Spring/Nay you reign and prosper."

As must be apparent from this summary description, the purpose of the kasida-yi medika is to celebrate the institution of rule, not the ruler. One finds am individualised portraits of the monarch here, nor of any of the other officials who filled the role of manufak. Indeed, the royal kasida-yi medika in all its many exemplars appears as the text of a ritual celebration of monarchy that gave the members of the court an appropriate public occasion on which to affirm their commitment to the myth of the security and well-being of the Islamle state.

For the monarch, the kashla-ri madha provided the means of being publicly celebrated as the living embediment of the ancient tradition of kingship in Iran. In this, the kashla-yi madha paralleted the common practice of concecting false genealogies that connected the sultan of the moment with the house of Sāsān as a means of asserting symbolic legitimacy.

The first great period of the kasida-yi madika in Persian was that of the early Charawids. Mahmad, the founder of that dynasty's great prosperity, expended vast sums to gather around himself a circle of distinguished poets, chief among them being 'Unsur' and Farrukhi [q.vv.]. Tales of his extraordinary generosity them became part of the mythology of patronage, and provided the model for subsequent rulers and their poets. Although Iranian courts from that time to this have generated an endless stream of royal patrons and eulogists, and the kasida-yi madika has attracted master poets in virtually every period, no later court has achieved an exemplary status comparable that of the Charmawid.

The Charnawid period also saw the appearance of what might be called the spiritual panegyric or anti-court haside. That is, the Charnawid bureaucrat and littérateur-turned Isinh'll propagandist. Nasir-i Khusraw [q.v.], used the language of court poetry and the genre of the haside to compose works that revile secular rulers and rebuke court poets for devoting their art to praising them. His argument runs that since Mahmild cannot assure the poets' well-being in the next world, they should rather expend their skill in celebrating those rulers of eternal, spiritual power—the Shiff Imdows—who can.

The example of Nasir Khustaw found few imitators in the centuries immediately after his death—although his influence on the great 6th/r2th century tasida writer, Khākāni Sharwani [4,n], can seem in that poet's pilgrimage tasidas—but in the Safawid period, the spiritual panegyric virtually replaced the secular. Later dynasties reinstated the secular as the preferred mode. There was a final efflorescence of the kasida-yi madiha under the Kādjārs that was, in large part, stimulated by the rediscovery of the poetry of the Ghaznawid panegyrists.

Unfortunately, the fantastic exaggeration of the panegyric style has proved so unpalatable to not given the basida-pi madifia the careful attention that its central position in Persian literary history merits. The prevailing approach to this substantial body of work is to treat the opening portion as the only true poetry, and to ignore the contents of madile and de'd'-which make up two-thirds m more of any poem-as of negligible interest. The assumption is that court poets wrote panegyries only out of economic or political constraint, not sincere, personal conviction, and this want of sincerity vitiates the literary interest of their work. The studies by Gh. Yūsuli, Farrukhi Sisidni, Mashbad 1341/1963, and J. W. Clinton, Manuckikri Damghani, Minneapolis 1972, are among the few exceptions to this rule.

Bibliography: General accounts of the hastdays madiha will be found in the standard literary histories of Iran. Principal among these are: Browne, LHP; J. Rypka et alii, History of Iranian literature, Dordrecht 1968; Furüzaniar, Sughan wa sughanwaran (2 vols. in 1), Tehran 1350/1972; Dh. Safa, Ta'rikh-ı adabiyydi dar İrda' (3 vols. ln 4 parts), Tehran 1353/1975; and, for the 19th century, Y. Aryanpur, Az Sabá tá Nimā, Tehran 1351/1973, i. In addition, recent editions of the dimens of kasida writers include in their introductions such biographical details of poets and their patrons as are readily available.

The section on poets in the Caker makela of Nisámi "Arúdi Samarkandi (cn. 550/1155), ed M. Kazwini, with notes by M. Mu'in, Tehran 1333/1955, provides a contemporary, and anecdotal account of the role of the court poet that is of great interest (Eng. tr. E. G. Browne, The Jour discourses, London 1921; Fr. tr. I. de Gastines, Les quatre discours, Paris 1968). The most complete and detailed statement of the art of the hasida, including the hasida-yi madika, is in the Muyam of Shams-i Kays (al-Mu'djum fi mu'ayir ash'ar al-'adjam, by Shams al-Din Muhammad b. Kays al-Razi, ed. M. Kazwini, revised M. Radawi, Tehran 1358/1960), completed in the early 7th/13th century, and never improved upon. (J. W. CLISTON)

3. In Turkish

In accordance with the well-established tradition that regulated the structure and use of the hasida, madib is the technical term used to refer to the section of this type of poem devoted to the praise of God, the Prophet, the sultan, the grand vizier, etc. Among the Muslim Turks, and especially the Ottoman Turks in the 19th century, the collective abstract form -madhiyya-used in exactly the same sense, min preferred. The same term designates any poem composed for the purpose of extolling individual. The nefes or iidhi types of poems written or uttered by members of the mystic orders to enlogise God or leading personalities (piran and bibas) of these religious fraternities, and even more, the secular poems circulated by the literary innovators of the last century, are generally given this designation also (see S. N. Ergun, On dokumence assedantes) Behtaşi-Kırılbaş Alevi şairleri ve nefesleri, İstanbul 1956, 359, and Şinasi, Milminhabates eş'dr, in Külliyal, i, Ankara 1960, 47-53 respectively).

It was, however, in the tasida, the paramount verse form of the Muslim panegyrist, that Ottoman Turks such as Baki [q.v.] and the premier kasidawriter Naf'l [q.v.] displayed their most characteristic and enduring mada in. The presentation of a laudatory poem to those in positions of influence and power was the accepted and almost expected

modern students of Persian poetry that they have | way for the literati to attract the attention of potential patrons for the purpose of securing employment or obtaining rewards and favours from them. The initial introduction of aspiring poet, for example, to a grandee may have been through the good offices of a friend or teacher, but ultimately it was the persuasive and pleasing madily featured in a suitable havide that forged the more lasting association with the patron or assured the most urgent favour. One may cite, among many other examples, the case of Mehmed Kara Fadil [q.v.], who launched a successful career - diman secretary to several princes thanks to a hazida he presented to Sultan Süleymän at the suggestion of his mentor Dhati [q.v.] (see Hasan Celebi, Tadhkirat al-shu'ara?, British Museum, London, ras. Add. 24,957, fol. 28ta, and Riyadi, Riyad-i shu'ara', Nuruosmaniye, Istanbul, ms. 3724, fol. 116), and the experience of the poet and vizier Ahmad Pasha [q.v.] who, having been incarcerated for an indiscretion, secured his release with a panegyrical kaşıda to Sultan Mehemmed II (see Latifi, Tadhkira-yi Lafifi, Istanbul 1314/1896-7, 78, and Ali Nihad Tarlan, Ahmed Paşa diranı, İstanbul 1966, 60-3).

In structure and form, the traditional kasidas, including those composed by the Ottomans, remained fairly constant. Following the exordium (nasib or fasible) and, sometimes, a short set 🖪 lyrical couplets (taghazzul), the poet very ingeniously eased the reader or listener into the madily by means of the device known as the guringah (see Gibb, Hist, of Ottoman poetry, 1, 84) in which we real purpose (maksad) of the poem was revealed, either by openly naming the patron who was to be the subject of the encomium that followed immediately or by a clever allusion that rarely left any doubt = to the identity of the patron (see Fahir Iz, Eski türk edebiyatında namm, İstanbul 1966, ifr, 73, 106). The madle was then followed by further praise in the du'a soliciting prayers for the patron and mentioning the poet's name.

Frequently, the above format and sequence were disregarded in favour of the me direct approach. Forsaking the exordium and the gurlagah, the panegyriat began his kaşida with the madih (see Nadimdiwant, ed. Khalli Nihad, Istanbul 1338-40/1920-2, 34-6, and contrast 21-4, 36-8). This tendency became especially prevalent when indoctrination and instruction replaced gain and advancement **m** the purpose of the poem. Particularly in the 19th century, when acciamation of new ideas or of a certain political. point of view displaced the praise of the individual, the madsh became the essence and indeed the only section of the kaşida (see Mehmet Kaplan, Şiir tablilleri, İstanbul 1969, 23-5, and Kenan Akyuz, Ban te sirinde türk şiiri antolofisi, Ankara 1970, 61-3).

As a feature of I karida, the message, spirit and language of the madify was necessarily determined by its particular function and objective. It made up of a varying number of couplets extolling such attributes or virtues, real, imagined or fabricated, of the individual or concept as courage, wisdom, justice, piety, generosity and benefits. It was mainly characterised by extravagant laudation that was often completely unjustified or misplaced, and by the use of every conceivable rhetorical device, the hyperbole of which was sustained by epithets and allusions that only those familiar with the obvated Islamic literary tradition could comprehend and appreciate. The epic similes and the imagery which were an intrinsic part of the madia were considerably removed from the realities of a restricted social milleu that expected, accepted and even cherished ingenious flattery and procaclous insincerity garnished with flowery language. However, impactly, as some of the examples given above indicate, had a certain utilitarian function and, incidentally, may very well have met a implied in its symbolism and reflections of a cesthetic ideal, as recently suggested by W. G. Andrews in his Introduction to Ottoman poetry, 146-50, it must be noted, at the same time, that it, along with many other verse forms, affords one many fine filustrations of the Turkish literary genius, versatility and inventiveness.

4. In Urdu

Eulogy probably existed in Urdu poetry from the earliest period of literary activity-certainly as far back as the second half of the r6th century A.D., though few early examples have survived. Two broad categories developed, according to the subject of the eulogy, sc. the secular and religious. The first was addressed to rulers, governors, nobles, and other rich or influential lay persons. It was usually termed mads rather than madis, other terms being tairif and sitairist. The religious entegory had its own distinctive terminology, though usage was not completely uniform, and might depend, to some extent, on the vagaries of copyists and editors. Praise of God was called hand, that of the Prophet Muhammad seV. That of the fourth caliph, and of subsequent Shiff Imams, was called manhabat, whilst eulogy of other religious figures, living or dead, including the first three Orthodox Calipha, was generally called made or tabil.

Like other major poetical genres in Urdu, madib was derived from Persian. In some instances, Persian eulogistic odes were translated, or more properly adapted, into Urdu. More often, and samin (metre and rhyme) of a Persian ode would be imitated in am Urdu ode. The debt to Persian models was no secret; from the roth century onwards, there are frank admissions indications by various Urdu poets that they are vying with Persian poets in their mastery of the madifi kasida. The chief poets to whom they were indebted were Anwari, Khākāni and Urll. Muhammad Kull Kuth Shah (ca. 1568-16x1) begins a may ode: "The name of Muhammad in the world is to me like a hundred Khākānls". It is worthy of note that 'Urfl was court poet to the Mughal Emperor Akbar in Dihll, and died there in 1590-1, when Kull Kuth Shah was in his early twenties. Apart from Indian local colour, including Hindu references, it is difficult to distinguish any single major feature in Urdu madih which breaks completely new ground. Nevertheless, some poets achieved such mastery in it that they seemed to breathe new life into it, and thus they gained recognition for their originality.

Urdu madih has been composed in aimost all poetical forms, including mainment, mukhammas,

musaddas, targif-band, tarkib-band, and, extremely rarely, even ghasal. But the eulogy form par excellence the kasida or ode. True, this form was used in other fields, particularly satire. But such has been the predominance of eulogy, that the term essida is usually understood to mean "eulogy", as an abbreviation of kasida-yi madhiyya. Consequently any account of Urdu madia must, of necessity, show how the pre-Islamic Arabic ode, modified in later Arabic poetry, and brought to India via Persia, adopted and adapted to the new environment, Unfortunately, it is hard to find an account of the Urdu kaşida form which is full and explicit without being discursive or biassed. In some accounts, the pre-Islamic ode, mexemplified in the Mulallahat. is over-emphasised, and there is too much reliance Ibn Kutayba and Ibn Rashik. What is lacking is a definitive comparison of the Persian and Urdu hasidas. Though most Urdu culogists were not unfamiliar with Arabic postry, its chief influence on them was in vocabulary. Occasional mention of Arabic sasida-writers, such as Dhawk's reference to Labid, al-A'shā, Diarir and al-Ma'arri, must be regarded chiefly as "name-dropping" designed to impress the hearer, rather than an indication of indobtedness. It may be that al-Büşür's Kaşıdat elburda, which was translated into Dakkanl Urdu by Muhammad b. Rida, around the turn of the 17th and 18th centuries, influenced the religious kasida; and Ka'b b. Zuhayr's celebrated ode in praise of the Prophet, Ednat Su'sid, was at times mentioned by poets critics to justify the inclusion of an explicitly erotic prelude in na't odes. But the kasida which came into Urdu poetry via Persian is as much akin to that of 'Abbasid poets such as al-Mutanabbi, al-Buhturi and Abft Tammam, as to the pre-Islamic

The form of the Urdu madih was fully developed by the middle of the 18th century, if not earlier. Like its Arabic and Persian counterparts, it was a monorhyme poem, usually in weighty metre, with elevated and rich diction, of roughly between 30 and 150 metric two hemistiches of the first verse, called the matia, also rhymed: and if the dasida were long, there might be one or more subsequent verses with this internal rhyme at irregular intervals in the poem, known as matia thank, maila the little and mon, more than four in all being rare. As is often the metric in Persian and Urdu poetry, the rhyme (bdfiya maradif) was often rich and difficult, and the poet's ability to sustain it was regarded as proof of his skill.

There were four main sections to the dasida. The first was the tambid or prolude, usually called taplofo, a throw-back to the erotic prelude or nasib of the Arabic ode. The opening verse (mails') however, considered so important in attracting the hearer's interest, that it is often discussed in if it were a separate section, not merely the start of the tasticts. The crotic theme was seldom used, and was often frowned on unless | were chaste. A wide range of other topics was substituted, whether singly or in combination. Pride of place was given to the description of spring, an ode with such a toubble being called a kasida bahdriyya. This topic was sidered particularly suitable, - suggesting youth and vitality, which were regarded as implicit in the term legible, and flattering to the memdah or subject of the poem. Moreover, this topic allowed for description of natural scenes, gardens, flowers and birds, which part of the poet's stock-in-trade,

This theme might is extended by a comparison

between spring and autumn. Further, the two might be depicted as kings or generals marshalling their armies to fight another, spring, of course, being the victor. Like practically all tagibib topics in Urdu, this extension of the spring motif goes back to Sawdā (1717-81), who is generally regarded as both the pioneer and the finest exponent of the full kasida form in Urdu. Amīr Minā'l (1626-1900) developed this theme further in one ode, by a vivid description of the actual battle. But, according to Sahar, (op. cit., in Bibl., 229), this had already been done in Persian.

Again, the tashbib might be devoted to the days of youth, or complaints of the times in which the poet lived, of his own misfortunes. Fahhr ("pride, boasting"), philosophising and moralising other topics. As the basic form of the basida was stereotyped, poets were always searching for fresh ways of composing the tashbib; for it must be beene in mind that the madil) ode was frequently recited to the patron in public, in the presence of other poets and men of taste and learning. The poet's reputation and his reward was at stake.

One interesting device was to turn the tashbib into a disputation or mandjara. In Persian, Asadiyi Tosi the Elder is said to have initiated this device, with mandjard between night and day, and heaven and earth among others. In Urdu, Sawda has one between greed and reason, whilst Amir Mind? pairs knowledge and imagination, and comb and mirror. Into this category should go the makilama (colloquy) favoured by 'Aziz Lakhnawi (1882-1935), as, for example, one between heavity and love (hussi non-fights).

Occasionally the lashbib consisted of an anecdote, possibly with dialogue, and somewhat dramatic. When intimate in tone and straightforward in language, it could form a charming contrast with the high-flown praise section which was to follow. A fine example of this is Sawda's eulogy of Asaf al-Dawla Rustam Djang, chief minuster of the Mughal emperor. with the rhyme -am (Kulliyyat 293 f.). The poet begins by relating how, prevented from sleeping or eating by the dinns, he consults Doctor 'Akl, who prescribes blood-letting and a purgative. The poet objects that the tax-collector had drained all his blood, while purgatives are for the over-eater, whereas be has been fasting for Ramadan. Can the Doctor prescribe a more effective treatment? What that is, shall see, when discussing the second section of the kasida (see below).

Two devices deserve mention which could be ? used effectively in the tagebib, without necessarily being independent topics. One was personification of abstract ideas or inanimate objects. This certainly goes back to Persian poetry, a famous example being Manucihrt's "Candle ode". It could leature in the munagara topic already mentioned. The other sar-ā-pā nigāri ("head = foot description"). A human being night be described-perhaps the poet's beloved in an erotic tashbib. But the most effective examples are descriptions of a houri or perioften seen by the port in a dream, or while lying awake in bed. Inshêt (2756-2817) commences an ode to Prince Sulayman Shikoh (Kalam, 206), by describing biraself as tossing and turning in bed one morning, unable to alcop because of the spring wind. He sees a beautiful peri by the bed, and gives a detailed description of her. His contemporary Mushaff (1756?-1826) has mode with the same rhyme, also containing a description of a peri. Amir Mina? I describes a profligate peri in an ode to Nawwab

Kalb All Khān; he not only we the same rhyme, but also refers back to Inshā' and Muşhaft in half-quotations.

The tashbib me regarded as an important pointer to the poet's merit: yet to many critics, the second section was the acid test. It was usually called gurer (Persian "deviation, flight"), but the Arabic terms makhlas, talkhis, and even takhallus are given as alternatives. Though very short-sometimes single verse, and seldom more than four, it was crucial; for it was the link between two apparently unconnected sections, the tashbib and the actual praise. Unless the gurds were skilfully constructed, the Ensida would lose its unity. Many lelicitous examples could be quoted from the leading poets, but one must suffice. We left the ode by Sawda with the poet asking for an alternative prescription for his illness. In the succeeding gures, the Doctor, in two verses, suggests that Sawdā take his complaint to the court of him (that is, Asaf al-Dawla) under whose protection the weak ant may be revenged on the elephant. Hearing this, and taking his kusida as a present, the poet attends at court. This gweet of only three verses leads to the praise, which is almost ode within an ode,

The third section was called made or mandale, and it was the most conventional. The qualities described had to be appropriate to the status of the mandrift. Thus a ruler or marie was praised for his justice, manliness, nobility, virtue, fear of God, generosity and clemency. To men of religion, other qualities appropriate-learning, asceticism, attendance to religious duties. But the distinction tended to be blurred when the kasida developed in north India. Thus Khalik Andjuman (op. cit., in Bibl., 261 f.) remarks that Sawda hardly distinguishes between secular and religious subjects in this respect. In addition to the personal qualities of the mandab, the post could refer to his environment and associations, and the trappings of power and wealth. In praising a ruler, his sword, horse and elephant might be described. According to Hashim! (op. cit. in Bibl., 107), this was not so in the Deccan-though it must be pointed out that Kull Kuth Shah certainly refers to Imain 'Ali's sword Dhu 'I-Fikar, and Walf Dakkan! (1667-1707) to the mule Duldul given to 'All by the Prophet. With Sawda, sword, horse and elephant were described fairly briefly. But some later poets such as Dagh of Dihii (1831-1905) somewhat extended these descriptions, and turned them into separate sections, with headings such as dar sijat-i asp and dar lavif-i-pil. A lesser 19th century poet, Kalak, of Meerut (1832 or 1833-1879), includes such sections, admittedly shorter than Dagh's, in odes to fairly undistinguished recipients. To the present writer, this clear division of the hasida into sections other than the four main ones was a continuing tendency which started before Sawda. The latter interpolates a ghazal in one basida, but Wali had already done this. Unlike Sawda, however, he did not have several maila's in one ode.

Thus the content of the made section was restricted. Nor could the poet escape by making it brief, as courtesy required that the taskbib must not be longer than the made—so if the latter were curtailed, so must the former be. Hence the mode of expression all-important in the made section. This was dependent on a rich and pompous diction, similes, metaphors, and all the apparatus of tankbi ma-badd's, with considerable play on words. Some of this was derived from Persian, but in any case, after Sawdh it rapidly became cliché-ridden. To give but one

example, a ruler or minister was often compared with Solomon. Sawdå expresses this neatly in the eulogy of Åşaf al-Dawia already mentioned:

Kuchh ham nahin gjihān min Sulaymān tērī tērādjāh Gü alsina pah Āṣaf-i-Dawla hay tērā nām. ("Your splendour in the world is no less than Solomon('s), Although on (people's) tongues your name is Āṣaf-i Dawla") (Kulliyyāt, 295).

This verse loses part of its effect, unless one knows that, in Muslim lore Aşaf [b. Barakbyā] (q.v.) was Solomon's Grand Vizier. Exaggeration in praise was taken for granted, though some 19th century poets such as Ghālib (1797-1869) disliked it. Shibil Numant, in his celebrated study of Persian poetry, Shi'r al-'Adjam (1908-18) (v, 21-6) tried to lay down conditions for acceptable panegyric. Firstly, the person praised must be praiseworthy; secondly, the qualities commended in him must be genuine: thirdly, the poet must describe them convincingly. Shibli admitted that all these three conditions were never fulfilled by any Persian poet, and went on to commend the sincerity of Arabic madily, in a way which would strike many Arabists in idealistic, if not naive. At the same time, Shibil denied that the baside caused subservience in the poet and egotism in his patron, since both realised that what was said was "pure exaggeration and word-play". Shibli was not speaking of Urdu madih, but what he says of Persian could equally apply, and is often quoted by modera Urdu critics. Dhawk (1789-1854) is generally regarded as second only to Sawda me eulogist, yet he exaggerated like other poets, calling the Mughal Emperor Akbar Shah II "shadow of God and deputy at the Prophet of God". This poet's biographer, Tanwir Ahmad 'Alawi (op. cit. in Bibl., 249-51), quoting this and other examples, Justifies them by saying: "the person praised seems to be not an individual, but a symbol of his time. In this sense, Dhawk's praise is very near to restity and realism."

The final section of the kaşida was called the khātima: and the term maktas might be applied to it as a whole, or merely to the last verse - two -since 🖿 impressive ending to an ode was considered as important as an impressive beginning. In contrast to Persian practice, except with 'Urff, the Urdu enlogist usually gave his lakkallus. This would normally be somewhere in the khalima, though there are instances where it is given earlier, alternatively or additionally. Sawdā makes his takhalluş the first word of his eulogy of Aşaf al-Dawla aiready quoted, and gives it again in the childrens. Nor is this the only hasida in which he gives his takhallus in the first verse. The secular's ode's khātima has two subsections, husn-i falab and du'a". The former is the poet's request for recompense, for which critics laid down various conditions. Summarised, they require the poet to steer a middle course between perfunctoriness and importunity-between taking the patron's generosity for granted and implying that he was mean. Some poets disliked begging: Dhawk, in his extant odes, avoids it, sometimes substituting the expression of his inability to praise his patron adequately. Sawda also often avoided begging, Duft? ("prayer, blessing") was the expression of the poet's wishes for long life and prosperity for his patron. In the religious basida the bhatima man somewhat different. The poet might express his own faith, and ask for a blessing to maintain it; and he might pray for the triumph of Islam, with suitable variations where the mandah was a Shiff imam. Here Sawda was often felicitous, a good example being the

mankabai to Imam 'Ali with the rhyme of (Kulliyyā), 243-7), which ends with the four requests, the last being that all "friends in both the two worlds may recognise the authenticity of the pure imams".

Some indication of the style expected in the hasida, has already been given. It was regarded as a linguistic and stylistic tour de force, and occupied a position in Urdu literature comparable to that of the makama in Arabic. The poet was allowed to go to extreme limits of abstruseness to demonstrate his skill and learning, using in _____ instances scientific technical terminology. Thus Insha' used much philosophical vocabulary. Tadmin-the interpolation of extraneous material-was common. This often took the form of quoting from some other poet, Perslan or Urdu. Another type, particularly suitable to the Indian environment, with its numerous languages, was for the poet to introduce hemistiches or verses in several languages. Every poet was expected to know Persian and Arabic, and he would normally know one or more of the other literary languages of the subcontinent. Insha, was addicted to this sort of virtuosity, and is said to have incorporated material from ten or more languages apart from Urdu. Dhawk was rewarded with the title of Khahāni-yi Hind by the Mughal emperor for a basida in seven languages, of which only a few lines have survived,

Thousands of culogy poems must have been written in India over a period of 400 years, but comparatively few have survived, and of these a dis-proportionate number are of the religious type. Various reasons may be given for this. Early Urdu poetry, in both the Deccan and North India, seems to show a preference for the mathnaut. From the mid-18th century onwards, chazal dominated the poetic scene, and did not have a serious rival apart from the Sh19 marthiya perfected by Anis and Dahir in the second and third quarters of the righ century. Many poets wrote kasidas, but for an overwhelming number, ghazal was their forte. The only absolute exception is Sawda, whose kayldas have been almost universally considered superior to his ghazals- -though some would argue that his satirical odes surpass even his eulogy. Of later poets, Dhawk and Amir are credited with equal skill in madily and ghasal, Moreover, when a poet's works were collected, first in manuscript, and later in print, they were largely limited to ghazals, and few hazidas, if any, were included. As see often the case in Persia, kayidas tended to be copied separately, and were liable to be lost. It was not unusual for a hazide to be copied in abridged form. This might be understandable where the purpose was to omit tadmin passages in other languages. But it is difficult to see why two mankabat odes by Ghalib should be thus abridged (see Mihr, Diwan-i Ghalib, 294-6, 296-8). At the same time, it seems clear that the writing of eulogies for gain was often looked down on by poets, critics, and people at large. In any case, the ¿aṣida was very much a poème d'occasion and was liable to lore its appeal with the passage of time. Whatever the cause, the odes of hundreds of minor posts seem to have disappeared, whilst some by acknowledge masters of the form are missing. Dhawk was court poet in Dihil for fifty years, and must have composed 200 odes or more in the course of his official duties: yet only about 30 are extant. Some of Amir's eulogies are known to have been lost, among them those in his first diwan, which was destroyed in the Indian Mutiny. Only 28 of his basidas have survived.

Nevertheless, the ability to write m good basida was often said to be m hall-mark of poetic skill.

Ghālib once said: "Whoever cannot write one ode should not be accounted a poet". Thus it has been argued (Tanwir Ahmad 'Alawi, op. cit., 225) that Inshā' wrote odes, and gave of his best in them, in order to complete his art.

Only m few brief remarks will made here m the history of madie in Urdu. Further information can be obtained from the works mentioned in the Bibliography. It is convenient to speak of three stages based on geography, and obviously overlapping the Deccan, Dihli and Lucknow. Very little is known about the Dakkani kasida. But in general it was short and simple, as can be seen from the printed odes of Muhammad Kull Kuth Shih, Sultan of Colkonda [see gups-shinf], They are all religious, and seldom of more than 40 verses, sometimes of under 20. There is little indication of the four sections of the later kasida. True, of about 50 poems which come under the heading of madib (Kulliyyal, i, 2-46, iii, 3-39), one (iii, 38-9) is a fragment of 16 verses entitled Ek kasida-yi mankabat-ki tashbib 🔳 dand agher. It is beautifully written, and begins:

In the black sea of night the golden skill sank. As it sank, a hundred thousand bubbles rose.

But even if it is by Kull Kuth Shah, there is nothing to show that it is really the tashbib of a kasida. and this seems unlikely. From the metrical standpoint, it is interesting to note that in a few of his kasidas, he divides the hemistiches into two, with internal rhyme, thus producing something like and amalgam of hasida monorhyme and subdiviyait, Wall Dakkani is considered the father of Urdu poetry, and he visited Dihli at least once. He was primarily a 50ft ghosal writer, and composed poetry for gain. However, he wrote eight religious eulogies-six kaşidas and two tardii bands. All the kasidas - of modest length, save a composite one of xxx verses which I devoted successively to the praise of God, the Prophet, the Imams 'All, al-Hasan and al-Husayn, followed by exhortation (maw'isat), a ghazai m the love of God and a khātima. Of Wall's kaşīdas, only two, to Musiim saints, show clear signs of conformity with the four-section form described earlier. They are addressed to Hadrat Miran Muhyi 'l-Din (Kulliyyai, 367-71) and Shah Wadjih al-Din (ibid., 37r-6). It should be noted that in both he mentions Persian eulogists-Khākānī and Anwari in the former, and 'Urfl in the latter, as if to put himself on a level with them.

Whether or not Wall was the link between the Dakkani and Dihii ghazai, there seems no question of any link so far as the hasida is concerned. For not only does internal evidence suggest that his madily poems were composed before he visited Dilhl, but there is a histus until the mid-18th century, before the hasida emerged in Dibil. Critics explain it in various ways, none fully convincing. Either practically no sulogies were composed, or such as were composed were short, weak and formless-or again. the Urdu language had not developed sufficiently to provide the right poetic diction. Sawda is variously described in having originated, reformed or perfected the basida. At any rate, until examples of the sulogy ode composed by other poets during the period 1700-40 come to light, we must acquiesce with those who state that Sawda followed Persian, rather Will Urdu, models. And there is me denying that he was, and remains, the leading Urdu mades poet. His tanked is varied in theme and manner, his gurez neat, and his madh cloverly expressed. Succeeding poets imitated him, but seldom equalled him and never surpassed

him. Variety and freshness are the keynote of his odes, and they are rarely of extreme length: of the 38 keildas in the Nawal Kashor edition of his kulliyyat, only seven have more than 70 verses, and of these only five more than a hundred. The language is rich, drawing freely on Persian and Arabic. His contemporary Mir [Taki Mir] (1722-1810) wrote a good deal of culogy poetry, mostly religious. There are only seven kajidas; the rest consists of mukhammas, musaddas, tardii* band, and maijnawi. Mir was a prolific ghazal writer; but his pessimistic temperament was unsuited to sulogy.

In latter part of the r8th century, Insha's was a leading harida writer. As we have seen, he was a virtuoso of languages, but he did not reach the top flight in any poetic form. His longest ode, of 170 verses, is in praise of King George III of England. During the period, Mushaff wrote over 60 hasidas. He was definitely influenced by Sawdā, and recembled him in the variety of his tachbib topics. But though he has a persuasive protagonist in Abu 't-Layth Siddlki, he is not favoured by critics in general. He was the first famous culogist of the Lucknow school. But, owing to political uphcavels in Dihli, due to Afghān and Marāthā incursions, many Dihli poets gravitated to Lucknow, including Sawdā

himself | the age of 60. Still, Dihli had its distinguished eulogists in the first half of the 19th century. Pride of place goes to Dhawk [q.v.], considered second only to Sawda. Much of his madth poetry is lost. Of what remains—22 kapīdas, a mukhammas, and a few shorter poems and extracts—all is secular save ... few fragments. The general scope of his eulogy poetry is narrower than that of Sawda. For example, it is nearly all addressed to the Emperor Akbar Shah II and to his son Bahadur Shah II. While his tegibib does not show Sawda's range, nor his ability to appeal by directness at times, he is by no means stereotyped. One taskbib, for example, is a delightful description of happiness. Dhawk was a learned man, whose hobbies were astrology, music and medicine, and his language is both rich and dignified. His contemporary Ghalib (q.v.) (1797-1869), often considered the prince of Urdu poets, is not generally included among the leading culogists, and he was too proud to include in madile, except when absolutely necessary. S. F. Mahmud (Ghalib, 200-4) quotes and commends the tashbibs of two early mankabat odes to Imam 'All; and the originality and individuality present in his equal is found also in his madth. Yet another contemporary, Mu'min (1800-54) excelled in ghatal, but also wrote nine kasidas, only two of them secular. He has been praised by Brelw! for his originality in the form. Finally, in discussing the Dill school, Digh [q.v.] (1831-1905) deserves mention. His Urdu dinde contains six odes, all secular. Five of them are addressed to the Nighm of Hyderabad, at whose court he spent the last 19 years of his life. Mention has already been made of his inclusion of sections on borse and elephant.

Madil thrived at the court of the Nawwabs of Oudh [see awade] until 1856, when the British exiled Nawwab Wagiid "All Shah to Calcutta and the court of Rampur took its place. Two types, or, more properly, two tendencies, have been mentioned by critics—the forceful and dignified based on Sawda and the Dihli school; and softer type, influenced by ghazal, and by the licentious Lucknow atmosphere. Most of the poets of the Lucknow school of eulogists are now forgotten. Not so, however,

Amir Mina'i. It is sometimes said that the Urdu haside began with Sawda and ended with Dhawk; but it would be truer to say that it ended-or nearly ended-with Amir. This poet a man of considerable scholarship, compiler of the first two volumes of ... Urdu dictionary which, if completed, would have been on a very large scale. His mastery of words stood him in good stead in his madily odes, of which only 28 have survived. Of the two Lucknow types, they are more akin to that based on the Dihll school. Most of them are secular, and have ■ dignity bordering == the epic, especially in the varied tashbibs. His language is at times heavy; but in general, it is less intricate than Dhawk's, and superior in beauty and freshness. He spent 43 years as court poet in Rampar. In 1900, he was invited to join Dagh in Hyderabad, but died there shortly after his arrival.

By this time, the madhiyya has!da we becoming obsolete. After the Indian Mutiny, India came under British control, and those splendid courts which had nurtured eulogy poetry were a thing of the past; though some rulers of the "native states" patronised poetry, it am not me the man scale. Poets increasingly introduced their new poems to the public in mucha aras [q.v.], newspapers and magazines, = at meetings of cultural and learned societies. A new attitude to poetry developed, fostered by the 'Aligath Movement, with the call for "natural poetry". Altaf Husayn Hall (see BALI) attacked the traditional časida in his Muhaddima-pi ski 7-6-skā iri, published in 1893. The virtues described in eulogy poetry, he said, were mostly imaginary; in fact, they were often the very opposite of the mamdith's qualities. If he were an ignoramus, III would III praised for his knowledge; if he were a tyrant, for his justice and impartiality; if he me idiot, for his sagacity (ab. vit., 82). Taking the Arabic poet as his ideal, Hall castigated lying and exaggeration in sulogy (ibid., 93 f.). The poet, = said, bad = important function to perform: by bringing to light virtues and vices, he should encourage reform. In fact, Hall was proposing a role for the Urdu poet not unlike that played by Ahmad Shawki and Haffa Ibrahim in Egypt not long afterwards.

In the 20th century, a few Urdu poets continued to write \$asidos. For example, Ahsan Mārahrawī (1876-1940) wrote in tarkīb-band for King George V's coronation in 1911. 'Azīz Lakhnawī gained something of a reputation for his eulogies, all directed to the Prophet and his family. But in India and Pakistan today, the madik baṣīda, whether religious, or in praise of public figures, is found

chiefly in magazines and newspapers.

Yet the kasida was not merely museless and regrettable by-way of Urdu literary history. At its best, it had a sort of Baroque brilliance. Its style, even when the tasibib was devoted to tashazard, differred from that of ghazal. It had a strength and dignity which, derived in part from the early narrative mathiaud, in its turn influenced the 19th century marthiya. Its rich vocabulary and idiom influenced not only other poetry, however, but also prose. Without the kasida, it could be argued, Urdumuch high literary Urdu-would have been much the poorer.

Bibliography: General accounts of hasida form will be found in 'Abd al-Salam Nadwi, Shi'r al-Hind, A'zamābād n.d., ii, 324-46; Abu 'l-Layth Siddlki, Lakhnāo kā dobistān-i skā'iri, Lahore 1955, 266-71; Muhammad Sadiq, A kistory of Urdu literature. Karachi-Lahore-Dacca 1964,

30-2, gives mental rather oversimplified account. Most of the critical studies of individual poets and editions of their works given below give some information on the form. For a historical account, see Diafāl al-Din Ahmad Diafrī, Ta'vēh-i hasā'idi-Urdū, Allāhābād n.d. For adverse criticism of Urdu madib, . Altaf Husayn Hall, Mukaddimayi-shift-5-shiftiri, Sartadi Publishing Company, Lahore n.d. 81-3. General criticism of the Persian kasida often applied to Urdu will be found in Shibli Nu'mani, Shi'r al-Adjam, Labore 1924, v, 1-28, especially 20 ff. The following works recommended for particular poets: Kull Kuth Shah, Kulliyydt, . Sayyid Muhyl 'I-Din Kadir Zör, Hyderabad, Deccan 1359/1940; Kulkiyyäi Wall, ed. Djanab 'Ali Ahsan, Awrangabad 1927, introd. 62-70, text, 338-76; Shayah Cand, Sauda, Hyderabad, Deccan n.d., 118-120, 180-215; Khālik Andjumān, Mirzā Muhammad Raff Saudi, Aligain 1966, 241-70; Kulliyyat Sauda, Nawal Kashōr Press, Lucknow 1932, i, 219-327; Kulliyyat Mir, ed. Tbādat Brēiwi, Karachi-Lahore 1958, 960-1060, 1183-1200, 1344-66, 1387-96, 1432-38; Kalām-i-Inskā², ed. Mirzā Muhammad 'Askarl, Allahabad 1952, 289-331; Tanwir Abmad 'Alawl, Dhasek-samanih aur tankid, Lahore 1963, 214-71; Rahat Afza Bukharl with Nadira Zaydi, "Shaykh Ibrāhim Dhawk" = Ch. v (b) ol Ta'rikh-i-Musulmändn-i-Pähistän-ö-Hind, viil, Labore 1971, 157-61; Diwdn-i- Dhawk, ed. K. M. Sardar Khan, Labore n.d.; for Mushafi, Siddiki, op. cu., 255-83; Sayyid Fayyaz Mahmud, Gaglibm critical introduction, Labore 1972, 121-2, 200-4; Diwān-i Ghālib, ed. Ghulām Rasūl Mihr, Lahore 1967, 294-350; 'Ibādat Brēlwi, Mu'min aur mıdüla a-yi-Mu'min, Lahore-Karachi 1961, 256-64; Kulliyyêt-i-Mu'min, ed. Brêlwî, Lahore-Karachi 1955, 179-232; Dagh, Undu Dîmên, ed. Sibt al-Hasan, Labore 1962, 506-57; Abū Muhammad Sahar, Mufalata-yi-Amir, Lucknow 1965, 219-59; Dittodn-i-Amir ma'ruf ba-ism-ita'rīkhi "Mir'āt al-ghayb", Lucknow 1922, 2-40, 335-44; Kalak, Kulliyyāt, ed. Kalb 'All Khān Fa'ik, Lahore 1966, 458-551. 'Abd al-Wahld, Diadid shu'ard2-s-Urda, Lahore 1954, gives short accounts of Ahsan Marahrawi and 'Azīz Lakhnawi, with examples of their kasidas (330-6, 419-32). Siddly gives further information about the odes of Azis Lakhnawi (op. cit., 796-803). Muhammad Sadiq (op. cit.) and Ram Babu Saksena, A history of Urdu literature, Allababad 1927, refer to various poets mentioned in this article, but neither gives much information about their madily poetry. Naşir al-Din Hü<u>sh</u>imi, *Dakkan mên Urdû*, Lucknow 1963, makes a few brief references to the Dakkanl başidas, for example, Chawwasi, 107, and Muhammad b. Rida, 371 f. For further accounts of the posts mentioned above, see the various articles in the Urdu Encyclopardia of Islam being published by the University of the Punjab, Lahore.

[J. A. HAYWOOD)

5. In Swahili

Praise poetry is an important category in the literatures of several Bantu peoples, such = the Zulu, Swazi, Tswana, Rwanda, etc. It is a general aspect of African oral traditions which has survived Islamisation in the literatures of the Somali and Hausa. In Swahlli, some of the oldest preserved manuscripts contain praise poems, in the first place the famous Ode of Liongo in self-praise. Praising one-self (Swah. heligambs, heligums) is a common aspect

of many African oral traditions, and this includes extolling one's ancestors, commemorating their exploits well as one's own. Liongo's Ode is composed in the uhamafi metre of 15 syllables in the line. Cf. v. 6.: "I am a young lion! I have institled the wish to die in my heart! I fear only the disgrace when the enemy sees my back." The lines are arranged in couplets of two lines, the last line rhyming in -me throughout the poem; this is the oldest-preserved type of metre other than dance songs. It may have been composed before 1600. A later poet added three lines to every couplet, making it a fahamisa (fahlmis [q.v.]). This structure became the model for later poets who making (unlike Liongo) and who composed hymns to Prophet Muhammad in this metre.

In Swahili, the word kasida normally refers to a poem praising the Prophet. The oldest kasida is dated 1062/1652, the first dated poem in the Swahili language, It is a translation of the Hamsiyya by al-Büşirl [q.v. in Suppl.]; without the Arabic text, the Swahili could not be deciphered. The second surviving kasida is the famous seroll now in the library of Trinity College, Dublin. It begins, like Llongo's self-praise, with the word toajiwaji, perhaps not originally so pronounced, which has since then become the term for a kasida or wa'ed (Swah, waadhi, perhaps owing to the similar shape). A special kind of kasida is the mandidi [see NAWLID]. Two wellknown Arabic kaşıdas are the two Burda odes, both of which have been translated into Swahili; in particular, the Burda of al-Büşüri and the Hamziyya still recited during Swahili ceremonies.

The Swahili word madaha is normally limited in meaning to the praises of God, many of which are nowadays sung in the mosques, for which reason they are simply referred to as dua. Numerous are the dua that have been composed in Swahili, some in the ukamafi metre, many in the easier but equally serious ulenzi metre. Swahill verbs like sabihi and kimidi

refer exclusively to the praises of God.

The verb sifu or older swifu corresponds with the noun sifa, which can mean "quality, description" as well as "praise name", as in Kulla swifa nima ndaka Nabiya "All worthy praise name are for the Prophet", the first line of the Maulid of Barzanji. Swifa is used likewise for praising living men and women (for the praises of the dead, marrilya), these praise poems fall into two categories, those for religious leaders, such as wells and sharifa and those for political leaders. Lamu is the centre for the poetry in praise of religious leaders such as the Egyptian Abmad al-Badawi and 'Abd al-Kādir ig.w.], as well as the founding Sharifs of the mosque at Lamu. This poetry is published in Lamu and Mambrui in Arabic script.

inserted in the Swahili epic songs there are many praise poems; of the oldest is 'All's praise of himself in the Uiessi wa Herekali (Heraclius) which itself traditional: "I am the lion of God. He has given me the sword Dhu 'l-Fikar. He made on the Breaker of Cities, His tool to punish the Käfirs. "The Prophet praises himself in the same epic in the letter to the Emperor Heraclius, and there are several passages in which he is praised by others, as "the first-created seal of the prophets, God's favorites". Other heroes, like 'Umar and Mikdåd, also praise themselves and are praised in the opic.

The Swahili tradition of composing praise songs was put to good use by the German administrators, who encouraged Swahili poets to write praises on the German governors and even on the Kaiser; one successful poet was even sent to Berlin and received by the Kaiser and "richly rewarded", exactly as a Muslim prince ought to have done. The poet's name was Hamisl Auwi, and the refrain of the poem is "Who has the true authority if not the Kaiser?",

The First World War produced some interesting songs, we in praise of General Smuts, who defeated the Germans south of Mombasa, and a new category of political songs, called the Beai dance songs, in which groups of (originally military) dancers praised their own "regiment", and chicled rival dance groups,

with political allusions.

Since independence, political verse has seen a new prosperity. The preparations for the elections are not complete without songs of praise for the leading candidates and mockery for their opponents. Some of these poems may appear in the press, but since the poet has to be cautious, he will use cryptic language, comprehensible only to the few insiders of the political arena. After the elections, the winning caudidate will, of course, III lavishly praised, since there is nothing more praiseworthy than success. President Nyerere is probably the most poetically-praised political leader of East Africa. Thus gradually the Swahili word madaks has acquired the meaning of "flattery, eagerness to please", and even "self-complacency, arrogance, pride".

For the exploits of Mikdad in Swahili epic, see J. W. T. Allen, Tendi, London 1971. For the poetry of the German period, . C. Velten, Prosa und Poesie der Sunteli, Berlin 1907, 349, and J. Knappert, The antecedents of World War I in Swahili literature, giving a translation of the poem on Smuts. For an example of "election poetry", see idem, A survey of Smakili songs, Toronto, forthcoming. For the Bent dance songs, see idem. Four centuries of Smahili verse, 1979, 37-8. When President Nyerere met President Banda of Malawi at Dar es Salaam Airport in 1964, a special song was sung in praise of President Banda. (J. KNAPPERT)

MA'DIN (A.), "mine, ore, mineral, metal". In modern Arabic, the word mandjam denotes "mine", while manddin means "miner" and diamid in a mineral.

In the vast Islamic empire, minerals played an important part. There was a great need for gold, silver and copper for the minting of coins and other uses. Iron ore manufacture

964

of iron and steel for arms and implements. Other minerals such as mercury, salt and alum, as welt as pearls and precious stones, were necessary for everyday life. The empire was richly endowed with the various mineral resources; the mining industry was metensive one and the metals, whether precious or not, were the object of a certain amount of international trade.

The article is divided in the following sections:

- x. Economic aspects
- 2. Mining technology
- 3. Mineral exploitation in the Ottoman empire
- 4. In Islamic art

1. ECONOMIC ASPECTS

In the period of the Umayyad and Abbāsid caliphs, the output of the mines in their dominions apparently sufficient to meet the demands for some of the most important metals. In later periods when the empire was dismembered into various kingdoms one often warring with the other, many of the Islamic countries needed one or several of the metals and had to import them from non-Islamic regions. This ___ due to the fact that the metalliferous ores were distributed over the Islamic countries very unevenly. Some III them had rich deposits of several metals, others almost none. Certain regions on the eastern fringes of the Islamic world were relatively rich in metais, especially Itak, Farghana, Ushrusana in Central Asia and 📰 mountains near Hāmiyān (eastern Ghur). Also, Fars had many mines which were very productive. The same was true for the country on the western frontier of the dar al-Islam, namely Spain. Al-Kazwini (Athar, i. 338) could write that in this Islamic country there were mines of gold. silver, lead and iron in every district. It seems that mining, which had somehow declined in the Visigothic period, was revived and flourished under the rule of the Spanish Umayyads.

In the times of the caliphs, there were still in Arabia a considerable number of mines, from which significant quantities of gold [see meanan) were derived. Egypt had the famous mines of Wadī al-'Allaki, on the eastern shore of the Nile [see AL-'ALLAKI]. There were also gold mines in Ushrusana and Ilak, near Shash and at Harat. But altogether, the output of gold in the Islamic countries was not sufficient for the regular coinage of gold distars, especialty after Spain had slipped away from the 'Abbasid empire. This is clearly borne out by the slow spread of gold coinage in the eastern countries of the calipbal empire. In fact, the Islamic countries were always dependent upon the supply of gold from the present countries of Senegal and Mali. When they had established their rule over the whole of North Africa and with this, the northern terminals of the commercial routes which were the outlets for the trade with these gold-producing regions, the mints of Trak and Persia could be supplied with sufficient stocks of gold. Dinars began to be struck in Marw in 842, in Rayy in 849, in Samarkand in 861 and Adharbaydjan in 885. The success of the Fatimids in gaining control over the former 'Abbasid province of Egypt was undoubtedly to a very great extent due to their riches in West African gold.

On the other hand, there were in the caliphal empire rich silver [see rippA] or argentiferous lead mines which made it possible regularly to strike silver dirhams. Most of them were in the countries then contained in the extensive province of Khurasan. The most renowned were those of Panglihir, not far

from the eastern sources of the Käbul river, and in Djärbyå, in the same district. Others were in Andarah, to the east of Balkh, in the neighbourhood of Tas, and in Farghana. The province of Fars also had silver mines. In the flourishing period of the 'Abbäsids, in the 9th century, the output of all these mines must have been considerable, as the gold-silver ratio changed, silver becoming chaper, although the quantities of gold increased. Spain, too, was rich in argentiferous [1] was exploited in the districts of Murcia, Alhama, Cordova and Beja (in the present Portugal).

Copper (autas) was derived from mines in neveral provinces of the caliphal empire; in Sardan in the province of Fars, in places | Glian, Adharbaydian, Bukbara, Ushrusana, Farghana; and in the Muslim West, in Igli in the Oued Sacura (in Western Algeria) as well as in Spain. The copper mines in Cyprus were always an important source. However, the accounts of the Arabic authors of that period leave no doubt that the copper production of the empire was not sufficient for the manifold employments of the metal. For copper was needed for the striking of locally-circulating small coins (fulus), the roofing of mosques, the covering of gates of towns and public buildings, but above all, for the thriving industry of fabricating copper utensils, e.g. kettles, receptacles and various other vessels. The big couldrons of Samarkand and the copper vessels manufactured in Farghana and in many towns of Persia were renowned all over the Islamic world. So from early times, copper had to be imported from Europe. In the period preceding the Crusades, when trade between Kh varazm and Persia, on one hand, and Eastern Europe on the other, intense, apparently great quantities of copper were imported from the Urals. A report of al-Idrial obviously refers to that period.

Metalliferous ores which contained lead (rasis, useub) and tin were not lacking altogether in the calinhal empire. Lead was taken from mines in the neighbourhood of Balkh, at several places of Anatolia, Upper Mesopotamin, al-Madidiana (in cestern Algeria) and at Cabra in Andalusia. But the demand for this metal was very great. It was used for ageducts, for the installation of public and private baths and for the roofing of public buildings. So it is doubtful whether the production was sufficient, and whether additional quantities had not therefore to be imported from non-Islamic regions. This was certainly the case as far in tin (resas kafi, kasate) was concerned. Tin was found in Spain, in the province of Algarve, and Judgeo-Arabic Geniza letters, dating from the last years of the 10th century and the beginning of the 11th century, testify to the export of copper, lead and tin from Spain to the Near East. But already in that early period, tin had to be imported both from Cornwall and Devon in Britain and from Malaysia. The name given to tin by the Arabs, viz. gal'i [g.v.] after Kalah, a well-known port on the peninsula of Malacca, bears witness to this fact.

Iron (hadid (q.v.)) deposits were insignificant in the Near East, but one could procure sufficient quantities from other provinces of the caliphal empire and neighbouring countries which were tributary to the calipha and their successors otherwise dependent upon them. Armenta had mines which produced excellent iron, such as that, for instance, used for the Kusasi swords. On the eastern slopes of the Caucasus, near Darband, there were iron mines which supplied of flourishing industry of weapons with material.

The province of ai-Mawyil, Fars. Khurasan (near Nishapur), Farshana and Shash also had rich fron deposits. Even in Kirman there were some fron naines. In Spain, iron was taken from mines in the Guadalquivir valley, near Cordova, Toledo and Murcia, and elsewhere. In the Maghrib, about ten fron mining areas were exploited, from Morocco to Libya; iron ore was produced and exported from Sirily, and some mines were worked in Nubia and on the Red Sea coast. The supply was sufficient for the production of various utensils, such as knives, needles, scissors, chains and lances. This industry was highly developed in Khwaram, in the major towns of Khurasan such Harat, Nighapit and others and also in al-Mawsil and in Toledo in Spain.

The term titiya (calamine metuty) was used to denote the natural zinc ores, especially zinc carbonate, or the white zinc oxide which was obtained during the treatment of the ores. The major mines for titiyal were in the province of Kirman, but it was available also in various mining areas in Spain.

Mercury (xi3bae) came chiefly from Spain [see AL-MASDIN]; another source was Farghana.

Salt (mile) was produced in numerous localities and, in some areas, on a very large scale, notably in the southern Sahara [see AZALAY]. Other important salt mines or production centres were in Khurāsān, Arabia and Arnenin.

The alum (shabb) of Yemen was famous for its quality, but according to al-Idrist, the major source was in Chad; it was experted to all the countries of North Africa and to Egypt.

Egypt was further a major production centre

for both alum and natron (sajras [q.r.]).

Among the many other minerals that were known and utilised was asbestos (falk) from Badakhshān, out of which wicks and fire-resistant cloths were made.

Coal (falm) was also known and was used in some areas such as Farghana where it was mined and sold. It was used as a fuel for the (tanner, pl. tanener) and its ashes utilised as a cleaning agent.

Petroleum (naff [q.v.]) deposits were exploited on

a large scale.

Precious stones of various kinds were mined. Arabic works on lapidary such as al-Bluinl's K. al-Diamishir are celebrated, and deserve detailed study. Rubies were mined in Badakhshin and were also brought from Ceylon. Diamonds came from Hindustain and Ceykot, agates from Yemen, emerakls from Egypt, turquoises from Nighāpūr, lapis lazuli from Egypt and onyx from Yemen. Cerundum came from Nubia and Ceylon. Rock crystal (billowr [q.v.]) was mined in Arabia and Badakhshān. Diving for pearls was a flourishing industry, and coral was obtained from the coasts of North Africa and Sicily [see further, Mawhar, in Suppl.].

When the empire of the caliphs crumbled, the unevenness of the distribution of metal deposits resulted, of course, in some countries suffering a temporary or permanent lack of important raw materials. Although the countries which had belonged to the empire remained to a great extent an economic unity, exchanging their products and keeping their economic structures, the stopping of the supply of metals which served as raw materials for manufactured goods and bullion for the mints was used as a weapon in the political struggle. Mediaeval statesmen were of course aware that cutting off the gold supply of the enemy's country meant weakening its financial resources and that curbing its supply of iron dealt a blow to the production of

Aiready in the second half of the 10th century, the supply of the mints of 'Irak with bullion for the coinage of gold diades was deficient, as the mines in the provinces which had remained under the sway of the 'Abbasid caliphs, or were accessible to them, were poor. The diades of the later Buyids of 'Irak and southwestern Persia ____ of bad alloy. Even the mines of Wadi al-'Allaki yielded in that period insignificant quantities of gold. Ibn Saad. wilting in the 13th century, reports that the gold derived from these mines was worth no more than the expenses paid for the work. Consequently, Egypt was during the Ayyobid and Mamitik periods wholly dependent upon the supply from West Africa, that is, the gold mines of the countries called by the Arabs Chang or Takrur. This supply rendered possible the regular coloage of gold dindra of full weight and excellent alloy until the 15th century, when the Portuguese diverted to themselves part of the West African gold. In the year 1425, the dinar of the Mamiluks was devalued for various reasons, one of them probably being the reduced supply of bullion. The coinage of Irak and Persia became from the middle of the rath century tially monometallic, as the aliver money predom-

965

inated overwhelmingly.

Even the supply of the Islamic countries with silver was in the later Middle Ages very irregular. In the 11th and 12th conturies there was everywhere a silver famine, so that the striking of silver dishems had to be discontinued. The catalogues of recentlyfound coin hoards of the Salditks, like that published by T. Khodjaniyazov (Akhahabad 1979), confirm the supposition of a great silver famine (see also M. A. Scyfeddini, Monetnoe delo i denetnos obrashčenie v Azerbaydćane XII.-XV. vv., i, Baku 1978). There were several possible tor this phenomenon. It may be that the campaigns of Mahmud of Ghazna in India and the flow of great quantities of gold from the subcontinent to Afghanistan and to Persia brought about as a concomitant the export of silver to the newly-conquered provinces (this being the opinion of Blake). According to another hypothesis, the silver famine resulted from the loss m enormous amounts of dirkums, which were used m payment for the commodities purchased by the Muslim merchants in Russia and were finally huarded there. Against the latter supposition one can adduce the fact that the silver famine in the Islamic countries began when the trade with Russia. had already considerably declined. Perhaps the technological shortcomings of mediaeval mining were a major reason for the silver famine; al-Idrisi recounts in fact that work - the "Silver Mountain", on the way from Harat to Sarakhs, had to stop because of technical faults and the lack of wood for melting the ore. But it seems that the shortage of silver was in that period a world-wide phenomenon. which was felt in India too (cf. S. Digby in BSOAS, xxxvii; 469). Anyhow, at the end of the 12th and at the beginning of the 13th century, silver coinage revived in 'Irak, in Syria and in Egypt, Apparently this was made possible by Central Asian silver being brought by the Mongol conquerors, m flowing to the Near East in the wake of their campaigns, when trade between Central Asia and the Levant had been intensified after the establishment of Mongol rule over Persia. This supposition would be enhanced by the fact that a new crisis which happened in Syria and in Egypt in the middle of the 13th century was overcome after a new invasion by the Tatara, From that time onwards, Persia and Trais had a

966

monetary system based on a silver dindr (of 12.0 gr.). In the early days of Ilkhanid rule, the increase of good silver coins in circulation was a striking feature of monetary development. When Ghāzān Khān again struck gold disars, the exchange rate was based on the gold-silver ratio of 12; z. That means that great amounts of silver available and that it was consequently cheep. The bullion was undoubtedly supplied both by mines in the Middle East and in Central Asia. Hamd Allah Mustawil, writing in the 1330s, has included in his Nushat al-hulub a list of silver mines, most of them in Central Asia. But there were also, according to his account and to other sources. rich mines in Gümüshkhäne, between Amasya and Erzindian, and in Luiß in Asia Minor. Ibn Battuta recounts that Syrian and Trakl merchants came to Gürnüshkhäne, of course, to purchase the white metal. But the quantities of silver recovered from these mines were by no means sufficient for the needs of the mints and the silversmiths of the Near East. Egypt and Syria were in the later Middle Ages supplied with silver both from Central Asia and from Europe. The American chemist A. A. Gordus has elaborated method of neutron activation which renders it feasible to find out the origin of silver by establishing its gold impurity. By this method, he has found that the bullion used by the Maralak mints for striking silver dishams was very diverse, coming both from Central Asia and from the European countries. Another silver famine from which the Near East suffered at the end of the 14th century and at the beginning of the 15th century came to its end some years after the campaigns of Timur. So the supposition that this was due to the renewal of trade with Central Asia and the flow of silver therefrom to the Near East is at least a good working hypothesis. However that may be, the supply of silver to the Near Eastern mints was sufficient throughout the 14th and the 15th centuries, though it slowly diminished. The difference between the gold-silver ratio in that region, at most less than to: r, against zg:r or meet in Europe, brings it home.

Just as the Persian and Turkish countries were in the later Middle Ages richer in silver, so tho supply of copper was much more abundant. In these countries and in some neighbouring ones, there were indeed mines which produced good and abundant copper. Some of them were in Adharbaydian, others in Armenia, Syria and Egypt, which urgently lacked copper deposits, had to import it from Europe. The abundant issue of copper coins and the manufacturing of manifold copper vessels would have been impossible if the Venetians and the Genese had not carried to the Near East heavy shipments of the German, Slovakian and Bosnian copper. The countries of the Maghrib, m the other hand, could supply themselves with copper, produced in the mines of Morocco, such as at Dai and elsewhere. But they had recourse . the import of silver coins from Europe. The Near Eastern countries also lacked lead and tin and were reduced to purchasing these metals from southern European traders, who imported them from Serbia, Bosnia, Germany and England. The Persian countries were supplied with lead from mines in Bukhāra, Ushrüsana and Farghana.

Even as far in iron was concerned, the resources of the Near Eastern countries were utterly deficient, and they were dependent upon a supply from Europe, where this export trade was sigmatised by the Church as treason against Christianity, and transgressors were threatened by ecclesiastical and secular authorities with severe punishment. Never-

theless the Italian merchants supplied the Muslims with this (and other) "forbidden merchandise", and the republic of Pisa, by a treaty concluded in 1273 with Saladin, formally undertook to sell iron to Egypt.

The newly-emergent Ottoman empire included various metalliferous regions, so that it could provide itself with some of the metals at least which it needed. Great quantities of good copper were hauled from the mines of Kastamuni, not far from the shorses of the Black Sea. The output of these mines was so abundant that, in the 15th century, Italian merchants exported great quantities of it to Syria and Egypt. When the Ottomans conquered Bosaia and Serbia, the rich deposits of gold, silver, copper and lead of Novo Brdo, Olovo, Srebrenica and other mines felt to them. Much excellent iron was produced in the mines of Samokov (formerly called Samakov) to the south-east of Sofia. Gold, however, was still imported from the Western Sudan, so that in the 16th century the Turkish gold coins were struck in Cairo, where the precious ore first arrived.

The output of the Central Asian mines had great importance for the economy of the Khanates of Bukhārā and Khīva IIII other Islamic states of that region from the 17th to the 19th centuries. In Farghana, gold was collected from the sand of the rivers Mukan and Usun Nahmad and especially from the rivers in the district of Namanghan, Lead was extracted from mines | Namanghan | Marghilan, and lead mixed with silver in the district of Andidian. Parghana also rich a silver, all in the 17th century the production was considerable. production of iron and copper, on the other hand, was both in Farghana and Khokand sufficient for local demand only. In Badakhshan, mining flourished sepecially in the 17th century, and see mine produced both gold and silver. Bukhārā and Khīva produced gold and silver. Gold was found in the sand of the Zarafahan river and Hisar river. The mining of silver, copper, lead and iron yielded an abundant output in eastern Bukhara. The export of gold and silver from the Khanates of Central Asia to Russia had in the middle of the 18th century and also in the 19th century m great volume, as is borne out by the registers of the custom offices of Orenburg and Troitek. In the years 1748-55, 800 kg of gold and 75.5 tonnes of silver passed through Orenburg, and in 1760 3.6 tonnes of silver, Even to Siberia, the Khanates exported considerable quantities of precious metals.

a. Mining TECHNOLOGY

1. Islamic mines

In the vast Islamic empire, minerals played an important part. There was a great need for gold, silver and copper for the minting of coins and for other uses. Iron me meeessary for the manufacture of fron and steel for arms and implements. Other minerals such as mercury, salt and alum were indispensable for everyday life. The empire was righly endowed with the various mineral resources, and the mining industry was mextensive Me'din (pl. ma'adin) denoted "mine" in Arabic sources, and mu'addin "miner". In modern Arabic, the word mandiam denotes "mine", while matdin or matdan is used mostly for "metal" or "mineral".

Information - Islamic mines occurs in geographical works, in alchemical treatises, in books mineralogy and in various other sources. But these, and archaeological discoveries, have not yet been searched for the purpose of writing a history of mining technology, although some studies have appeared the distribution of Islamic mines. We shall mention here only some of the minerals and a few of the mining centres, since it is not possible here to list all the mines.

Gold (dhahab [q.r.]) mines were found in western Arabia, Egypt, Africa and in some eastern Islamic lands. But the first major gold mining area was at Wadī al-'Allāķī, which is a right-bank tributary of the upper Nile. It lay in the Budja country, which was between Ethiopia and Nubia [see BEDIA]. The mines were in a desert between the Nile and the Red Sea. The nearest towns were Aswan [see al-uswan] on the Nile and 'Aydhab [q.v.] on the Red Sea. The second major gold mining area was called by al-Birûnî the Maghrib Sudan, This is the area south of the Sahara in Sonegal and on the Upper Niger in Nali. According to al-Idrisi, Wangara was the most important gold mining centre on the upper Niger. Salt, cloth and other commodities were exchanged for gold.

Silver (fidda [q.v.] was either mined individually or in association with lead www The major silver mines were in the eastern Islamic provinces. Promiuent among these were the mines of the Hindu Küsh in the towns of Pandible and Djärfydna, both in the neighbourhood of Balkh. According to one report, there were about 10,000 miners working at Pandihir. Other important silver mines in Spain, the Maghrib, iran and Central Asia.

Lead (usrub, rașāș) was obtained mostly from galena (lead sulphide), which was of very common occurrence. This lead ore is often associated with small quantities of silver. Only two other lead ores have any importance raw materials. One is cerussite (lead carbonate) and the other, which is of minor importance, is anglesite (lead sulphate). Lead ores, especially galena, were exploited in Spain, Sicily, the Maghrib, Egypt, Iran, Upper Mesopotamia and Asia Minor.

Copper (nukās) ore deposits were exploited in various areas, including the important mines of Spain in the west, and several deposits in the east, such as those in Sidistan, Kirman, Marw, Farghane, Bukhārā, Ţūs and Harāt. The copper mines in Cyprus were always an important source.

The word calamine or tutia (Arabic lilliya) was used to denote the natural zinc ores (especially zinc carbonate), or the white zinc oxide which was obtained during the treatment of the ores. The major mines for tutia were in the province of Kirman in the east. Tutia was available also in various mining in Spain.

Tin (reses hal's, hasdir) came from the Malaysian peninsula, which was known as Kala, hence the _____ half for the metal.

fron and steel were in great demand in the Islamic empire. Hence from ores utilised whenever it was feasible. These cres were distributed in most Islamic lands. Five major iron mining areas were utilised in Spain. These included the mines was Toledo, and near Murcia. In the Magheib, about ten iron mining areas exploited in Morocco, Algeria and Tunisia. These included mines in Diabal ai-Hadid in the Atlas mountains, the Rif, Gawe al-Hadid in Algeria, and Madidianat al-Ma'dan in Tunisia. Iron ores were produced and experted from Sicily. Iron was mined in the Libyan desert and in the Fessan. Egypt exploited those we that were available, for example in Nubia and on the Red Sea coast. Syria was famous for its fron and steel metalfurgy (Damascus steel), and the iron ores were obtained in the south and in the mountain ranges between Damascus and Beirut. The Islamic countries of the | (al-Mashrik) were better ondowed with iron ores than Egypt, Syria and Trak. The province of Fars had m least four important iron mining centres. There also Iron minesin Khurāsān, in Transoxania, in Ādharbāydiān and in Armenia.

Mercury (zibah) came chiefly from Spain. Al-Idrisi mentions the mine to the north of Cordoba, where more than one thousand men worked in the various stages of mining the ores and extracting the mercury. Another source was Farghana in Transoxania.

Salt (milh) was produced in numerous localities. It was an essential commodity, and production was undertaken in some areas on a very large scale for export purposes, for example in the Maghrib, where the salt mines were on the desert edges in the south. Salt was produced and carried by caravans wouth of the Sahara to be exchanged for gold. Thousands of men and camels were involved in these operations. Other important salt mines or production centres were in Khurasan, Acabia and Armenia.

The altim (shabb) Wemen we famous for its quality, but according to al-Idrisi, the major was in Chad. It was exported to Egypt and to the countries of North Africa. Egypt was also = major production centre for both alum and natron, Among the musy other minerals that were known and utilised asbestos from Badakhshān, from which wicks and fire-resistant cloths were made. Coal was also known and used in some areas such as Farghâna

in Transoxania, where it was mined and sold. It was used = s fuel for ovens (tendnir, sing, tannar), and its ashes were utilised as a cleanting agent. Petroleum deposits were exploited on a large scale [See NAFT].

Precious stones of various kinds were mined. Arabic works on lapidary such as al-Blrant's al-Diamakie are celebrated and deserve detailed study. Rubios were mined in Badakhahan, and they were brought from Sarandib. Diamonds came from Hindustan and Sarandib, agate from Yemen, emeralds from Egypt, turquoise from Nishapar, lapis lazuli from Egypt and onyx from Yemen, Corundum came from Nubia and Sarandib, Crystal was mined in Arabia and Badakhshan, Diving for pearls (lullu (q.v.)) was a flourishing industry, and corals were obtained from the coasts of North Africa and Sicily.

2. Mining technology.

Although mining operations in Islamic civilisation were very extensive, yet like most aspects of Islamic technology no attempt has yet been made to study the technology of mining. This is another field that requires extensive research. There is therefore moticeable gap in the history of mining in general, and whereas much information and archaeological research has been published on ancient and Roman mining, research is completely missing for the period between the rst/7th and 9th/x5th centuries. Not only should this gap be filled, but there are academic reasons for re-examining much of the material that has been published on ancient and Roman mining technology.

It is possible to give here an outline of Islande mining technology by looking into the brief accounts of the geographers and some of the lapidary books. In Europe it was not until A.D. 1556 that the first book on mining, that of Agricola, made its appearance. Before that time, only a few books on lapidary techniques, mainly translated from Arabic,

availabie.

There are not just a single mining technology in Islamic lands. Methods differed from mineral to mineral, from country to country, and from one method of ownership to another. In any one country could be found a range of technologies, from the primitive to the highly developed.

As with modern mining, there were two major types of operation—the underground and the opencut. In brief words, al-Biruni says: "The search for last (a kind of ruby) is of two types; one is to dig the mine under the mountain, and the other is to search for it among the gravel and earth which result from the collapse of the mountains by earthquakes or their erosion by floods" (al-Djamdhir fl matrifat al-diaudkie, Hyderabad 1355/1936-7, 83).

In underground mining, one method was to sink shafts vertically into the soil, and m drive horizontal passages when the veins were reached. In Syria, the shaft of the mines was called the bir, i.o. the well, and the horizontal tunnel the darb, i.e. the road. In the Lebanese mountains, a typical shaft was only 6-7 metres deep, and the tunnels were "very long". Al-Idrisi - the mercury mines to the north of Cordoba in Spain, and he was told that the depth from ground level to the bottom of the mine was 250 fathoms (kāma) (Nuthul al-mushiāk fi 'hhtirāk al-āfāk, section on al-Maghrib, Ard al-Südän, Egypt and al-Andalus, Leiden 1864, 214). Other mines of intermediate depth were reported. Thus in the silver mines in the Maghrib, the depth was 20 cubits

(dhird). The technique of drilling vertical shafts and horizontal tunnels was a familiar operation in the Islamic countries if we remember the great tradition of constructing the underground hands systems [q.v.], with the exacting technical experience which they require.

More often, however, in underground mining miners preferred to dig horizontal adits into the slopes of a mountain and follow the veins, rather than to sink shafts. This method was easier and less expensive for a miner who was working for himself. It is noticeable that the reports of mines with vertical shafts usually apply to mines owned by the state. A vivid description of the silver mining activities in Pandibir in eastern Khurasan, where to,000 men were employed in the mining industry, is given by Abu 'I-Fida'. He says: "The people of Pandibly made the mountain and the market-place like a sleve because of the many pits. They only follow veins leading to silver, and if they find a vein they dig continuously until they reach silver. A man may spend huge sums of money in digging, and he may find silver to such an extent that he and his descendants become rich, or his work may fail because he is overpowered by water or for other reasons. A man may pick wein, and it is possible that another man picks the same vein in another position. Both start digging. The custom is that the miner who arrives first and intercepts the passage of the other miner wins the vein and its results. Because of this competition, they execute a work that devils cannot achieve. When one arrives first, the expenses of the other are wasted. If they arrive together, they share the voin and then they continue digging as long as the lamps are burning. If the lamps are extinguished and cannot be relit, they stop their progress because anyone who reaches that position would die immediately. [In this business) you will see that a mes starts his day owning one million, and by nightfall he owns nothing. Or he may start poor in the morning and by evening he becomes the owner of uncountable wealth (Takwim al-buldin, ed. Reinaud and E Slane, Paris 1840, 465).

The miner was the pickaxe (minkár, sákús). It had a sharp end to peck the stone and a flat end to hammer or to drive wedges. There were also various hammers, chisels or wedges,

crow-bars, hoes and shovels.

Windlasses were used for hauling and materials out of the shafts. An efficient and simple form of windlass was used in the iron mines in Syria, and is still used in constructing the kandi system in fran, in drawing water, and in the building industry. Here an assistant sits on a bench - one side of the mouth of the shaft or well, pulling the horizontal bars of the windlass towards him with his hands and pushing the opposite ones away with his feet at the same time. The ore is loaded into a small bucket about 30-35 cm. in diameter, which has two handles. The rope is attached to the bucket by books fastened at its end. More suphisticated capstans were used for hanlage also, when loads were heavier.

Oil lamps were used for illumination. The lamps were useful for aligning the direction of the digging, and were also good indicators of the adequacy of fresh air supplies, as was the case in the silver mines of Pandjhlr. In Arabic technical literature, there are different designs of ingenious lamps. One such design, suitable for outdoor use and protected against being extinguished by winds, was described by the Bank Masa.

Ventilation was an important problem. In Pandihlr,

MACDIN 969

as we have seen, with thousands of small miners working for themselves in a frantic search for silver, capital investment was kept to a minimum, and no provision for ventilation was usually made. The miner simply abandoned the digging if the lamps stopped burning. In the more organised mining work, especially in the state mines, a means of ventilation was always provided. This would be essential, particularly II the very deep mercury mines which we mentioned. Special ventilation shafts were provided. When installing a drainage system, several shafts were needed for this purpose, and these also served as ventilation shafts. Special ventilation shafts have been found in Iran, and some of these go back to pre-Islamic times. The problem of ventilating wells and mining shafts attracted the attention of Muslim engineers. They designed special ventilating machines. The Banu Mūsā describe a design for "a machine for use in wells which kill those who descend in them. If a man uses this machine in any well, it will neither kill nor harm him. This machine is suitable for wells that kill and for dangerous pits. If a man has this machine, which we shall describe, with him, he --descend in any well immediately without fearing it and it will not harm him" (Kitāb al-Hiyal, Arabic tex ed. A.Y. al-Hassan, Aleppo 1981, 374, Eng. tr. D. R. Hill, Dordrecht 1979, 240).

The other important problem in mining was drainage of the mines. Here also, small miners of silver could not afford to solve the problem, as we have seen = Pandihir. On the other hand, in the state allver mines in Zakandar in the Maghrib, drainage was carried out properly, as al-Kazwini reports; "Here are the silver mines. Anyone who wishes ____ undertake processing them. There are underground mines in which many people are always working. When they descend 20 dhira's, water appears. The sultan installs water-wheels and water is raised until the mud appears. Workers bring this mud up to the surface of the ground and wash it. He does this in order to take the fifth . . . Water is raised in three stages, since it is to third's from the ground level to the surface of the water. He installs a wheel down in the mine on the water surface. Water is hifted and it is discharged into a large tank. Another wheel is installed on this tank. It lifts the water and pours it into another tank. On this tank a third wheel is justalled. It lifts the water and discharges it on to the surface of the ground to irrigate the forms and gardens. This operation cannot be undertaken except by a very rich person possessing thousands. Ho sits in the mouth of the mine and employs artisans and workers, who bring out the mud and wash it in front of him. When the work is done, the fifth of the sultan is put aside and the rest is given to him. It may come to be smaller than his expenditure, and it may be (more). This depends on the man's efforts" (Zakariyya al-Nazwini, Athar al-bilād, Beirut 1960-1, 199-200).

The technique of water raising by water-wheels was highly developed in Islamic civilisation, and it flourished in North Africa and Spain. The above passage by al-Kazwini is important, and should prompt a reconsideration of archaeological findings, since it quite certain that other mines in Spain and North Africa were being drained in a similar manner. The Muslims carried out extensive mining operations in central and southern Spain in the areas of Cordoba, Almáden, Ovejo, Huelva, Murcia, Ilbira and elsewhere. Water-raising devices of various types were used. These included the compartmented wheel,

the chain-of-pots wheel, the Archimedean screw, the rag-and-chain pump and the piston pump. Archaeologists have found a acrew pump in a mine near Cordoba with a oak screw and a barrel of sheet lead, but R. J. Forbes has expressed doubts is in whether this pump was really of Roman date (Studies in ancient technology, vil, Leiden 1966, 219).

We meet now to a discussion of the dressing of ores. This includes the crushing, sifting and washing of ores. Such operations were usually conducted at the mines' sites before the transport of the ores to the metallurgical centres. The ores were pounded or reduced in size, and in the case of gold ores they were crushed or milled to a finer degree. The milling operation was more important with me reel gold which occurs in quartz veins. Milling = crushing of these ores was done either by querns or by water driven trip-hammers. Al-Biruni in his Diamakir, 233-4, discusses this operation: "Gold may be united with stone as if it is cast with it, so that it needs pounding. Rotary mills (fazāhin) can puiverise it, but pounding it by mashādjin is more correct and is a much more refined treatment. It is even said that this pounding makes it more red, which if it is true is rather strange and surprising. The mashadiin are stones fitted to axles which me installed on running water for pounding, as is the case in the pounding of flax for paper in Samarkand". This is an important text since it indicates that water driven trip-hammers (mashādin) were already established for crushing over before the 4th/xoth century.

3. Pearls and underwater resources.

The exploitation of corals and pearls involved very extensive activity. Pearls of the Gulf area were highly valued; the Chinese considered them to be the best pearls. The operations were organised by entrepreneurs. One of these would hire divers for two months and pay them regularly; such enterprises were often highly profitable. However, we read detailed descriptions of the great dangers which faced the divers.

Al-Biruni gives in his Diamahir again (149-50) . detailed description of a diving operation, including a description of a new diving gear: "I was told by a man from Baghdad that divers mill invented in these days a method for diving by which the difficulty of holding the breath is eliminated. This enables them to frequent the sea from morning to afternoon, as much as they wish and as much as the employer favours them. It is a leather gear which they fit down their chests and they tie it at the [edges?] very securely and then they dive. They breathe in it from the air inside it. This necessitates a very heavy weight to keep down the diver with this air. A more suitable arrangement would be to attach to the upper end of this gear opposite the forehead a leather tube similar to a sleeve sealed at its was by wax and bitumen, and its length will be equal to the depth of diving. The upper end of the tube will be litted to a large dish at a hole in its bottom. To this dish are attached one or more inflated bags to keep it floating. The breath of the diver will flow in and out through the tube as long in he desires to stay in water, even for days"

An ingenious dredging machine was designed by the Sanii Musă în their Hook of ingenious devices. They say: "We wish to explain how to make a machine by which a person can bring out jewels from the sea if he lowers it, and by which he can extract things which fall into wells or submerged

im the rivers and seas". This worked on exactly the same principle as the modern clamshell grab (Kitáb al-Hiyal, text 376, Eng. tr. 342).

4. Non-ferrous metallurgy.

Much information about metallurgy can suined from the alchemical and chemical treatises. There was a close relationship between the work of the metallurgist and the chemist, and the Arabic sources reflect the experience gained in the laboratory and in the metallurgical furnace.

Gold. Speaking about native gold which is collected from gold mines, al-Biruni says that it is usually not free from impurities and therefore this gold be refined by smelting only, or by other methods. He gives details of the amalgamation method that was used in the mines on a commercial scale: "After pounding the gold ore or milling it, it is washed out of its stones, and the gold and mercury are combined and then squeezed in a piece of leather until mercury exudes from the pores of the leather. The rest of the mercury is drived off by fire" (Djandkir, 234).

He further describes (236) how gold is mined from the deep waters of the Sind river: "At its sources there are places in which they dig small pits under the water, which flows over them. They fill the pits with mercury and leave it for a while. Then they come back after the mercury has become gold: This is because at its start the water is rapid and it carries with it particles of sand and gold like mosquitoes' wings in thinness and fineness. Water carries these particles over the surface of the mercury which picks up the gold, leaving the sand to pass

away".

The cupellation process was used extensively both on the laboratory and the industrial scales. The gold is alloyed with lead in a special crucible and it is then oxidised by means of a strong current of air blown on to the surface of the molten metal. The base metals such as copper are drossed, while the gold and silver remain as a button of silver-gold alloy. The separation of the gold from the silver was done by what is known as the salt and sulphur process. The liquation process was also used in combination with the cupellation process. What is new in these processes-and this was an Islamic innovation-is the use of nitric acid in the separation of gold from silver. Djabir b. Hayyan [q.v.] described this process, it was also mentioned by other later writers. Gold was tested by various methods. These included the touchstone (al-miliahk), measuring the specific gravities, and noting the speed of solidification of gold after it had been removed from the furnace.

Silver and lead. Unlike gold, native silver was not found in alluvial deposits or in the sands and gravels of rivers, but me to be sought in mountainous regions in embedded veins. In general, however, notive silver was not abundant, and the main source was from galena (lead sulphide), which was usually associated with small amounts of silver. The first step would be to obtain the lead itself (which usually contains silver) from the earth and stones (i.e. the galena). This was done first by roasting, followed by smelting. The resulting lead could then be treated to extract silver. In Arabic literature, we find the results of some experiments indicating the amount of silver which could be recovered from an ingot of lead. This was usually in dirhams in one masla (one silver musta - 50 ratis). There were smelters (sabbākūn) specialising in gaining silver from lead Ingots.

Sometimes silver was associated with gold in what is called electrum. Here also, as we have seen, methods were adopted to separate these two precious metals. Silver was also obtained from its ores, or from lead or copper ores.

These different sources of silver necessitated the application of various techniques which were mastered by Islamic smelters and chemists, such me reasting, smelting, exidation, liquation, leaching, cupellation and amalgamation. Details cannot be given here, but these methods fascinated the alchemists and were largely responsible, in our opinion, for the vast alchemical literature that resulted from the alchemists' experiments with atones (addist) and metals (adjead).

Tin, zinc, antimony and arsenic. Tin mone of the seven malleable metals or bodies. It was brought mainly to the classical Islamic countries from the Malaysian perinsula and, to some extent, from Spain and the West.

Zinc was not known as a distinct metal by the early Islamic metallurgists and chemists. It was first known, and used extensively, through tutin (zhic oxide) which was one of the stones (abdids). Later, as we shall see, with (rith al-tilliya) was known as a distinct metal. Tutia is usually the pure sinc oxide which is obtained from natural in carbonate, Various authors described the method of producing the pure product from the natural one. The ore is placed in furnaces which contain long ceramic rods. Upon heating the ores, the smoke of tutia ascends and adheres in films to the ceramic rods. Al-Mukaddasi, 470, saw the "curious tall furnaces in the mountain villages" in Kirman. They later also attracted the attention of Marco Polo when he visited the area. Before the roth/roth century, rūji al-lūtiya (zinc) = a metal was known and was used with copper to form brass. It replaced thursing as the seventh metal. Abu 'l-Fadl in the A'in-i Akbari gives several compositions employing rah al-taliva (E. Wiedemann, Aufsätze zur Arabischen Wissenschafts-Geschichte, i, Hildesheim 1970, 706).

Antimony was obtained from antimony sulphide (Sb₂S₂) and was so of the constituents of copper alloys. Arabic chemical books described this process.

Copper and its alloys. Copper was usually obtained from the sulphide ores. It seldom occurred as oxides or carbonates. These latter ores required only the simple treatment of heating with charcoal, while the sulphides (sadjat) required roasting, smelting with fluxes and partial oxidation. An interesting discovery took place in Spain. The sulphide ores, on exposure to air in the presence of water, are oxidated to soluble sulphates. "The Moors then found that if water containing copper sulphate is allowed to this over fron, pure copper is deposited and the iron disselved. As iron was cheap and abundant in Spain, this discovery yielded an efficient method of recovering copper from sulphide ore, and direct mining of copper ore became less necessary" (Singer et alii, A history of lechnology, ii, Oxford 2979, 21).

Brouze (safr, isfidedy) is alloy of copper and

tin. It was much used for plain kitchen wares and implements, and was the alloy upon which coppersmiths based most of their work.

Brass (shabah, blrindj) is alloy of copper and zinc. Zinc with copper forms alloy which is stronger, harder and less malleable than pure copper. Various kinds of brasses are obtained by varying the zinc content. A 20% brass simulates the colour of gold. When zinc was not known a metal, copper was heated in a mixture of powdered zinc ore and charcoal. A proportion of the zinc formed in the vicinity of the copper was diffused into it by cementation. Later we read in the Arn-i Akhuri about three qualities of brass with increasing amount of zinc content; one is ductile in the cold state, the second is ductile when it is heated, and the third is not ductile but the be cast (Wiedemann, Anfadtee, 1, 706-71.

A cheaper quality of alloy was called by al-Birûni bitrûy and by some authors rây. This was a kind of bronze alloyed from copper and lead. It was also shabab mulragh, and was used for hardware.

Kinrsini was a metal (or alloy) which was listed more of the seven metals of early Islamic alchemy. It was attributed to China. All Muslim writers said that it was not available and was extinct. A time came when it was replaced by zinc in the list of the seven metals. Some historians now think that thersini was zinc. Others believe that it was meupronickel alloy. Talihim was another alloy (or metal) of uncertain composition. This uncertainty existed since al-Birûni's days, but the general opinion is that it was a kind of copper alloy.

5. I ron and steel.

The importance of iron (hadid) in Islamic civilisation is exemplified in Strat al-Hadid, LVII, 25: "God sent iron down to earth, wherein is mighty power and many for mankind". Indeed, iron was considered as essential food and clothing and it was always a source of power. Even after the sword had ceased to be a major military weapon, the manufacturing of iron and steel in our days is basis for industrial civilisation and hence for economic and military power.

We have seen that iron mines in the Islamic empire were spread from Spain in the west to Transoxania in the east and there were famous steel production centres like Harāt, Bukhārā, Damascus, Yemen and Toledo. Iron and steel technology in the Islamic lands has well a long and flourishing history, assoclated with the sword until recent times, and the excellence of steel for these swords was represented by Damascus steel. As is the case with other major issues in the history of technology, the history of iron and steel, and the history of Damascus steel in particular, have been a source of controversy. Islamic Iron technology was ignored and the important sources were not taken into consideration. At one extreme, some writers have alleged that Damascus steel was alien to Damascus and to Islamic lands.

In this vast subject, we can only give extracts from some of the major Arabic sources, the best authorities on this subject known until now being al-Kindl and al-Birûni, both of whom had critical minds that rejected legends and subjected scientific knowledge to actual observation and testing. The second main group of sources is the alchemical and chemical treatises of Djübir, al-Rāzi, al-Djüdaki and others. The third group is the military treatises which discussed the manufacture of steel for swords,

its heat treatment and the care for its firind; but there are numerous other sources of information, all of which deserve attention.

Types of iron and steel. From studying some of these sources, we conclude that the following main kinds of iron and steel were utilised in Islamic metallurgical centres: (r) Wrought iron (marmdhin); (2) Cast iron (dis); (3) Meteoric steel (glabityldin); and (4) Manufactured steel (falidin).

Wrought iron (narmdkin) is soft and it is the "female". It could not be heat treated, but could be used where strength was not important, and it was used as a raw material for manufacturing steel (fülüdh).

Cast iron (des). It is very important to know that east iron was produced, since this was not realised by historians of technology and was totally ignored, al-Biruni says in his Diamdhir that day is the water of iron and that it is the liquid which flows during the melting and the extraction of metal from from stones. Al-Rāzī defined al-dūç as water of izon. In a commentary by al-Dilldald on the Kutāb al-Hadid by Habir, we read the following description of the production of cast fron: "Chapter. Learn, brother, that it is your comrades who found (yaşkubûn) iron 🔳 foundries (especially) made for that purpose after they have extracted it (i.e. the ore) from its mine as vellow earth intermingled with barely visible veins of iron. They place it is founding furnaces designed for smelting it. They install powerful bellows me all sides of them after having kneaded (yaiuttiin) a little oil and alkali into the ore. Then fire is applied to it [l.e. the ore) together with einders and wood. They blow upon it until it is molten, and its entire substance (diismuhu wa-diasaduku) is rid of that earth. Next, they to drop through holes like [those of] strainers, [made in] the furnaces so that the molten from is separated and is made into bars from that earth. Then they transport it to far lands and countries. People it for making utilitarian things of which they have need" (ms. 4121, Chester Beatty Library, fols, ta-2b).

The properties of this east iron can be summarised from al-Blrūnl's Djandhir as follows: (t) It is quick to flow like water when smelting iron ores; (2) It is hard and whitish-silvery in colour. Its powder had sometimes a pinkish reflection: (3) It cannot be forged to make swords: (4) It does not resist blows. Its shatters into pieces: "breakage and brittleness are characteristic of it"; and (5) It is mixed with wrought from in crucibles for making steel. Dūş was sold as a raw material in the 9th/r5th century. We learn that there were at least two commercial brands, one from Trāk, the other from Ittakhr.

Meteor steel (shaburkāu) is often mentioned in early Arabic literature, with the comment that this was a care material.

Manufactured steel (filidal). Filidals was usually manufactured in the molten state. It was made, in some cases, from wrought iron bars by camentation. The iron bars were packed with charcoal and heated until they absorbed enough carbon. In the molten state, steel was made in Islamic lands by the following methods: (x) By decarbonisation of cast iron; (2) By carbonisation of wrought iron; and (3) By the fusion of a mixture of wrought iron and east iron; here we obtain two qualities of steel, depending upon the degree of fusion.

We have given above a text from al-Dilldaki conmenting on Diabir describing the production of cast iron. Let us now give the rest of the text to

how the rods of cast from are utilised to produce steel by carbonisation: "As for the steel workers, they take the iron bars and put them into the founding-ovens (masabik) which they have, suited to their objectives, in the steel works. They install firing equipment (aliesir) in them (i.e. | ovens) and blow fire upon it (i.e. the iron) for a long while until it becomes like gurgling water. They nourish it with glass, oil and alkali until light appears from it in the fire and it is parified of much of its blackness by intensive founding, night and day. They keep watching while it which for indications until they are sure of its suitability, and its lamps emit light. Thereupon, they pour it out through channels so that it comes out like running water. Then they allow it to solidify in the shape of bars or in holes made of clay fashioned like largely crucibles. They take out of them refined steel in the shape of ostrich eggs, and they make swords from it, and helmets, lanceheads, and all tools". This refining of iron from its blackness is a decarbonisation process: already, the Linda al-'Arab states that steel (falidh) is refined iron.

The other method of producing molten steel in crucibles by carbonising wrought from is described by the following text from al-Birûnl in his Diamâhir, 256:

"Mazyad b. 'All, the Damascene blacksmith, [wrote] a book describing swords, specifications for which were included in al-Kindl's treatise. He commenced by dealing with the steel composition and the construction of the furnace (kir) as well as with construction and design of crucibles, the description of [the varieties] of clay, and how to distinguish between them. Then he instructed that in each crucible five rafts of horseshoes should be placed, and their nails, which are made of narmakan (Pers. "soft iron"), as well as a weight of ten dirhāms each of rusukhtadi, golden marcasite stone, and brittle magnesia. The crucibles are plastered with clay and placed inside the furnace (kur). They are filled with charcoal and they (i.e. the crucibles) are blown upon with rāmī bellows, each having two operators, until it (i.e. the iron) melts and whirls. Bundles are added containing illladi (myrobaian), pomegranate rinds, salt (used in) dough and oyster shells (aydaf al-lu'lu', lit. "pearl shells"), in equal portions, and crushed, each bundle weighing forty dirhams. One [bundle] is thrown into each crucible: then it (i.e. the crucible) is blown upon violently for an hour. Next, they (i.e. the crucibles) are left to enol and the eggs me taken from the crucibles".

The third method of producing molten steel in crucibles from a mixture of cast from and wrought iron was also described by al-Birumi. This was the method of producing cast steel in Harāt. Two qualities of steel can be obtained. One is obtained if the components are "melted equally so that they become united in the mixing operation and component can be differentiated or seen independently". Al-Biruni says that "such steel is suitable for files and similar tools". A second quality of steel is obtained if the degree of melting of wrought from and cast Iron is different for each substance "and thus the intermixture between both components is not complete, and their parts are shifted and thus each of their two colours can be seen by the naked eye and it is called firind".

Some of the above important texts were confirmed by observers and travellers who described the making of crucible steel in Bukhārā in the last century. In 1820 Amessoff, a Russian expert, was in Bukhārā and found that crucible steel was made by carburising wrought iron with charcoal and other organic matter. Later Massalski, another expert who was also in Bukhārā, wrote in 1841 that Damascus steel was made there from a mixture of wrought iron and cast iron, as al-Birûni bad reported goo years earlier from Harât. Observers thought that these reports were conflicting, but it is now clear that there is no contradiction: steel was made from different materials, and the quality obtained varied with these materials and with other manufacturing conditions (P. Annossoff, in Annaive du Journal des Mines de Russe, 1861, 192-236; Massalski, in idid., 297-308).

The Damasous sword and the firind. C. S. Smith noted that "In comparison with the relative neglect of structure by the European metallurgist, the enjoyment and utilisation of it in the Orient is impressive. In the Orient, etching to display patterns depending on composition difference was in use contemporaneously with the European pattern-welded blade, and me thereafter continually developed to a high artistic level" (A history of metallography, Chicago 1965, 14). The best achievemeat in this direction in the Damascus sword, which were made in all the Islamic centres and in India. Because III its excellence, its name was given later to all swords with a pattern. Islamic lands exported and imported steel and swords. They imported from India and they exported to it. Al-Birani mentions that steel eggs were cast in Harat and then sent to India. Al-Idrisi says that from was exported from the Maghrib to India. In general, we may say that Islamic lands and India formed one area of Damascus steel culture.

Patterned swords (with a firind or giamhar) were in use before Islam. Imra' al-Kays (d. ca. 540 A.D.) describes the firind of the sword as resembling the tracks of ants. Another poet, Aws b. Hadjar, a contemporary of his, describes the blade of the sword as if it has a water whose wavy streaks are like a pond over whose surface the wind is gliding. In fact, in Arabic poetry the beauty of the sword with the firind was always a source of inspiration. Damascus steel was thus a speciality of the Islamic world and India for many centuries; as Smith notes, "The geographical distribution of these swords seems to have been practically coextensive with the Islamic faith, and they continued be made well into the nineteenth century" (op. cit., 14).

In Furupe, steel was produced by hearth-carbonisation of wrought trou rods. To imitate the firind or pattern of the Damascus sword, they resorted to placing together strips of iron and steel and welding these together; but these imitations never matched the qualities of the true Damascus steel.

Cast iron was first produced in Europe in the 15th century A.D. and crucible steel in the 18th one. But a stool comparable in quality to Damascus. steel was still required. For more than 150 years, a large number of metallurgists in European countries carried out extensive research on Damascus steel, including eminent scientists like Faraday. Smith, in a chapter "European attempts to duplicate Damascus steel", says that these attempts failed to reproduce true Damascus steel; what happened later was that the "interest in the duplication of the blade declined as European steelmakers developed their own techniques and the introduction of Bessemer and Siemens processes gave homogeneous steel more adaptable to large-scale production".

There were, however, some advantages behind

MACDIN

this research, in that we came nearer to an understanding of the structure of Damascus steel. According to Smith, "Damascus blades are made of a very high carbon steel (about 1.5-2.0%) and owe their beauty and their cutting qualities alike to the inherent structure of the cakes of steel from which they were forged". "The light portion contains numerous particles of iron carbide (cementite). while the dark areas are steel of normal carbon content (approximately sutectoid). The structure, of course, is clearly visible only after etching, which was done with a solution of some mineral sulphate". It is amazing how close is this modern interpretation of the firind to that of al-Biruni,

Welded "Damascus" gun barrels and swords. Another beautiful technique which flourished in later centuries in Islamic lands and India was the welding technique for gun barrels and swords, which was quite different from that of cast Damascus steel, but which was also called "Damascus". According to Smith, "the technique seems to have originated in the Near East in the sixteenth century, and such guis were a farnous product of the Kashmir smiths in the early nineteenth century" [op. cit., 30]. The manufacture of barrels of this type in Europe started in the 18th century, and during the 18th and 19th centuries great efforts were exerted in Europe to use this technique for both gun barrels and blades.

in 1798 Nicholson made a Damascus-textured metal by compressing fillings of steel and wrought fron in a die, restriking the compact at a welding heat and forging it into a plate; Smith says that this is interesting anticipation of modern power metallurgy. But according to al-Biruni, a somewhat similar procedure was practised in the 4th/toth or 5th/11th century: "I was told by somebody who was in the land of Sind that he sat by a smith who was making swords. He looked into them and found that their material was wrought iron (nasmāhin), on which he see sprinkling a linely pulverised drug (dated?) whose colour gave a reddish shade. He sprinkles and welds by driving the powder deep, then he takes it out and elongates it by forging and he sprinkles again and repeats the work several times. He said: Then I asked hun what that was, He glanced at me derisively. Then I looked carefully into it and realised that it was cast iron (dus) which mixes with wrought from (narmāhin) by forging to elongate and bammering (to drive in) to obtain m steel similar to that of the eggs that are obtained in Harkt by melting".

6. Furnaces, crucibles and other equipment.

We can learn much about Islamic metalturgical equipment from a study of the alchemical equipment. The istinual operation is mainly the smelting of to obtain metals. There was, according to al-Rasi, "equipment for maiting metals (adisad) and stones" and there was "equipment for the further processing of these metals". Iron melting was given special attention in the alchemical apparatus. We can safely that the alchemical equipment was the pilotplant size of the actual metallurgical equipment. Sometimes the details in construction were identical, as we shall presently see. Iron production from ores was achieved by blast furnaces. Further research will reveal how the design of these furnaces had developed in Islamic lands. We know that cast iron was produced before the 4th/10th century. Al-Diildaki (see above) gave a description of the melting process; historians reported experiments

on the casting of large field cannon from cast iron at the turn of the 10th/16th century in Egypt; and m the end of the 12th/18th century, a typical blast furnace in the Lebanese mountains was 16 apans (3.84 metres) high by 7 spans (1.68 metres) wide and was constructed from masonry. Twenty men worked in the site. Layers of fresh wood and iron ore were stacked in the furnace; two horizontal bellows gave the necessary blast of air, each being operated by one man. The air from the bellows was combined in one outlet, and iron that accumulated at the bottom ____ taken out in small amounts. This iron decarbonished in several hearth furnaces and forges - the same site in order to produce wrought iron for making useful articles. About 450 kg, a day were produced from this furnace: similar furnaces were in use in the Maghrib.

973

Crucible steel was melted in small crucibles. The text by al-Birûni which was cited above on the making of crucible steel by a smith in Damascus shows that several crucibles ____ put in the furnace. Several beliews were used, each operated by two Such an installation was still used in 1840 in Bukhārā to make Damascus steel, and was of the same design as that described by Djabir me centuries earlier.

3. MINERAL EXPLOITATION IN THE OTTOMAN EMPIRE

Our treatment I the subject of mining and metallurgy in the Ottoman Empire is based on the assumption that both in terms of the laws enforced and the organisational principles applied, and even the types of minerals exploited, Ottoman mining be clearly divided into two distinct periods. The first period spans all of Ottoman history up until the mid-19th century, while the second is concentrated in the last few decades of the existence of the Ottoman state as the mining industry developed under the impact of foreign investment. Because of the wide scope of the subject both from the standpoint of periodisation and the profusion of ancillary topics involved, the focus is limited to those time periods whose first-hand archival documentation - have studied most olosely (i.e. the 9th-11th/16th-18th centuries) and those subjects which have been least fully studied in the published literature. For the principal publications in the important fields of Ottoman mining law, and Islamic and Ottoman metallurgy, see Bibl., sections II-III, and for developments in Ottoman mining during the 19th century section V.

In what follows, mining law and administration are first discussed under the following headings: A. Administrative modes, and B. Organisation of labour, and then there is a description of the principal mineral types and their geographical distribution. In this second section, the principal subdivisions are as follows: (A) Classification of mineral types

and (B) Marketing and distribution:

A/I. Bullion and other smelted ores, i.e. t. Gold; 2. Silver; 3. Copper; 4. Iron; 5. Steel (including some data on prices of the principal metals).

AJII. Crystaline formations and other minerals mined from pits in their solid state, or extracted through a process of distillation from their liquid state, i.e. r. Alum; s. Sulphur and Saltpetre; 3. Salt [see MILE] 974 MASDIN

Finally there is a short summary of major developments in Ottoman mining in the post-Tanzimäi [q.v.] period, and brief discussion of mining technology in both the classical and the modern periods.

Introductory remarks on the economic importance of the mines and uses of metals in the Ottoman Empire.

Possession of and control of the sources of mineral wealth was of critical importance to the state. The Ottoman interest in the conquest of Serbia from the early 8th/14th century arose in part from desire to secure the rich silver production of the Balkan mines, thus providing wital financial basis for further expansion. In a very real sense, the mines were the ultimate source of prosperity for the emerging Ottoman state and an assured supply of metals of military importance such as lead, iron and tin was essential to state security. Because of the critical importance of their uninterrupted production, mineral resources were carefully protected and closely regulated by the Ottoman government (see section below on market organisation, distribution and supply).

One of the principal | for precious metals was to supply the imperial initial located throughout the empire, usually in the vicinity of the mines. While during the reign Süleyman 1 (926-74/1520-66) the treasury enjoyed an abundant surplus, requiring even the opening of a treasury annex at the Yedi Kule fortress in Istanbul, in the 11th/17th century production levels lagged far behind money in circulation. Information from the state treasury budgets from the time of Murad IV (1032-49/1623-39) indicates that while the mines produced silver for striking some 160 million abors, deficit spending the level of 200 million agers a year and more was common (see the Kepeci budgets listed in the Bibl.). In order to balance the budget, recourse was commonly made to the practice of debasing the currency. The following list shows the steady drop in the silver content of the ages over the 150-year period 1490-1640:

Date	no, of ables struck from too dishams taw silver		
half-century leading			
up to 1566 *	420		
1566-1584	450		
1584-1500	800		
1600-1611	950		
1611-1640	1,000		
Source: Barken (1070).	5 ウェーブ.		

For midea of the relative stability of the able's silver content before the 16th century, compare the table in Inalcik (1951), 678.

Despite these manual, the surpluses stored in the Sultan's inner treasury (Maxine-ye endersin) periodically became depleted to dangerously low levels. According to the report of the Venetian bails Contarini, after the large outlays for the Ottoman recapture of Baghdad in 1048/1638, the inner treasury reserve sank to only million gold pieces (Barozzi and Berchet, Relations, i/x, 163). No new sources of silver were either discovered or exploited, and by the 19th century state bankruptcies became an almost chronic problem, leading in the end to the establishment of a foreign-controlled public debt commission (see DUYON-1 'UNOMIYYE). Parts of the silver-producing areas of Serbia had been ceded to Austria as early as the treaty of Passarowitz in 1130/17:8, and from that date the Ottoman mineral resource base in the Rumalian provinces continued to shrink.

According to Islamic law, minerals and hidden treasures made up a special category, rikas, whose product was made subject to the payment of a one-fifth tax, the so-called bhums-s sher's (Halebi, i, 150-1). Building on these principles laid down in the canonical law, the Ottomans introduced some refinements and customary practices in their administrative law as it applied to mines, taking into account new conditions and changes as they occurred over the course of time. The reign of Bayezid II (886-918/1481-1512) was perhaps the most important period for the standardisation and codification of Ottoman mining law, Since there already exists a rich literature on this subject (see Bibl., section II), there is no need to enter into the details here except to emphasise the fact that Ottoman practice incorporated applied knowledge from previously existing Saxon mining law. The extent of their indebtness to their predecessors in this field is indicated by the in the Ottoman &dudu-udmes of Saxon and Slavic loan words for many technical terms and specialised skilled professions.

Administrative modes: the factors determining Ottoman mining activity through the ages.

There were three principal ways in which mining activity was organised in the Ottoman Empire and the choice as to which made was to be employed was determined to a large degree according to the source of the capital invested to bring a mine into active production. The expenses for equipment, fuel to operate the forges and the wages of the mine workers were considerable, and since such large investments were beyond the means of the average individual, large-scale mining operations tended to be undertaken either directly by the government itself or by means of investment partnerships. The three commonly used administrative modes were: (1) eméneten, direct administration of mines or mining districts through state-appointed superintendents; (2) illisamen, farming out of mining revenues to investors on m short-term contract basis (the usual term for these contracts in the mining context was six years); and (3) ikāle, long-term concessionary leasing of state lands for purposes of mining exploration to licensed individuals or mining companies. These broad generalisations may help to clarify the position of the lands administered under each of these headings, but in actual practice often find that a mixture of government and private financing, as well as the phenomenon of subcontracting of mining leases, resulted in some hybrid form of two or some of these administrative categories. Nevertheless, generally speaking it may be said that direct state administration tended to be applied in the case of disused mines in those requiring a relatively greater level of investment to render them profitable. In such cases, after careful analysis of ore samples (¿ashal) and estimation of requisite expenditures for improvements by technical experts, the state agreed to undertake all risks and meet all expenses for operation and development of the mine. When, on the other hand, it was a question of operative mines with a known and regular yearly production which could be auctioned competitively, the usual procedure we to farm out the operation of these mines to private investors. In such cases, the investor gambled that he would make up his original investment consisting of the bedel-i illiaim payment mentering the contract MA^cDIN

975

plus costs. The third category, thale, were to have been widely used only beginning with the 13th/19th century when new types of minerals came into demand. This system was used to encourage mineral exploration in abandoned (marcit) lands and lands of low population density. Although usually no previous mining activity would have taken place on such lands, after a determination had been reached on the basis of expert reports that they did possess a potential for development, the investor undertook to make whatever improvements were needed to realise maximum productiveness. According to the terms of the ikale system, the original investment consisted of the resm-i berät or ferman chardil paid to register a claim to work the land, but unlike the illiam system, the government then claimed only a small percentage of the mineral production realised, ranging from between r-5 % for unrefined ore found in scattered deposits, and between r-5% for unrefined ore found in scattered deposits, and between 10-20% for unrefined ore occurring in concentrated deposits. Although have no way of estimating the proportion of lands which fell into one category m opposed to another, the following table gives an idea of the extent to which the ifiale method was employed in the 19th century, particularly for the mining of coal and other near-surface minerals:

Statistics on mining concessions in the Ottoman Empire at the turn of the 20th century

type of mineral needed	extent of land exploited (in <u>dieribs</u>) =	% of total
chrome	19,076	7-0
lignite	13,340	5.0
argentiferous leads	12,357	4.6
other (coal, etc.)	225,227	83.4
Total	270.000	100%

From the above discussion, it may be seen that ability to invest was mimportant factor in determining the mode of administration selected for a given mining enterprise. A second factor which was critical in determining the intensity of mining activity at a particular time was the price of metals on the international market. The fluctuation in the price of metals in turn was tied to levels of production in the three principal mining centres of America, Europe and the Ottoman Empire, as well as to the relative balance between the three at given time. Thus for instance, while we know that production of silver in the Americas increased five-fold in the century 1520-1620, the impact of this influx of cheap metal **each** felt more sharply and immediately in Europe than in the Ottoman lands. While European mining suffered = almost immediate collapse, the Ottoman mines continued to find markets for their production, both as a result of long-lasting disruptions in the heartlands of the European mining industry during the Thirty Years' War and because of continued upward pressure on prices based on rising demand for basic metals in the military and industrial sectors of the internal economy of the Ottoman Empire. Until now, it has been generally assumed (particularly among the Balkan historians, Bibl., works of Dinić, Kovačević, etc.) that the production

of the Balkan mines suffered an irreversible collapse coinciding with the Turkish occupation of Serbia completed in 1460. The issue of mining decline is considerably more complex than that, and depends on detailed study of price fluctuations of precious metals over the long term. Since this study has not been undertaken for the Ottoman Empire, it is at present very difficult for m to present any conclusive evidence or to chart accurately the course of periods of expansion and decline in the mining industry. A further factor to be considered, linked with the question of price and having a direct bearing on intensity of mineral production, is the application of new technology and mechanisation in mining. Since it was only when demand for a metal was high that investment in technical improvements was economically feasible, such improvements was usually introduced through state planning and initiative (examples in Refik, 45 (doc. dated 1029/1618), in which the government provides 150,000 after to instail four new water-wheels (larkh) to power the lifts and pumps of a sliver mine at Inegol; and Refik. 52 (doc. dated 1228/1716), in which the government approves the transfer of money from a provincial treasury to allow for continuation of work on a drainage channel which has been abandoned by private developers due to insufficient funds).

Dramatic improvements both in the quantity and the quality of mineral production were achieved in the 19th century as the result of the introduction of mechanical aids. While the purity of copper smelted in small forges equipped with hand-operated bellows was uneven at best, with the erection of large, state-built and state-operated smelting houses with mechanically-driven bellows, a consistent level of purity of 85% was achieved (for examples describing the impact on production of the building of state smelting houses at Ergani in 1266/1850 and subsequently at Tokat, I flyd'iyydt-i máliye, 1325/1907, 263; on the effect of mechanisation on mining yields in the 13th/19th century, see below). Nevertheless, the price was always the final determinant in deciding whether a proposed improvement was cost effective. When, as a result of downward market pressures of foreign competition the price of a metal fell, this could result in the closing of mine which had been profitable and even worthy of investment for improvement under the earlier pricing structure.

The organization of labour

In order a cusure that an adequate work force was available to operate the mines, workers in the state mining operations (matdendiis), like the guardians of the mountain passes (derbendtis) and keepers of the way-stations on the imperial highways (monzildjis), registered in the cadestral surveys under a special category of functionaries exempt from the payment of the extraordinary 'andrid [q.v.] taxes. As an example of how this system operated, a survey of 1082/1672 covering 155 mining villages attached to Srebenica is illustrative (BBA, KK 5275, pp. 60-2). In this survey, and individual village is assigned a specific duty in connection with the mining process, Some were assigned as excavators (knyudjus), others were charged with preparing charcoal for the forges (köműrdjűs) or as lumbermen and wood-cutters (domruhdjular we odundiular). Tasks ranged from the very specialised, as in the case of one village whose people men designated as makers of rope for operating the pulleys in the min shafts (urghandils) to unspecified casual 976 MA^cDIN

labour (aylik). Those villages were required to provide work as long as the mining operations in their region continued, and ma'dendii status was even passed on sale father to son and from generation to generation. In order to insure against production loss due to absenteeism, the madendis were also required not to leave the mine for any period of time without specific permission from the supervisor of the mine (Refik, 26). On the other hand, they were exempted from being called away for the performance of other kinds of labour, such as road repair and fortress building, which was required as a compulsory service (muhellef khidmel) in partial satisfaction of the cawfrid tax obligation of other relayed (see orders preventing summaning (ihdas) of mine workers for other tasks on the part of the provincial governors, Refik, 27-9, 32-3, etc.). As skilled workers, the conditions under which the registered madendis performed their jobs in the mines were carefully specified in special regulations, and care was taken to enforce their application. In the first place, mining activities tended be seasonal, most intensive work taking place in the 71/2-month period between Newsas (21 March) and Ras-i Kasim (7 November). In addition, the working week and defined a lasting five days, the remaining two days being designated as idle days (audre) (Anhogger-Inalcik, 7, 12, 14, 15. etc.). Since registered maidondis with experience were usually in short supply, their numbers had to be holstered by the use of hired labour. Stetistics from salt mining operations published by Güçer suggest that the proportion of workers registered minagins and enjoying a share of the mine's production (sometimes 1/11 sometimes 1/2) man about equal to those workers taken on seasonally and pold a cash wage (example in Güçer, 206-7, citing the case of the Beçin salt works in Mugla province where of a total of 415 workers 195 (47%) were registered tustius and the remaining 220 hired labour). Due to the hard physical nature of work in the mines, crewwere normally expected to work only two-hour shifts with rest periods in between. By means of revolving duty, the mines could be kept in continous operation on a 24-hour basis. A document of 1126/1714 (Refik, 50-t) suggests that a work crew of 20 men could be kept working for m days at this pace, but every 20 to 30 days a fresh crew would be called in to replace them. During the period in which they were engaged in working at the mines, mine workers were provided with food rations and shelter m government expense. In 1126/1714, in addition to weekly wages amounting to me hurush for every simple labourer (irghad) hired to work in the mines, an allowance of two paras each day was paid m a cash equivalent for food rations, Sometimes however the food rations were paid in kind in the following amounts: 141 pounds (50 wikiyyes) of wheat per month per worker, with a weekly supplement of 51/2 pounds (2 milityres) of leavened bread (Mamfr), In an interesting document dealing with the terms of operation of a state salt works in Zwornik province published by Handžić (see Bibl., Handžić (1959)), we learn that working conditions and the share of workers in the profits of a mine could even become a subject for collective arbitration. In this example, the workers' share in the salt works had previously been determined in the product of three days' work, and the treasury share as the product of four days' work each week. However, - consulting with - parties concerned, the workers proposed a more equitable accommodation whereby they agreed to take their share in the proceeds of the mine each day in kind, in an amount defined in detail and guaranteed in the specific wording of their agreement (muddenle). This latter system of apportioning shares in kind, rather than as the product of a particular day's work, protected both the workers and the treasury, since it was in neither party's interest to slow down = abandon production on the days devoted solely to the other's account. Other examples from different mining operations and forms of organised group labour show that the working conditions, and terms of recompense for workers, even those recruited for compulsory services such m fortress building, were negotiated so as to equal or to better the current rates in effect at the time (see Murphey, Mosul, 167).

Apart from the simple labourers who did the hard physical work excavating the mines, there was a whole range of more specialised skilled workers and supervisors. Their positions, like those of the maidendies, were confirmed by imperial diploma (berdf) and carried with them certain special conditions and privileges. As an example (BBA, Ibn al-Emin, "Metadin", no. 108) a document confirming the inherited position madendji-bash? = certain Mehmed in charge of inspecting all the mining shafts and forges at Gümüsh-khana in order to ensure smooth operation and to guard against concealment or theft of silver ore, states that the holder of this office was to enjoy a customary revenue ('awa'id) of me basket of ore for every forge under his inspection. The distribution of the mineral production between these various experts, foremen and inspectors working in a mine followed long-established tradition and based a division of the production of each mining shaft into 66 distinct shares (Alsse) (Beldiceann 1964, 86). However, further deductions (besim) and fees both in pure metal and as cash assessments were set aside as the share of the money coiners (sarrafin) and other mint officials to whom the refined was usually sold.

Because of the risks and expenses involved in mining exploration, and the hard physical nature of the work, we find in some instances that the local populace deliberately falsified prospecting reports and tried to discourage the opening of new mines in their districts or the reopening of abandoned shafts (see Refik, 46-37, doc. dated 2122/1700, in which the populace of Sidrekapsi oppose the reopening of an abandoned mine in order to avoid lorced labour requirements). With the intensified production of the 13th/13th century, in particular in the coal mining industry, the labour situation changed completely (on this, see the study by Quatact in Bibl.).

One should note as a preliminary that the sites exploited by the Ottomana were to a very large extent centres which had been known and mined since ancient times. In the pre-Ottoman period, the major mining centres were in Serbia (see survey by Jireček based on records preserved in the Ragusan archives) and in northeastern Anatolia (for aucient times, . P. de Jesus; for the Byzantine period, Veyonis). Contrary to what is sometimes claimed (in particular by the Balkan historians, mabove), the establishment of the Ottoman state in these lands did not result in a collapse of the indigenous mining industry. In fact, with regard to the Serbian mines, for instance, we know from the observations of Iacopo de Promontorio in 1475 (cited by Vryonis, 15) that the Ottomans were responsible for dis-

covering and exploiting new sites which had previously lain idle, thus opening the way for a new period of expansion in Balkan mining.

Categories and regional distribution of Ottoman mineral resources.

In the fifteenth section of the Managir at-familian (Nurnosmaniye ms. 3426, fols. 349b-3512), Mehmed 'Ashik organises his information under three broad headings: precious metals (filiahit), precious stones (ahigh) and precious oils (ahigh). In accordance with the traditional classification, the tirst group (fols. 342b-352b) is subdivided into the seven principal metals (hall hogh), i.e. gold, silver, copper, lead, tin, iron and speculium metal (hhār-i shai [a.p.]).

The sources for gold mentioned by 'Ashib as most productive in his time (fol. 349b) were the mines in the environs of Sidjilmassa [q.v.]. Another source for fine quality gold used in the Cairo mint was in the region at Udile (S. Shaw, The financial and administrative organization . . . of Ottoman Egypt, 128). An indication of the extent of the production of these mines is given when one remembers that the yearly treasury contribution (irsalivye (q.v.)) of Egypt was fixed at 500,000 gold pieces (Shaw, op. oit., 284-5). Although a part of the irsāliyys was sometimes paid with other coins, it was typically made up of at least one-half gold (see orders to that effect to the governors of Egypt dating from the reign of Murad IV (1032-49/2623-39); University Library, Istanbul, ms. T.Y. 6110, fols. 46b-47b, 80a-80b, 91a-92b, all dealing with kinsing 734 1.

The principal silver mines of the Ottoman Empire were concentrated in Serbia, with other important centres in Thrace (Sidrekapsi and Pravista) and Macedonia (Üsküb/Skopje, Kratova, etc.). The value of the annual production of ten of the largest of these mines is summarised in [11] following table:

Name of mine or mining region	yearly value of lease of tax-tarm (muhāfafa [q.v.])	уеаг
Skopje	4,695,9x5	1584
Zaplana	4,600,000	1603
Sidrekapu	3,690,000	1585
Demirhisar	1,710,000	258g
Lofés and Berkofé	a r,633,333	?
Pravišta	95x, 182	E590
Srebrenica	848,105	r858
Trepča	333,333	1585
Rudnik	273,333	2585
Novobrdo	216,666	1385

Source: R. Murphey, Silver production . . ., 82-5.

Although estimates for overall production levels of the silver mines in Rumelia vary considerably, official statistics from the turn of the 11th/17th century indicate annual production of silver somewhere in the neighbourhood of 1,600,000 ounces (Murphey, Silver production, 79).

As for Anatolia, silver deposits were to be found in the mines at Diandia near present-day Gümüshkhane. Register MM 922 in the istanbul archives gives us in idea of the scale of this mine's production in the year roso/1601. At this date, during a four-month period, a quantity of 149,049 dirhams or 14,802 troy ounces was produced. This indicates a yearly production of silver at Diandia of around the 450,000 dirhams level. However, after the 11th/17th century, silver was no longer produced in large quan-

tities at Djandla. This was due partly to a failure to recover from disruptions during the Dialall rebellions $[q, v_n]$ period, and partly to natural exhaustion of the surface veins. Peysonnel's report of 1787 indicates a significant decline in the intensity of mining activity in the mines around Gümüsh-khane by stating that in his day only eighteen forges remained in operation (Peysonnel, 82). Both silver and gold were also produced in the mines at Ergani, in the northwest sector of Diyarbekir province. A document dating from 1155/1742 (BBA, KK 5192) indicates that during a twelve-month period a total of 201,157 dishems of gold (19,885,06 tray ounces) and 1,130,810 dirhems of silver (112,208,04 troy ounces) were smelted in 1,982 separate forges, each under the direction of an expert known as the ifrangji. Each mithal of gold (1 mithal = 1.5 dirhems) was valued at 460 skies, while silver was priced at 12.5 kurughs per čehi (t čehi = 100 dirkems) or 15 aktos per dishem at the standard rate of 120 aktos to the kurugh. A second register compiled five years proviously in 1249/1737 (BBA, MM 18,404) records that 3,225 forges were in operation, producing . yearly quantity of 134,521.5 dirhoms (13,277 troy cunces) of gold and 522,272 diehems (51,548 troy ounces) of silver. Unlike the silver mines at Diandia. at Ergani a high level of production was maintained well into the 19th century.

Apart from gold and silver, with regard to other mineral resources the Ottoman Empire was in a particularly favorable position. Copper was supplied from the mines in the province of Kastamonu, in particular the mine of Küre in the sandiak of Incholu and the mines in the township of Cankiri [q.v.] (Kastamonu wildycti säinämesi, tene 1316 H., 533-4). Copper production at the Küre mine is well documented from archival sources. The earliest acdates from 919/1513 (BBA, Ibn ul-Emin Tasnif, "Me'adin", == 3) and records the operation of 29 forges producing 28,638 wakiyyes (36.74 metric tons) for an 81/2 month period. The pure copper once extracted was valued at III aktas per unihiyde. Subsoquent records for the year ro81/1670 (BBA, MM 15997) give only the lump-sum valuation of the taxfarm lesse for the operation of the mine fixed at 3,500 balmans or 24.85 metric tons, without specifying actual production. However, a still later register dating from 1200/1785-6 (BBA, KK 8945). while not exclusively concerned with the Küre mine but recording shipments of copper ore from the Black Sea region as a whole, permits us to make some more precise estimations about overall levels of copper production. This register records 23 separate shipments made from the port of Samuen in the early months of \$200/2785-6, including \$2,243 pieces constituting a total weight of 75,931 batmans or 510.57 metric tons (note: the equivalent of 431,465 wilkiyyes, 150 dirkems, given for the shipments totalling 7x,911 balmans, allows us to fix the true weight of the baiman in use for metals at this time at 5.5379 wakiyyes or 7.1 kg). Since, however, these shipments were made directly to the foundry in Istanbul, they cannot be regarded accurately reflecting the overall output of even the mines of the Black Sea area. D. Urguhart writing in 1833 describes Küre as "perhaps the richest copper mine in the world" and notes that its yearly production reached three million okkas or 3,800 metric tons. One-quarter of this total supplied directly to the imperial arsenal in Islanbut for gun casting, one-third was consumed by local

industry, and the remaining surplus of about 41%

exported to foreign markets, in particular India. Peysonnel (see summary statistics in Bibl.) also provides some information on copper exported from the Black Sea ports. Aside from Küre, we know from Edwards' account of Ottoman mining in 1914 (Edwards, 195) that there were rich copper deposits in the Hendek basin east of Adapazart, in addition to which Solakian (62-70) speaks of dozens of small mines along the Harghit river valley near Tirebolu. (For further information on copper production, see also the Farley report cited in Bibl., and Issawi, 278-9.) According to Mehmed "Ashik (Mendstr altendation, fot. 351b), there existed some copper deposits in the Osogovska mountains near Kratovo and in various locations in the neountains of Bosula.

Iron ore excavated in large quantities in the mines of Samakov in present-day Bulgaria, and shipped to Istanbul for various uses in civil and military construction via the Black Sea port of Ahyolu (Barkan, Süleymaniye Cami, i, 367). There ____ other smaller mining centres throughout Bosnia which could also be mobilised time of need (on the smaller iron-producing mines in the vicinity of Novo Brdo, see Bibl., Handlić, 1976). An interesting example of the reopening of a mine at Kamengrad in northern Bosnia is to be found in vol. 121 of the Mühimme defters for the year 980/1572. The document is addressed to the governor of Bosnia and specifies that, in order to meet a pressing need for carnon balls at the front, the responsible authoritles in the area are to recruit the necessary workmen from the neighbouring villages without delay and resume production at the mine immediately. A fact which should not 🔤 overlooked when analysing the pattern of Ottoman mining activity is that, in addition to the richness of a given deposit, geographical proximity to the place where military need was the greatest could also be a major factor in determining which mines were exploited and also the level of production which was sought in particular locations.

Information about the two largest consumerof iron products, namely the imperial naval yards (tersane-yi 'amire) and the impurial arsenal (diebekhām) allow us to make rough estimates about the levels of production in the major iron-producing regions. In the case of the naval yards, m register dated 1073/1663 (BBA, MM 1800) specifies that 1,328 hanters or about 75,000 kg. of raw from weer provided from Samakov at a cost of 623,267 abics approximately 470 akčes per kanjar. An idjmdi register prepared by the overseeing agent (narls) of the Samakov mine covering a two-year period from Muharrem 1025 to Dhu 'l-Hididia 1026/January 1616 to December 1617 (BBA, MM 2067) incilcates that the following finished goods were sent to the arsenal in that year: 1,024 shovel blades (kircks), 2,552 picks (harmas), 2,000 axes (balla) and 14 crowbars (hushu). Ewliya Celebi (Seyahat-name, vi, 128) speaks of a yearly quantity of 8,000 wagonloads of raw iron being sent to the central lands of the Empire chiefly via the scaport of Salonica. In Anatolia, one of the principal iron ore deposits exploited by the Ottomans was at Kigl in the mountainous region southwest of Erzerum. (on the production of cannon halls and other finished fron products at Kigi, Murphey, The construction of a fortress . . ., documents in the addenda). Another centre of iron production in Anatolia, at least one that was active in the 19th century, will in the township of Zeytun north of Martash, According to the yearbook for Aleppo province for the year 1321/1906 (446), there were two active mines producing a yearly quantity of 2,500 wakeyyes of raw iron (on these mines, see also Edwards, 193, and Solakian, 52-2).

The provenance of steel used in the Ottoman Empire was various. From the east, it was brought from India and Caucasia, in particular Derbend, and found its way to Damascus, where it was fashloned into various finished products, such as aword blades, by the celebrated artisans of that city (see Bihi., section iii). Some steel also came from Europe and was known as frengt, although there were also indigeneous centres in the Rumelian provinces at Buda and Samakov, Because of its foreign origin and the costly nature of the process by which it was refined, tempered steel, referred to as "Frankish steel" (telik-i frengi), fetched the highest unit price among the baser metals, commonly being sold at 4,000 aktes per hanter (91 aktes per webiyye) and in one instance for as much as 1,300 ables per hanjar or 98 ables per wuhiyye (BBA, MM 6760, register dated 1006/1597-8). The regulated prices as set in 1049/1640 fixed a maximum price of 70 shies per wakiyye for the čelik-i frengi supplied to the rasp-makers' guild (türpüdjüydn) in Istanbul (Es'de defteri, Topkapu Saray: Library ms. Revan 1934, fois. 1972-198b), but clearly there were extensive gradations in quality. The official price regulations of 1049/1640 established the following four categories:

- (t) frengi čelik 70 akčes por wikiyye;
- (2) Peshte telik 35 aktes per wilkiyye;
- (3) Samakiu čelik 25 aktos per wakiyye;
 (4) čelik of low quality not suitable for use by

 (4) telik of low quality not suitable for use by the file-makers - 20 skess per wikiyys.

For the prices of various other metals used in the production of ordnance, an account register of the imperial cannon foundry (109-2014-10-1) from 1006/1597-8 gives us precise data (BBA, 31M 6760). At this date, copper was supplied to the foundry at a price of forty ables per wakings (x wahings = 1.2828 kg.). Tin varied in price between 3,800-3,900 ables per banjas (x hantas = 44 wikings), or 86-89 ables per wahings according to its provenance. In one notation, an item of expense of 1,372 ables for the cost of a pack house to transport tin from Semendire is seconded.

Other minerals

Apart from the sums precious motals (haft-i hosh), another class of minerals was made up of sum of low intrinsic, but high practical value. Principal among these ores were alum (shab), sulphur (hikkiri) and saltpeter (gohartile).

Alum was used in the textile industry during the dying process, well as in the paper-making and other industries. Its mannfacture in Turkey dated back at least to the 8th/14th century (Innicia, Classical age, 134; Cl. Cahen, Pre-Ottoman Turkey, 160-1; W. Heyd, Histoire du commerce du Leuani, ii, 565-71). Until alternative sources were discovered, Anatolia was the major and almost unchallenged supplier of alum to the European textile industry, principally through the intermediacy of Genoese morchants. A Florentine merchant of the early 14th century lists five fully distinguishable grades and regional varieties of alum from Anatolia, as follows: (1) Kütahya alum; (2) alum from Karahitär (= Shebin-Karabisår); (3) alum from Phocea (= Ytfd Foca); (4) alum from around Ulubad on the western shore of Apolyont Gölü; and (5) impure alum from the various islands of the Marmara sea (known as

alum of Cyzicus (= Kapudaghi yarim-adasi) (Pegolotti, La pratica della mercatura, 43, 293, 369). (For the reversal of this state of affairs with regard to the Turkish predominance in the production and supply of alum to the West by the 12th/18th century, see below.) The principal alum pits were found in north-central Anatolia at Shebin-Karahisār and in western Anatolia in the area around Kütahya. The toponym Shabkhāne still in today in the vicinity of Gediz, and other variants such as Shabdi near Tavahanii, attest to the former importance of the alum deposits in this region. Additional deposits found at Maronea near Gümüldjine [q.v.] in Thrace (Shasfiyya court records of Aleppo, Evāmiris sulfāniyya, xiv, 70-x) and Ipsala (Singer, 29-94).

Since sulphur and saltpetre were two of the principal ingredients used in the manufacture of gunpowder [see BAROD], it is not surprising that supply of these essential materials was controlled by of a special regulatory system. The accounting system applied for securing gunpowder supplies was known as the odjobile or special fund allocated for purchases and requisitioning of essential supplies (the same system was used to secure supplies for the imperial kitchens, the imperial navy and other branches of state service). The regions whence the essential minerals for the production of gunpowder could be procured within the Empire were limited. For supplies of sulphur, the government turned to either extreme of the Empire. A document dated 978/1570 indicates that a yearly quantity of 2,000 kanters was supplied to the government by the governor of Hakkari province from his own region together with Erdiish (Refik, 7-8). On the other side of the empire, an indication of sulphur I in Suwer, fols. 43b-44a).

being mined M Schnik province is found in a budget for the year 1079-80/1669-70 (Barkan 1935, 249), where an expenditure of 33,000 acces is recorded for hiring of pack animals to transport the ore. Since we know from other (Refik, 7-8) that the standard rental me for each draught animal was 200 aéces, we may interpret these figures as representing 165 animals, each bearing the standard load of 18 batmans or about 300 pounds. Saltpetre, too, because it required specially humid climatic conditions, such as those found on the edges of the salt lakes of Karaman province, or in the Nile delta of Egypt, though more abundant than sulphur, could only be produced in certain places. Like sulphur, it too was supplied to the government by means of the yearly fixed contribution in kind. The level of this contribution was supposed to me constant, but additional extraordinary requests could be made in time of need. The yearly level fixed for Karaman province m a whole was 500 banfars or 28,222 kg. (Konya, Shartiyys court records for the year to40/ 1630, 30). More often than not, the saltpetre was produced in a number of smaller workshops or distilleries called kennes (Derleme, viii, 2744), to be collected and transported to centrally-located factories for the manufacture of gunpowder. One centre was at Bor, which annually produced a quantity of 91,000 wilkippes (approx. 2,000 kanters or 112,890 kg.) of finished gunpowder for delivery to the arsenal in Istanbul (Onen, 21). Egypt's regular contribution (irsality)e) was 3,000 hanters (Feridan, ii, 201-2), but in some years it reached m high as 10,000 kanters (see the order addressed to Tabani-Yasi Mehmed Pasha, governor of Egypt 1038-40/1628-30,

Table. Statistics Anatolian mining in the roth-reth/r7th-18th centuries

For the purpose of quick reference, a table follows which shows the scale of various mining enterprises in Anatolia. An accompanying map shows the geographical distribution of the principal minerals.

Market organisation: distribution and supply.

The principal purpose of the state regulation of mines was to ensure self-sufficiency, particularly in materials of strategic significance. It seems moreover that in order to achieve this, the state was even willing to sacrifice a measure of efficiency in production. This is most obvious in those mines administered by disam (see above and MOLTEZIN). Under this system, after deducting expenses for materials and payment of the treasury tithe, an investor was left with only some 60% of the production with which to pay his workers and realise a profit for himself. As is indicated in a memorandum in the subject written in about 1600 (see Murphey, Silver production, 90), this left little margin for experimentation with new techniques or investment in production-boosting improvements. In point of fact, the Ottoman Empire was independent of outside sources of supply for all significant minerals with the possible exception of tln (on the import of tin from the Cornish mines, we saron at i, roos, and H. Inaleik, The socio-political effects . . ., 215 ff. Also, Ewliya Celebi mentions that the supply of tin for the Istanbul craft-guilds came from England (Seyāhāt-nāme, i. 579: Ingiltere diyarindan). Modern geological exploration has determined that the only place in the Middle East where tin occurs in any appreciable deposit is the Lebanon (see de Jesus, I, 53, and ii, 395, map). However, there is no evidence that the Ottomans made use of this site (on the 17th century tin trade between England and Turkey, Hedges, 84-5).

While mining production itself was also carefully monitored, strict government control was exercised, particularly in the marketing phase. One aspect of state regulation of the market place was the limiting - total prohibition of export of some mineral products at times when local stocks became depleted. Examples of the periodic imposition of trade restrictions in iron and lead, as well as other metals, are recorded in the well-indexed catalogue volumes of the Public Record Office in London (see Bibl.). These trading bans were imposed only as an exceptional measure, but with regard to the sale and distribution of certain scarce resources within the empire itself there was a whole range of restrictive regulations, ranging from government price control to the enforcement of artificial market boundaries known | drii.

To illustrate the fundamentally protectionist principles of the state with regard to mineral production and distribution, the conditions regulating the state alum mines - particularly revealing. Details on marketing of alum mined at Shebin-Karahisar (Karahisar-i Sharki) for min the manufacture of gunpowder and other products are provided in the ghar type court records from Aleppo. In an order dated it Muharrem 1194/19 January 1780 to the authorities in Aleppo, one of the restricted areas where the ore could be sold, the government barred the competition of European traders (efrendicter)

MAGDIN

who sought to flood the market with cheaper alum. Ship captains were warned that if they persisted in attempting to sell their cargoes at the deflated price of six hurughs per hantar (56,443 kg.), as opposed to the fixed price of forty-three kneughs per kanjar set for the produce | the state-operated mines at Karabişar, their cargoes would be confiscated (Damascus, Markas al-matha ih al-ta riha iyya: Emdmir i sulfaniyye (Halab), xv, 384-6). Another order dated as Muharrem 1191/5 March 1777 provided guarantees for the maintenance of treasury revenues deriving from alum sales by blocking access to the market to all suppliers until such time m all the state-produced alum had been sold. The order also provided that any shipments of alum not authentically proven to have originated from the state mines by the issuance of a treasury agent's permit (tedhkire) would be made subject to immediate confiscation, as well as to the payment of an indemnity amounting to twice the value of the seized shipment (Erramir al-sulfaniyye (Halab), xiv. 70-1). Such harsh restrictions and overtly monopolistic marketing practices based on defined areas called drit were applied in connection with a limited number of mineral products such as salt and alum. Nevertheless, the government applied similar restrictions on some precious metals as well, both with an eye to protecting treasury revenues, and to assuring the availability of scarce materials which, by their very nature, could easily be made the subject of hoarding and speculation. Thus the sale and circulation of raw silver was strictly controlled by the government. A limit was fixed for the use of the iewellers and related craft-guilds (such = the strau-keshan) by the comptroller of the mint (darbghane might), and unauthorised export of silver was also forbidden (on this question, see the refercuces in Murphey, Silver production . . ., 89). Furthermore, by periodic regulation of the coinage (tashik-i sikks) to account for fluctuations in the market value of silver, official government rates of circulation (rd'idi) for all major currencies, both internally and externally-minted, were determined and were universally applied in all provinces of the empire. Thus all phases of Ottoman mineral production, minting, and circulation followed the mile of strict government regulation and control aimed at preserving self-sufficiency and at assuring abundence in the supply of precious metals for the home

Concerning the distribution for use of mineral resources, it is clear that the greater part of the empire's mineral production was set aside and made directly available to the state for two principal uses:

(t) military

- a. the imperial cannon foundry (top-khane-yi Samire)
- b. naval shipyards (teridus-yi 'dmire)

(2) tiss in civil construction

- a. buildings serving the public need
 - (r) mosques
 - (a) schools
 - (3) hospitals
 - (4) Simdrels
- b. buildings reserved for state use
 - (t) royal palaces
 - (2) residences of high government (unctionaries.

A relatively smaller proportion was distributed to the craft guilds for the production of household utensils and consumer goods. Manufacture of common household items such as copper cooking pots (\$asghan), charcoal burners for household heating (mangel) and copper eatingware (\$40) also used up large quantities of metal. According to Ewligh's list (Sayāhāt-nāme, i, 579) in Istanbul alone there some r,000 separate metal founders' shops (dökmedfis) employing some 1,300 skilled craftsmen, It was only when these two needs had been fully satisfied, that is to say, the needs of the state and the needs of the internal consumer market with a substantial surplus kept in reserve in case of gency need, that the issue of export could even arise. When export did occur, the state also carefully supervised all aspects of these transactions in order to determine the appropriate trading partners, the volume of the trade, and the proper price level.

981

These peculiarities of the Ottoman marketing system are nowhere more in evidence than with respect to the distribution and sale of salt [see MILH]. For purposes of salt sales, each production district or delt was further divided into sub-units called diwans, to which salt was distributed for sale on the basis of carefully calculated population estimates. The purpose of such a system was obviously to guard against the occurrence of shortage caused by price speculation on the part of merchants who knew how to profit from a naturally occurring price differential based on the geographic proximity of their potential markets to the centre of production. Pigures for several salt works in Anatolia and Rumelia published by Gücer tadicate that the distribution of salt typically followed a repeating pattern: 85 % of the salt produced in sigiran production district brill was blocked for distribution at fixed prices to local industries (bakeries, etc.), while only 15% made its way outside the confines of the öril, either as a contribution to a state organisation such as the imperial kitchen (majbakh-i Mmire) = for distribution in another ors experiencing a temporary shortage. Of the total of 85% consumed locally, Güçer was able to determine that 70% sold directly in the mine or in its immediate environs, and a further 15% was sold in remote rural sales districts (divens) with limited access to the mine. Far from being oppressive, these sales restrictions were designed to ensure equitable distribution of commodities which were either naturally scarce or liable to become the object of price speculation.

Nineteenth-century developments in Ottoman mining.

In considering the development of Ottoman mining in the 13th/19th century, one should note the three areas of fundamental change:

(a) Mining law. (For this, see the relevant articlesfrom the Distile listed in the Bibl., section II. On the law governing capital investment and ownership of land by foreigners, see Engelbardt, i, 211 ff., and Solakian, 5-6. On the concessionary tégime, see introdzăt.) (b) New mineral types exploited in the 19th century and the role of foreign capital in the development of Ottoman mining, (c) New technology and the impact of mechanisation. Only the major themes and issues relating to the last two topics, in particular, that of mechanisation in Ottoman mining (see below), will be treated here.

The exploitation of other mineral resources in the Ottoman Empire such as chrome and nickel and the more intensive exploitation of existing fields as in the coal industry, began on a large scale relatively late in Ottoman history. Under the impetus of increased demand sparked off by the Industrial Revolution in Europe, mineral exploitation rights in 982

Table. Statistics on Anatolian mining in the 19th century

Minerals found	Location	Yearly volume of production	Price per unit	Source of information	Date
copper gold silver copper fuller's earth meerschaum	Ergani Bulgar Dağı (Adana) Bulgar Dağı Küre (Kastamonu) Ankara Eskişehir	6,172 metric tons 64 oktas (8-4 kg.) 922 oktas (1,183 kg.) 340 metric tons 7,408,720 metric tons 5,648 sandits (one sandit = approx. 35 kg.)	72 para	Ihşā'iyyāt, 263 Ihşā'iyyāt, 263 Issawi, 279 Ihṣā'iyyāt, 265	average over 1859-1909 average over 1805-25 1851 average over 1820-5 average over 1820-5

Anatolia became the subject of intense competition between the various capitulatory nations and were often made a specific article of agreement in the bilateral negotiations for the financing of such large-scale projects as the Hidjäz railway. In order the better occordinate the leasing and exploitation of the state of the increase their profits, separate Department of Mines attached to the Ministry of Public Works (Nafigya) was established in 1887,

The most significant development in the new period was the intensive exploitation of the empire's coal reserves with the participation of foreign capital. This sector of the mining industry has been thoroughly studied by Quataert (see Bibl.), so there is no need to enter into details here. Two points which should be stressed, however, are firstly that the marked rise in mineral output in the late 19th century was almost entirely used for export outside the empire and not to fuel internal industrial activity (according to Owen, 213, 80%-90% of all coal production was exported, according to Quataert somewhat less, whereas Solakian (10) provides statistics from the first decade of the 20th century showing that minerals alone usually accounted for between 60-70 % of all exports), and secondly that of all the minerals, coal was far and away the most important, comprising nearly 80 % of all mineral output (see statistics in Ihsa'iyyat, 100). The table below excludes coal production (for which, see Quataert and statistics on the Eregli mine in last'iyydi, 262-3) = to give a more balanced picture of developments in the 19th century as compared with the earlier period. With reference to this table, it should be noted that two quarried minerals which were also intensively exploited during the new period, once again primarily for export, were fuller's earth and meerschaum (for statistics = these, see Ibsa'iyyat, table 27, at pp. 102-3, which gives the mineral output of the empire by province according to two categories, mines (mardin) and quarries (fast odiakiari).

Mining technology.

1. The earlier period. Some Interesting details of the technological aspects of Ottoman mining are provided through the first hand observations of Mehmed 'Ashle, who was in residence during a three-year period between 994/1586 and 997/1589 in the mining town of Sidrekaps. According to his description, the mine shafts were typically dug to a depth of some 150 to 200 dhirā's (one dhirā' = approx. 75 cm). A system of mechanically operated surface pumps linked to the subterranean water channels was installed to facilitate drainage. The process whereby the ore smalled and purified in small forges is also described by him. As the byproduct of the first smelting, the ore was divided

into pure silver ingots and a quantity of litharge. The litharge could then either be sold in its raw state or else further refined to produce lead for roofing or ammunition. As described by Mehmed 'Ashik, the forges at Sidrekapsı were rather small in size, with mentral heating chamber connected to au exterior collecting chamber where the smelted ore was left to solidify. The major technical difficulty seems to have been overheating, particularly in the winter months when the water circulation needed for cooling was impeded by freezing temperatures, which gave rise periodically to the explosion and collapse of the small, clay-built forges. A document which further describes the operation of the smelting houses (kal-khānes) attached to the imperial mint and which specifies the percentage of metal lost during each stage of the assaying process, has been discovered in the Topkapu Sarayi archives (D. 9572) (see further, Beldiceanu 1964, 95-7). Ewliya Čelebi's sath/a7th century description of the iron works in Samakov gives evidence of the so of hydraulic power to work the iron-stamping presses (Seyāhātmanus, vi. 228).

z. The roth century. We have already referred to the application of improved techniques in order to raise yields, a notable example being the construction of a centralised smelting plant at Tokat to process ore from mines throughout northeastern Anatolia (see above). Alongside improved technology, mechanisation in key areas such as the transport and loading of ore had a dramatic impact on mineral output at the turn of the 20th century. To take em example from the Eregli coal fields, the building of a rail link and installing of cranes for rapid loading of the ships in the port are singled out by Quataert as the critical factors leading to m three-fold increase in production within a few years of the establishment of the French Company, the Societé d'Heraclée, in 1896 (see Quataort; Owen, 213, taking a longer time frame, speaks of a better than tenfold increase in coal output between 1855 and 1913). Proximity to existing railway lines also affected the decision to exploit known deposits in other sectors of the mining industry. The development of chrome mining in the province of Aydin, and intensified exploitation of the beds of schist - Hendek for extraction of copper, became economically viable only by virtue of the proximity of these areas to existing railway lines. In the case of the Hendek operations, = are told by Edwards (196) that at the time of his report in 1914 there were as many as 26 separate concessionaires working in - area only So miles square. As a result of intensified mining activity and mechanisation in the industry, in a single decade at the turn of the 20th century overall mining production in all sectors of the industry doubled from about 600,000 tons to 1.15 million tons (Solakian, 9). This improvement in output was

achieved without a significant increase in the number of mines operated (Solakian, table at p. 9, shows that the number of mines operated fluctuated between 82 and 94 over the period rgor-ro), and in the absence of new mineral finds of any significance.

Bibliography: I. Ottoman Mining. (a) Archival sources: London, Public Records Office, Calendar of State Papers and Manuscripts relating to English affeirs existing in the archives and collections of Venice and other libraries of northern Italy (see index under "trade" where sub-headings for commodities include: iron, lead, tin, silver. ete.); Istanbul, Başbakanlık Arşivi, (BBA) Maliyeden mildevver (MM) 2067 - Idimāl-i muhāsebt-yi wāridāt ve ikhrādjāt-i muhimmāt-i then der didnib-i Samakov fi sone 2025-6; Kamil Kepeci (KK) 5267 - First draft of a survey recording mining centres in Rumelia, This draft contains chancellery notations indicating where comparative statistics from other years to be entered. As an example, on p. 9 of this register, a single figure for the valuation of the tax-farm of Skople/Cskiib pertaining to the year 1003/1595 is given. Below this is inscribed the instruction 987, 990, 991, 992, 1015, 1024, 1025, ve 1043 senerleri daht görüle; MM 22, 148 = completed draft of the above survey containing data spanning the years 990-1041/1582-1631; State Treasury budgets from the KK series: KK 1919 = budget for 1036-7/1626-7 KK 1921 = budget for 1037-8/1627-8 KK 1927 → budget for rogg-40/1630-r. Istanbul, Topkapu Saraya Arsivi, Defter 9572 = a document dealing with the administration of the mint at Sidrekapsı dated 944/1537. For a brief description on archival sources on mining, ... M. Sertoglu, Muhteva bakımından Başvekalet Arşivi, Ankaza 1955, 78-81. In particular, see BBA, KK 5167, KK 5169, KK 5171, KK 5175, KK 5184, KK 5185, KK 5196 registers dealing with the Rumelian mines, and BBa, KK 5190, KK 5191, KK 5192, KK 5195, KK 5204 - registers dealing with the Anatolian mines. In addition, see the Cevdet tasnif, Darbhane (Sertoğlu, op. sit., 70), and the collection of documents mostly from the 18th and 19th centuries dealing with the state mines and imperial mint transferred to the archives from the Department of State Lands (milli emidit), Sertogiu, op. cit., 8r. The Ibn ul-Emin Tesnit, Me'adiu (vol. xix) contains 248 documents dealing with various aspects of mining. These documents are particularly useful, since apart from statistical information, they give us an idea how the nines were physically operated. Particularly useful in this regard and Ibn ul-Emin, Me'adin, no. 17 = a report sent by the kids of Magnisa dated 996/1588 concerning mineral deposits in the vicinity, and Ibn ul-Emin, Me'adin, no. 105 = | report by the kadf of Kure in Kastamonu province dated 1093/1682 concerning the state of the mining and smelting operations in the copper mines. A. IN ISLAMIC ART.

Materials and techniques.

In Muslim civilisation as in classical antiquity, precious metals and alloys of copper, tin, lead and iron were used for artistic purposes. We have only scanty information about the metals, and particularly about the alloys of which metalware was made. Our ignorance in this respect stems from a number of reasons. One is that most of the Islamic metal objects have never been properly analysed, and terms like "bronze" or "brass" used indiscriminately in catalogues and other scholarly publications. Another reason is that the mediaeval Islamic terminology for metals and their alloys is often ambiguous and therefore difficult to evaluate (Aga Oğlu, A brief note, in JAOS, izv [1945], 228-23). It would seem, however, that from the early Islamic period to at least A.D. 1200, materials conform with those used in classical antiquity and with those mentioned by al-Djazari, namely: gold (dhakab); silver (fidda); with bronze (isfadrak, from the Persian sapid ray, a bronze with heavy content of tin, antimony and lead); bronze (suft); brass (shabah); copper (nuhās), and tin (rasās al-kal's). In early Islamic times the of iron (hadid) to have been negligible. It became important, however, for the production of steel for weapons and tools, and may have also been used instead of bronze for the plating of doors and city gates.

Together with the unbroken tradition in the use of metals and their alloys, there was a technical conservatism in the fashioning of Islamic metal objects. Several methods of casting—one of the oldest arts in the world-were practised in Islam. One was the cire-perdue or lost wax process, applied in cases of closed shapes. An accurate, though somewhat sketchy description by al-Diazarl [q.v. in Suppl.], active in Diyarbake in the second half of the 6th/reth century, testifies that in northern Mesopotamia the lost wax technique was well-established. Dated mid-6th/sath century objects indicate its use in Iran too (L. T. Ghizalian, A bronze qulumdan, 97). Another method described by al-Dinzari was casting with green sand. This method, which is of obscure origin, is mentioned also in Chinese sources contemporary to al-Diazarl. (For the first description in Europe, see Biringuecie,

De la pirotechnia, 1540.)

Casting in open or piece moulds was used for works in the round in for the composite shapes, and required soldering. Hollow, primarily circular vessels, were often produced from disks or sheet metal, such as beass or white bronze, by burnishing the shape on a lathe. This technique, discovered by Roman artisans and known today m spinning, presumably passed to Islam from late Roman and Byzantine sources. No written documents on this technique, comparable to al-Diazarl's book on automata [see HIVAL in Suppl.] have so far come to light. The same applies to the widely employed method of raising-or sinking-in which comparatively thin metal sheets were transformed by hammering into jointless, hollow vessels of almost any shape. Among the objects fashioned in this technique are jags, bottles, cups and bowls raised in precious metal or white bronze, covered brass vessels with fluted bodies and lids, and the like.

The most common method employed for decuration were punching, chasing and bossing, tracing, graving and intay. None of these techniques was

entirely new. Their originality lies in the application of these conventional methods to create surface decorations of unprecedented Islamic character and

artistic feeling.

(t) Punching: This method, known also as ringmatting and executed by stamps which terminate in a small ring or hole, is particularly appropriate for soft metals. It was employed by Chinese and Soghdian gold- and silversmiths primarily as background pattern, while in Islamic metalwork punched circles were also applied to objects made of bronze and its alloys. The most common use of ring-matting was to set off the main decoration or an inscription from the ground. Yet particularly on early metalware, punched circles also formed the principal decoration. On bronzes, ring matting appears to have gone out of fashion by the early 7th/13th century. The latest dated example of ring-matting on bronze known to the writer occurs on an inlaid penbox, which was made in 607/1210-11 by Shadhi for Madid al-Mulk al-Mugaffar, one of the viziers of 'Ala' al-Din Nuhammad Kh varazm Shab.

(2) Chasing and bossing (tandife): Repoussé, or ornamental relief work, is produced by hammering metal sheet, and like punching it is closely linked to the work of the gold- and silversmith. We still possess a relatively fair number of chased and bossed gold and silver objects. The bulk of the surviving objects comes from Iran and antedates the 7th/13th century. Reports of later Muslim travellers like Ibn Battūta imply, however, that such vessels continued to be manufactured also outside Iran and in larger quantities than the surviving examples suggest. The application of repoussé to bronze in order to create an over-all decoration, which was practised in the Near East since remote antiquity, was relatively rare in Islam. It is known foremost from a group of late 6th/12th to early 7th/13th century candlesticks and some stylistically closely-related rectangular tray-like objects (see also Rice, A Seljuq lamp from Konya, SIMW. V). In modern times, chasing and bossing of brass and copper is practiced all over the Islamic world.

(3) Tracing and engraving (hafr): The decoration of the majority of Islamic metal objects was done either with chisels to produce grooves, or with gravers in order to remove the metal which once filled these grooves. Both techniques are not related to any specific material, and were employed singly and in conjunction with other techniques. They were used for unpretentious decorations of household utensile; for tracing intricate arabesque patterns; for preparing the grooves for copper and silver inlay, or to enrich repoussé or other decorations. Both tracing and engraving are still practiced in almost any bazaar workshop.

(4) Inlay: Inlay I metal (takfit or tuffin) is a technique by which the artist enriches a metal object by overlaying parts of its surface with patterns formed from wires or sheets of a different metal. Although this craft too is of considerable antiquity, it was not popular before the mid-6th/12th century. On early bronzes, as for instance a pear-shaped ewer in the Victoria and Albert Museum (434-1900), an often-discussed ewer in the Hermitage, or a ewer in the Metropolitan Museum of Art (47,100,90), a thin piece of red copper was hammered into a small cavity in order to mark the eyes or feathers of a bird - to indicate a fruit or floral motif. Silver wire, which in later centuries had become a common medium for inlay, was only rarely used with these early examples. The wider use of inlay with copper

and silver II documented only from the mid-6th/rath century conwards. According to al-Diazari, the inlaying of the doors at Diyarbake in the last third of the 6th/12th century was done by cutting the pattern for the inlay from metal sheets, casting the grooves in the lost wax technique, and finally fitting both parts together. Although this method was known in ancient times, inlaid Islamic metal objects from the 6th/12th and 7th/13th centuries point to two different techniques. In the first, the so-called dove-tailing employed for red copper and silver inlay, the design was traced into the bronze or brass with a blunt tracer. The channels, or spaces to receive the copper or silver wire, were roughened and undercut, and the silver hammered into these "dovetailed" grooves. Where the space to be inlaid was greater than a wire would fill, a piece of sheet metal instead of wire was beaten down into the undercut spaces and subsequently engraved. No undercutting took place in the second method of inlay. In this method, which was employed for gold and is docunseated since the mid-7th/13th century, shallow grooves following the contours of the design were traced, and the thin gold leaf was secured by harnmering it into the grooves. When larger panels were prepared to receive the gold, the bottom of the respective ornament was thoroughly roughened with a punching tool.

On the majority of mediaeval bronze and brass objects, chased lines or background scrolls are filled with a black, bituminous substance the composition which has so far not been analysed. Similarly, the composition of the niello powder used in Islamic times m gold and silver ware is still unknown.

Types of metalware.

Broadly speaking, Islamic metalwork falls into five categories. The first and largest are objects made for domestic and religious - They are well represented in museums and private collections and therefore hetter known than the rest. The second group are doors and windows and their accessories. It includes knockers, locks, keys and window grills. Scientific and medical instruments, astrolabes, globes, knifes and scissors form the third group of metalwork. The interest in these instruments lies primarily if the history of science and technology. Yet in their excellent craftsmanship and beautiful decoration they me often real works of art. The fourth group are arms and armoury. They too are often of exceilent craftsmanship, though for evident reasons they differ in design and workmanship from the former categories. The same applies to jewellery, which for technical and other reasons deserves a separate study [see DIAWHAR, ii, in Suppl.]. The last three categories are therefore not included in this section. Artistically-outstanding examples will be mentioned below.

Objects made for domestic and religious use.

(t) Lighting implements, Islande lampstands basically follow Byzantine, Meditorranean models. Two types, both common in pre-Islamic Iran, Syrka and Egypt, had particular influence on the formation of the Islamic stands. The first is characterised by a post made up of baluster-shaped links, and is topped by a pan and m faceted spike to hold the lamp. The second type has a plain shaft which is bordered above and below by either disks, rings or a squat knob. Both kinds rest on three pawed or hoofed animal feet. The base is formed by three curving trefoils with a raised sharp edge along the centre, MATDIN

ox, more rarely, in the shape of a shallow dome. The artistic changes brought about by Islam not so much affect the main elements of the Roman-Byzantine models than their stylistic transformation. This is expressed in the preference for segmental shapes, faceted shafts, or geometric, flattened renderings of the zoomorphic feet or trefoil bases (Barrett, Islamic metalwork, Pis. 3, 4a). Another Roman variation, the pricket-type lamp stand, recurs primarily among early Mamlük specimens (cf. Louvre, no. 6030; Berlin, Museum für Islamische Kunst, no. 1 655, repr. H. Glück and E. Diez, Die Kunst des Islam, Berlin 1925, Pl. 4at). In later centuries, lampstands of the above-mentioned types became less adequate as lighting utensils and interefere rare.

Mediaeval Islamic oil lamps also follow the Roman-Byzantine tradition. Their oval, or occasionally bulbous body has one or several nozzles for the wick, a hinged lid to cover the central filling hole, and is often applied with a handle at one end of the longitudinal axis. In contrast to the Roman specimen, the Islamic oil lamps were not made for a pricket stand, and are either footless or rest on a splayed, often faceted foot. This last form is generally regarded as an Iranian, particularly East Iranian feature and associated with 6th/rath to 7th/13th century Khurāsānian workshops. Many of them had animal or blirt-shaped finials.

Zoomorphic oil lamps, too, were created both by Christian and by Islamic artisans. Yet whereas the shapes of the Byzantine and Coptic lamps were restricted to birds of symbolic content, in mediaeval Islam no clear preference for one or the other animal shape seems me have existed. The species of birds or quadrupeds became more and more differentiated and imaginative, and many me provided with burners attached to the breast or head of a fabulous creature.

In contrast to the lighting implements mentioned so far, the models for the mediaeval types of Lilamic candlesticks are as yet obscure. Since about the end of the 6th/zath century the dominant type of these objects consisted of three clearly-marked elements: a truncated base, a socket which on a smaller scale repeated the form of the base, and a tubular neck serving as a link between the two. Aside from different proportions and sizes—candlesticks manufactured for mosques or public institutions may have reached height of more than 50 cm.-hase and socket took on a variety of shapes. There were two basic trends. In the first, the truncated cone of these elements had straight sides. The general appearance of those candlesticks was therefore heavy and somewhat sturdy. In the second, and more elegant variety, the flanks were contracted. In addition, the surface was often faceted, subdivided into straight vertical tianges, into raised ogee-shaped arches or two registers of pentagonal compartments. In "transitional" type between the faceted and truncated forms, body and socket projected strongly towards their base, and the body rested on a slauting foot. This strong projection is counterbalanced by a protruding, flat shoulder (Ferbérvári, nos. 159-60; A. S. Melikian-Chirvani, Le bronze tranica, 52-3). In a special category of Iranian 10th/16th to 11th/17th contury candlesticks, base, neck and socket were unified and turned into a cylindrical, and occasionally faceted stand with a slanting foot (Melikian Chirvani, op. cil., 116-17). In most of these so-called pillar candlesticks, some traces of the basic three sections in the form of low mouldings or rings have been retained.

Mosque lamps, polycandelons and chandeliers belong to a variegated group of suspended float-wick lamps, of which relatively few examples have survived. To judge by the few complete and the numerous fragmentary metal mosque lamps so far known, they closely resembled glass lamps. They were either fashioned of sheet metal or cast in bronze, had a bulbous perforated body, a flaring neck and low foot, and three suspension rings were attached to the middle of their body. Suspension arms, also made of sheet metal, were hooked to these rings. The few specimens which have survived do not allow a closer typological classification. By the late 7th/13th century, their place appears to have gradually been taken by glass or ceramic lamps.

The number of polycandelous—a suspended lamp consisting of several glass containers fitted into a metal frame—is even smaller. This type, which stems from the Roman-Byzantine tradition, was developed in western Islamic countries rather than in the east, and was transformed in Mamilik Egypt into huge prismatic, many-tiered or pyramidically-shaped chandellers.

(2) Perfume vessels. The most type of incense burner (mibhhara or mabhhara) had m cylindrical body with an inner shallow bowl for the incense, a domed cover, straight handle soldered horizontally to the body, and three, often zoomorphic feet. The cover, and in many cases also the body, were pierced for the emission of the smoke. The shape of these incense burners stems ultimately from Byzantine of Coptic thurification vessels, and also the feet in the form of animal paws in different degrees of stylisation correspond to the feet of Byzantine and Islamic lampstands mentioned previously. Between the early 7th/13th and the end of the 3th/14th century this traditional Byzantino type dominated in Syria and Egypt, while in Iran it seems to have been less abundant. Another kind of Mamilik incease burner common in Syrla and Egypt consisted of two, partly perforated hemispheres held together by clasps, which had no feet and were either suspended or rolled on the floor. To hold the chargoal they enclosed a small iron bowl which was set in gimbles to move freely when the incense burner was rolled or swang. In the 9th/15th and roth/r6th centuries, such vessels were widely exported to Italy and then produced by Mamilia artists who resided in Venice. Similarly-shaped incense burners occur already among Chinese silver vessels which are generally attributed to the T'ang period. The Chinese specimens are, however, much smaller, and their relation to the Islamic incense burners is so far obscure. Some early 4th/10th to early 7th/13th century East Iranian incense burners with a square excluding body to relate to a Buddhist, Central Asian tradition. They rested on low feet of a type also common in other East franian bronzes, and certain details in their decoration, such as fotus petals and blossoms are remiaiscent of pinnacles - Buddhist stupes or votive vessels. A variant of these East Iranian immediate burners, which was also popular in East Iranian households between the late 4th/roth and the 7th/13th centuries, was fashioned in the form of a cylindrical, hooded receptacle. It also rested on three zoomorphic, generally faceted feet; its low body had a niche-like upper aperture with an archshaped opening, and the front of the semi-dome was flanked by a pair of flat, projecting bird beads.

Another type of incense burner was fashioned in the form of highly-stylised felines or birds. These 988 MAGDIN

vessels, which are generally assigned to North-East franian workshops, seem | have been in vogue throughout the 6th/12th century. Their body hollow-cast and perforated. In the feline-shaped incense burners, the animal-head was removable to permit placing the incense in the body, while the bird-shaped examples had a drawer for the charcoal in the bird's breast. There is still much uncertainty about zoomorphic incense burners in Fățimid Egypt. Although a considerable number of animal-shaped, presumably Fățimid objects have been preserved, their function is not always clear. and the group comprises fountain heads and objects which may have served various decorative purposes.

The identification of mediaeval Islamic bottles perfume flasks (\$um\$um) is often ambiguous. Among the extant flasks and bottles the following types almost certainly served this purpose. One is a group of Persian, 25-21 cm. high silver or parcel gift bottles attributable to between the late 5th/fifth and the mid-6th/rath century. They have a globular body resting on a low, splayed footring and a narrow, tubular neck. A small fluted cover with a ring, which probably once held - chain by which it was attached in the neck, has been preserved in some of these speci-To prevent the evaporation of the perfume they would have required an additional stopper (Survey, Pl. 1350). A second group of Persian 12th century bottles is characterised by a funnel-shaped neck, a bell-shaped, longitudinally-fluted body, and a flat horizontal link between collar and neck (Survey, Pl. 1311 B.E.). Other hottles of this type have oblique or softly-rounded shoulders. Their bodies are cylindrical - facetted, and occasionally the mouth of the neck is sealed with a small filter. Similarlyshaped pottery and glass vessels with a piercerl filter and m filling hole at the bottom make an interpretation of these bottles as perfume-sprinklers even more likely. Small, 8-9 cm. long bronze perfume flasks with a facetted, slightly flaring neck, rectangular body and four tooth-shaped feet, which evidently were fashioned after a widely-used type of glass and rock crystal flasks, bear further witness to the affinities between broaze and glass flasks of that kind (C. J. Lamm, Mittelalterliche Gläser und Steinschnittarbeiten aus dem Nahen Osten, Berlin 1929-30, i, 160-2; ii, Pt. 59; cf. idem, Das Glas von Samarra, Berlin 1928, Pl. VII).

Mamlük pariume bottles were particularly appropriate for sprinkling odoriferous oils.Fashioned in 📖 ovoid shape, these bottles had a long tapering neck that terminated in a pointed end and a base that was fitted with a plug, resembling the filling holes of the Persian perfume flasks, (Cairo, Cat., 1969,

no. 79, Pl. 15).

(3) Mirrors. Islamic mirrors fall into two categories. The first and larger category consists of mirrors with a central perforated boss for fitting a cord and is based upon Chinese prototypes. They are relatively small-the average diameter varies between to to 20 cm.-the face of the mirror is east in relief decoration, and the reverse is smoothly polished. In the second and smaller group the mirror was furnished with a handle, which was cast either separately or in one plece with it. This second category stems from Mediterranean tradition, and dates back to classical antiquity. Mirrors of this type appear to have served primarily as tollet accessories, while the originally Chinese type presumably had a magical or talismanic purpose. In spite of the considerable number of extant mirrors, which include inscribed and even dated specimen, these objects have never 1

been properly studied, and both categories need further investigation.

(4) Inkwells and penboxes. The most type of inkwell (dawat or milibara) had the shape of a cylindrical pot and was covered with a separate domed tid. It was used in Iran since Samanid times. and only the proportions, the profile of the cover and the decoration changed in the course of the centuries. The extant specimens fall chronologically into three groups. The first consists of Persian inkpots from the second half of the 6th/12th century. They are relatively small, 7 to 13 cm high. The base is either flat or has three low, almond-shaped feet cast together with the vessel. The cover has m fluted, domeshaped centre, and lid and body are furnished with loops or tubular appendages for fastening the pot the hand of the scribe. In the second group, which appears to have been used also in Syria in the 7th/13th century, the dome is hemispherical and rests directly the level surface of the lid. In the last group, represented by Persian inkpots of the 10th/16th to rath/r8th centuries, the body is slender, and its width hardly exceeds the width of the doned pover.

Penboxes (kalamdan) fall into several categories. The most rectangular boxes with a separate hinged cover and differently-shaped partments for the ink and other writing implements. The shorter ends of the Iranian specimens were generally rounded. The rectangular shape was more characteristic for Mamilik Syria and Egypt and for Ottoman Turkey. Fencases which were placed in the belt were more delicately shaped. The first and earlier type was wedge-shaped. It me made of two parts, and the inner, compartmented box could be entirely removed. Most of the extant specimens of this kind are Iranian in style and attributable to the 7th/13th century. The second type, known from 10th/16th to the 12th/18th centuries, apparently West Persian examples, consisted of a flat, either tubular or rectangular pencase and a cylindrical inkpot attached to it (Survey, Pl. 1387 A). A similar type was used by Ottoman officials.

(5) Caskets and boxes. The earliest preserved metal caskets come from 4th/roth century Spain. They are made of silver, mostly gilt and inlaid with niello, and their shape and proportions closely follow contemporary Spanish-Islamic rectangular ivory caskets with gabled lids (Migeon, Manuel, ii, 16-17, fig. 220). In the Eastern Islamic lands, silver caskets of this type are rare, and not known before the Saldith invasious. Two particularly fine examples are said to come from a Persian hoard and are kept in the L. A. Mayer Memorial Museum in Jerusalem (Suresy, Pl. 1352 A, B). Brass and bronze caskets made between the late 6th/12th and later 8th/14th centuries more The earlier specimen (Rice, SIMW, VI, Pl. VI) have a flat base and closely follow in their proportions the silver caskets. Later 7th/13th and 8th/14th century examples become higher, relatively shorter and wider, rest on low feet and generally have slightly slanting sides (Barrett, Pl. 37; Survey, Pfs. 1359, 1360 B). A derivative of the former caskets has a flat top and a partial lid which is secured to the fixed portion of the roof by hinges. Their form, too, is paralleled in ivory and [Rice, SIMII', VI, Pls. I-III; Survey, Pl. 1303, dated 593/1197).

Kur'an boxes are square and of larger dimensions. They we generally plated and not cast. The Mamlûk specimens have a bevelled lid (Berlin, Cat. 1971, no. 19, Pl. 69), while Iranian Kur'an boxes MAYDIN 989

have often flat covers. Along with angular, round and cylindrical boxes occur caskets of less conventional shape or exceptionally small size. To the last category belongs an oblong miniature box of remarkable artistic quality by Isma'll b. Ward al-Mawsill, dated 617/1220 (Rice, SIMW, II, Pl. IX), = a kidney-shaped box in the British Museum which is attributable to an Egyptian or Syrlan workshop of the middle to second half of the 7th/13th century. Similarly unusual in shape are a shallow, but relatively large, hemicircular box in the Harari Collection (Surpey, Pl. 1305 C) = a "casket" in the Louvre. The last follows the shape of cylindrical, late 7th/r3th century candlesticks with narrow, contracted waists, and has a low convex lid which is fastened to the container by hinges.

In the 8th/14th century, Persian metalworkers produced also a variety of polygonal caskets of various sizes. Among the preserved specimens are memall octagonal box (Survey, Pl. 1360 A) and four larger dodecagonal caskets, all of which have been assigned to workshop in Fars (Melikian-Chirvani, Le bronze iranien, 80-2). Marnlük, usually oval-shaped lunch boxes form a category by itself. They consisted of one to three separate units which were placed one on top of the other, and had a lid with a handle that could also be used as a foot. To prevent food poisoning, they were made of tinned bronze []. Allen, Later Mamluk metalwork, II, in Oriental Art, N.S. nvii/2

[1971], 156-64; Barrett, Pl. 31).

(6) Ewers and jugs. In spite of the relatively large number of preserved ewers (ibrik [q.v. in Suppl.]) and their importance as art historical documents, they have not yet been sufficiently studied. The suggested typological evolution, and most of the chronological or geographical attributions, are therefore tentative. Particularly difficult is the classification of ewers from the first four to five centuries A.H., where one finds an exceedingly large number of shapes and combination of forms for which so far no models have been traced. Among these ewers are vessels with slender, oval and heavily bulging-out bodies; with and without shoulders; with elegantly contracted and long tubular necks; with tubular or bird shaped spouts and a large variety of straight, gently curved and zoomorphic handles. Between the end of the ath/roth and the 6th/12th centuries new forms appear to have been introduced from the Eastern Islamic world, which include types of ewers with an oil-lamp like spout. Signed specimens of that kind have been found in ancient Farghānā and Ushrūsana by Russian scholars who dated them to the mid-5th/rith century. While these early examples were either plain only little decorated, later 6th/rzth to early 7th/13th century Khurasanian ewers of that type were inlaid with silver and copper, and attest to the new artistic trends of that time (Survey, Pl. 1309A). After about the first half of the 7th/13th century, more emphasis was put on decoration, while shapes became more standardised. The Mesopotamian standard type of ewer with a pear-shaped body, a low, splayed foot and m straight, tubular spout was retained as m model for Tranian and Mamilik ewers, which in Egypt and Syria developed more strongly swelling bodies, high splayed feet and top-heavy necks (for an ewer of Ka'it Bay, see Rice, SIMW. IV, Pl. VI). The development of Şafawid and Ottoman ewers is known from a small number of examples only. Among their typical elements - can tentatively single out curving spouts and handles, waisted necks with a bulging ring and hoat-shaped openings,

which presumably stem from the lamp-shaped openings of the earlier mediaeval tradition.

Jugs and pitchers (kar, pl. akwar), on the other hand, were fashioned in simple conventional shapes -a squat globular body and low foot, a short neck and a curved handle. The earliest extant models of gold and gilt silver date from the second half of the 4th/10th to the 6th/12th centuries (Survey, Pl. 1345; 1349, now in Jerusalem, L. A. Mayer Memorial Museum. For a jug made for Şamşām al-Dawla, now in the Cleveland Museum of Art, see Kühnel. Die Kunst Persiens unter den Buyiden, in ZDMG, evi [1956], fig. 6). Şafawid and Ottoman specimens basically conform to the Buyid prototypes. In addition to the conventional type of jug, there occur zoomophic hollow-cast vessels which resemble the European aquamanile. The purpose of these objects is often ambiguous. Some may have served for pouring water (bird in the Hermitage by Sulayman, dated x80/796; bird in Berlin, Cat. 1971, fig. 37; bird in the Monastery on Mount Sinai). Others were presumably fountain heads. Several specimens of the last category, such as "hares" "lions" or "horses" were either of Fatimid or Spanish origin.

(7) Bowls, cups and goblets. Mediaeval Islamic cups and bowls reflect a particularly longlasting affinity to Iranian and Soghdian gold and silver models. Of particular interest in this respect is the continuity of hemispherical, either plain or fluted howls, like the early 7th/13th century "Vaso Vescovali" (Rice, Wade Cup, Pl. 16), the "Wade Cup" (ibid., Pl. 2) or a parcel gilt silver bowl in the Keir Collection (Fohérvári, Pl. G). In mmore restricted sense this also applies to the continued use of ring handles with projecting thumb knobs. Although ultimately such handles appear to derive from Roman drinking cups, they too were introduced into Islamic civilisation via Soghdian silver vessels and persisted in metal cups until at least the early 5th/17th century (Melikian Chirvani, White bronne fig. 15), while with ceramic cups this feature lasted even much longer. By the later 7th/13th century, bowls with strongly-projecting walls, similar in profile to contemporary ewers, as well as new types of cups, bowls and goblets, began to appear simultaneously in Syria, Egypt and Western Iran. Among the new shapes were cups with a strongly contracted base and high, funnel-shaped foot turned upside down (Barrett, Pl. 34); footless bowls with walls that project strongly up to about one-third to balf of their beight, and bowls that have a nearly angular profile (Rice, Two unusual Mamluk metal works, Pl. I; VII; Barrett, Pl. 36 for a late 8th/14th century fracian example). Bowls with strongly curving-out profiles continued to be made in Safawid Iran. However, many of the 10th/16th to 11th/17th century bowls hark back to the more gently-rounded 7th/13th century models, which to have more agreed with the taste of the time.

Doors and windows and their accessories.

(t) Doors. Although plating of doors was practiceri since early times (Nāṣir-i Khusraw, Sajas-nāma, ed. and tr. Ch. Schefer, Paris 1881, 81, for door bearing the some of the Abbasid caliph al-Ma'mun at the Akşå Mosque, and p. 28 for iron-plated door in Diyarbakr; Djazarl-Hill, 191-5, 267-8 for description of later 6th/12th century door), specimen made before the beginning of the 7th/13th century is m yet known. The earliest preserved door at the mosque of Cizre or Diaginat ibn 'Umar (C. Preusser,

990 MACDIN

Nordmesopolamische Baudenkmaler, Leipzig 1911, Pl. 36 and p. 25) is inscribed with the name of Abu 1-Kāsim Mahmūd b. Sandjar Shāh (605/1208?). Nearly contemporary are three iron-plated doors from the constructions of the Ayyübid al-Zāhir Ghāzi (606-7/1209-10) at the citadel gates of Aleppo. Bronze or iron-faced wooden doors were particularly widespread in Mamlûk Egypt (for elements from door platings of Baybars, now in the Victoria and Albert Museum, 🚥 M. S. Briggs, Muhammadan architecture, Oxford 1924, fig. 232). Plaques from Mamlük doors - well - complete door wings are preserved in the Islamic Museum in Cairo). The 8th/cath century doors of the Mosque of Sultan Hasan, re-employed at the Mosque of al-Mu'ayyad in Cairo, are a very good example of its kind (Migeon, Manuel, il, 82-4, fig. 259). While the majority of extant doors were plated with iron or alloys of bronze, some roth/roth to 12th/18th century silver, or silver-plated, doors have also remained [Mayer, Metaluorkers, "Ilyas"; "Yahūda"). It may be safely assumed that earlier silver doors have been meited down and that their material has been re-used for other purposes.

(z) Doorknockers. In contrast to the plating, which was generally made up of flat bronze straps and polygonal lattice work panels, doorknockers cast in heavy bronze. Aside from polylohed rings which were filled with arabesques in openwork (Sevilla, Puerta de Pardón; Cairo, Sultan Hasan madrasa), numerous zoomorphic doorknockers are known. Earlier specimen, like the doorknockers of the Ulu Cami in Cizre (Djazfrat ibn 'Umar) are formed by a pair of confronted dragons which are suspended from hinges attached to a lion mesk (Ulker Erginsoy, in Gönül Öney, Anadolu Selçuklu mimarisinde stisleme ve el sanatlars, Ankara 1978, 168, fig. 141; The David Collection, Islamic art, Cat. Copenhagen 1975, 69. An identical knocker of unknown provenance is in the Berlin Museum). In later renderings, as for instance in m Mamlük example with the name of Muhammad b. Kalawun in Hebron, the ring is formed by a pair of facing dragon heads (a similar example is in the Louvre. See also knocker adoor of the Mosque of Kadimas al-Ishaki in Cairo, 885-6/1480-r).

(3) Window grills. Aside from a few silver and gold inlaid brass balls from monumental window gratings, window accessories have been preserved. (The number of wooden accessories preserved in situand in nuseum collections is however considerable.) Three of these balls bear the name of the Ilthanid Shahi (703-16/1304-16). The rest cannot be precisely dated, although their resemblance to the inscribed specimen places them in the same category.

(4) Locks and keys. On the whole, little attention has been devoted by art historians to locks and keys. They are poorly represented in museum and other collections, was soldom signed or dated, and once removed from the area in which they were made are difficult to identify. For stylistic and other reasons, most of the preserved pieces are said be iranian, though for lack of information this cannot be verified. Most of these locks me padlocks and were intended for chests, boxes, trunks or similar containers. They me generally very small-the average proportions are 5 cm width and 3.5 cm height—and fashioned in a variety of shapes. Yet a typical Iranian preference for animal shapes, inherited from ancient times, has been retained until today. Judging from the recently-catalogued locks in the P. Tanavoli Collection (Parviz Tanavoli and John T. Wertime, Locks from Iran, the Smithsonian Institution and P. Tanavoli, 1976), certain animal forms in vogue particular times only, while others were favoured throughout the centuries, A special category of padlocks was used as amulets and bear inscriptions of protective character.

Keys of the Ka'ba form a class by itself (J. Sourdel-Thomino, Clafs et _____ ds la Ka'ba, Paris 1971). Many carry ____ and titles of the sultan for whom they were made and ____ therefore dated or datable. On the whole, they are historical documents rather than works of art.

The decoration.

Although Islamic decoration follows some general, ubiquitous principles by which designs were interchangeable between various media, one can nearly always detect certain strains which characterise any specific form of art. This applies also to metalwork, which seems to have developed certain preferences with regard to ornaments — decorative schemes as well as to loonographic themes.

(1) Geometric patterns. In addition to primary geometric grids by which the surface of every object was subdivided and its decorative elements organised, metal workers employed all the geometric forms used by artisans working in other media. Designs obtained by means of intersecting parallel bands to form 📺 overall surface pattern of squares or lozenges, which could also easily be perforated, were often adopted for incense burners or mosque lamps (Rice, SIMW. V). To avoid the monotony of these patterns, artisans used to fill the empty spaces by adding punching mark or circular cavity at the points of intersection, matting the interior of the lozenges or filling them with a floral design. Small circles were employed also to create continuous lines and geometric patterns. Particularly on early metal objects, artisans sucreeded in producing a variety of patterns of tangent or overlapping circles and ring-matted geometric forms set into the interspaces (see for instance, Melikian-Chirvani, The white bronzes, 136 ff.). As a rule, the artists omitted certain portions of the circles in order to create new variants of interlacings. Patterns of this kind, which were often imbued with m remarkable inner tension (Barrett, Pl. 2a), were employed up to at least the 8th/14th century for single and repeat patterns alike. Between the second half of the 7th/13th to about the middle of the 8th/ zath century, circles inscribing six or eight interlaced coundels became a favourite design of Syrian, Egyptian and Persian metal workers. In these later examples, many of these patterns have lost their former inner tension (Baer, Nisan tan; cf. 8th/14th century Persian penbox, Hayward cat., no. 206).

As in architectural decoration, hexagons formed also the base for surface and star patterns. Sixarmed clockwise or anti-clockwise wheel patterns (erroneously called swastika), which were **seement** in brick architecture = early as the 5th/11th century, were not employed in metalwork before iiii first third of the 7th/13th century, and until the second half of the 8th/14th century they remained a favoured design for filling petals or circles. Hexagonal star patterns were particularly popular in East Iranian and Afghanistan workshops, which in the 6th/12th and 7th/13th centuries developed them into intricate designs or into notched 🖚 looped motifs interwoven with a variety of geometric forms. By the second half of the 7th/x3th century, this type of pattern disappeared from the repertoire of Persian and Mesopotamian metalworkers, and its place was taken by medallions formed by overlapping circles.

In spite of the common geometric language which metal objects share with other fields of Islamic art, there is a clearly noticeable difference in emphasis. In contrast to architectural ornament, in metal the geometric patterns are confined to close borders; they are generally combined with other designs, and only rarely form the main decorative feature. They either form a grid or a network into which other motifs are set, or function—like "swastika" or basketweaving—as background pattern. In Safawid and Ottoman metalwork, certain geometric interlacings continue to fill medallions or other inscribed spaces (Survey, Pt. 1385). On the whole, these objects hear however floral and epigraphic decorations.

(2) The floral répertoire. As in other artistic media, vegetal croaments on metalware fall into three main types: motifs derived from Hellenistic Mediterranean and non-Hellenistic tranian models; infinitely curling scrolls and arabesques; and blosand foliations that stem from Far-Bastemi prototypes. Motifs of the first type-acanthus leaves, palmettes, vine scrolls or stalks bearing grapes or pomegranates—continue to figure in traditional and new compositions. One some early bronze and silver objects these motifs appear in sophisticated combinations (Dimand, Some early Islamic bronzes from Iran in American collections, in Akten 24. Intern. Orientalisten Kongress, 1957. Munich 1959, 347-9). On less ambitious objects, undulating stalks and branching-off shoots carrying vine and palmette leaves constitute the only decoration.

Fully-developed arabesques do not appear before the 4th/toth century. From this time onwards, two types of arabesques—a flowing, constantly changing design, and an arabesque based on axial symmetry—recur on metal-work of all periods. Another form of arabesque which gained much popularity on metal-work consists of pairs of knotted, bifurcated palmettes which blossom out from a crescent-shaped loop (Rice, The brasses of Badr al-Din Lu²lu², fig. 8). Modifications of such floral interlacings, in which a crescent-shaped loop is either substituted by a bar, or transformed into lotus blossoms, or even completely omitted, remain a favourite motif in 7th/13th and 8th/14th century brasses in the rast and west

Winding, often hooked stalks, whose foliage is reduced to small buds and split palmettes, serve as background pattern and filling device alike. On franian, 7th/13th m 8th/14th century metal objects the background scrolls used to be light and airy and wind regularly, while the Syrian types are heavily loaded with buds. On early Mamilik brasses, the beraldically-composed arabesque reached the popularity it had gained in Iran. Background patterns on Egyptian metalwork of the first half of the 8th/14th century are formed by continuously winding and freely intersecting scrolls. Most delicately drawn arabesques, carrying tiny buds and flowers occur on toth/16th to trth/17th century steel helmets, daggers, steel or iron belts, pierced plaques and surgical instruments.

As in other artistic media, varieties of lotus blossoms, peonles and morning glories are encountered on both Mamlük and Persian metal objects, Persian artists made, however, a somewhat wider use of these motifs than their Mamlük contemporaries. On later 7th/13th to early 8th/14th century West Iranian metalware, the flowers grow "naturally" from the

ground. Sprouting between and behind the figures, they form the background for figurative motifs or cover the entire surface of an object. It tendency towards sum symmetric composition can ill detected on Mamfak metal objects (Rice, Two unusual Mamfak metal works, Pl. V), while the individual, carefully engraved petals have generally retained a naturalistic flavour.

(3) Animals and imaginary creatures. On mediaeval metalwork, animals and imaginary creatures were one of the most conspicuous themes. The frequency in which these motifs were employed, as well in the species depicted, were determined by different factors. Yet even at times when animal decorations did not constitute a major theme, they did not disappear from the repertoire. Because of their abundance, and often intricate iconographic implications, the present survey includes only the most current animal motifs and compositions.

Many of the animal motifs were carried on in Islamic metalware from Säsänid and Soghdian silver (Barrett, Pls. 1, 4b). The same is true for compositions, such as a single bird or quadruped inscribed within a round or polylobed medallion. The preference for heraldic compositions, inherent in Near Eastern and Iranian art, applies also to animal designs, oven if the prominence given to these compositions varied. Broadly speaking, in earlier metalwork they are more monumental in size and style, while later objects they me integrated in a larger decorative scheme. In many of these heraldic compositions the central axis is taken by a plant design or a curtailed "tree of life", a knotted motif or other derivative of the "tree of life". Pairs of ducks flanking a crescent-shaped motif and characteristic for North Mesopotamian, Mamilik and Persian metalware from the mid-7th/13th to the second half of the 8th/rath century. Physically-linked pairs of animals imaginary creatures do not occur on motalware after the early 8th/14th century, while the motif of heraldic birds - quadrupeds, set into cartouches or pendants, was carried on in Şafawid and later metalwork. Other ancient Near Eastern animal motifs employed in metalwork are animal friezes, animals in combat (Baer, Inhwell, particularly 206-8), and real and imaginary creatures revolving around a central axis. In 6th/sath and early 7th/sath century examples from Eastern Iran, Afghanistan and Northern Mesopotamia, the ears, wings or necks of the centrifugally-rotating creatures meet-or intersect-in the centre (Rice, The brasses of Bade al-Din Lu'lu', figs. 1-3; Ettinghausen, Wade Cup, figs. L, P, 21, 34). In later 7th/13th to 8th/14th century examples, the rotating creatures - no longer physically linked. In the last phase in the development of this pattern, the real imaginary creatures we substituted by flying birds, and the rotating movement is | longer consistently adhered to (for a typical Mamible example, see Cairo cal. 1969, no. 58, Pl. 8).

Another motif is that of animal (or white which animal bodies or busts attached to, or amalgamated with a vegetal design. Spreading from Syro-Mesopotamian and Persian to Egyptian metalware, it appeared in the first half of the 7th/13th century (Hayourd eat., no. 200) abruptly as it disappeared in the last quarter of the 8th/14th century (for a late example, E. Combe, Cinq cwiness musulmans date: des XIII, XIV et XV sikeles de la Callection Benahi, in BIFAO, XXX [1931], 56-7. On textiles and carpets, the motif survived, however,

992 MA'DIN

in various related forms. See for instance, Surrey, Pls. 1172, 1212B).

The animal decoration in later metalwork closely follows the mediaeval repertoire. Conventional themes, such as combatant — chasing animals, friezes, flying birds, peacocks or animals of preywere carried on, and are re-employed in modern metalwork (Survey, Pls. 1380, 1383, 1386B. For armourly see also Pls. 1408 D. E. 1418, 1430-31 D).

(4) Epigraphy. Stylistic poculiarities. In metalware, the first epigraphic bands which carry not only message but have a clear decorative function occur on ard/oth to 4th/roth century mosque lamps (Rice. SIMW. V; for earlier inscriptions, cf. a 2nd/8th century bronze ewar in the Thilisi Museum. III birdshaped vessel in the Hermitage, dated 180/706-7. and on 4th/20th to 5th/22th century bronze and silver objects (Survey, Pts. 1343, 1345-6). From this time onwards, particularly since the mid-6th/rath century. epigraphy remained a constant factor in the decoration of metalware. The formal integration of the script, being into continuous or compartmentalised bands, cartouches or medaltions, complies with the general stylistic tendencies of the time. On Mamiûk metalware, inscriptions appear not only in continuous and intersecting bands which may occupy a considerable part of an object, but also in a circular arrangement in which the hastae of the letters point towards the centre. Starting from the mid-8th/14th century, such radiant inscriptions are most prominent.

The stylistic development of script = metalware, and the possible divergencies from other artistic media, still remain to be studied. In the present state of our knowledge, there appears to be only type of script which at least in its later stages of development is unique to metalware. This is a scrip! in which either the whole letter or part of it are made to assume human or animal forms. According to the figural features which dominate in each of its variations, it falls into four types; ornithomorphic, human-headed, zoomorphic and anthropomorphic (Rice, Wade Cup; Baer, Metalwork). Out of these, only the first is known from objects other than metalware, occurring on Samanid ceramics about 250 years prior to the first dated evidence of figural script on metal, the "Bobrinski Bucket", which was made in Harat in 550/1263 (Ettinghausen, Wads Cup). The figural script had disappeared almost completely by the end of the 7th/13th century.

The integration of the script into the overall composition of a decoration, like its artistic development, is however only one aspect of these inscriptions. Aside from their artistic value, these examples are texts which, if properly read and interpreted, may provide valuable information which is not available from other sources. Although the general categories eulogies, and dedications, religious inscriptions, moral dicta, inscriptions connected with the usage or quality of M object and verses from Persian literature-are known, only a very limited number of inscriptions have actually been read. A proper investigation and evaluation of each of these categories has therefore been postponed until we possess a comprehensive corpus of inscriptions on metalwork (for some ideas, ... Beer, Metalwork).

(5) The thematic repertoire. The thematic repertoire of mediaeval Islamic metalwork falls into three main groups. The first and by far the largest representations of pleasure and pastime. They include, aside from banqueting scenes, dancers and musicians, a rich selection of hunting methods, fal-

conry, hunting with the cheetah and phases of the animal's training and fowling. Visual renderings of this last game are rare in other artistle media. Other pastimes, like polo games and travelling in a howdah on camel-back, have parallels in ceramics ■ miniature paintings. Salling in ■ pleasure boat, princely pastime which could be practiced only in Mesopotamia and Egypt, seems to have no analogues in ceramics, textiles and the like (Baer, A brass ressel, 299-325). Representations of outdoor activities in a rural environment appear to be characteristic of a small group of early 7th/13th century Mesopotamian-style metal objects, while tournaments or battle scenes seem to have been a favoured theme in the later 7th/13th to 8th/14th century in Syrian, Egyptian and West Iranian metalwork alike. On the whole, these scenes were less popular on Iranian brasses than on contemporary Mamluk objects (Rice, Baptistire), The second category are cosmic and terrestrial cycles. It comprises representations of the Labours of the Months, the planets and the zodiac, and scenes in which a princely image is shown in a cosmic setting. The first and the third thome - as yet known from metal objects only (for Labours of the Months, see Rice, The seasons and labors, 1-40; E. Atil, Two 11-khunid candlesticks, 1-33). Astrological signs, on the other hand, are not limited to metalwork. It would seem, however, that on metalwork the iconographic programme of this theme is particularly rich and has no known analogues in other artistic media (Hartner, The Vaso Vescovali; Baet, An Islamic inheell. For the princely image in cosmic setting, see Baer, Metalwork).

Epics, legends and religious themes as an inspiration for the third group. In comprises illustrations of certain episodes of the <u>Shāh nāma</u>, and ornamental designs based upon popular belief and folklore. Both relate to pottery and the art of the book. Their iconographic meaning is allusive (Baer, Fishpond ornaments).

In a group of mid-7th/13th century North Syrian and North Mesopotamian metalware, Christian religious themes are combined with traditional Islamic decorations. In addition to saints or high church officials, they depict cycles of the life of Christ. Themes so far identified are "The Entry into Jerusalem", "The Nativity", "Baptism", "The Presentation in the Temple" and "The Virgin and the Child enthroned". However, the problem of Christian subjects on Islamic metalwork needs further research.

Workshop centres.

Our information on centres of manufacture of metalwork stems from two main sources. One is written evidence provided by mediaeval geographers and historians. It is generally reliable, but often exceedingly brief, and even when the author reports on his native town (cf. Ibn al-Fakih, K. al-Buidan, 253, Il. 19-20, for Hamadan), the products are often only listed but not described (for an exception see al-Makrisi, below). The second source of information is inscriptions which figure on the objects themselves. Two types are particularly suggestive. One are inscriptions referring to the place of manufacture. So far only a relatively small number of places have been deciphered. Future systematic collection of these inscriptions may provide new evidence (the following place appear in far on in object only: Başra, ewer by Ibn Yazid, dated 67 or 69/688-7 or 688-9, Mayer, Metalworkers, 48; Kashan or Kasan (?), bird-shaped vessel by Sulayman, dated 180/790-7. Melikian-Chirvani, in Propylden Kunstgeschichte. Islam, ed. J. Sourdel-Thomine and B. Spuler. 1973, — XVI; Mosui, "Blacas Ewer", decreated by Shudia" b. Man'a in 629/1232. Hayward cat., no. 196; Misr, candlestick by Muhammad b. Masan, dated 668/1270, Wiet, Objets en caure, Pl. 27).

The other type of inscription on metalware is that of signatures giving not only the more of the artist but also his wishe. An often-made assumption that intrinsically the nisbs that the artisan was active in this centre has to be discarded. In may have been carried by an artist who had left his native town many years ago and was working hundred of miles away. It can therefore be considered significant only if taken in conjunction with other elements. One of the most striking examples for the continuous use of a nisba by artists who were active in another centre is the misbs al-Mawsill, found on least 30 objects made throughout the 7th/13th and the first quarter of the 8th/14th century, out of which only one single specimen stems unequivocally from Mosul [Rice, Iniald brasses. To Rice's list add a candlestick by 'All' b. Kusayrat, working in Damascus, and a Kur'an box by Ahmad b. Bára, Cairo cat. 1969, nos. 56, 60).

On the basis of the above mentioned criteria, only three larger centres can so far be singled out. One is Damescus, which at least since the 4th/10th century and throughout Mamiliak times exported metalware to all parts of the Islamic world, including Cairo (al-Mukaddasi, 181, 1, 1; Nāṣn-i Khusraw, Safar-ndma, ed. Scheier, 52, 1, 13; al-Makrizi, Khitāi, ii, 112, For metal objects inscribed with this provenance, Rice, Inlaid brasses, 326, no. 16;

Cairo cal. 1969, no. 56).

The second centre which, like Damascus, had flourishing workshops during the Mamlük period is Cairo (for a detailed description of the Market of metal Inlayers—sub al-bultivyin— in which bronze vessels were inlaid with gold and silver, see al-Makrizi, Khilai, il. 103. For metal objects inscribed with this provenance, see Rice, Inlaid brasses, nos. 23, 24, 261. At the time of al-Makrizi's account, i.e. after 820(1417).

this industry had already declined.

The third reasonably-documented centre, famous for its richly-inlaid bronze objects, is Harat (Kazwini, Athar al-bilda, ed. Witstenfeld, 322, I. 30-323, I. z). Two objects, the "Bobrinski Bucket" dated 559/1163, and an ewer in the State Museum of Georgia in Thilisi, dated 557/1181, carry an inscription stating that they were made in Harat (the exact text of the Tiffis me has, however, never been published. See Mayer, Metalworkers, 59, Mahmud b. Muhammad; Ettinghausen, Bobrinshi "Kettle", in Gazette des Besux Arts, 1943, 196). Four other 6th/12th contury Inlaid pieces of metalworks, worked in similar style and technique, and signed by artists using the sisba al-Harawi, suggest that these artists had already left Herat and were active in another centre. Information on other centres of manufacture is even more scanty. Places put forward by art historians should therefore be used with caution.

Arabia and other parts of the Orient (see Yākūt, s.v.), and is also found in the toponomy of the Iberian peninsula. Under the form Almaden. this term refers to the locality in the province of Ciudad Real, 125 km, to the north of Cordova, in the Sierra de Almadén (A. Dilbāl al-Ma'din), which has of the richest deposits in the world of mercury (A. 17'das and variants, whence Spanish asogue and the fullest form of the place name Almadén de Azogue). According to Garcia Bellido (España y los españoles hace dos mil años segun la Geografia de Sisabón, Madrid 1945, 79-81), these deposits were already being exploited in the 4th century B.C., since the Greek philosopher Theophrastes (ca. 372-287) mentions the cinnabar of Iberia. At the present time, they still produce each year about 1,800 tonnes of mercury.

The Portuguese town of Almada, situated opposite to Lisbon on the southern bank of the Tagus, owes its name (A. Hisn al-Ma'din) to the grains of gold dust thrown up by the sea on to this bank (al-Idrisi, Description de l'Afrique et de l'Espagne, text 184, tr. 223 — Opus geographicum, Naples-Rome 1975, v. 547).

MADINA, urbanism. [See Supplement].

AL-MADINA (usually Medina in English, Médine in French), residence of the Prophet Muhammad after the sedire and seem of the sacred cities of Islam.

Medina is situated in the Hidiaz province of Sa'Odl Arabia in latitude 24" 28' N, longitude 39' 30' E, about 160 km. from the Red Sea and about 350 km, north of Mecca. It has developed from oasis on relatively level ground between the hill of Ubud in the north and that of 'Ayr in the south. East and west are lava flows (in Arabic harra [q.v.] or labs). There we several models or watercourses which cross the casis from south to north. Though these normally contain only after rain, they maintain a fairly high water table, m that there are many wells and springs. After heavy rains the central area of al-Munakha used to form a lake, and a number of serious floods are recorded which threatened the stability of some of the buildings. On one occasion the caliph 'Uthman erected a dam m a protection against flood-waters (al-blafadhurl, Fullis, 22). Serious floods an also recorded in 660/40, 734/216 and 772/256. The water is in places salt and unpalatable, and in the past various governors of the town built aqueducts to bring good water from wells further south. The soil consists of salty sand, lime and loamy clay, and is everywhere very fertile, especially in the southerly part. Datepains must numerous before the time of Muhammad, and cereals were also grown. At a later date oranges, lemons, pomegranates, bananas, peaches, apricots, ligs and grapes were introduced. The winters are cool with a slight rainfall, and the summers bot but rarely sultry. In former times, the air was reckoned pleasant but conducive to fevers (al-Baladhuri, 17 f.; Wensinck, Mohammed un da Joden, 31; Goldniher, Muk. Stud., ii, 243). The Umayyads called the town al-Liabilia, "the dirty", in contrast to the honorific of Tayba, "the sweet-smelling", given to it by Muhammad (Goldziner, op. cit., ii, 37; al-Baladhurl, rr).

(i) HISTORY TO 1926

1. The pre-Islamic settlements

In pre-Islamic times the common name was Yath-

rib, though this is said to have been applied originally to only part of the oasis (al-Sainhūdī, i, 8-ro). This name occurs once in the Kur'an (XXXIII), 13). Inthrippa is found in Ptolemy and Stephanus Byzantinus, and Ythrb in Minaean inscriptions. Al-Madina is properly "the town" or "the place of jurisdiction", corresponding to Aramaic medinia. The word madina as a common man occurs ten times in the Kur'an and the plural made'in three times, all in stories of former prophets. In four relatively late verses (IX, 101/2, 120/1; XXXIII, 60; LXIII, 8) almadina appears, referring III the oasis me inhabited mainly by Muslims, but it is possible that it has not yet become a proper name. The same holds of its in the last clause of the Constitution of Medina (Ibn Higham, ed. Wüstenfeld, 341-4), since in the preamble and other two clauses of this document the name Yathrib appears by itself. It is often suggested that the name is a shortened form of madinat al-nabl, "the city of the Prophet", but this is unlikely in view of its use in the Kurlin, especially in LXIII, 8, where it is spoken by Hypocrites. Of the poets of the oasis, the pre-Islamic Kays b, al-Khatim [q.v.] speaks only of Yathrib, whereas Muhammad's contemporaries Hassin b. Thibit and Ka'b b. Mâlik [q.vv.] use both names.

Medina was at first not a compact town, but a collection of scattered settlements, surrounded by groves of date-palms and cultivated fields. For defence, therefore, a large number of forts or strongholds (ddm, sing. udum; also ddjdm, sing. udimm) had been constructed, purhaps about 200 in all. In these the local inhabitants took refuge in times of danger. The idea of the utum probably mem from the Yemen (cf. H. Lammens, Taif, 72 = MFOB, viii(1922), 184).

The later Muslim historians (cf. al-Samhudi, i, 150-65; hdb 3, fast 1) had no reliable information about the earliest history of Medina, and the views expressed appear to be conjectural; e.g. that the first cultivators "" 'Amālik [q.v.]. It seems probable that before the arrival of any Jews there were made that before the arrival of any Jews there were hose found subordinate to the Jews at the time of those found subordinate to the Jews at the time of the settlement of al-Aws and al-Kharradi. It was probable because of this close relation to the Jews that certain small Arah clans (Khatma, Wā'il, Wākii, Umayya b. Zayd, sections of 'Amr b. 'Awf) did not in first accept Muhammad as prophet.

There is also obscurity about the earlier history of the Jews of Medina. It mine probable that some were refugees from Palestine, perhaps men who left after the defeat of Bar Kokhba; but others may have been Arabs who had adopted Judaism as religion. Certainly, the Jews of Medina intermerried with Arabs and had many customs similar to those of their Arab neighbours. It is clear from the Kur'an, however (e.g. II, 47/4 ff.), that they claimed to be of Hebrew descent, despite the fact that the names of the clans and most of the most of individuals Arabic. Early Arabic poems ascribed to Jews indistinguishable in literary form and in content from those of desert Arabs (Th. Nöldeke, Beiträge sur Kenninis der Possie der alten Araber, 52 11.). While there may have been simple agriculture before the coming of the Jews, they almost certainly developed the cultivation of dates and cereals here as in other bases such as Khaybar (cf. W. Caskel in G. E. von Grunebaum, ed., Studies in Islamic cultural history, Menasha 1954, 43; - American Anthropologist, lxvi/2, Memoir no. 76).

There were three main Jewish groups in Medina at the Hidles, the class or tribes of Kuraysa, al-

Nadir and Kaynukā'. Of these, the first two had some of the first lead in the casis, while the third had no the but were armourers and goldsmiths, besides conducting a market. In addition, at Samhūdi lists about dozen other purely Jewish groups, of whom the most important was the Banū Hadl, which was closely associated with Kurayza. He further mentions among the Jewish groups of the which are sometimes given Arab genealogies, such as Unayf and Marthad (parts of Bali), Mu'awiya b. al-Hārith (of Sulaym), and Diadhmā' and Nāghisa (of al-Yaman).

The Jewish domination of Medina came to an end some time after the settlement of two large Avab groups, al-Aws and al-Khazradi [q.w.], sometimes called together the Banū Kayla, but mostly referred to as the Ansar or "helpers" of Muhammad. They are among the Arabs said to have left South Arabia after the breaking of the dam Ma'rib [q.n.]. At first these Arabs were under the protection of some Jewish tribes, and a sign of their inferiority was that Fityawn, the leader of the Jewish-Arab group of Thafiaba, exercised a ius primae nociis over their women. This was resented by Mālik b. al-'Adjlan (of the clan of 'Awf of al-Khazradi), and he revolted successfully and became independent. Subsequently, with help from either . Ghassanid or a South Arabian ruler (according to somewhat legendary accounts), he enabled the other class of al-Aws and al-Khazradi to become independent of the Jews. It is sometimes said that the Jews now became subject to these Arabs. This is not borne out, however, by the historical accounts of the period up to 5/627. The main Jewish groups, though doubtless now weaker than the Arabs, retained a measure of independence and continued to occupy some of the best lands. They were not politically united by their religion, but different groups were in alliance (hilf) with different Arab clans, and were sometimes involved on opposite sides in the fighting between Arab clans. Some of the groups of judaised Arabs seem to have gradually become merged with Arab clans (as the Banu Zacura' with 'Abd al-Ashhall.

The historical accounts make it clear that the effective political units in the pre-Islamic period were not the tribes of al-Aws and al-Khazradi, but smaller units, which may be called clans. Those inentioned in the Constitution of Medina (see below) al-Nabit 'Amr b. 'Awf and Aws Manat (later Aws Allah) among al-Aws, and al-Nadidiar, al-Harith, 'Awf, Sā'ida and Djusham among al-Khazradj; but even smaller groupings were also important. From at least fifty years before the Hidira there had been a series of blood-feuds between Arab groups, behind which, at least latterly, there may have been an economic factor, namely, desire for better lands. These feuds led ## fighting described as "wars". The earliest recorded was between Mālik b. al-Adilān of 'Amr b. 'Awf and Uhayha b. sl-Djulah of Salim (Kawākila). Four small "wars" occurred between this and the "war of Hatib", which was the bloodiest and culminated after several fights in the battle of Bu'ath [q.v.] in about 617 A.D. Most of the clans of al-Aws took part under the leadership of Eudayr b. Simāk, and most of the clans of al-Khazradi under 'Amr b. al-Nu'man of Bayada. The Jewish clans of Kurayza and al-Nadir in this occasion supported Hudayr because 'Amr b. al-Nu'man had killed hostages they had given him. One or two Arab clans and prominent leaders, notably Ahd Allah b. Ubayy, did not take part # the battle. The fighting was severe and both leaders were killed, but neither side had a decisive advantage and m formal peace

made. This unresolved conflict was doubtless one factor leading the Arabs of Medina to invite Muhammad to go there.

Al-Aws and al-Khagradi were noted for their devotion to the deity Manat, whose shrine was at al-Mushallai between Medina and Mecca (Weilhausen, Reste prabischen Heidentums1, 26; T. Fahd, Panthéon, 123). The Medinan poet Kays b. al-Khatlm bas references to Allah (Disam, ed. Kowalski, Leipzig 1914, 5.6; 6.22; 11.8; 13.12), but these may reflect not so much Jewish or Christian influence as the widespread belief in a supreme god or "high god" often called Allah (cf.). Teixidor, The pagan God, Princeton 1977, 17, 162, etc.). There seems, however, to have been movement towards monotheism before the contact with Muhammad; e.g. Asfad b. Zurāra and Abu 'l-Haytham (lbn Sa'd, iii/2, 139, 22), and Abu Kays Şirma b. Abi Anas (Ibn Hisham, 348). Another man, known as Abū 'Āmir al-Rāhib, though a monotheist and ascetic previously, became an opponent of Muhammad (Iba Hisham, 411 f., 561; etc.).

z. From the Hidira to the caliphate of All

There was probably some knowledge in Medina of Muhammad's mission from an early date. Suwayd b. al-Şāmit, who died before the battle of Bu'ath, is said to have accepted the Kur'an (Ibn Hisham, 283-5). The first definite converts were six with of al-Khazradi who came to Muhammad probably in 520. At the pilgrimage of 62; they brought a party of twelve ___ (including two from al-Aws), and the party formally accepted Islam and made certain promises. This was the Pledge of the Women, or first Pledge of al-'Akaba. In 622 seventy-three men and two women from Medina, who had become Muslims, made the pilgrimage to Mecca, and promised to protect Muhammad and his followers as they would their own nearest kinsmen. This was the second Pledge of al-'Akaba or the Pledge of War (bay'as al-harb). On the basis of this agreement, some seventy of Muhammad's Meccan followers with their dependants emigrated, or made the kidira, to Medina in small groups. Muhammad and Abû Bakr came last, and reached Kuba' in the south of the oasis on 12 Rabi' al-Awwal (= 24 September 622), The Emigrants (muhādjirān) from Mecca were given hospitality by the Muslims of Medina, Muhammad himself did not accept any of the many offers of hospitality, but ostensibly allowed his camel to make the choice for him. It halted on a piece of land belonging to two orphans, and Muhammad bought the land and used it for his mosque and for his own house. It was probably because **III** the same desire not to have a special relationship with any of the rival claus in Medina that none of Muhammad's marriages was with a woman of either al-Aws or al-Khazradi.

At al-'Akaba in 622 Muhammad had asked for the appointment of twelve "representatives" (suks-bd'). The number twelve mm probably suggested by the tribes of Israel and the disciples of Jesus; but the fact that when the first representative of the clan of al-Nadjrijār died Muhammad took his place (one of his great-grandmothers had been m woman of al-Nadjrijār) suggests that the suksbā' were part of a political structure for Medina which fell into disuse. The effective structure of the community is doubtless that indicated in the document often known as "the Constitution of Medina" (Ibn Hishām, 341-4; discussed by Weihausen, Skings und Vorarbeiten, iv, 65-83; Wensinck, Mohammed on de Jedon, 74-81;

996 AL-MADINA

Caetani, Annali, i, 391-408; Watt, Muhammad at Medina, 221-8; R. B. Serjeant, The "Constitution of Medina", in 1Q, vili (1964), 3-16; idem, The Susnah Jami'ak, pacts with the Yathrib Jews, and the tahrim of Yathrib, in BSOAS, xli [1978], 1-42). The document is composite, as is shown by repetitions. In its present form it would seem to belong to a date after the Kurayza affair in 5/627, but some of its articles may go back to the Pledge of War at al-'Akaba. By this document all the people living in Medina em constituted a single some or community in accordance with traditional Arab ideas of confederacy. There are nine primary members of the confederacy, eight local "clans" (three of al-Aws and five of al-Khazradi) and the group of Emigrants from Mecca. Although the underlying political conceptions were pre-Islamic Arab, the confederacy was one of Muslims, since at least the leading men in each of the eight class had accepted Muhammad as prophet, Many of the articles speak of "the believers", and there are several references to God. About ten distinct groups of Jews are mentioned in separate articles, and are confirmed in the practice of their own religion, as well as having certain rights and obligations. Even unbelievers or idolaters in the Arab class appear in have been accepted as members of the community, though with restricted rights. There some two dozen general articles dealing with various matters conductive to the smooth running of the community. Muhammad is given no special powers, but is recognised as prophet and is to have disputes referred to him. At least until 5/627 be could not issue commands but had to consult the clan leaders and get them to agree to what he proposed. After the conquest of Mecca in 8/630, however, his authority was unchallenged as a result of Muslim successes. When Arab tribes accepted Islam and became allies of Muhammad they were presumably included in the confederacy, and the Muslim community ceased to consist solely of the inhabitants of Medina. Al-Aws and al-Khazradj, as Muhammad's earliest allies, were called the Ausar or "helpers".

The period from the Hidira to Muhammad's death was characterised by a series of over 70 expeditions **=** razzlas (*maghāst* [q.v.]), in which the number of participants varied from a handful to 30,000. In the first few small expeditions, only Emigrants from Mecca took part, but in the expedition of 2/624 which culminated in the battle of Badr the Muslims of Medina constituted about three-quarters of Mubammad's force. After the victory at Badr most of the Muslims of Medina were committed to Muhammad's general policies, though a few, the Hypocrites (mund/ibin (q.u.)), opposed them. This opposition within Medina was dangerous for Muhammac when the Meccans invaded the oasis in 3/625 and the Muslims of Medina suffered many casualties, and again in 5/627 when the Meocans with many ollies attempted to besiege Medina. There was also opposttion from some of the Jews, and this led me the expulsion of the class of Kaynuka' and al-Nadir (in 2/624 and 3/625) and the execution of the men of Kurayza and selling into slavery of its women and children (in 5/627). Jewish verbal criticisms of the Kur'an had been felt | threaten the acceptance of Muhammad in prophet, while Kurayza had apparently been intriguing with the Meccans during the siege. After 5/627 the remaining Jews of Medina gave no further trouble. In succeeding years, many Arab nomade on accepting Islam came to settle in Medina and were attached to the group of Emigrants; and this further strengthened Muhammad against the

Ansar, On the whole, he managed to keep the peace between the rival groups in Medina, though at times was able to use the hostility of al-Aws and al-[Chazrad] to further his own ends. After the conquest of Mecca and the acceptance of Islam by many of the leading Meccans, both sections of the Ansar felt threatened by these last (cf. Ibn Hisham, 824, 853 f.), and this division in the Ansar gradually ceased to be of political importance. The opposition to Muhammad from 'Abd Allah b. Ubayy [q.v.] and his supporters, known as the munafikum, seems to have faded cut at the time of the siege of Medina, for 'Abd Allah b. Ubayy participated in the expedition to al-Huday. biya. About 9/630, however, another group of mundfihas appeared. During the expedition to Tabuk an attempt on Muhammad's life was planned, but was foiled. About the same time a mesque had been completed in the southern part of the casis, the Masdjid al-Dirar = "Mosque of Dissension", but instead of honouring it by his presence Muhammad sent to demolish it, having realised that it designed to be a focus of intrigue against himself. (For the details of all these events, see MUHAM-MAD.)

After the great expedition to Tabük, Muhammad did not leave Medina except to make the Pilgrimage of Farewell to Mecca in Dhu 'l-Hididia 10/March 632. About two months later he fell ill, and asked permission of his wives to remain in 'A'lsha's apartment (instead of spending one night with each in turn). He died 🖿 13 Rabli I 11/8 June 632 and was buried in this spartment. He had made no arrangements for succession to his political authority, except that he had appointed Abū Bakr to lead the public prayers. The Ansar met in the hall (sakifa) of the clan of Satida and appointed the leading Khasradil, Sa'd b. 'Ubada, as their ruler. 'Umar and Abū Bakr, however, heard of what was happening, hurried the hall, and persuaded the Ansir that only aman of Kuraysh could be accepted by everyone as head of the community. They then appointed Abū Bakr who took the title of "caliph (khalifa) of the Messenger of God".

Aba Bake continued to reside in Medina and to follow a policy of expansion by sending expeditions northwards. Most of his brief reign [11-13] 632-4), however, was occupied in subduing revolts among various Arab tribes (the wars of the Ridda). His successors 'Umar (13-23/634-44) Withman (23-35/644-56) also resided in Medina, apart from brief visits to recently conquered provinces. Medina was thus briefly the capital of mempire, but had little of the dignity associated with such a role. The callph lived in his private house, and had guards. Thus when insurgents from the previnces attacked "Uthman in his house, his only support was from the sons of some of the leading men of Medina who had been sent as a token force. When the insurgents attacked seriously, there was virtually no resistance and 'Uthman we killed. Upon this, the Muslims in Medina accepted 'All as caliph, but they now only a small proportion of the whole Muslim community, and their choice of caliph was not accepted in all the provinces. The Muslims of Syria favoured their governor Mu'awiya, while Talha and al-Zubayr opposed 'All, first from Mecca and then from Başra. 'All, feeling constrained to counter the moves of these two, left Medina for "Irak in October 656 and never returned. In effect, Medina was replaced as capital by Kūfa, and, after the acknowledgement of Mucawiya as caliph in 661, by Damasous.

3. From 66x to 1946

After it coased to be the centre of the caliphate, Medina became something of a backwater politically. For a brief moment in 63/683 it came into the historical limelight. Many of the leading men of Medina disliked Yazid's succession to his father Mufawiya in 60/680. Some may have been moved by the hope of regaining for Medina some of its former influence. Others seem to have sympathised with 'Abd Allah b. al-Zubayr [q.v.] who was organising opposition to the Umayyads from Mecca. A large body of the Muslims of Medina, led by 'Abd Allah b. Hanzala, formally renounced allegiance to Yazid, and forced a thousand members of the Umayyad family and its supporters to take refuge in the quarter of Marwan b. al-Hakam [q.v.], the head of the family in Medina, though III a different branch from Mu'awiya. Yazid sent an army of from 4,000 to 12,000 Syrian troops under Muslim b. Ukba, but before they arrived the rebels had allowed the Umayyad party to leave Medina for Syria. Muslim's army encamped on the Harra to the north-east of Medina and invited the rebels to submit. Instead they marched against him and were severely defeated, and Medina . alleged to have been pillaged for three days by the Syrians. There seems to be some anti-Umayyad exaggeration in the accounts of this battle of the Harra [q.v.] and its aftermath. These events did not greatly alter the position of Medina, except perhaps to reduce its political importance still further.

In 130/747 m group of Ibādiyya [q.v.] who had established themselves in the Yemen sent an army loto the Hidjaz and, after defeating the governor of Medina and a locally raised force, occupied Medina for three months until defeated by m army from Syria (Wellhausen, Die Oppositionsparteien, ch. xli; Eng. tr. The religio-political factions). After the establishment of 'Abbasid rule, afeding was the centre of two short-lived and unsuccessful Hasanid revolts, that of Muhammad b. 'Abd Allah, the "pure soul" (al-mafs al-sakiyya [q.v.]) in 145/762 and that of Husaya b. 'Ali, the sahib Fakkhh [q.v.], in 169/786. Another incident that has been recorded was the defeat in 230/845 by the Tuckish general Bugha al-Kabir of the nomadic tribes of Sulaym and Hilal who had been making depredations in the region of Medina. About two years later they escaped from prison, but were put to death by the people of Medina (Tabert, iii, 551 ff.; Ibn 2l-Ahlr, sub annis 230, 232). For the first three centuries of Islam these are the main events involving Median.

Even in the reign of Mu'awiya, Medina was becoming remote from the caliph and his government, and was beginning to attract those who wanted to keep aloof from political turmoll and maintain an attitude of neutrality between the opposing groups. Prominent among the neutrals was 'Abd Allah b. 'Umar b. al-Khattāb [g.v.]. To Medina also came al-Hasan b. 'All (q.v.) after renouncing his claim to the caliphate in 41/561, and to Medina was brought at-Husayn's wives and son after his death at Karbala?. Another son of 'All, Muhammad b. al-Hanafiyya [q.v.], also lived quietly in Medina. As already noted, too, an important section of the Umayyad family, not closely involved in the government of Murawiya and Yazki, resided in Medica. Many others of the Kuraysh of Mecca also settled there. Such people were able to enjoy the wealth brought to them by the wars of conquests, and life in Medina became notorious for its luxury. The caliph Marwan II expressed surprised that men of the participants in

the rising of 127/745 had not been [18] back by the wine and singing girls of Medina (Tabarl, fi, 1910).

At the same time, however, Medina became an important centra of Islamic intellectual life, Fthe beginnings of Islam, it would seem, mea had met in mosques to discuss matters of religious interest, In Medina in the Umayyad period such discussions. led to criticisms of current legal and administrative practice on the ground that these were not in accordance with Islamic principles. As these discussions and criticisms became more systematic, Islamic jurisprudence began to take shape. The early school of Medina seems to have been important (though Schacht, Origins of Muhammadan jurisprudence, Oxford 2950, 223, etc., thinks it was subordinate to the 'Iraki schools). There are many references to "the seven lawyers of Medina", a group of who died a little before or shortly after 106/7:8; the lists of the seven vary somewhat [see PURARA? AL-MADINA AL-SAR'A in Suppl.]. One of the most prominent was 'Urwa b. al-Zubayr [q.v.], who also a collector of hadith and of historical information about the life of the Prophet, Among his pupils were his son Higham and (Muhammad b. Shihab) al-Zuhri (d. 224/742 (q.v.]), one of the greatest scholars of the time in several fields. The real flowering of the legal school of Medina, however, through the work of Malik b. Anas (d. 129/795) [q.u.], who was the founder of pur of [10] four Sunni legal rites. The textual study of the Kur'an was represented in Medina by Natic al-Laytht (d. 169/785), the authority for one of the seven canonical sets of readings. Ibn al-Ka'ka' al-Makhzümi (d. 130/747) from Medina was also highly thought of for his textual studies. In the exegesis of the Kur'an important place was held by Abd al-Rahman b, Zayd b, Aslam (d. 182/798), whose father had been noted as a lawyer. A pupil of Malik's, Ibn Zabala, wrote one of the first histories of Medina (Sezgin, GAS, i, 343); it has not survived, but is occasionally quoted by al-Samhildl.

No wall was built round Medina until it was felt to be threatened by the Fățimid conquest of Egypt. In 364/974 the Buwayhid 'Adud al-Dawla built m well enclosing the central part of the town. This was restored in 540/1145 by a Zangid vizier, but a few woars later in 557/1162 the Zangid Atābeg of Syria, Nur al-Din Mahmud, built a second wall of greater extent with towers and gateways. After the Ottoman conquest, Sultan Sulayman Kānuni [1520-66] built walls about 12 m. high of bacalt and granite, with a trench in front. He also built m covered aqueduct to bring water from the south. These walls were reised to 25 m. by Sultan 'Abd al-'Aziz [1861-76].

In 601/1203 the people of Medina were involved in a quarrel between the governors of Mecca and Medica, but, though there was some fighting, an agreement was eventually reached. Hulf-a-century later, in 654/1256, Medina was threatened by a volcanic eruption. After a series of earthquakes, a stream of lave appeared, but fortunately flowed to the east of the town and then northwards. After this, little is recorded of Medina until the 19th century. In 1804 the Wahhabls [q.r.] took the town, plundered the jewels, pearls and other treasures of the Prophet's Mosque and prevented pious "visits" I his tomb there. In 1813 it was recaptured for the Ottomans by füsün, a son of Muhammad 'All of Egypt, and in 1815 the Wahhabl amir, 'Abd Allah b. Sa'od, recognised Ottoman sovereignty over the hely places in the Hidjaz, and there was no change in this respect until the First World War. Shortly before that, in

1908, the Ottoman government built the Hidias railway from Damascus to Medina. Though primarily intended for pilgrims, this had some military importance, and was the object of attacks after November 1916 when the Grand Sharif of Mecca, Husayn b. 'All [g.v.], revolted against the Ottomans. A contingent of Ottoman troops, under Fakhri Pasha, however, maintained themselves in Medina until after the peace in 1918, not surrendering until to January 1919 with his 9,800 mm (see A. L. Tibawi, The last knight of the last catiphs, in IQ, xv [1971], 139-63). In 1924 after the abolition of the caliphate by the Turkish republic the Grand Sharlf (now King) Himayn assumed the title of ealiph, but met with much opposition from Arabs and other Muslims. In particular, Ihn Su'ad invaded the Hidjaz in August 1924; Husayn abdicated in favour of his All, but ill latter too had to leave the Hidian, and in January 1926 Ibn Su^cūd became "King of the Hidjaz" m well as of Nadid. Medina was thus incorporated into the Su'udi kingdon.

(ii) THE MODERN CITY

As early as 1923, growing hostility between the Hāshimite king, Husayn b. 'All, and the Su'ûdî sultan, 'Abd al-'Azīz b. 'Abd al-Rahmān, led to fears that 'Abd al-'Azle's Ikhwan [q.v.] might capture al-Madina. In fact, the redoubtable Faysal al-Dawish, Ikhwant leader and chief of al-Mutavr tribe, had raided into al-Hidlaz, where he destroyed track of the already defunct Hidlar Railway and generally frightened the population. By late 1342/June 1924, al-Madina had been largely cut off from outside supplies; nevertheless, at the time of the Sufüdi/ Ikhwan capture of al-Tabif (4 Şafar 1342/5 September 1924) and the subsequent fall of Makka, an exodus began from the latter which brought a surge of refugees into al-Madina. During 1343-4/1925, occasional loads of supplies reached the beleaguered city, but by September when the Harb [q.v.] tribe defected to the Sufadis, al-Madina was completely isolated. By the beginning of October, the garrison commander, 'Abd al-Madild al-"Milatio", was down to = 20-day supply of necessities, and the population began to slip away. By November, the citizens who remained approached 'Abd al-Maditd and one Taxat Effendi, controller of the railroad, and asked them to negotiate the city's surrender. The terms were to open the gates if a general amnesty were to be declared and if the Ikhwan would guarantee the safety of the defenders and of the populace. From the Su'udl point of view, the city could have been captured soon after the capture of al-Ta'lf and Makka. but 'Abd al-'Azīz apparently preferred to wait until Muslim opinion had digested the new regime's control of Makka. Indeed, false, but not implausible reports that Su^cūdī artillery had damaged the famous dome over the Prophet's tomb had already in October 1925 brought an Iranian mission of investigation in well as protests from foreign consuls in Djudda [q.v.] and from all over the world. Not long before the city's fail, Philby, en route to Rabigh. reports that he are a detachment of the Sufudi army under the sultan's third son, Muhammad, marching on al-Madina. According to Philby, in the last weeks of the siege Medinese fear of the Ikhwan led 'Abd al-'Aziz to have food smuggled into the city in order to prevent Fay;al al-Dawish from effecting the capture. In any case, the surrender took piace on 19 Diumādā I 1344/5 December 1925 and was accepted by Amir Nasir b. Su'ild and Shaykh 'Abd Allah b, Fadi. The Ikhwan entered the exterior fortress of al-Sala' but not the city, Amir Muhammad b. 'Abd al-'Aziz entered -December, prayed in the Prophet's mosque, and then ordered his troops to distribute 1,000 bags of rice and 2,000 of flour to the hungry citizenry. Faysal al-Dawish aspired to the post of governor of al-Madina (which is a town on the Nadid plateau unlike Makka, a city of the coastal plain) and its dependent villages. His failure to receive it may have been one cause of his participation in the subsequent Ikhwan revolt. But from 'Abd al-'Aztz's point of view, since the Mutavr disa already reached from the confines of al-Aḥsā' [q.v.] almost 🖿 al-Madina, a further extension of his power would have given him possibly prependerant influence from the Red Sea to the Gulf. The first governor appointed was lbrahim b. Salim b. Subhan, a relatively liberal-minded native of Harif [q.v.],

The Wahhabi (q.v.) scalots were in the end served following the arrival of 'Abd Allah b. Bulayhid, the chief Wahhabi kadi. He soon assembled the local 'ulama' and asked them to give him, after due deliberation, an opinion on the legality of the elaborate tombs erected over the years in al-Baki' cometery. After two weeks of discussion, a fatud [q.v.], motivated partly by fear, was issued by Shaykh Muhammad al-Tayyib al-Anşārī, with reluctant approval from his colleagues, which sanctioned the Wahhabi view that the tombs, cupolas, etc., should be destroyed. Shaykh Muhammad - for the rest of his days referred to with opprobrium as "the Wahhabr', Ibn Bulayhid now had legal justification to implement the Wahhabi view. He had, however, a problem: there were almost no Wahhabis in al-Madina, and the regular population was reluctant to implement the fatori. In mend, he had to hire the Shift pariah class al-Nakhawila (see below) to perform the task, When Eldon Rutter visited the city just after these events, 🜃 found that al-Bakit looked like a razed town, it strewn with a rubble of earth, timber, iron bars, bricles, cement, etc., through which paths had been cleared. It was said that 10,000 of the Companions of the Prophet had been buried there, but all graves, from thuse of the Prophet's family, of 'Uthman, Malik b. Anas and other well-known Muslims, to the palmfrond graves of the poor, were systematically destroyed. Some of the Nahhawila, who had never been allowed bury their own dead in al-Bakl' cometery, were still raking over the rubble when Rutter visited the site. Also, outlying religious buildings such the mosque of the tonib of Hainza were destroyed.

Ibrāhīm b. Sālīm b. Subhān was soon replaced, but there was one saving grace amidet the carnage. Full public security throughout the peninsula, unknown for long years, provided the basis for a future of

far greater hope.

In 1926 King 'Abd al-'Azlz, to use his new title, visited the Prophet's city and conducted diplomatic negotiations with the British Agent and Consul, Mr. S. R. Jordan, but little came of them. 'Abd al-'Azlz, who had been absent from Nadjd for two years, had to return to affairs there. The only other highlevel meetings which modern al-Madlan has known was in early 1945 when King Farûk b. Fu'âd [q.v. in Suppl.] of Egypt visited King 'Abd al-'Azlz and invited him to visit Cairo, which he did in January 1946.

The population of the captured city was much depleted, but there me no exact figures. Estimates with source for the 19th and 20th centuries are as follows:

1814	16-18,000	Burckhardt
1853	16-20,000	Burton
1877	20,000	Keans
1908	30,000	Wavell
1910	бо , 000	al-Batanûnî
ere of World War I	80,000	Philby
1925	6,000	Rutter
early 1930s	15,000	Philby
early 1940s	20,000	Western Arabia and the Red Sea
19508	40,000	Lipsky
1962	71,998	census
1968	90,000	Sogreah Co.
1970	112,000	Doxiades
1972	137,000	Robert Matthews
		Co.
1974	198,186	census
1976	150,000	Area kandbook
2000	250-400,000	Makki

One could assume that by 1983 the population was approaching 200,000. Current estimates for the province of al-Madina - approximately 500,000, but it should ill emphasised that the estimates only estimates. The compulsory recording of births dates only from 1965. In 1972 it was estimated that average population density was 2332/km² with a centre-city density of 30-40,000/km2. The Robert Matthews Co. survey of 1972 showed that 36 % of heads of families were born in al-Madina: 28 %, elsewhere in Su'ūdī Arabia; and 36 %, outside the kingdom. As to age distribution, the 1974 estimate me that 50% of the population was below age 15, and in addition that the economically active age group was only 23% of the total. A curious phenomenon in al-Madina is that the age group over 65 is larger than the 60-64 group which in turn is larger than the 55-59 age group. This is explained hy what might be called "religious retirees"-those who wish to retire and spend their last days in the Prophet's city. Oil-stimulated immigration consisted on the one hand of professionals (teachers, doctors, engineers) who came largely from Egypt, Lebanon, and Syria, and labourers who were primarily but not exclusively from Yemen. Yemen's constituted some 75% of all foreigners. It should be noted that the economic activity rate of migrants was higher than that of Saudis, whereas family size me smaller,

The population of the somewhat dazed or even partially ruined city that the Su'adis took over in 1925 spoke a Medinese dialect distinct from that of other Hidjaz localities. It has affinities both to

Syrian and Egyptian Arabic, and Turkish words and phrases still hourd in the last quarter of the 20th century. There were considerable areas of the city that mee abandoned and semi-rained, especially those outside the northern and western walls where wealthy Turks and others had built homes, especially after the coming of the railroad. Traditionally, the population lived in clearly compartmented quarters (house, pl. skware) and, in addition to native Medinese, included North Africans (attracted by the tomb of Mālik b. Anas), Indians, black Africans (Takārina), Mauritanians (Shanāķita) and Central Asians. A newer "immigrant" group are tribesmen; those of Harb - concentrated in the eastern barra; those of Djuhayaa in the western. In addition, there was Harat at-Aghawat, which was the home of the cunuch and other servants of the mosque (al-Haram al-Nabawi). These Included imams, mu'ndidhins, caretakers, etc.

Religiously, the population is mostly Sunni, of whom the large majority is Hanaff with a few Shafiffs. There are also several groups of Shifts. One of the most interesting of these is the Nakhāwila (sing. Nakhwall). This is a twelver Shift parlah class who formerly had their own haugh, which was, however, broken up by the Sufadi regime first, apparently, in the 1920s and, definitively, following serious communal disturbances in the mid-1970s when a large highway was run through it. The origin of the Nakhāwila, who are currently roughly estimated to number between five and ten thousand, is obscure. They themselves claim to be descendants of the Anşar; others believe they are descendants of African slaves, that they came from eastern Arabia or from Iran, etc. Some date their ostracisation from the time of the callph Yazid I. The name derives from their specialisation in cultivating palm trees, They also perform other menial services, Rutter reports that they were not allowed to live within the city walls, although they came in during the day to sell vegetables near Bab al-Salam. In addition, the Nakhawila were not allowed to pray in the Prophet's mosque, nor do they bury their dead in al-Baki', but rather in their own cemetery east of Kubā³. Popular Sunnī feeling, according to Rutter, was that they would pollute these localities. They practice mul'a (q.v.), and it was said they rent their houses to Iranian pilgrims during the badidi season. It may also be noted that the late Ottomans effectively prevented them from participating in elections, and King 'Abd al-'Aziz, following a general protest against their participation in voting for the madilis al-shara in 1937, followed the Ottoman procedent. There are also a few Shi'lls of the Band 'All section of Harb and the Band Husayn of al-Sådåt. It may also be noted that there is mail upper class group of Shiffs in al-Madina. These,

from two families, 'Umran and Mashhadi. Among the well-known Sunni families are the Khuraydis, of Nadjdi origin but long connected with trade in al-Madlina, who in the mid-1930s had the finest residence in the city; the Sakkāfs, whose scion 'Umar was for some years Sufudi Foreign Minister, and newer rich families such as the Asfads and the Kurdis who made fortunes in land speculation in the 1970s.

originally from 'Irak, are to a considerable degree

integrated with the Sunni upper class and basically

The febrile modernisation of the 1960s, 1970s and 1980s, has largely destroyed all of see old cheests and has promoted a considerable homogenisation of the people, but slums remain in certain parts of

the old city, and these continue to have ethnic settlement patterns. On balance, Philby's judgment continues to be sound, that the people of al-Madina, favoured as they me by location, water supplies, and relatively abundant agriculture, "lead more spacious lives" with something of the patrician and the patriarchal about them, in contrast to their neighbours in Makka.

physical appearance of al-Madina has changed dramatically in the six decades since the Wahhabis first took it over. Rutter was teld that the houses

bathing and siests room for the people on that floor. The bucket was a rope which operated from a pulley in the ceiting, and thus people on each floor could get water as needed. The water, which was not in short supply, an anomally about five metres below surface of the ground. The whole city enclosed by a substantial wall with various gates, and there was also an outer wall extending from southeast of the old city westward and then north to the into the main citade! at al-Bāb al-Shāmī on the northwest of the inner city. Finally, the

in the oldest sections of the city around the mosque, but especially between the haram and al-Baki', were built so incredibly close together in order to prevent the samum from penetrating them. These houses, which me built of granite or baselt blocks and some of which had pillared halls opening on bathing pools, were typically three or four stories tall. Almost every house had a well with a hole directly above it on each floor. The hole itself had a small room (bayi al-bi'r) built around is which served as a

Hashimite King Husayn built another wall from the northeast section of the old city north and then westward, but the Hashimite kingdom ceased to exist before the man wall reached the existing outer wall on the west. With the coming of the past Swadiano, the whole system became obsolete, and gradually the walls disappeared before bulldozers. Philby reported in 1957 that they may gone, but some fragments still exist.

Modernisation has brought completely different

architectural approaches and materials, and much of the old has been swept away. Courtyards have been replaced by balconies, and coment and bricks are now standard. Sometimes old and new are combined, with traditional materials used on the ground floor and concrete blocks above. The latter, being lighter, allow larger rooms than would stone. The new construction is less insulating than the old, but air conditioning offsets this loss. Much of the growth of the city has been uncontrolled. Immigrants have settled on the eastern and western karras and bidonvilles have emerged. Some of the prosperous immigrants have replaced their shanties with substantial structures, but growth in these areas has been chaotic. Running water did not exist as late as about 1980; electricity reached the harras only about 1978.

By the 1960s, a city plan emerged. It teatures wide streets, street lighting, plantings, pavements for pedestrians and parks. Various new streets were cut, others were widened. The castle at al-Bāb al-ShāmI was demolished and replaced by apartment

houses, and certain streets formerly connected by stairs were placed on the same level. The ahudsh disappeared; buildings were built across the water course that cut through the southern part of the city on a northwest-southeast axis.

In general, the central business district near the Prophet's mosque has not shifted, but there are satellite suburbs which have grown rapidly. These include al-'Awall to the scutheast, Kupā' to the south (which with its orchards and cafés is a suburb of the affluent), and Sayyid al-Shuhadā' to the northeast.

The old layout of the city continued to impose itself on some developments. The Hidjäz railway station and the Ottoraan barracks were both located in the southwest just inside the outer wall. The straight road, Shāri' al-'Anbariyya, which led to the centre of town at al-Bāb al-Miṣri, had also by 1925 attracted the public — Egyptian kitchen, the governor's residence, and other private mensions, in the late 60s, the barracks were demolished and replaced by a large government building. Other

AL-MADINA

multi-story buildings soon followed. The location of the residence of the amir exerted a pull on the location of upper-class housing. As long as the governor's house was in the south, the well-to-do lived there, but when in the 60s the amir's palace moved to the north of the city, Sultana Street, which led porthwest towards the old (Sultana) airport, and the community of al-(Uyûn (7 km. away) began to attract affluent villas. The new airport located about 14 km. northeast of the city has also been an attraction northwards, and in general the area between Sharif al-Matar (airport road) and Sultana Street has filled in. West of Sultans Street, Diabal Sala', a difficult and substantial rocky outcrop, impeded development, but by the 80s villas were appearing north of it as well. To exemplify the overheated inflation in land prices, we can cite a garbage area north of the outer (Husayn's) wall where no one would build. Cleaned up in the 60s, land was seiling there for \$ 2,500/m2 by the mid-70s.

Other points of Interest that Industry has generally moved outside the city where land there was the expand. Public open spaces in al-Madina are below international standards (totalling, in about 1980, 2,321 m²), but this inadequacy is partially compensated for by recreational use of the green areas, which are themselves diminish-

ing, north and south of the city.

Traffic has always been a problem in al-Madina. Rutter reports that streets in the old sections in 1926 were so narrow that m occasion a person had to walk sideways to pass. During the restoration of the mosque under Sultan 'Abd al-Madild (1848-60), a breach (al-'Ayniyya) made in the inner wall, and straight street driven through to near the southwest gate of the mosque (Båb al-Salam) so that columns and stone blocks could be brought in from Wadt al-'Akik. As long as camels discharged their loads in the area (al-Manakha) west of the inner wall reserved for that purpose and goods were then taken in by donkey or porter, the streets could also be used by pedestrians, but with the coming of motor vehicles the situation became acute, especially as there was a shortage of parking space. One major parking for does, however, exist in a portion in the old railroad yards.

Streets were added and widened in two stages: (x) 1950-5, when by private contract the almast and axièta were greatly altered, by building new roads. especially Sharif al-Matar and Sharif Abi Zar which runs north and south to the east of the old city, by widening others, and by asphalting others; (2) 196r-5, when the municipality itself carried the process a stage further, installing inter alia a oneway traffic system in me sections and traffic lights. There continued in the early 1980s to be some unasphalted streets. The increase in vehicles can be gauged by the fact that in the period 1948-72, 6,511 vehicles licensed, whereas in 1973-4 along 6,158 were licensed. In addition, at hadidi time many outside vehicles appear. One may also note Shari' al-Khawadiat, which links, north of the city. the airport with Abyar 'Ali sons 8 km, southwest of the city, where there are TV and power statious. Designed as a road which non-Muslim technicians would be allowed to use (hence its name), it has become the main truck route because it bypasses the heavy city traffic. The city boasts two bus stations and faxi companies (cabs can be ordered by phone). Traffic, however, apparently remains a serious problem. Makki reports that accidents and ensuing violence between drivers are common,

that parking fines are not levied, and that roads are hazardous for pedestriens.

The economy of al-Madina may be conveniently considered under three headings: agriculture, comand industry, and the pilgrimage. Agriculture and agricultural self-sufficiency have constituted one of the giories of Islam's second city. Palms ripened early in June, and the main harvest was about a month later. The grapes, of which the best were a long white variety called Shariff, were also well known. Modernisation, however, has disastrously close to ending the city's agricultural sector for three reasons. One is that urban sprawl in the 1950s overtook those farms which immediately surrounded the city. A second reason is the economic opportunity which the oil-driven economy of the country presented in other economic sectors; and the third cause is the fall in the water table because of apprecedented demands for water. By the 1950s, the formerly planted banks of Wadl al-'Akik had become barren and the desolation of the natural acada forest, al-Ghaba, the traditional outdoor recreational area of the Medinese, and a source of wood, located some 7.5 km, north of the city, was well under way, This process was accelerated by the successive construction of small dams ('Akal, 1956; al-'Aktk, 1958; and Buthan, 1966) which prevented destructive floods in al-Madina, but also prevented water from reaching al-Ghāba. Makki betieves (1982) that the process might still be reversed, but notes no sign of the required effort. The agricultural areas south of the city have held up more successfully, though some decline is noted there as well. The decade 1962-72 showed a total reduction in agricultural land of 16.8 % from 8.14 to 6.77 km2. Over 40 % of the total is in al-'Awall and Kuba' south of the city. According to the Ministry of Agriculture, crop distribution in 1962 was m follows: 64 % palm trees, 21 % fruit trees, 14 % alfalfa, and 1 % garden vegetables, including tomatoes, eggplant, carrots, potatoes, squash, peppers, cucumbers, watermelons, cabbage, and cauliflower. It may be noted that the date trade was especially important in an export (to Syria, Egypt and the Indian subcontinent) crop. The dates in fact had a religious aura 🖿 a kind of blessing for the eater. There are many varieties, of which Rutter says the best three are al-'Aubart, al-Shalabi and al-Halva.

The estimated percentage distribution of the non-agricultural and non-religious work force is, after Makki, as follows:

Activity	1972	1974
delivery services	22.01	24.03
scientific and vocational services	10.84	20.00
governmental services	24-50	\$2.72
primary industries	x.6x	31,20
construction and maintenance	4.90	10.12
lransport	6.67	7.73
other	17.75	6.71
education	7.78	4.81
handicrafts	1.20	2.31
electricity and water supply	2.05	.83

Highlights of the local economy are as follows. Industrial activities are principally date packing and vehicle repair. These are located on the periphery of the city on a totally unplanned basis. In 1971 manufacturing firms numbered 107, most of which employed 10 or less workers. Of the total, 35 were in our repair, 17 in building tile manufacture, 15

in bricks, 4 dairies, and I large date-packing factories. Estimates are, for 1971 and 1974 respectively, that there were 1,452 and 3,517 industrial workers and 3,105 and 5,207 commercial workers. Hotels and hospices, including a Sheraton, numbered I in 1971 and employed some 1,225 workers in 1974. In 1971 there were 2,208 retail and 28 wholesale stores and the sub system received its first challenge in that year with the establishment of two supermarkets, in the city and on ISuba' Street. The social importance of the sail has also declined with changing life-styles, because accompanying traditional social activities such as public baths and coffee shops have almost disappeared. According to Makki, men's barbers, often ladian or African, are still conspicious as they work outside on the sidewalk attending to the needs of, especially, Yemenis and other unurbanised immigrants. At the same time the new life-style has given rise to ladies' coiffenses who use modern equipment but operate from their private homes. Of the three known to Makki (two in Kuba' and one in al-Bab al-Madikil), two were run by foreign teachers and one by a Medinese lady.

It is difficult to get a clear picture of the impact of the kadidi on the economy of al-Madina. Rutter estimated in 1926 that the number of those who served the haram was about 1,000. This number included, in addition to the shayhh al-haram, his deputy, and the treasurer, imams, preachers, lecturers, muladadhins, overseers, doorkeepers, sweepers, lamp cleaners, water carriers, etc. Most were supported at least in part by walfs, many originating in Egypt. He reports that King 'Abd al-'Aziz initially reduced the number to 200. The corps of eunuchs numbered about 50. They were popularly believed to be wealthy, and they had enter alia black boys in training to enter the mosque service. In more recent times, Long has estimated that the guild of guides alone received some \$800,000 in fees (gratuities are also important) in 1972 when pilgrims numbered about 480,000. His estimate of gross hadidi income, including public sector expenditures, in that year - 8 213 million. Of this, could guess that al-Madina might be allocated one-third. Other estimates are higher, Robert Matthew Co. estimated for the same year that external pilgrims spent just under \$ 100 million, of which two-thirds was for gifts. Makki's finkdwork in the same year indicates that average pilgrim expenditures were 583 Su'adi riyals (SR; 2.00 = SR 4.15 = 1972) broken down as follows:

gifts	SR 331
other	99
lodging	72
food	.54
transport	47
religious donations	43
	SR 583

He estimates total revenue from external pligrims at SR 381.4 million (= \$91.9 million). Total pilgrims on Makki's projection produced a revenue of SR 558.5 million (= \$134.5 million).

The Haram al-Nabaset of course is the central focus of al-Madina, although other buildings and localities have high religious significance. The exact of the sacred territory (haram) from which non-Muslims are excluded is unclear. There is indeed a certain stubiquousness about the haram quality of al-Madina. Abu Hanifa said it was not a haram. Rutter reports that "common opinion" held that the area is bounded by the lave fields on the east and west, by

Diabal 'Ayr on the south and Diabal Thawr ("behind Ohod") on the north, an area about 16 by 3 km. Philipy wrote in the early 1930s that the whole district from Kuba' to Diabal Uhud was hardm. Nallino reports that, according to the Saudi Arabian Mining Syndicate convention, it was defined as a radius of 30 km. around the walls of the city—a significantly smaller area. Non-Muslims now regularly travel the Shari' al-Khawādjāl and stay in such hotels as the Sheraton.

When the Wahhābis first arrived, they discouraged the visit (siyāra) to al-Madīna as constituting idolatrous tomb worship, but King 'Abd al-'Aziz, for whom the revenues had some interest, justified it on the ground that he permitted pilgrims to pray in the mosque but not to visit the Prophet's toinb. For Rutter, the mosque with its green dome and golden apex ornament rising high above the walls to one-half the height of white minarets were "... picture of the most striking beauty and magnificence." Philby opined that it was the "chief architectural feature not only of Medina but of all Arabia." Rutter noted that many of the religious students had fied, but others were still studying at the feet of teachers such as Abmad al-Tantawi and Ibn Turki. Philby, who visited the city in 1931, found that all the tombs (other than those in the Haram) war in ruinous condition. He also reports that the Shi'lls of India had offered King 'Abd al-'Azla £ 50,000 to spare the tomb of Fāţima, but that it, like others in al-Bakit, was then almost gone. In 1934 when Shaykh 'Abd Allah Sulayman visited the city, many of the historic tombs were tidied up, and basalt borders and simple headstones set in place.

As to the Prophet's mosque itself, it has undergone substantial changes under Sufudi rule. The first known attention to it took place during 1934-8 when, largely through the generous efforts of Teleat Harb of Egypt, badly needed repairs were carried out. These included installation of a new marble floor, and a new wooden screen to separate the women's section from the much larger men's part. Major enlargements followed. On 12 Sha'ban 1368/9 June 1948 King 'Abd al-'Aziz wrote an open letter to the Muslims of the world (published in al-Madina al-Munamoura, no. 301, 5 Ramadán 1368(/r July 1948)) indicating his intention to enlarge the mosque. A committee of notables to assess the value of those properties that were condemned and an office with some 50 officials was established in Shatban 1370/ May June 1951. For actual building, a team of 14 architects, artisans and 1,500 labourers was assembled. A workshop area was established at Abyar 'All both for the repair of equipment and also for making mosales. Equipment and supplies were brought in from Yambus and included coment, iron and 30,000 tons of timber. The foundation stone was laid on 13 Rabit I 1373/20 November 1953 before 2,000 dignitaries, and the inauguration of the new structure took place = 5 Rabi* 1 1375/ October 1955 with King Su^cūd, who had succeeded to the throne, officiating. The total cost was # 11 million. The total new area added to the mosque was 6,024 ms. Other new features included 474 square and 232 round pillars. The lengthening of the building to the north was 128 m. and the new northern wall is gr m. long. Essentially, what the builders did was to double the size of the mosque by integrating a whole new building on to the northern and of the original one. The new section has its own courtyard plus minarets at the new northern corners. (The old Ottoman style minurets at the former

1004 AL-MADÎNA

northern corners well as the minaret just north of Bāb al-Rahma were torn down.) The building itself is in neo-Moorish style; the minarets, neo-Mamfük. In addition, as the accompanying Figs. 1 and 2 indicate, the Su'odl builders straightened out the asymmetrical shape of the exterior of the earlier structure and rebuilt the east, west, and north structures surrounding the original courtyard. West of the reconstructed mosque a large permanently canopied area was built in 1974-8 to provide shade for the vehicles and bodies of the hundreds of thousands who visit annually, although many old residences in the abwash were thereby destroyed. Finally, in Radjab 1403/May 1983 King Fahd b. 'Abd al-'Aziz ordered a further expansion of the mosque-basically on the east and west-from the present 26,000 m2 to a staggering total of \$2,000 m2 with m m, minarets, the whole to be air conditioned. Little will remain of the old city.

There are of _____ other religious buildings and sites in al-Madha, and in 1980 they constituted about 1% of the total city area (down from 6.4% in 1950). The most important is al-Bakl^a, the connectery lying to the east of the mosque. This tract, which has been used by all Medinese except the Nakh^a-wila since the Prophet's time, was expanded in 1953 to an _____ of 52.741 m². It cannot in practice be moved because it holds the graves of many famous people. Makki estimates that bodies decompose in al-Bakl^a within six munths, after which a grave can be re-used. Sometimes at the height of the hadigi.

Other well-known sites include the mosque of al-Kiblatayn, the so-called al-Masādiid al-Khamsa and the mosque of Kubā? In the city proper are also the al-Chanāma, Abb Bakr and 'All mosques near al-Manākha street. A common characteristic of mosques in al-Madina is that they have m courtyard surrounded by roofed columns. In addition to the cemetery and mosques, there are m number of so-called adwiyas or chapels in private homes. These often have a door opening directly on the street, but by 1980 many bud been abandoned. In Ottoman, Sharifi and early Su'udi days, the Ramadān caunou was fired from the Ottoman fort on Diabal Sala', but with the modern growth of the city it could not be heard; other cannons were set up in various jocations.

The logistics and management of pilgrims in al-Madina differs from that in Makka, but still constitute - annual event of massive proportions. The differences are that only about three-fourths of the hadidits make the visit (ziydra) to al-Madina and that they may man either before or after the badidi proper. As in Makka, however, guilds have arisen to service the visitors (zā'ir, pl. zenvwār): the murameiran (sing, musaweir "he who conducts s visit") and the adilla' (sing, dalit "guide"). The former are those who conduct the visitor through the religious customs, such as reciting the proper formulas; the latter me responsible for the physical needs of the swereer, such as food, lodging and local transport. This dual system constructs with that of Makka, where the mufauwifun (sing. mufawwif, he who conducts the tawaf [q.v.]) are responsible for both spiritual and physical needs. The adilla's like the mutamwifun, are divided into subguilds by nationality, and since the issuance of a decree in 1356-7/1938, there has been a governmentappointed shaykh al-adilla'. Governmental control evolved because by the late 1930s, internal transport had improved to the point where the visit to al-Madina could be made from Makka or Djudda in a matter of hours and the number of visitors steeply increased. Usually the adilla' an also mazawairin, but not every musawwir is a dalii. Traditionally, dimost every native Medinese served at me time or another as a mustapurir. As spelled out in the regulations, the responsibility of a dail is: (a) to receive the hadidils on their arrival at me official reception centre; (b) to assist them to find lodgings and to move in; (c) to guide them to the principal shrines and to assist | devotions; and (d) | assist them in arranging onward travel (which in usually to Makka, Djudda, - Yanbu'). The 1972 regulations, as cited by Long, specify the shrines as: al-Haram al-Nabawi al-Sharif, al-Bakis cometery and "other shrines." Offices of the Directorate of Hadidi Affairs of the Ministry of Hadidi and Wakis are located at the main sites to hear complaints.

Like pilgrims proper to Makka, visitors to al-Madina have come by every form of transport, certainly not excluding walking and, before World War I, including the railroad. However, since the SucadI takeover, the railtoad from Damascus has remained derelict and walking has practically ceased. As early as 1929 the number of visitors who came by camel caravan had declined to about half, while most of the other half came by motorcar. The first visitors to arrive by air came in January 1936 as the result of a contract made by the Sufudi government with the Egyptian Misr Airlines (now Egypt Air). In 1937 the aircraft made two flights per day from Djudda to the old Sultana airport with five passengers per flight. In all, 105 visitors came at a cost of £E 30,500, of which half was tax. In 1939 the aircraft developed engine trouble, and the service was discontinued. By 1950, according to Long, the camel had practically disappeared as a means of transporting pilgrims. Roads to the holy cities received very high priority immediately after World War II, and the Djurkla-al-Markina sector was paved by 1958. Exact figures for mode of travel to al-Madina in more recent years - not available, but a rough idea may be obtained from the following. In 1972 there was a total of 1,042,007 pilgrims Makka, of which 479,339 came from abroad and 562,668 from within Sufudi Arabia (of these 178,378 were from Vakka itself and presumably did not visit al-Madian). Of those who came from abroad, 20% came by sea, 30 % by land and 50 % by air. One could assume by 1980 that motor vehicles and aircraft brought all but the smallest handful of success to al-Madina.

Some idea of various charges paid by zucade in modern times can be garnered. In the late 1920s, the round trip automobile fare from Makka to al-Madina was taxed £ 7.50 (\$ 36.00), but this impost was lowered by 1921 \(\mathbb{H}\) \(\xi\) \(\xi\) (\$ 28.80). Transportation fees, round trip (? from Djudda), were listed in 1945 as follows: first class (car), £ 24; second class (bus), £ 12; third class (truck), £ 8. In 1972 the feet more exact:

Single person fare	SR	8 8
Bus from Djudda or Yanbu ^c to al- Madina and back to Djudda or Yanbu ^c		
Car from Djudda or Yanbu ^c to al- Madina and back to Djudda or	90.	******
Yanbu ^c Car from <u>Di</u> udda or Yanbu ^c and	144.	34.70
thence to Makka Bus from Makka al-Madina and	zño.	38.55
thence to Djudda or Yanbu ^c	101.25	24.40

By royal decree of 1384-5/1965, the fee for a dalil was fixed at SR 10 [= \$ 2.22; from 1378-9/1959 to 1390-1/1971 the exchange rate was \$ 1 = SR 4-5]. Accommodation is a private sector matter, but there are government-suggested prices. According to the 1391/1972 regulations, SR 20 (\$ 4.82) was the suggested daily rent for a "house." The Hadidi Accommodation Control Committee of the Ministry of Hadidi and Wakts is charged with regulating abuse. In all, it has been estimated by Long that in 1972 adilla? were paid SR 3.6 million (\$ 867,470), assuming that 360,000 visited al-Madina.

Al-Madina had been famous for libraries and learning from early Islamic times, but Rutter found a mixed situation in regard to both. The library of 'Arif Hilamet Bey [q.v.], a former Ottoman shaykh al-Islām who had also served mullā of al-Madina in 1239/1823 and following, was one of the richest in al-Hidiaz, with estimated holdings of 17,000 volumes. Although Fu'ad Hamza opines that "in the Ottoman period" a considerable part of the collection bad been removed, others do not corroborate his contention. Located just off the southeast corner of the Haram, the library we open to the public but noncirculating, Rutter describes it as a building composed of two domed rooms set in a walled garden. Access was through a large ornamental iron gate. Within, Rutter remarks on the cleanliness and high level of upkeep. The principal attendant and his assistant were both highly competent Turks, and several people were reading. Philby indicates that the library contained unique manuscripts. In regard to the very recent stege and Suindl accession to power, the assistant told Rutter that "we do not eat of the hand of the king, neither from the hand of El Husayn, nor from the hand of Ibn Safud. Our provision comes from the waqf bequeathed by the Shaykh ['Arif Hikmet]. Therefore, it is of no account to us who is king or who is sultan; we render praise to God, Who is Lord of All." Although it had presumably withstood the siege intact, the Sultan Mahmud library (4,569 volumes), adjoining Bab al-Salam, could not be examined by Rutter because the key could not be found. Other libraries (Bashir Aghā (2,063 volumes), the al-Shifa' school, 'Umar Effendi and Sultan 'Abd al-Hamid [1,659 volumes]) were simply gone. Various explanations ____ offered: the books had been stolen when the inhabitants fled; they had been sold by their caretakers; the Wahhabis had burnt them. The Haram itself contained approximately too large Kur'ans.

At the time of the Su^cudi conquest, Nalline counted public schools more elementary (ibtida²/yya) and two preparatory (takdiriyya). By 1937 this had increased modestly to one elementary, three preparatory and one school for adult illiterates. But there were also some eight private schools, including Dar al-Hadith, which had 49 students, as well as Madrasat al-Ukim al-Shar'syya with 394 students. In all, the private schools enrolled 873 students. By 1938 these institutions had been increased by the addition of an Italian orphanage. A different type of educational institution also appeared in 1354-5/1936—namely, the four-page weekly al-Madina al-Mannacuara, which was owned by 'All and 'Uthman Haffz

and managed by the latter.

Nallino signals six Medinese writers of prominence in the 1930s: (1) Ahmad al-'Arabi (b. ca. 1327-8/1910), who was sent by King 'Abd al-'Ariz on a mission to Dar al-'Ulum in Cairo and graduated from al-Azhar. On his return, he taught at Madrasat al-'Ulum al-Shar'iyya and became in 1935 the director

of the prestigious Madrasat al-Umara? (school for princes) in al-Riyad. (2) Abd al-Kuddus al-Anşarl (1324-1403/1906-83). A prolitic writer, al-Ansarl received his diploma in 1346/1927-8 from al-fulum al-Shar Tyya, worked in the diwds of the amirate of al-Madina and taught Arabic literature at his alma mater. His important prose works include Athar al-Madina al-Munawwara (Damascus 1935) and Bayn al-ta'viàk ma 'i-áthar (Beirut 1969). (3) 'Abd al-Hakk al-Nakshabandi (b. 1322/1904-5), a poet, who after primary studies in al-Madina, accompanied his father during World War I to Syria. After returning to al-Madina for further study, he went to India, where he camed a teaching certificate, after which he taught at al-Ulum al-Shar'iyya. (4) 'Ali Hafia (b. 1321) 1903-4), m poet, studied in al-Haram, became kalib dabl (secretary) of the higher court in al-Madina and then bead secretary. He was a founder of al-Madina al-Munawara. (5) 'Azlz Diyā' al-Din b. Zähid (b. 1332/1913-4), a poet and prose writer, who, following primary studies in al-Madina, studied in the "health school" of Makka (closed in 1347/1928g). He became secretary to the Directorate General of Health and then went to the Directorate of Police, (6) 'Abd al-Hamid 'Anhar (b. 1326/1908-9), a prose writer who both studied and taught at Madrasat al-Ulum al-Shar'iyya.

In recent years, the Islamic University of al-Madina has been the institution of highest learning in al-Madina. This institution was founded in the early 1060s, with encouragement from members of al-Ikhwan al-Muslimon driven into exile by President Diamal 'Abd at-Nasir of Egypt, an international seminary modelled at least in part on al-Azhar and designed to propagate Islam. It contains both a secondary (thanawiyya) curriculum and a university-level programme. The secondary section schedules 34 classes per week for three years, and the total hours per week per subject for the three-year curriculum are as follows: shari's 12, taftir, 12, Arabic language 12, kadith 10, ladiwid 9, totchid 9, bistory of Islam 6, usill al-fifth 4, fured 4, semantics 4, principles of tafsir 3, principles of hadiff 3, speech and composition 3, Arabic reading and literature 3, literary techniques 3, Kur'an 2, handwriting 2, Islamic morals 1.

The university-level programme lasts four years. Students take 25 classes per week in the first two years and 24 in the last two. The total hours per week devoted to each subject are as follows: partia 16, Kur'an 14, lawhid 12, hadith 12, Arabic language and grammar 12, well al-fibb 8, vocabulary of hadith 4, sementics 4, Islamic morals 3, speech and composition 2, literary techniques 2, and bour each for each of the following: sira, history of the caliphs, Islamic history, contemporary Islamic world, social doctrines of Islam, al-Bukhéri, Muslim, Abū Dāwād and al-Tirmidhi, al-Nasē'l and Iba Mādja.

The university, led for many years by the well-known ultra-conservative 'Abd al-Aziz b. Bāz (and more recently by 'Abd Allāh Ṣālih al-ʿUbayd) is academically under # Higher Consultative Council, which in 1974 was almost equally composed of well-known foreign and Su'ddl educators, 'ulama', or religious administrators. At that time these included, e.g., Hasanayn Muhammad Makhid, former mufti al-Miyar al-Miyriyya; Muhammad Amin al-Husayni of Palestine; and 'Abu 'l-'Alā' al-Mawdddl, former president of al-Diāmi'a al-Islāmiyya of Pakistan. In 1975 the journal published by the university (Madjallat al-Diāmi'a al-Islāmiyya) indicated that, at the university level, there were three faculties:

Kulliyyat al-Sharf'a, Kulliyyat al-Da'wa and Kulliyyat Usul al-Fikh, and that these faculties grant the "higher idiasa" which bestows on its holder the same rights as equivalent degrees granted by the secular universities of the kingdom.

Despite the great increase in educational facilities liliteracy continues to be a major problem. According to Makki's analysis of the 1914 consus, about 74% of the Sufudi labour force in al-Madina was illiterate, and 51% of the foreign labour force was illiterate. A major explanation of continuing high illiteracy rates in the influx of illiterate people from desert

and rural areas into the city.

Medical facilities have also burgeoned in al-Madina since 1925-not least because of the pilgrimage, its medical problems and the public relations aspects thereof. One early milestone in this development - the establishment in 1356/1937 of an Italian-Muslim hospital under the auspices of the king of Italy. The hospital was under local control and was financed by a walf from Tripoli, Libya. By the mid-1960s, a 50-bed hospital of tropical medicine as well as enlargement of the main general hospital both under construction, and by 1975 a control station for schistosomiasis (bilharzia) had been opened. Patients treated in Medinese hospitals reached 903,635 in 1969, but declined in the subsequent year. Death rates have also generally declined, and the death rate of zuwwar dropped from 1.6% in 1942 to 0.31% in 1974. It might also noted that the city gave its name to the parasitle Guinea Worm, in Deacunculus medinensis, Vena medinensis - Filaria medinensis.

Modern communications in al-Madina cover the following: roads, facilities for air travel, telecommunications and rail service. Revival of the Hidiaz railroad from Damascus to al-Medina has been discussed by the Syrian, Jordanian and Su'udi governments throughout the post-World War II period. Periodical announcement of positive decisions have been made, but nothing has been done up to 1405-6/1985. The evolution of the telephone service has been steady since 1313/1896, when a line connecting the city with al-'Ula, Tabuk, 'Amman and Damascus was installed. In 1323-4/1906 a second line was put in place, and by 1333-4/1915 there was a 50-line exchange located outside al-Bab al-Shaml and reserved for military use. Philby reports that a wireless service III Djudda began under the Ottomans. The Häshimites spread the telephone service to other government offices. The Su'adis installed, in 1932, Marconi (British) equipment with at exchanges of zoo lines each. In this period there were some 1,890 lines in all, of which 1,458 were private and the remainder official. A new radio telephone was installed in 1395-6/1956, and automatic service arrived in 1391-2/1972, as well as a co-axial cable to Yanbu', Djudda, and al-Tā'if. In that year there were 3,737 telephones in use, with long waiting lists. A local television station surrived in 1388-9/1969. The first airport was located near Sultana, northwest of al-Madina, and was derelict from World War I until 1936, when Bank Misr opened, briefly, its kadidi service, but the modern airport, in me by the mid-x96os, is located 15 km. northeast of the city on the road to al-Hanakiyya. By the early 1980s, al-Madina was linked with neighbouring population centres in all directions by a completely modern highway network. Al-Madina again benefited from its religious importance and was given early priority in the development of roads for that reason. The Diuddaal-Madina sector was completed as early as £392-3/1953. Finally, it may be noted that although the Sufudi government joined the International Postal Union in £345-6/1927, in £357-8/1939 al-Madina's post office was — of only four (the others: Makka, Djudda and Yanbu's) in the country that could handle all operations specified by the international conventions. In £357-8/1939, the al-Madina postal service — twice per week.

It is difficult to get a clear picture of the administration of al-Madina. The Hāshimite surrender was taken by Muhammad b. 'Abd ai-'Azīz, and the following is a quite incomplete list of smirs (with known dates of incumbency) compiled from various sources:

 Ibrāhīm b. Sālim b. Subhān
 1926

 'Abd al-'Azīz b. Ibrāhīm
 1932

 'Abd Aliāh al-Sudayrī
 1936, 1937

 H.R.H. Muhammad b. 'Abd al-'Azīz
 1952

 H.R.H. 'Abd al-Muḥsin b. 'Abd al-'Azīz
 1981

The main function of the smir is the maintenance of public security. The city was one of five in the Hidias that had had a municipality in Ottoman and Hashimite times. The highest body was composed of a president and four members. In Safar 1345/ August 1926 "fundamental instructions" on rule were issued by still juridically separate Kingdom of the Hidiaz. According to article 34, an administrative council (madilis idari) was established for al-Madina. It was to be composed of the \$45m majdm (head of the amiral secretariat), his assistant, the heads of the various departments and four people nominated by the king. Al-Madina was one of only three cities in al-Hidiaz that had police at the time of the Su'adl takeover; overwhelmingly, members of the police force were, all over the Su'adt realm, from 'Asir and Nadid, Other administrative aspects may be mentioned. In 1347/1928-9, notaries (sing. Adtib al-'adl) were instituted in al-Madina well as in Makka and Djudda. (Elsewhere, hadts performed this function.) Justice was, in the period till World War II at least, administered by a summary (musta dilla) court under a single kadi and had jurisdiction over petty civil cases and criminal cases not involving execution or loss of limb. The higher court (al-mahkama al-kubrā) has a kādi as president and two "substitutes." In cases involving capital punishment or loss of limb, the decision had to be pronounced by the full court. Al-Madina also had a customs office which was a branch of the Djudda office. Originally, walf administration in al-Madina - independent and reported to the local amir; however, by m royal decree 1354/1936 the wekf administration in Makka was upgraded to a directorate-general with the Medinese director to report thereto. Finally, because of the importance of water and its interrelation with various proporties in and outside the city, a special authority, Hay'at 'Ayn al-Zarka', composed of five members, established. It was in part financed by special wakfs, but was also written into the state budget as early as 1926. The name of the authority was changed in 1978 to the Water and Drainage Department, Writing in 1936, Fu'ad Hamza (al-Billed, 184, 186, 193, 236) gives the names of most of the then incumbents of the various posts.

By the 1980s, water was for most Medinese piped into houses, offices and apartments from desalinisation plants on the Red Sea coast, but when the Su'ūdis took the city over the situation was very different. Al-Madha's not unplentiful natural water

but basically from the south: (1) south of the city in and around Kuba'; (2) ground water throughout the of al-Madina; and (3) north of the city in and around al-Tryim. In addition, several wides intersect more or less in al-Madhia and often generated destructive flash floods. These wadis have gradually been dammed, starting with a dam built in the 1940s to the northeast of the city and including the 1966 dam across the upper course of Wadi Buthan which used to flood the city frequently. However, the dams reduce the water available in the northern agricultural areas and thus lead to a decrease in cultivation. Actual rainfall in al-Madina fluctuates greatly. From 1957 to 1978 it ranged animally from zero to almost 104 mm, and averaged 38.04 mm. Historically, the most important source of domestic water has been 'Ayn al-Zarka', which was actually series of wells connected by covered conduits in the Kuba' area, where they joined into a single double-decker aqueduct. The upper channel carried drinking water to ten public watering places (manhal, pl. mgpshil). The lower channel is a drain for the upper channel and for the mandhil. North of the city this aqueduct emerged above ground, and the water was used for irrigation. The manakil were about to m, below ground and were reached by steps. The aqueduct passed under only two buildings: the former al-Bab al-Shaml and the mosque. There were also ordinary sabils up until the early 1960s. The first pipes and public taps were installed in 1909, and in 1957 there were 49 of these taps (kabbas, p), kabbását) from which and often to individual houses by hose. By 1965 there were 1,500 habbasat, but by 1974 their number had declined to 600 because of the spread of indoor plumbing; those that remained were in outlying areas of the city beyond which water tankers delivered to the poorer population. Water meters began to be used in 1959. In addition, in the earlier period brackish water was readily available at depths of 4-zo and most houses had wells to tap this water. Recent use has now lowered the water table significantly, and the supply is inadequate. All have been abandoned, as well as the unusual bays al-bi'r architectural feature (described above) which provided summer cooling for generations.

The situation with agricultural water is parallel. The natural springs in the al-'Uyûn area which irrigated 500,000 palm trees in 1915 were by 1980 all dried up. Owners have compensated for the decline in the water table by pumping. Philby reported that around 1954 pumping was well established and expanding, and Makki (on whom most of this analysis of water is based) indicates that 672 desei pumps were in use in 1962. Makki pleads eloquently for the 'Ayn al-Zarka' Authority to control well-digging and pumping. A further development has been the erection in 1968-71 of large tank top of Djabal Sala', whither water is pumped from the Kuba' pump station. Other tanks on high ground also ensure adequate water

There are two additional pressures the natural water supply. The first is the recent increase in paved and asphalted areas which, with their runoff characteristics, reduce infiltration; and the second in sewage problems. There was no disposal system prior to the 1970s. Rather, each building had its own cesspool (bayydra) which was cleaned (? by the Nakhāwila) periodically. This practice made for special difficulties in the harvest because

supply came from three main interrelated sources, but basically from the south: (1) south of the city in and around Kubà'; (2) ground water throughout the of al-Mantha; and (3) north of the city in and around al-'Uyun. In addition, several sodds intersect more or less in al-Madha and often generated destructive flash floods. These wadis have gradually been dammed, starting with a dam bullt in the 1940s to the northeast of the city and including the

Al-MADINA Al-ZAHIRA, a city founded in 366/978-9 to constitute a court by al-Manşûr Ibn Abi 'Amir [9,15] in a place called Alagh, Baliash or Manzil Ibn Badr, on the right bank of the Guadal-quivir to the east of and a short distance from Cordova. Al-Zahira's existence was of short diration, since it was sacked and utterly destroyed in 399/1009, at the time when Muhammad II al-Mahdl revolted against 'Abd al-Rahman Sanchuelo, whom he had imprisoned and killed, and usurped the caliphate, dethroning Hisham II. The ploughshare subsequently caused the last traces of the city to disappear, whose site, was a longer known.

The Arab chroniclers do not supply as many details on al-Madina al-Zāhira as on Madinat al-Zahrā [q.v.], but they mention in their texts some very precious evidence for determining the exact site of the dictator's city. They tell us, for example, of the general name of the man where al-Zāhira was built:

Shabular = Ramla, i.e. "sandy terrain" (in Spanish asenal). This terrain is still called "Cortijo del Arenal", an important part of which, the "Pago de Tejavana", is easily identified with the main nucleus of the old city. Today the traces which remain are not very significant, but they show us that the buildings of al-Madina al-Zāhira were made of materials of mediocre quality-bricks, quarries stones, clay wall etc.-and, consequently, without possible comparison with the riches and majestic edifices of its rival Madinat al-Zahra?. However, the palaces of al-Zähira were notably endowed with fine, sculpted marble cisterns in the form of Roman sarcophagi and intended as fountains, of which the museums preserve marvellous examples which were executed-as their inscriptions testify-at al-Zähira for the Bant 'Amir.

Finally, it is worth noting that, according to the historian al-Dabbi (Bughya, biogr. no. 1544), the famous Munyat al-ʿĀmiriyya was one of the palaces of al-Madka al-Zahra and, consequently, was not located alongside Madhat al-Zahra', as some contemporary authors presume, who confuse this manya with the Munyat Wadi 'l-Rummān given to the caliph al-Ḥakam II al-Mustanṣir by his great fatā Durd al-Asghar in 362/973.

Bibliography: principally guetuba, and also L. Torres Balbás, Al-Madina al-Zābira, la ciudad de Almanzor, in al-Andalus, xxi (1956), 353-9 (with a very complete account of the historical notices concerning the city supplied by the Arab chroniclers and geographers).

(M. Ocana Jimánez)

MADÎNAT SÂLIM, the Arabic name, which has become MEDINACELI, of a small town in north-eastern Spain, on the railway from Madrid to Saragossa, and almost equidistant from these two cities; it lies at an altitude of more than 3,280 feet/x,000 m., on the left bank of the Jaión. It owes its more than Berber from the Maxmüda, Sâlim, who repaired Roman forfress which Tārik [q.v.], according to Yakût, iii, x3, had found in mruinous state.

The Arab geographers give brief descriptions of Medinaceli. According to al-Idrisi, it was a large town built in a hollow with many large buildings, gardens and orchards. Abu 'l-Fidi' says that this town was the capital of the Middle March (al-

thoght al-awsaf).

Through its geographical position, Madinat Salim was of considerable strategic importance for the Umayyads from the 4th/toth century onwards. It was on many occasions, as the last stronghold on Muslim territory, the point from which forces assembled at Cordova finally started for expeditions against the Christians of the north-east of the Peninsula and to which they retired. Though somewhat decayed down in the reign of 'Abd al-Rahman III al-Nasir, it was rebuilt, if we may believe the detailed evidence of a chronicler quoted by 1bn "Idhars, in 335/946; this ruler put the work in charge of his client, we general Ghalib, and all the garrisons of the country lent their aid in the work. This Ghalib remained governor of Medinaceli and all the Middle March until the power was seized by al-Mansur Ibn Abi 'Amir (q.v.). It was in Medinaceli that this famous badish thed on 27 Ramadan 392/ to August 1002, on returning from his last expedition against Castile. In the following century, Medinacell was frequently taken by the Christians and retaken by the Muslims, before being finally incorporated in the Kingdom of Castile.

Madiaat Sälim should not be confused with Madi-

nal Ibn al-Sălim or Ibn Sălim, which was situated in the region of Seville, probably the modern Grazalema in the province of Cadiz (see Lévi-Provençal, Hist. Esp. mus., i, 342).

Lévi-Provençal) MADINAT Al-ZAHRA', governmental city

of the Umayyad callphs of Cordova.

According to the texts which recount the construction of this madina, it was the monumental work of 'Abd gl-Rabman III who had it built to satisfy the whim of a didriga of his haram, al-Zahra'. The city was constructed 5 km, as the crow flies to the north-west of Cordova, on the southern flank of the Diabal al-'Arus ("the Bride's Mountain") of the mountain chain cailed today Sierra Morena. The work was begun m the beginning of the year 325/19 November 936, under the direction of the Crown Prince al-Hakam, with the technical collaboration of the architect Maslama b. Abd Alfah. During the fitum or civil war which was to lead to the fall of the caliphate of Cordoba, the Berbers of Sulayman al-Mustafia occupied Madinat al-Zahrā' by force and it was sacked and destroyed (401/1010). The ruined city later fell proy to pillage and systematic destruction, especially in the Almoravid and Almohad periods.

When Cordova was conquered by Ferdinand III in 1236, the old site of the royal madina was a vast terrain, occupied by ruined walls, which called "Castillo de Cordoba || Visja"; the monarch gave this terrain to the Cordoban Municipal Council, and hewn stones continued to be taken to build palaces, churches, convents and bridges in the capital. In 1408, the Council gave the ruins to the monks of St. Jerome who exploited them intensively to build in mearby orchard a monastery called "Valparaiso", in which Ambrosio de Morales, the great Cordovan historian, stayed in m 1532; he sought to identify the neighbouring rules, but, in his study published in 1575, he asserted that they were of Roman origin and that their site was that of the famous Colonia Patricia. În 1627, another Córdovan historian, Pedro Dizz de Rivas, demonstrated that they were not Roman but Arab and belonged, in a concrete manner, to a great palace erected by 'Abd al-Rahman III; and this same thesis we upheld by P. Francisco Ruano in 1760 and Antonio Ponz in 1792. The painter and historian J. A. Ceán Bermudez was the first researcher to identify "Cordoba la Vieja" with Madinat al-Zahra? (1832), and this identification was confirmed in later years, when European Avabists began to publish the Arabic sources for the history of Muslim Spain, m that, in 1854, Pedro de Madrazo and Pascual de Gayangos were charged by the Spanish state with carrying out an archaeological exploration at "Cordoba la Vieja", but their work was not crowned with success.

Meanwhile, the architect Ricardo Velázquez was to inaugurate, in 1911, a new period of exploration which he continued until his death in 1923, with excellent results: the discovery of a sector of the

northern part of the city, where the principal drawingroom of the caliph was excavated, richly decorated which Ricardo Velázquez called the "Salón Occidental"-and, on the other hand, a large madilis-for its discoverer, the "Salon Oriental"clearly marked by its austers decoration which proclaims a military purpose. The excavations carried out by Ricardo Velázquez were not conducted following a preconceived programme, and it was at his death that a local commission was named in Cordova [Rafael]iménez, Rafael Castejon, Ezequiel Ruiz, Félix Hernández and Joaquín Ma de Navascués) which had as its aim the delimiting of the extent of Madinas al-Zahra? and the establishing of a plan of work to follow in future excavations. The survey of the ruins which flourished under the covering of vegetation allowed Hernández, the architect of the commission, to draw up, in 1924, the topographical plan on a scale of 1:800 of the terrain where the city was located. Later the same architect drew up, in 1926, a pian = a scale of 1:200 of the part explored by Velázquez, of which the drawing-rooms, courts, vaulted passages, etc., were enumerated following the chronological order of their discovery, and this order has prevailed until the present. Quite soon after, excavations were pursued and the two principal sectors discovered by Velázquez were gradually enlarged until they constituted a good cohesive group. At the beginning of the year 1930, the commission having been reduced to only two members, Castejon and Hernández, the reconstruction was begun, up to a prudent height, of the northern wall encircling the city. The system was followed during the following years, with all the walls separating the terraces which had been discovered, before the reestablishment of the masonry in its broad outline. The civil war of 1936 paralysed the work until 1941, when it was pursued according to the system presented above. Simultaneously, excavations were undertaken in some then unexplored sectors belonging to the southern part of the Alcazar of the city, where in 1944, a magnificent reception madilus was discovered, whose architectural work was a dreadful ruln, while its revoluents of sculpted stone, although very fragmented, remained almost complete. This important discovery proved in an indisputable manner that the plunderers had pillaged everything that could be utilised I future the constructions—hewn stones from walls. capitals, shafts and bases of columns, etc.-and had disdained the surface decoration of the halls, generally composed of thin stone plaques which would be useless to dislocke and place in pieces in another construction. The year 1944 signals, in the excavations of Madinat al-Zahra', the beginning of a new age characterised by the reconstruction of halls by means of the preliminary recomposition of the decorative piaques and the restoring of these plaques on the walls and rebuilt arches. While the structure of the reception madilis was rebuilt, excavations were pursued in the same sector and there was discovered, in the course of the following years, the whole architectonic entirety of which the madilis was the heart: a vast tetrace, delimited on the east, south and west by a very thick wall fortified with towers; a small hasr or pavilion placed opposite the madilis and separated from it by a large pool; a dommain or steam bath, and some drawing-rooms with courts, staircases and public conveniences. According to the epigraphy placed at the time in this sector, the madilis was built by

Abd al-Rahman III al-Nasir during the years 342-si 953-6, under the direction of his fate Shanayi, as was the pavillon, but under the direction of the fatā Diaffar (the Diaffar b. 'Abd al-Rabman, who was to be the hadiib of al-Hakam II), in 1964. Basillo Pavon explored, with the assistance of Hernández, the sector corresponding to the site of the diamic of the city, perfectly illustrated in the topographical plan of 1924; this building had been totally destroyed by the plunderers, but all the principal elements of its structure have been identified and they will shortly allow for the reconstruction of the mosque. At the end of 1969 Hernándes remained the sole director of excavations, which were then concentrated in sector located in the Western wing of the great Alcazar of al-Zahrā? and probably belonging to the house of Diaffar, the hadrib mentioned above. Finally, in 1975, - the death of the great master of Hispano-Moorish art Félix Hernandez, the direction of the works fell to the architect Rafael Manzano, who has continued the enormous task of restoration begun by his predecessor.

The Arab chroniclers and geographers have supplied with excellent descriptions of Madinat al-Zahrā' and plenty of accounts and pieces of information acquaint us with the motive for its foundation: the choice of its site; the duration of its struction; the number of the workmen there, camels, mules and the materials and large sums spent on it; the palaces, reception balls, outputldings, baths, pools, gardens, barracks, etc., built its enclosure; the principal wonders contained in its buildings; the people who lived there; the bureaucratic services of the state which moved from Cordova to the new court; the memorable feasts celebrated in honour of the great dignituries and ambassadors or to recall the memory of important events; the twilight of the city; and, finally, its destruction and ruin. Furthermore, excavations have confirmed for us that the foundation of al-Nasir was a dazzling city built within a rectangular rampart which measured 750 m. from north to south and risco m. from east to west, flanked by towers regularly spaced. This rampart was formed by two walls separated by a corridor, except in the central tier of its moethern flank, where single wall - defended, it seems, by another rampart placed in from of it up to the ridges of the neighbouring hills and attached to the general enclosure. The buildings constituting the Alcazar of the city-Royal Palace, Civil Headquarters, Military Headquarters and prodigious reception halfs with their secondary annexes-were laid out on stepped terraces and adapted to the relief of the lower slopes of the mountain and supported by solid reinforcing walls. The most occupied by the Alcazar, the whole northern sector of the city, was approximately 45 hectares, of which only 12 hectares have been explored at present, although corresponding to the central part of this supreme architectural complax. Owing to the fact that the unexplored parts are, for the moment, greater (33 hectares) than those which have been explored, it is still not possible to identify the buildings discovered in terms of the documentation supplied by the texts; consequently, the Arabic names which have been given to these buildings are also gratuitous rather than definitive. For the moment we must be satisfied with contemplating the exceptional spectacle which, following the most recent work, Madinat al-Zahra' offers to the visitor to the ruins: a reception madilis of the 4th/10th century reconstructed with its origin-

decoration, whose themes sculpted in stone and marble reveal the high degree of experience and exquisite artistic sensibility of all the artismis who worked for the great Cordovan caliph 'Abd al-Rahman III al-Naşir.

MADIRA (A), a dish of meat cooked in sour milk, sometimes with fresh milk added, and with spices thrown in to enhance the flavour. This dish, which Abil Hurayra [q.v.] is said to have particularly appreciated (see al-Mas'odi, Muriidi, viii, 403 -§ 3562, where a piece of poetry in praise of madira is cited), must have been quite well sought-after in mediaeval times (a)-Djahiz, however, does not cite it in his K. al-Bukhald'; see nevertheless al-Tha alibi, Lata if, 12, tr. C. E. Bosworth, 46). Its principal claim to fame comes from al-Hamadhani's al-Makama el-madiriyya (no. 22 In Muhammad 'Abduh's edition), in which 'Isa b. Hisham records solely at the beginning of the makama an occurrence which he witnessed and then tells the story, it goes without gaying, in the mouth of Abu 'l-Fath al-Iskandari, of an adventure which had happened previously to this last. In effect, this story is the satirical portrait of a nouveau riche who invites Abu 'i-Fath to his house in order to try some madira, but goes on such length about his skill in acquiring the house and other objects, whose praises he sings with such wealth of details that the invited person, overwhelmed, takes to flight. Pursued by street urchins, he hurls a stone which wounds one of these last grievensly, and spends two years in prison. Hence he has vowed never more to eat madira, thus explaining why, at the beginning of the makima, he refused a dish of it.

The matama we been translated into German by O. Rescher, in Beiträge zur Magamen-Litteratur, v. Leonberg 1913; into English, by W. J. Prendergast, The Magamat of Badi' al-Zaman al-Hamadhani, Madras 1925 (and ed. with Preface by C. E. Bosworth, London-Dublin 1973); into Italian, by F. Gabrieli, Lo magama madiriyya di al-Humadhani, in Rend. Lincei, 1th Ser., 1v/11-12 (1949), 509-15; and into French by R. Blackère and P. Masnou, Al-Hamadani, choix de Magamál, Paris 1957 (with the title: La stance de la madira ou Le parvenu) and by R. Dagorn, in IBLA, 153 (1984/1), 113-23.

AL-MADIYYA, AL-MADYA, LEMDIYA, in French Manta, a town of Algeria situated about 100 km./ 60 miles to the south of Algiers (in lat. 36° 15' 50" N., long. 2° 45' E.), at an attitude of 920 m./3,018 ft. and on the northern border of the mountainous massif which divides the high plateau from the Mittidia. Down to the French occupation, it could only be reached by a bridle-path over the Muzaya pass (079 m./3,270 ft.). The building of a road through the gorges of the Chiffa, alongside of which a railway runs, has made access to it easier. The town itself is built at the foot of slopes covered with vineyards which yield wines of superior quality and orchards in which, me a result of the temperate climate, fruit trees grow very well. In the neighbourhood, a number of villages have grown up in which the cultivation of careals is combined with that of the vine. There is also a fairly busy market, but it is losing in importance since the railway has been extended to Dielfa at the southern end of the high plateaux. The population, which, in 1926, was 13,816, of whom 2,225 Europeans, has today increased consider-

Médéa occupies the site of a Roman settlement, Lambdia, which A. Pellegrin, Essai sur les noms de lieux d'Algerie et de Tunisie, Tunis 1949, 98, proposes to connect with the Berber root b.d. "to rise, stand up". According to Ibn Khaldun, 'Ibar, vi, 154, tr. ii, 6, this region was inhabited by the Sanhādja telbe of the Landivya, whose name survives in the ethnic Lemdani which people originally from Médéa bear. In 349/960, Buluggin b. Ziri [q.v.] restored and enlarged (but did not "found", m the sources say) the urban complex (see Iba Khaldun, loc, cit.; al-Bakri, Description, 65-6, tr. 136; Yakut, iv, 413, 2.v. Matildja; H. R. Idris, Zirides, III and index). We know virtually nothing about the town's history. Leo Africanus (tr. Épaulard, 351-2), who, having stayed there two months, apparently wanted to stay there, and, following him, Marmol, Africa, ii, 394, merely tell us that after having belonged to the sultans of Tlemcen who kept | garrison there, it passed into the hands of the sultans of Tenès, and then of the Turks when the Barbarossas [see 'ARUM] established themselves in Algiers. Under Basan Khayr al-Din, Médéa became the capital of one of the three provinces (beyliks) of the Regency, the beylik of the south or of Titteri, to which at a later date was added the lower valley of the Sébaou in Kabylia. Down to about 1770 we therefore find the bey of this province alternately at Médéa and Bordi-Sébaou. It was not until this date that, the region of Sébaou having been incorporated in the Dar al-Sulfan governed by the dey, the bey of Titteri settled permanently at Médéa, where he was in a better position to control the nomadic tribes of the plateaux. He had, however, no authority over the inhabitants of the town itself, who were under the authority of a hakim appointed by the agha of Algiers. The population, which did not exceed 4,000-5,000, among whom many Kulughlis (see gut-oghtu) and Turks retired from the service, became wealthy through its trade with the south. Caravans brought thither the produce of the Sahara and also negro slaves, who were sold to the citizens of Algiers.

During the years which followed the capture of Algiers, the French on several occasions (Nov. 1830, May 1831, April 1836) occupied Médéa, without taking permanent possession. Abd al-Kädle [q.v.] however placed a bey in it and had his ownership of it recognised by the treaty of the Tafma. The outbreak of hostilities again between the amir and the French led to the final occupation of Médéa by the latter on 17 May 1840. It was in Medéa that, shortly afterwards, the future poet Joan Richepin

was to be born.

MADJALLA [see HEDIELLE] MADJAR, MADJARISTAN, name given to the Hungarians or Magyars and to Hungary in the Ottoman period.

1. In pre-Ottoman feriod

(1) The names for the Hungarians and Hungary in the Arabic and Persian authors of the 3rd-8th/9th-r4th centuries. The earliest meation of the Hungarians (Magyars) occurs in

the Kitab al-A'ldk al-mafisa of Ibn Rusta (Ibn Rosteh), written between the years 290-300/903-22-13 on the basis of the geographical treatise of al-Diayhani (ca. 300 A.H.) who used, in the composition of this work, an anonymous historical account dealing with Central Asia and Eastern Europe and dating from the second half of the 3rd/9th cautury. In this source the Hungarians appear with the name of al-Madighariyya, i.e. the Magyars. In this period they inhabited the plains adjacent to the Black Sea, between the Don and the Lower Danube, their eastern neighbours being the powerful Turkish tribe of Badjanāk (Pechenegs). It was under pressure from this tribe that they were compelled to withdraw, in ca. 889-92 A.D., into the basin of the Carpathlans, where they founded a state which survived, within its 9th-roth century frontiers, until the end of the Fiest World War.

It seems that the same Anonymous account of the 3rd/9th century is also the basis for the description of the country al-Madighariyya (Ar. bilād al-Madighariyya) contained in the Kilāb al-Masālik wa l-mamālik of al-Bakrī (ca. 460/1668). In fact, the Hungarians mentioned in this account led a nomadic existence, and their territories, situated on the Black Sea, bordared — the provinces of the

Byzantine Empire (Ar. bilad al-Rum).

A description of the al-Madighariyya people is also found in the Jaba's al-hayaran of Sharaf al-Zaman Tābir al-Marwari [q.v.] composed in ca. 514/1120. Analysis of this description reveals that the period in question is prior to the years 889-92, a period during which the Hungarians were still a nomadic people inhabiting the plains of Southern Russia, between the rivers Dūnā (Danube, croncously in the Arabic text Rūtā), and Atil = Etul (Don). The description of al-Madighariyya contained in the work of al-Marwari is also based — the treatise of al-Djayhāni.

The anonymous Persian geographical treatise entitled Hudud al-falam written in 982 A.D. mentions the Hungarians with the some of Madighark According to the author of the Hudud al-talam, the country of the Madighari was situated to the west of a range of mountains which corresponds to the Carpathians and to the north of a Christian people called Wanandar. This latter people must be identified as the Bulgar tribe of the Onugundurs who, in the 6th-7th centuries A.D., occupied the northwestern Caucasus, in the region of the Kuban. It is known from Byzantine sources that, under the command of Asparukh, part of this tribe left the region of Kuban and travelled towards the Lower Danube which it crossed over in 679 A.D., founding to the south of this river the Turko-Slavic state of the Bulgars. The new arrivals were baptised in 864, The information given by the Hudild al-'alam concerning the frontiers of the territory of the Hungarians is therefore not derived from the Amonymous account of the 3rd/9th century, but from another anonymous more composed later, in the ath/roth century, after the conquest by the Hungarians of the Carpathian basin in 889-92 A.D.

The name Madighari or rather Madighariyān (the plural in Persian of Madighari) is also found in the Zayn al-ahitār, a Persian historical treatise composed in the years 44x-4/to48-52 by Gardizl (or Gurdizl). Gardizl considers this people to be Turkish. In the paragraph of the Zayn al-ahitār devoted to the Madighariyān, Gardizl has used two different sources, these being the Anonymous account of the 3rd/9th century compiled by al-

Djayhani and an anonymous source of the 4th/10th century, the same one that was used by the author of the Hudad al-falam. The Bulgars of the Danube are here called Nandar.

In his Tabā's' al-hapawān al-Marwazi also calls the Hungarians (whom he knew still in their ancient homeland to the north of the Black Sea, between two rivers which may be identified as the Don and the Danube) al-Madighariyya. He considers this people me being of Turkish origin. Like Ibn Rusta, he too has taken his account concerning the Hungarians from the Anonymous account, the work dealing with Central Asia and Eastern Europe compiled by al-Djayhānī.

The name ai-Madighariyya is also found in the Tahwim al-buldan, a geographical work by Abu 'l-Fida' (d. 732/1331), in ■ passage probably derived from the Kitāh al-Masālik ■ 1-mamāhik of al-Bakrl. For this reason this author calls the capital of the

said people Madighari.

In another passage of his Takwim al-builden, Abu 'l-Fida' also mentions the Magyars under another form of this name, sc. Mādjār. According to this passage, the people in question lived, alongside the Serbs (Ar. al-Sarb), the Vlachs (Ar. pl. al-Awlāh) and other "infidel" (Christian) peoples in mountains called Kashkā Tāgh (Kashka-Dagh), where the Danube (Ar. Tunā) has its and which may be identified with the Carpathians, linked to the Alps on an side and to the mountains of the Balkan Peninsula on the other.

In his cosmographical treatise entitled Küäb Nuhhbai al-dahr fl 'adja'ib al-barr wa 'l-bahr, al-Dimashki (d. 727/1327) also mentions the Mādjār or Hungarian people among the tribes inhabiting the territories situated on the tributaries of Nahr al-Şahāliba wa 'l-Ras (here, the Danube and the Tisza, wrongly considered tributaries of the Dnieper). Besides the Mādjār, al-Dimashki also mentions among these tribes the Bahkira, which he takes to be a separate people but which was, as will be demonstrated below, simply another name given to the Hungarians by the mediaeval Arab

goographers.

The Arabic and Persian al-Madighariyya, Madighari, Madighariyan and Madjar produce the Finno-Ugrian ethnonym Magyar which is also known from mediaeval European sources. Thus for example, the Byzantine author Constantine Porphyrogenitus (writing in 949-52) mentions among the Hungarians who were settled in the basin of the Middle Danube, a clan called Μεγερη (Hungarian Megyer). The Hungarian chronicler Simon of Kéza. (writing in 1282-5) states in his Gesta Hungarorum that the ancestor of the Hungarians bore the name of Mogor. It may further be noted that in the Gests Hungarorum of the Hungarian author called Belae regis Notarius (ca. 1200), the territory occupied by the Hungarians before their arrival in the Carpathian basin (889-92) bore the name of Dentumogor (Hungarian Dould magyar). The second part of this name, i.e. -mogor, corresponds to the name of the ancestor of the Hungarians according to Simon of Kéza, while the first part, i.e. Dentie, seems to be the origin of the name of Dana, known from the Kitāb al-Buldān of Ibn al-Fakih (290/902) as being that of the territory situated on the Lower Don, and also the name of Tanat, mentioned in a letter of the Khazar king Joseph in the 10th century A.D. The Italian geographical charts of the 13th-14th centuries call this region Thanatla.

The second which the Arab geographers

of the 4th-8th/10th-14th centuries designated the Hungarians was that of Bashkirs. The latter were in fact . Turkish tribe which had lived, since the 3rd/9th century if not earlier, in the territory corresponding to the old Russian provinces of Penza and Orenburg; they had nothing in common with the Hungariaus, who spoke and still speak a Firmo-Ugrian language. Thus the use of the name Bashkirs to denote the Hungarians (in addition to the correctlynamed Turkish Bashkirs) is an enigma which has yet to be solved, despite the efforts of numerous historians and linguists, Hungarian and others. The Turkish Baghkirs were called Baghkird by the mediaeval Arab authors (thus for example in the work of Ibn Fadian [q.v.], ca. 310/922). The same, or analogous, names were also used by the Arab geographers to denote the Hungarians,

The first Arab author to give the Hungariaus the name of Bashkirs was al-Mas-fidl (d. 345/956). Describing in his Munidi al-dhahab the war fought by the Hungarians and their allies the Pechenegs against the Byzantines in the years 320-32/932 to 43-4, this author denotes the Hungarians by two different but related names, these being Badighird and *Bashirda, making of them two different.

though kindred, peoples.

In his Kitab Masalik al-mamalik, al-Istakhri also the Basdier to denote both the true Bashkirs and the Hungarians. The Basdjirt/[true] Bashkirs lived, according to this geographer, between the Oghuz-Turks (al-Chuziyya) and the Bulgars of the Kama (Bulghar), under the domination the latter, while the Basdjirt/Hungarians were based in the vicinity of al-Rum, i.e. of the Byzantine empire. They meighbours to the Badjanak or Pechenegs who lived at this time between the Don and the Lower Danuhe. The work of al-Istakhel was the principal source for the geographical treatise of Ibn Hawka! entitled Kitab al-Masalik = "I-mamalik or Kitāb Sūrat al-ard (first edition prior to 136/ 967, second edition in sa. 367/977, definitive version in co. 378/988), which likewise mentions the Hungarians under the name of Basdjirt.

The name of Bashkirs (written Bāshghird) as that of the inhabitants of the country called Unitarsyya (Hungary) is also encountered in the work of the Arab traveller and writer Abo Hāmid ai-Andalusī al-Gharnāti (d. 565/1:69-70) called al-Mu*rib 'an ba'd 'adia'ib al-Maghrib. He arrived in Unkūriyya in 545/1:150-1, stayed three years and left the country in 547/1:153, leaving behind his eldest who had married the daughters of local Muslims. This same author provides another description of Hungary in his second work, the Tukyāt al-albāb. In this latter book, the Hungarians bear the name of

Bä<u>sheh</u>ürd.

In his Mu'djam al-buldan, Yakût (d. 626/1229) likewise calls the Hungarians and their country Bashchirdiyya or Bashkirs. This writer met a group of Bashchirdiyya at Haieb (Aleppo) in Syria. Yakût also mentions, in this account, the European name

of Hungary as al-Hunker (al-Hunger).

Ibn Sa'ld al-Maghribi (d. 683/1286) divides the Rungarians into two different nations: al-Bashkird (Bashkirs) who are, according in him, Muslim Turks and who live to the south of the river Dūma (correctly Dūma, in Hungarian Dūma—Danube) and al-Hunkar who are Christians. He into appreciate that the Bashthird and al-Hunkar are one people which is divided only by religion. Ibn Sa'd's great geographical work in which these ideas are contained was used by Abu 'l-Fidia' in his Tahalim al-buildan.

The Arab cosmographer Abū Sharus Abū 'Abd Allah al-Dimashki (d. 727/1327) also mentions, in his Nukhbal al-dahr fi 'adjā'ib al-barr "l-bahr, the Bashghird people which he locates in south-eastern Europe alongside the Mādjār or Hungarians. He does not appreciate that they are in fact the same people. Possibly al-Dimashki intended in this fashion to distinguish the Muslim Hungarians from the Christian Hungarians, as Ibn Sa'id al-Maghribi had done.

In his Aikār al-bilād, the Arab cosmographer al-Kazwini (d. 683/1283) also mentions the Muslim

Hungarians whom | calls Bashghirt,

The Persian writers of the Mongol period also the name of Bashkirs to denote Hungary and the Hungarians. Thus for example, in the <u>Didni's elementich</u> of Rashid al-Din (d. 718/1318) these Bashkirs are mentioned, alongside the Ås (Yasl Alans of the Russian throuides) the Urus (Russians), the Cerkes, the Klpčak and the Kelar (in other words, Christian Hungarians, below) among the subjects of these descendants of Cingiz Khan who dominated the western portion of mempire.

It has been stated above that al-Bakri uses the term ol-Madighoriyya la his Kitab al-Masdik 🚃 'I-mamdlik to denote the Hungarians at the time when they were still leading a nomadic existence on the shores of the Black Sea (before 889-92). However, to describe the Hungarians mestablished. after the year 892 A.D., in the Carpathian basin, he employs two other terms which he has taken from the account of the Jewish merchant and traveller from Tortosa in Spain Ibrahlm b. Yackub al-Turtüshi (355/965-6) [q.v.], these being al-Unkali (gen. pl. al-Unhaliyyin) and al-Turk (pl. al-Atrak). Leaving aside, for the moment, this last-mentioned name, which will be discussed below, the ethnonym al-Unhalifal-Unhaliyyin deserves attention. Now, fbråhim b. Ya'kub mentions this tribe in a brief list of the peoples of Central and Eastern Europe, between the * Tudushhiyyin (Germans) on the side and the Badjandkiyya (Pechenegs), al-Rus (Russleps) and Khazars on the other, and stresses that all these peoples speak Slavic, in view of their close connections with the Slavs. Kunik, the first commentator on that part of the geographical work of al-Bakrl which deals with Central Asia and with Eastern and Central Europe, had already identified the Ungarians, a conclusion also admitted by F. Westberg and T. Kowalski. The reason for this identification has been confirmed by the information concerning al-Unkaliyyin found in **iiii** chapters of al-Baktes Kildb al-Masälik wa-'l-mamälik which were unknown imtil edited, very recently, by Abdurrahman Ali El-Hajji (Beirut 1387/1968). One such membion is contained in the paragraph intitled Dhike balad al-Unkaliyyin which also to belong the account by Ihrāhīm b. Ya'kūb. Now, according 🖫 the paragraph in question, we are dealing here with a Turkish tribe (dies) settled in proximity to the Slave, between the land of Buwayra (Bavaria) and the kingdom of Bûyaşîāw, i.e. Boleslas I of Bohemia (935-67 A.D.). According to the same passage, the Russians were the neighbours of al-Unkaliyyin to the north, the Pechenegs to the east and the Bulgars to the south. There is no doubt that this localisation favours the identification of ai-Unkalipyin with the Hungarians. Al-Bakri also mentions another ethnonym written in a similar fashion, al-Inkilish. It is cited in a paragraph of the Kitab al-Masalik wa'l-mamalik intitled Bilad Ifrandia ("Land of

the Franks"). According to al-Bakri, these of-Inkilish belonged to the al-Madius [q.v.] (in this case Danes and Norwegians) who meighbours of the Slavs (in fact, the Slavic tribe of the Obodrites who formerly lived in what is now Mecklenburg were neighbours of the Danes on the south-eastern side). Now, these al-Inkilish had nothing to do with the Hungarians; it is more likely that they were the English who, shortly before the time of al-Bakrl, lived under Danish domination (1012-42). The name al-Unkalippin belongs to the same group of names for the Hungarians as the Old Slavic Ugri (Ungri), the Byzantine Ungroi, the Latin Hungari, Unguri, Ungare, Hungaria and Ungaria and the Polish Wegry (pronounced Wengry). All these names derive from that of Oneger, a nomadic Turkish people known from Latin and Byzantine sources of the 6th contury A.D. As for the transformation of the phoneme r to I in the names Unkall < Ungari, this is not an isolated phenomenon in the Hungarian language. In fact, the Germano-Latin proper name Gerard became Gellert in Old Hungarian (rath century).

In the Kitāb Nashat al-mashtāk, al-ldrīsl's geographical treatise composed in Sicily in 548/1154, Hungary bears the name Unkariyya, which probably represents the Latin Ungaria — even the Italian

Ungheria.

Belonging to the same groups of names is also Unkariyya (for "Unguria or "Onogwia), the name for Hungary employed by Abh Hāmid al-Andalusī al-Gharnāti in his al-Mu'rib. The name of the inhabitants of Hungary was, in this treatise, as has been observed above, Bashghird.

One of the names for the Hungarians employed by Yākūt is al-Hunkar (for Hungar), a name derived from the Latin "Hungar(i). Another orthography of this ethnonym is al-Hunkar ("Hungar(i)); it is employed by Ibn Sa'dd al-Maghribl (d. 685/1286) in the extract from his great geographical treatise

used by Abu 'I-Fida'.

Besides al-Unhalifal-Unhaliyyin, Ibrahim b. Ya'kûb also uses, to denote the Hungarians, another name, al-Turk (pl. al-dirdk) "the Turks". It seems that the term was borrowed by this author from the Byzantines. In fact, Constantine Porphyrogenitus, who was writing some lifteen years before Ibrahim b. Ya'kûb, calls the Hungarians Turkoi and their country strusted in the Carpathian basin Turkio.

To mentioned finally is a wholly isolated nomenclature, this being Kelar or Kilar, which concludes the list of names for the Hangarians and Hungary used by the Muslim geographers, historians and travellers of the 3rd-8th/9th-14th centuries. This nomenclature is mentioned several times in Rashid al-Din's Diami' al-tawarikh as the name of a people mentioned with the Bashkirs, the As (Alans, Russian Yash), the Urus (Russians), the Cerkes and the Kipčak among the subjects of the descendants of Cingix Khan. In all probability, these Kelar or Kilar m nothing other than the subjects of the hirdly (Hungarian, "king") of Hungary. This Hungarian word was already known to al-Gharnati. who had heard it during his stay in Hungary in 1151-3 and who wrote it in his Marib as kaili instead of *k. rall. It is possible that by the name Kelar/Kilar, Rashld al-Din understands the Christian Hungarians, while he denotes the Muslim Hungarians. with the term Bashkirs.

(2) The Huagarian Muslims in the 3rd-8th/9th-14th centuries. It seems that the most ancient Muslim elements which may be identified

among the Hungarians appeared as early in the second half of the 3rd/9th century, thus in the period when the tribes constituting the Hungarian federation were still leading a nomadic existence between the Don and the Lower Danube, as neighbours and allies of the great Turkish state of the Khazars $[q,v_*]$, whose capital Atil $[q,v_*]$ = Itil was situated close to the estuary of the Volga. The population of this state, which was of a heterogeneous nature, included, among others, numerous Muslim groups, among which were pure Khazars, partially Islamised, according to the Arab chronicles, from the 8th century A.D. onwards, Iranian Muslims of the Sarmatian tribe of Arstyya (ancient Aorsi) who formed the guard of the Khazar Khagans, Khwarazmians, and finally a great number of Muslim traders, of very diverse origins, who lived in the Khazar capital where there were mosques and Kur'an schools. According to the Risals of Ibn Padlan, there was in Atil a Friday mosque, and the leader of the local Muslims was me of the pages of the king of the Khazars. According to al-Istakhri, there were in Atil 10,000 Muslim inhabitants and thirty mosques. Similarly, in the Khazar city of Samandar (situated in what is now Daghistan) there was Muslims and musques. The Khazar state and the heterogeneous population of this empire exerted a great social and cultural influence on the tribes of the Hungarian (Magyar) federation, especially
the time when this federation was joined, in the second half of the 9th century A.D., by the great rebel Khazar tribe known as Kabars (or Kavars) which took flight following an abortive revolt against the Khatar Khagan. It is known from the De administrando imperio of Constantine Porphyrogenitus that the Kabars played a leading role in the organisation of the Magyar federation and that they were at the head of this federation at the time when the Hungarians decided on the conquest of the Carpathian basin. It is also more than likely that this tribe, which me doubt included both Jewish and Khazar-Muslim elements, was the one joined by groups of Arisiyya and of Muslim Kh *arazmlans, well well more is less numerous groups of Muslim traders from Atil and Samandar and the neighbouring provinces of the 'Abbasid caliphate. But it should be stressed that all of this is only a conjecture which requires verification.

The earliest substantiated information concerning the presence of Muslim elements in the midst of the Magyar federation, at least in the context of written sources, does not appear until the first half of the 4th/toth century, some four decades after the Hungarians had conquered the land situated on the Middle Danube and the Tisza which subsequently became historic Hungary.

The first written information telling of Muslims living among the Hungarians in historical Hungary comes from al-Mas'ūdl's Murūdi, in which he refers to the subject in his description of the war waged by the Magyars in alliance with the Pechenegs against Byzantium in 329-32/932 to 943-4. The Pechencys, who at this period were leading a nomadic existence between the Don, the lower Danube and the Carpathians, are denoted in the Muridi alshakab by the twofold name Sadjandk and Badjand, and the Hungarians (Magyars) are called here by two different names, Badjehird and Baskirda. Among these two tribes there lived, if al-Mas'udi is to be believed, numerous Muslims divided into two quite different groups. To the first of these groups belonged the Muslim traders who more from

the land of the Khazara, also from Ardabil, from Bab ai-Abwab (Derbend) and from other places situated within the 'Abbasid caliphate, while the other found its recruits among the Hungarians and Pechenegs proper who had been converted to Islam. In addition, it should not be forgotten that among the Magyars who had come to Hungary from the steppes of southern Russia and among the Pechenegs immigrants to this country there were also Irenian Muslims, including Kh "arazmians and probably also Arsiyya, descendants of the ancient Aorsi and kinsmen of the Aians. At all events, the Maraunians appeared in Hungary in large numbers at least mearly as the rith century A.D., at which time they mentioned for the first time in Latin sources emerging from Hungary. As for the Muslim who meet from the land of the Khazars and the provinces of the 'Abbasid caliphate and who lived, in the first half of the 4th/toth century, among the Hungarians and Pechenegs, these were so numerous that, according to al-Mascodi, they were able to form the entire vaguard of the "Turkish" army, that is, the allied Pechenegs and Hungarians, in the war against the Byzantmes.

Furthermore, the Hungarians living in the Carpathian basin during the 4th/10th century maintained political and economic relations with lands situated to the south of the Caucasus and belonging to the 'Abblisid caliphate where their kinsmen lived. In fact, after the arrival of the Pechenegs in the steppes of southern Russia, the Hungarians, displaced by them, split into two parts, of which the first withdrew, in 889-92, towards the Midde Danube and the Tisza, while the second, less numerous, made its way towards the south-east in the direction of Transcaucasia. This is known from Constantine Porphyrogenitus who, in his De administrando imperio calls this second Hungarian group Sabartoi asphaloi; they were settled, according to this author, "in the lands of Persia". These Sabartoi asphaloi (the meaning of the second part of the title, asphaloi, remains obscure) are known in the Armenian chronicles by the seem of Severd-ik! (the termination -iht is the sign of the plural in Armenian) and among the Arab historians of the 3rd-4th/9th-10th centuries by the of al-Savardiyya (al-Baladhuri) that of al-Siyawardiyya (al-Mas'adi). According to the latter author, the tribe in question lived on the banks of the river Kur, on the frontiers of Adharbàdian and Georgia, Al-Baladhurl knew them, furthermore, immediately before the year 279/892. According to Constantine Porphyrogenitus, the Hungarians established in the Carpathian basin often sent merchants wisit these Sabartoi asphaloi, who sometimes returned to Hungary with official messages. Little is known concerning the religion professed by the Sabartoi asphaloi but it is most likely that, living under Muslim domination, they exposed to the influence of Islam.

The second author writing in Arabic who tells of the existence of Muslims in Hungary is Ibrahlm b. Ya'kūb. In the course of a visit to the countries of Central Europe, this traveller made his way as far as Prague (Ar. F. rāgha) and he describes, among other things, the commercial life of the city. According to him, among the foreign merchants who this city from Hungary, besides the "Turks", i.e. Hungarians proper, there were also Jews and [ahl] al-isiām, i.e. Muslims.

According to a passage in the Hungarian chronicle known as the *Anonymi gesta Hungarorum* composed in 1196-1203, there arrived in Hungary, during the reign of the prince Taksony (?955-972 A.D.), a group of Ishmaelites, i.e. Muslims, originally from terra Bular (Bulgaria), led by two semi-legendary figures, these being Billa (Ar. Bi 'llah?) and Bocsu(?) . The majority of scholars who have studied this problent are of the opinion that the reference here is to Bulgaria of the Kame, a land which had been islamised several decades before. However, I is not impossible that the source used by the 4nonymi gesta Hungarorum relates here rather to Bulgaria of the Danube, where there were numerous Muslims from as early as the middle of the 9th century A.D. In fact, a letter exists written by Pope Nicholas in the year 866, in which he orders the extirpation of the Saracens in Bulgaria of the Danube. The Bulgars of the Danube were a Turkish tribe, sister the Bulgars of the Kama who settled to the south of the Lower Danube in 579 A.D., and man adopted the Slavic language. It is interesting that the name of a settlement of people from terra Bular, according to the Anonymi gesta Hungarorum, bears the name of Pest (read Pesht) which is without any doubt of Slavo-Bulgar origin and signifies "furnace"; it in today a quarter of Budapest, capital of Hungary.

It seems that after the conversion of Hungary to Christianity, which took place during the reign of King Stephen 1 (997-1038), one group of Hungarian Muslims ostensibly adopted the Christian faith while remaining, in reality, crypto-Muslim. Prominent among this group were the Khwarazmlans (in Hungarian, Káliz) who will be considered below.

In mediaeval Latin documents and in the ancient Hungarian chronicles written in Latin, the Muslims of Hungary are known by numerous names, which may be divided into four main categories, as follows:

1138, ca, 1165, 1215 and 1222.

(b) Ismaelitae (year 1233), Hysmaelitae (1194), Hysma-kelitas (1222), "Ishmaelites". These - the descendants of Ism5'll, son of Abraham who was, according to Arab sources, the progenitor of the Arabs, According to the work of Constantine Porphyrogenitus, a "Nisaros (in the ms. incorrectly written Zinoros), Arabic Nizar, descendant of Isma'll, was "father of all the Sarakanoi". It is not impossible that by the name of Ismaolidae the ancient Latin sources of Hungary specifically designated not the Muslim Arabs, but the Islamised Pechenegs who had settled in Hungary (to be further considered below). If this is the case, the ancient Hungarians followed the view of the ancient Russians who considered (as emerges from the chronicle of Nestor, beginning of the 12th century A.D.), that the Pechenegs, as well as the Oghuz Turks ("Torki"), the Turkômans and the Comans (Polovisi) were descended from the Biblical Isma'll. In addition, the term "Ithmaelites" in certain Hungarian documents written in Latin also designated other groups of Muslims. It is known for example that the Hysmaslites mentioned in a document of the Hungarian king Emeric in 1196, written on the occasion of the market at Eszek (the former county of Valko, currently Osijek on the lower Drava in Yugoslavia)

were Pechenogs, but rather Káliz or Khwaris-

(c) Bissarmini, Bezzermini, Birirmani, Bezermen. Burnesses. This is the transcription, in aucient Hungarian documents written in Latin, of the Hungarian word Bastormeny "Muslim". This is not the only usage of the word in Central and Eastern Europe. In fact, it is found in Polish, in Old Czech and in Russian, where the words bisveman (businman), besermen and baswrman (busurman) signify "Muslim", It is interesting to note that John Plano Carpial, the famous envoy of Pope Innocent IV to the Khan w the Mongola (1245-7), also mentions in his work a people which he calls Bisermini, correctly identified by I. Hrbek with the Kh arixmians living on the lower reaches of the Amu-Darya. Thus it is not impossible that the Biscemini of Hungary may also be identified, at least in part, with the Hungarian Kh "Arazmians. However, in two Hungarian vocabularies composed in ca. 1400, the terms Ysmaelita and beserman and ismaeliticus do not refer to any ethnic group but indicate the Muslims in general. It should further be added that the name Böszörmény is attested in numerous Hungarian toponyms, in four in five administrative districts of Hungary, within its historical limits, and also in certain mediaeval documents. For example, in a document of 1248, villa Nogbesermen (in liungarian, Nagy Böszörniény "the great Böszörinény") is the name of a village situated to the east of the middle Thaza, in the district of Nyir (Nyr).

(d) Calis (year 1111), Kales (1156), Qualis (1156), Kuales (1212), modern Hungarian Kallis, in the German chronicles Kutsel, Costones, Koltsens "Kh"arazmians". This name was mentioned for the first time in Hungarian sources in a Latin document of the year IIII, where there is a reference to people called "in Hungarian" Caliz. The Byzantine equivalent of this name is Khalisici. According to the Byzantine historian John Kinnamos (writing 2150-65), this people was subject to the King of Hungary and, in the middle of the 12th century, as auxiliaries of the Hungarians, tought alongside the Dalmatians against the army of the Byzantine Emperor Manuel Comnenus. The opinions of this historian regarding the religion of the Khalisioi are very confused; in one place he considers this people as being of Persian (i.e. Islamic) religion, while in another passage he states that they professed the Mosaic faith. The Hungarian of Kdhs, as well as the Byzantine denomination of Khalistoi, corresponds to that of Khvalisl which was the old-Russian term for the Kh "ārazmians and Kh "ārazni; it is encountered for example in the Russian chronicle of Nester composed at about the beginning of the tath century. The Hungarian name of the Khwarazmians I also found in that of al-Khazar al-khalis, "the Khatos-Khalis", an ethnic group identical to the Kh arazmians which lived, according to al-Istakhri and Ibn Hawkai, in the western part of Khazar (Atil), capital of the Khazar realm, with the king of this state and his army. The Khwarazmians-Khalis appeared in the Khazar realm prior to the 8th century A.D. In fact, the bishop of Khowaids is mentioned in a list of bishops composed before the year 787 A.D. These were the bishops subject to the metropolitan of Doros in the Crimea, and the list probably includes all the bishops of the Khazar empire. The bishop of Khoualls is placed here immediately after that of Astel, i.e. the Khazar capital Atil. According to Kulakovsky and Vasiliev, Khoualis was a town sliuoted in the Khazar realm, near the estuary of the Volga and near the Caspian Sea, which bore, in the chronicle of Nestor, the name of Khoolinthad more, "the me of Khvalinsk" (it was perhaps the eastern part of the Khazar capital, of which the western part was called Astel (Atil). A section of the Kh "arazmians of the of the Khazar realm had probably joined, prior to the years 889-92, along with the Khazar tribe of the Kabars or Kavars, the Hungarian (Magyar) federation and settled in historic Hungary after the conquest of this land by the Magyars. It seems furthermore likely that another group of Khazar Kh "arazmians joined the Pechenegs. In fact, al-Bakri says that in his time (1068 A.D.) there were among the Muslim Pechenegs (of which the main bulk was then leading a nomadic existence in the steppes of South Russia) considerable numbers of al-Khawalis (al-Khvalis), that is to say, of Kh warazminns. This was the name given by the Pechenegs, says al-Bakri, to [Muslim] foreigners, slaves who had come to them from Constantinople or from other lands. The Pechenogs gave them the choice of staying in their country, where they could marry their daughters, or of leaving for another country of their choice. It may be added furthermore that Anna Commena mentions, in her Alexiad, a Pecheneg chief named Khalis. Nor should it be forgotten that the ancestors on the maternal side of the great aristocratic Pechenog-Hungarian family Aba, which gave Hungary the king Samuel Aba (1041-7) were, according to the Hungarian chronicles, of Khwarazmian origin (de gente Cornsmina, de Corosminis orta).

It is certain that a number of Hungarian Muslims became Christians at the time of the conversion of Hungary to Christianity which took place during the reign of King Stephen I (997-1038). But subsequently, these converts reverted in part to their former religion. Such - situation towards the and of the 11th century. This is known from the resolutions of the Hungarian Diet held at Szabolcs in 1052 during the reign of King Ladislas the Holy (cap. 9), which decreed that those Muslims who, after being baptised, reverted to Islam and were agam performing the rites of this religion, must removed to other villages. The successor to Ludislas the Holy, King Coloman III (1095-2114), was also the author of medict containing resolutions directed against the Muslims. This pur furthermore the time of the First Crusade, and it is easy to understand the hostility of the Hungarian clergy and Christian aristocracy towards Muslims in general in this period. According to the decree in question, all Ishmaelites caught in the act of performing their religious rites were to be taken before the king's tribunal, and a part of their property was to be forfeited 🔳 the one who had denounced them. According to the decree, the inhabitants of Ishmaelite villages must build, in the middle of each village, a church which was to be maintained by the local Muslims. Besides this, half of these ishmeelites must leave the village in question and settle in purely Christian villages in order to become assimilated with the local Christians. It was envisaged by the king that this scheme would lead to the conversion of these people to Christianity, Accordingly to another resolution of this decree, the Ishmaelites must give their daughters in marriage to Christians and, if entertaining Christian guests, must eat with them only pork. Obviously, this last requirement constituted a violation of one of the sternest prohibitions of the Muslim faith. Nevertheless, in spite of the decrees of Ladislas the Holy and Coloman III, a large number of the Ishmaelites of Hungary remained faithful

to Islam. It is even the case that in the 12th century there took place a major expansion of this religion in Hungary, especially during the reign of King Géza II (1141-61) who was, according to the account of the Arab traveller al-Gharnáti, a good friend of the Hungarian Muslims.

It is to this latter individual, both scholar and traveller, that there is owed an important illustration of the situation and the life of the Muslims in Hungary towards the middle of the 6th/12th century. Abû Hāmid al-Andalusī al-Ghamāţī was born in the neighbourhood of Grenada in 473/1080-81 and left his native country for good in 500/1006-7, travelling to Egypt and subsequently to Syria to study there and to learn hadith. In 516/1123-4, he left Syria and made his way Baghdad, where he stayed for some time as a guest of Ibn Hubayra al-Shaybani [q.v.] the eminent statesman, general, scholar and future vizier of the 'Abbasid caliph al-Muktaff; this politician became his protector and patron. Later, in 524-5/2130-1, Abu Hamid travelled to Persia, to the Caucasus and subsequently to Khwarazm, a land which he visited three times. Later, he travelled from this country (which had for many years maintained close relations with the land of the Votga), to Sadisin or Saksin, a large Turkish commercial town situated on the lower reaches of the Volga. It seems that he settled there in 525/1131 and stayed for some twenty years until 545/1150. It is known that he possessed a house there and had concubines and sons. During his stay in Sadisin, he made z journey to Bulghar on the Volga, where he was seen in 530/1135-6. In 545/1150-51, Abû Hâmid made his way to Bashghird, in Hungary, passing through the town of Bulghar and subsequently embarking on the Nahr al-Şakāliba or "River of the Slavs" (this is to be taken as covering a whole system of rivers, including the upper Voiga, its tributary the Oka, the Desna, tributary of the upper Dnieper, and finally the Dniepr itself, probably as far up as Kiev). Subsequently, he travelled towards the south-west, passing through South Russia, and arrived, having crossed the Carpathians, in Hungary. Abu Hamid's stay in the latter country lasted three years, until 1153. In this year he left Hungary, making his way to the town of Ghuckunan (* Mankerman or Kiev) and later to Sadjshi. On this occasion, the king of Hungary entrusted to him the mission of recruiting Turkish archers from South Russia III Sadisin for his army. In 549/2154-5. Abū Hāmid left the town of Sadisin for good with the object of making the Pilgrimage to Mecca, and travelled to Baghdad. During his second stay in the capital of the 'Abbasia caliphate, he composed his al-Mu'rib 'an ba'd 'adid'ib al-Maghrib, which contains a rich store of information concerning Eastern and Central Europe and, inter alia, a long description of Hungary and of South Russia. In 566/rr6r, he travelled to al-Mawail, where he composed, the following year, his second work, the Tuhfat al-albāb, a work which also contains a considerable quantity of information concerning Eastern Europe and Hungary, Later, towards the end of his life, he went to Syrla where he stayed for five years (560-5/£165 to 1169-70), la Aleppo and subsequently in Damascus, where m died at the age of eighty.

Abn Bämid's descriptions of Hungary contained in the Murib and in the Tukfa were very important and factual, and they reveal some extremely interesting details. The account here will be limited to the information concerning the Hungarian Muslims. Our author, who lived in Hungary, as

stated above, for three years, knew very well the Muslim milieu of this land, one to which he was joined by personal links; in fact, his eldest son Hämid, who had accompanied his father on his journey to Hungary and bad settled in the country, married the daughters of two local Muslim dignituries and stayed in Hungary after his father's departure for the Orient in crs3. According to al-Mulvib, there were in Hungary two distinct types of Muslims, these being the amidd al-Maghariba "descendants of the people of the West" and awlad at Kh aratmiyyin "descendants of the Kh "arazmians". In the case of the first of these groups, their name al-Maghāriba ("the Maghribla") remains mysterious. It is true that Abu Hamid speaks of the existence of "sons of the Arabs of the Maghrib" (awidd al-'Arab min al-Magheib) at Sadjaln on the Volga, an important East European commercial centre, which could be true, especially as these people professed, according to this author, the Maliki law school like the true Maghribis; but in another passage of al-Mu'rib, he gives the name of abad' al-Maghariba "sons of al-Maghariba" to people with no connection whatsoever with true Maghribis. In the second case, it is a question of meet thousands of people living in the vicinity of "Mankerman "Kiev" who had "the appearance of Turks, spoke the Turkish language and shot their arrows like Turks". According to this passage of al-Mu'rib, the Maghariba of the neighbourhood of Kiev also here the name of Badjana, meaning Pechenegs (it may be recalled, in fact, that one of the two names given to the Pechenegs by al-Marudi was Badjana, without final -k). Thus It appears that the Maghariba of Hungary were identical to the al-Maghariba/ Badiana of the Kiev region, and that one is dealing with numerous groups of Pechanegs (Abn Hamid counts these Maghāriba/Pechenegs in thousands) living between the roth-15th centuries A.D. in the Carpathian basin as a subsidiary people to the Hungarians, These Pochenegs (in the mediaeval Latin sources Bisseni or Bysseni, from the Hungarian Besenye, read Bestenyo - Badjana Bedjene or Palana Pelene of the Arabic sources) arrived in historic Hungary from the steppes of South Russia in several waves, The earliest of these waves apparently arrived in Hungary in the time of the prince Arpad, at the beginning of the roth century A.D. The men arrivals who were, according to the Hungarian chronicles, led by a certain Chaha, received from Arpad land situated in the Matra mountains. As for the second wave, a very important group of Pecheneg immigrants, it arrived in Hungary (if credence is to be given to the chronicle Anonymi Belas Regis Notarii de gestis Hungarorum, composed in ca. 1200 A.D.) during the reign of the prince Zolian who lived in the first half of the roth century A.D. These Pechonegs were settled by Lake Ferto, near the northwestern frontier of Hungary to protect the young Hungarian state against attacks by the Germans. Soon afterwards, there arrived in Hungary, during the reign of the prince Taksony (? 955-72), a new and very numerous group of Pechenegs led by Thonuzoba, a person of princely origin. Taksony gave him, as a seat, land situated in the vicinity of Kemey, extending as far as the river Tisza, During the reign of the prince Géza (972-7), there arrived in Hungary a new group of Pecheneg immigrants. This is known from the Gesta Hungarorum of Simon of Kéza (13th century), who calls the newcomers Bessi. The new wave was linked to the victory of John, comes of Sopron, a county situated in the

north-west of Hungary. In 1072, according to the Chronicle of Thurocs, the latter routed a large detachment of Pechenegs in the service of the Byzantine governor of Belgrade, taking prisoner several thousand Pechenegs whom he probably settled in his domain. The last wave of Pechenegs arrived in Hungary in 1122-3. These were the remnants of a large Pecheneg group which, in withdrawing from the steppes of South Russia, and attacked the frontiers of the Byzantine empire and had been defeated by the army of that state. These remnants settled in Hungary under the command of their Khan, named Tatar. The newcomers were received very amicably by the Hungarian king Stephen II (1115-31). This wave was the last phase in the long series of Peckeneg immigration into Hungary which had lasted almost two hundred years. The Pechenegs who were settled as guards on all the frontiers of Hungary, as well as those who lived in the interior of the state, were required to supply troops of horsemen, who constituted the light cavalry of the Hungarian army. The first information regarding Pechenegs as forming a part of the Hungarian army comes from the year 1052 A.D., at the time of the Hungarian war against the Germans = the river Leitha. In 1176 Fechaneg warrlors are found in the army of Stephen II. Later, in the year 1146, the Pechenegs, who probably made up two detachments of the garrison troops on the Austrian frontier, were included in the formation of the Hungarian army during the war against the Austrian Duke Henry Jasomirgott, in the battle near Moson. They were commanded by two Pecheneg "counts". In the year 1150, the Pechenegs constituted, along with the Khalisiane (Kh "arazmians) Hungarian auxiliary troops in the war of the Hungarians and the Sarbs against Byzantium. The question of the participation of the Fechenegs in the Hungarian army has yet to be studied. However, it should be noted that in the battle between the Hungarlans and the King of Bohemia Ptemsyl Ottokar II near Kressenbrun In 1260, the Pechenegs are not mentioned among the auxiliary troops of the Hungarians.

There were two different types of Pecheneg settlement in Hungary, these being settlements situated close to the frontiers and establishments located in the interior of the country. The colonists settled near the frontiers had the duty of defending the wooden stockades which surrounded the entire territory of Rungary. They were called in the Hungarian documents written in Latin speculatores or confinarum custodes. Pecheneg guards of this type existed as early - the time of St. Stephen (997-10381 and even before this period. They were settled in groups quite close together, not far from the western frontier of Hungary, notably in the counties of Sopron and Moson. This latter territory was even salled, in ca. 1230, on account of the large number of Pecheneg military colonists, by the name of terra Hissenorum ("the land of the Pechenegs"). The Pecheneg guards settled near the Bohemian frontier were also very numerous, in contrast to the northern, eastern and southern borders, where their numbers were relatively small. As regards the Pocheneg settlements in the interior of Hungary. these may be divided into four groups, these being the group of Fejervár-Toina (or of Sarviz), the group of Körös and the group of Csanad or Aranka. The largest of these four groups of villages, and at the time the largest group of Pecheneg settlements in Hungary in general, was the group of Fejervár-Tolna situated between the Danube and Lake :

Balaton, along the river Sarviz, in the southern half of the county of Fejervar and the northern half of that of Tolna. All these settlements had the duty of defending from the enemy the town of Szekes-Fehérvár, the royal capital of Hungary under the Arpads (in the year 1192 Belgrade, 997 Alba Regia; in German Stublweissenburg). These Pecheneg villages enjoyed a degree of independence and various privileges. It may be added that besides this last group of villages, in the territory situated between Lake Balaton and the Danube, numerous other villages of the Pechenegs are encountered. Thus it may be stated that the largest number of settlements of Hungarian Pechenegs - situated in western Hungary, to west of the middle Danube. Besides this, there were more than Pecheneg villages situated in western Slovakia, about twenty - the upper Tisza, some fifteen between the Tisza and the middle Danube, another fifteen in the basin of the Maros and a further ten Transylvania.

The Pechenegs who arrived in Hungary through numerous waves during the 10th, 11th and 12th centuries, were for the most part pagans professing the primitive religion of the ancient Turks. However, there were considerable numbers of Muslims the newcomers, m may be judged from al-Mas'odi's account regarding the war waged by the Bagianah Budiana in alliance with the Hungarians against the Byzantines in 320-32/932 to 943-4. This has been mentioned above. Later, however, Islam disappeared without trace among the Pethenegs of steppes of South Russia, and-al-Bakel (460/1068) states in his geographical treatise that, according to the reports Muslim slaves returning from Constantinople, this people professed, until the year 400/1009-10, the pagan faith (din al-Madjusiyya). However, immediately after this date, there came among them a learned Muslim fakik who succeeded in converting a number of Pechenegs to Islam. This, according to al-Bakri, marked the beginning of an active Islamising campaign among the Pechenegs, which ultimately in to war between the new converts and their compatriots who had remained pagana. According to al-Bakri's informants, the converts to Islam, who numbered only 12,000 warriors, succeeded in defeating the pagens. A large number of the latter were massacred, and the others became Muslims. According to al-Bakri, this event took place prior to the year 460/1068. At this time there already were among the Pechenegs, if al-Bakri is to be believed, fakths, scholars and Kur'an readers. If the account given by al-Bakri is true, the conversion to Islam of the vast majority of the Pechenegs cannot have been other than superficial, with the retention of numerous pagan rites. In view of his account, it is not impossible that the Pechencys taken prisoner by the Hungarians in 1072 A.D., in the Hungarian war against the Byzantines, and subsequently established, probably as guards, close to the frontiers of this kingdom, could have professed, at least in part, the Islamic faith. Similarly, it is quite possible that the last wave of Pechenegs immigrants which was established in Hungary in 1122-3 A.D., consisted of people half-Islamised, among whom there were fakihs and Kur'an readers. If this is a case of Pechenegs very superficially Islamised, the fact is also confirmed by the image of the Maghariba/Badjana (Pechenegs) presented by Abu Hamid al-Andolusi al-Gharnati 🔳 1151-3. These people had only the vaguest ideas of the rites and duties of Islam. Thus, for example, they drank

wine, which was forbidden them by Abu Hamid. Before his arrival, they knew neither the Friday prayer nor the kinfba; they learned these only, this traveller boasts, after his arrival in Hungary. Nor did they practise, before the coming of Abū Hāmid, polygamy and concubinage as enjoined by Islam. As regards the former crypto-Muslims of Hungary (these were, for the most part, Bulgars and Khwarazmians converted to Islam and later, during the reign of Stephen I, officially compelled to renounce this religion), their knowledge of the principles of Islam must, no doubt, have been considerably greater. The general situation of Muslims in Hungary in this period was relatively propitious, since King Géza II who reigned at this time, according to Abū Hāmid, "loved the Muslims". The Maghariba/Badjana were, like a great many of the Khwarazmians, warriors, and Abu Hamid speaks of their participation in the war of Hungary against Byzantium. They were very numerous, "thousands of people" according to this author, referring both to the crypto-Muslims and to the Muslims openly professing their faith. As for the number of places inhabited by these two types of Muslims, there were, according to Abn Hamid, "more than ten thousand"; this latter estimate seems much exaggerated.

It is known that the Pechenegs established between the roth and the 15th century in Hungary possessed their own aristocracy and nobility. In fact, the various groups of Pecheneg immigrants arrived in Hungary led by their khāns (dur in the mediaeval Hungarian sources written in Latin) who enjoyed, in the first period of the Pecheneg presence in Hungary, that is in the roth-righ centuries A.D., considerable respect. Among these khans belonged, for example, Zulian, princeps Bissenorum of the ancient Hungarian chronicles, as well as other Pechaneg khāns named in these sources, for example Aba, Kemey, Botund, and the dux nomine Tatar known from the war between the Pechenegs and Byzantium in 1123, who settled in Hungary in the time of King Stephen II. It is known that the prestige of these Pecheneg khans in Hungary was so great that one of these persons, Samuel Aba, became in 1041-7, king of Hungary. Later, the different groups of Pechenegs settled in various parts of Hungary were placed under the authority of representatives appointed by the Hungarian kings who hore the titles of comes of fudez and who were, in the majority of cases, of Pecheneg origin. These countes and judices also commanded the Pechenegs in times of war, as was, for example, the case of the comes of the Pechenegs in the Arpas locality in 1222. The descendants of the khans and the Pecheneg nobility obtained posts in the administration of the Hungarian state and in the royal court. Thus, for example, a certain Pacheneg named Mag (Magh, Mock) whose name seems to derive from the Arabic Madjus, was palatine of Hungary and comes of the district of Bacska situated between the Danube and the lower reaches of the Tisza. Another Pecheneg, named Benedict, was, in 1329, comes of the district of Baranya. In 1404-6 e certain Paulus Byssenus de Eorghede was governor (ban) of Dalmatia, of Croatia and of Slavonia. As for the Pecheneg aristocrats who made careers in the Hungarian royal court, there - for example a certain Aba Bissenus (of the Pecheneg family of Aba of Kerney) who was, in ca. 1225, a home regius of King Andrew II. Besides the aristocents, there were in Hungary a fair number of less exalted Pecheneg nobles. The mediaeval documents mention several of these nobles, who are designated ; by the title mobilis (for example, mobiles bisseni de Kwasfalw). It seems that it is from these Pecheneg khāns who was to Hungary in immigrants that Ismā'il b. Hasan was descended. He was, according to Abū Hāmid, "the descendant of valiani Muslim princes" of Hungary, and he accompanied this traveller on his journey from Hungary to "the land of the Slavs", that is, to Kiev. Abū Hāmid also states that his eldest con married the daughters of two respected Muslims of Hungary. It was that the persons in question here were Islamised Pecheneg nobles (nobiles bisseni).

To return to the second group of Hungarian Muslims mentioned by Abû Hamid al-Andalust al-Gharnati, these are the Khafarasmians: the Kaliz of the Hungarians, al-Khawalis or al-Khalis of the medineval Arab sources, the Khalisioi of John Kinnamos and the Khunlisl of the Russian Chronicle of Nestor, According to Aba Hamid, there were thousands of them in Hungary (this author even states in one passage that they were "innumerable"); according to him they were in the service of the king of Hungary. Officially, they called themselves Christians and they disguised their Islam, in contrast to the Maghariba/Pechenegs, who overtly professed the Muslim Inith and served the Christians (meaning the king of Hungary) = soldiers. It is also known, from Hungarian documents, that the Káliz sometimes fulfilled the function of administrators of the royal treasury (institores regii fisci, quos hungarice culic vocant). One Caliz (Khwarizmian) named Etheius (from the Arabic 'Atiyyat [Allah]) who occupied this post in the county of Nyitra (Nitra) is known to us from a Hungarian document of the year rare A.D. In the same document there is reference to another Káliz who was administrator of the royal treasury and at the same time count (comes) of the mint. His name was Maging (Ar. Madiudi). These two individuals must have been, judging by their names, Muslims overtly professing their faith. At about the middle of the 6th/12th century, Khvarazmians (Khalisioi) lived, among other places, in the county of Szerém (in ancient times, Sirmium, currently Mitrovica in Slavonia) in the south of Hungary in its historic frontiers. The memory of this ethnic group is also preserved III some fifteen toponyins in the counties of Fejér, Veszprem, Zala and Somogy (all four of these being situated to the west of the Middle Danube), in the county of Nyitra (Nitra) in western Slovakia, in the counties of Közép-Szolnok and Zemplén (both situated on the upper Tiszal and in the county of Pest situated immediately to the east of the middle Danube. The mediaeval Hungarian documents written in Latin also mention a road which takes its name from the Khwarazmians (1212: in valle Kualux), located in the county of Fejér. A colony of these people (generatio Kales) also lived, according to a document of the year 1135, in the village of Budakálasz; it may be noted that the second part of this last name, i.e. -kdlass, has olso retained the designation of its former Khwarezmian inhabitants. A document of 1185 also mentions a road called Koissel (Kalus-ut) which in another document dating from the year x208 bore the name: of Calusata. The road in question was an important highway which led from Szeged, a town situated on the eastern bank of the middle Tisza, to Batmonostor. In the Middle Ages, this road played an important role in the Hungarian solt trade and its name indicates that, in this case at least, the sait teade was managed by the Káliz or Khafrazmians, It is most probable that the Khwarazinlane also

sometimes hid themselves under the name of Böszörmény or "Muslims" (Bissermini of the Hungarian documents written in Latin). It is thus very likely that the Böszörmény toponyms which are encountered in four or tive counties could also designate villages formerly inhabited by Khwarazmians. In the Register of Várad (13th century), concerning the eastern frontiers of Hungary as it then was, there in mention of a Villa Nogberermen dicta (1248). According to the Register, this locality was the centre of the Ishmaelites (Ismaelites) of Nyr, a territory extending to the north of Várad. It is not impossible that the name of this village denotes the Kh arazmians. It is very probable that the terms bezermen and buzermen (Bözörmény) and Ismaélitas do not refer to an ethnic group, in most cases, but quite simply indicate the Muslim religion. It is in this sense, for example, that the name of the Besermenket well, situated in the region of Pest and mentioned in a document of the year 1325, refers not to an ethnic group (the population of this area was composed not only of Bulgars but also of Khvārazmians and Pechenegs converted to Islam) but to Muslims (in Hungarian, Böszörmény) in general. Similarty, the name Saracesus (Saracen) referred not to a people but only to the Muslim religion. This name is also identified with that of the Ishmaelites (in the mediaeval documents Ismaelitae, Hyamaelitae, etc.). So, for example, willage of the county of Bodrog (between the Danube and the lower Tisza) was called in 1192 villa Hysmaslitarum, and in 1206 villa Saracenerum. The Muslim soldiers who were sent to the aid of the Emperor's troops, at the time of the siege of Milan in 1161, according to one chronicle bore the name of Saracens (Saraceni). The Muslims of Pest, probably of Bulgar, or possibly of Kh "ărazmian (káliz) origin, who in the 12th century bore the name of Ishmaelites, are called Saracens in a document of 1318. On the other hand, the letter sent by the Czech King Přemysl Ottokar II to Pope Gregory IX, in which there is reference to the battle between the Czechs and the Hungarians near Bressenbrun (1260), distinguishes the Berrermini from the Hysmahelitae. It is possible that in this case the first of these names denotes the Kaliz or Kh varazmians (it will be recalled that the Kh arazmians were called Bisermini by John of Plano Carpini), while the second may refer to the Islamised Pechenegs.

The situation of the Muslims of Hungary which was, if al-Gharnati is to be believed, very prosperous in 1141-61, during the relyn of King Géra II, and continued to be favourable at the beginning of the 13th century, in the time of King Andrew II (1205- At first, this king also was ■ friend of the Muslims, but later he was forced to change his attitude under pressure from the clergy. The Hungarian Muslims were at this time still very numerous, In fact, in a papal letter of the year 1221 there is a reference to multitudo Saracenorum Hungariae. It is from the period of Andrew II that there emerges the description of the Hungarian Muslims supplied by Yakût in his Mu'djam al-buldan. His account is based on information which this author received from a group of these Muslims (Yāķūt calls them al-Bashehirdiyya) whom he met at Halab (Aleppo). The date of this meeting is not known exactly. It is known, however, that Yākūt spent some time there In 613/1216-17, in 614/1217-18, in 621/1224 and finally in 626/x229, shortly before his death. According to this author, the al-Bashghirdiyya were people with very red (or blonde) hair, and with complexions

that were also very rosy (here = white-Yākût uses in both cases the Arabic word shuler); they professed the law school of Abū Ḥanīfa. Yākūt asked of the members of this group for information on their country and their way of life, and received the answer that their country was situated beyond Constantinople among a population belonging to the Franks (in other words, Western Christians) who called al-Hunkar or Hungarians. They were subjects (Ar, raciyya) of the al-Hunkar king, and were settled in the most distant parts of his domain, where they inhabited some thirty villages. It seems probable that these were the Muslim Pechenegs of which the most important groups had settled, in the roth-13th centuries, in the counties of Sofron and Moson and between the middle Danube and Lake Balaton, in the western part of Hungary, on the Austrian frontier and around the ancient capital of the Arpads, Székes-Féhervár. According to Yakūt's Informant, each of these villages === large enough to resemble a small town. However, these places were not surrounded by walls. In fact, the king of Hungary did not allow the local Muslims to fortify their villages with walls, for fear lest they rebel against him. According to the remainder of this account, the language of al-Hunker, as of al-Bashghirdipya, was the same as that of the Franks. It is very likely that Yākūt's informant was thinking here of Latin, which was the official language of the Hungarian state in the Middle Ages. According to other information from this source, the al-Bashehirdiyya dressed like the Hungarians and were liable for military service, as were all the other inhabitants of Hungary. In fighting the enemies of the country, Yāķūt states, the Hungarian Muslims were also engaged in the Holy War, the dilhad, in view of the fact that Hungary was surrounded by infidels hostile to Islam. Yākūt also asked his informant how the Muslims came to be living in Hungary. among infidel countries. He was told that according to the sayings of the ancestors of al-Bashghirdiyya, there came to Hungary, from the land of the Bulgars (bilad Bulghar), in ancient times, seven Muslim individuals who sattled among the al-Baskghirdiyya and converted them to Islam. This tradition corresponds to that of the Hungarian chronicle known Anonymi gesta Hungarorum, composed in 1196-1203. according to which there came to Hungary, during the reign of the prince Taksony a group of Ishmaelites from terra Bular (Bulgaria of the Kama or rather, of the Dannbel. This has been discussed above. Yākūt's informant adds that the Bashghirdiyya who have performed the hadidi are highly respected by the Hungarian Muslims, who entrust to them control of their religious affairs. He also says that the Bashthirdiyya who engage in military service in Hungary shave off their beards, as the Franks do, in other words in the Christian fashlon. However, this is not the case as regards the others, those not performing military service. In view of the fact that the people met by our geographer at Aleppo had shaven beards, they would have belonged to the military caste. Elsewhere in Yākūt's article it is revealed that the road leading from Hungary to Aleppo passed through Constantinople and was four months' travelling time in length. It was already known, from the account of al-Gharnāți, that the route used by Hungarian Muslims in their travels in the Orient also passed through Küniya (Konya) in Asia Minor,

It has been stated above that King Andrew II, who was initially well-disposed towards his Muslim subjects, was compelled, in the year \$222, to pro-

claim a charter, also known at the Golden Bull, defining the rights of the Hungarian people. The second edition of this Bull appeared in 1231, and the document contained numerous restrictions imposed in the Muslims and Jews of Hungary. It emerges from these documents that, until this time, the Muslims (Hysmaelitae, Saraceni) and the Jews of the country had the right to take - public functions, in particular, supervision of the mint and of salt works (year 1222; Comites camere monetarii, Salinarii at Tribidatii Hyamaelitae fieri non possunt; 1231: Monetae et Salibus, ac altis publicis officiis Saracent non praeficiuntur; 1232: Saraceni praesiciuntur camerae et publicis officiis; etc.), which were forbidden them in the Golden Bull, However, all these restrictions, in the period 1222-31. existed only on paper, as is shown by an edict of Archbishop Robert of Esztergom dating from 1232, medict declaring the excommunication of Hungary. According to this edict Andrew II, after proclaiming the Golden Bull, again appointed Muslim dignituries to public offices; he also tolerated the presence of Muslims in his estates. According to another passage of Archbishop Robert's edict, it was a royal chamberlain named Samuel who was especially favourable towards the Muslims and the "false Christians", i.e. the Patareni. The Archbishop forbade Christians to do business or maintain other relations with Hungarian Muslims, except those who had freed their Christian slaves (or slaves of Christian origin) who were of Hungarian, Bulgar, Cunnan or any other race. Following the excommunication by Archbishop Robert, King Andrew | repented and concluded. on 12 August 1232, an agreement with the legate of Pope Gregory IX, in which he promised that in future the Saracens would be forbidden to administer the mint or the revenues of the state, and would be barred from occupying other public posts. He also undertook in this pact that in future the Saracens and Jews would be obliged to carry signs to distinguish them from Christians. They would in future be unable to buy possess Christian slaves. The king further promised that each year there would be m census of Saracens and Jews carried out by the Palatine, or some other senior state official, who would be authorised, on behalf of the bishops, to take from the Saracens and the Jews any Christian slaves and Christian wives. According to the same undertaking by Andrew II, marriages of Saraceus and Jews with Christians were to be dissolved or annulled, and both parties would be punished by the loss of their property and their freedom. Thus it is probably from the year 1232 that there began the most serious oppression of the Hungarian Muslims by the Church, and it is only from this time onward that one can speak of the Christianisation of this part of the Hungarian population, This Christianisation is marked especially by the building of Christian churches and monasteries, which began at about the middle of the 13th century in villages occupied by the Pechenegs who until this time had remained superficially Islamised - even pagen. It is in the documents of this period that phrases appear such as ecclesia de Besenu or even abbatia de Becenu (from Hungarian Besenyé "Pecheneg").

There is no doubt that the invasion of the Mongols (Tatars) in 1241 elso contributed, in the highest degree, to the reduction of the Muslim element in Hungary, an element composed for the most part of soldiers in the service of the kings of Hungary. On account of its tenacious resistance, this element suffered particularly severe losses at the hands of

the Tatars. This issue will be discussed further, in the context of m analysis of the description of Hungary given by Ihn Sa'ld al-Maghribl.

It is quite possible that there were also Muslims for at least people superficially Islamised) among the Comans (in Hungarian, Palocs), a Kipcak tribe which took refuge in large numbers in Hungary in their flight from the Mongols, who appeared in 1223 in the plains by the Black Sea where the Comans were leading a nomadic existence during the 11th-13th centuries.

Moreover, these were not the first Coman groups to settle in Hungary. In fact, it is known that early as 1080-7 the Hungarian king Solomon summoned a military detachment of this people into Hungary, and that another Coman group settled in Hungary in 1110-20 probably in the Matra mountains. These newcomers were exposed, in the steppes of South Russia (like other Turkish tribes who led a nomadic existence there and were in general animists. and sharmanists), to the influence of Islam. They could thus add to the number of Muslims (or rather of superficially Islamised animists) in Hungary. In this manner, the Muslim presence in this country maintained in spite of pressure from the Church and in spite of the losses suffered during the Mongol invasion of 1241. It is stated, in fact, in a letter of the king of Bohemia Přemsyl Ottokar II, addressed to the Pope and giving a description of the battle of Kressenbrun between the Czechs and the Hungarian King III IV (r250), that among the auxiliary units of the Hungarian army which took part in this battle, there were an innumerum multiludinem hominum Comonorum at Ungarorum et diversorum Sclavorum, Siculorum quoque et Walachorum, Bezzerminorum et Hysmahelitarum, Scumaticorum etiam ut pote Graecorum, Bulgarorum, Rusciensium et Bosnenzium kaereticorum. It has been demonstrated above that Bezzermini is the name not only for Muslims in general, but also for the Kh "iranmians (Káliz) and that the word Hysmabelitae (Ishmaelites) can also specifically denote the Muslim Pechanegs.

it is from approximately the period of the battle of Kressenbrun that there comes the last Arabic source concerning the Muslima of Hungary. The source in question in a short account of Hungary (al-Hunhar) and of the Hungarian Muslims (al-Bashghirdiyya) by Ibn Safid al-Maghribl. This account, part of his major geographical work, has been reproduced in the Take-Im al-buildin of Abu 'l-Fida'. According to this text, Hungary was divided at this time into two parts, of which one, situated in the east of the country, was inhabited by al-Hunkar (the Hungarians), a Christian people, while the western part of the country was inhabited by another people, known as al-blightird and professing the Muslim faith. This people lived on the river Dama (to be corrected to Duna, "Danube") as neighbours to the Germans. The capital of the bildd al-Bashhird, according to Ibn Sa'ld, bore the name of Kiral and was situated in the south of the country. In all probability this word is simply an Arabic transcription of the Slavic term grad "town" and represents the second part of the name Belgrad (the "White town") which was the Slavic name for Saikes Fehirvar, the capital of Hungary under the dynasty of the Arpads. This name figures, with different forms, in numerous Latin documents of Hungary in the 11th-13th centuries. Its mediaeval Latin equivalent is Alba civilas regulis, in German it is Stublucissenburg and in Hungarian, as has just been stated, Salkes Fehlevar. Al-Idrisi calls this town

Hal(a)ghrāta or Bal(i)ghrāta. Ibn Sa@d adds that the el-Bashbird people were converted III Islam by I Turkoman faith "who taught them the rites of the faith", It seems that the mission of this fahile (who was not the first Muslim missionary to visit Hungary, a land where, as has been shown above, Islam had been present since the 4th/roth century) cannot have taken place until after the end of the 11th century, a time at which the Turkomans, a Turkish tribe mingled with Iranian elements, was living in a primitive state in Central Asia, as neighbours of the Saldink Turks. When the latter conquered Asia Minor towards the end of the 1th century, the Turkemans united with them and lived in this land, recognising the authority of the Saldiuk rulers of Konya. During his stay in Hungary in 1131-3, al-Gharakti saw Turkoman mercenaries in the service of Byzantium taken prisoner by the Huagatians. Seeing that the route taken by Hungarian Muslims who, according to Abu Hamid, made their way to the East and especially to Mecca, passed through Konya, the arrival in Hungary of a Turkoman missionary, probably a native of Asia Minor, seems entirely probable. It may also be noted that Ibn Battūta (757/1356) uses the name Turkomāns to denote the Ottoman Turks.

The bilad al-Bashkird was invaded, according to Ibn Saud, by the Tatars (1241) who slaughtered many of the inhabitants. According to another passage in the work of this author, the Bashkird, as allies of (or rather, subjects of) the Hungarians, look part, in the same year of 1241, alongside the Germans and the Hungarians, in a battle near Sebenico (Sibenik in Crostia), in which the Tatar forces were annihilated. The facts given by Ibn Salid are also confirmed by the Latin sources, including the Rogerii carmen miserabilis where there is reference to the exmed resistance of the Hungarian Muslims against the Tatars. In another Latin document of this period there is mention of the Saracen district called Bew which was entirely devastated during the Tatar invasion of 1231.

Little is known of the later history of the Muslims of Hungary because the Arab - Christian sources concerning this religious group become less and less numerous. However, it is stated in a Latin document that in 1290, at the time when the Hungarian King Ladislas IV left his capital, going to live as a nomad with the Comans (Hungarian Palocz) who lived in the Matra mountains and in some other districts of Hungary, he handed over all responsibilities state to a Muslim dignitary named Misse (Ar. Milsä ?), who had himself baptised immediately after this appointment. As regards the Arabic sources of this period, the one most worthy of mention is the Athar al-bilad of al-Kazwini who gives an interesting description of Hungary (he calls it "the land of Bashghirt") composed in the basis of the account of a fakih who was a native of this country. This account was written, as can be from its content, some time after the Mongol invasion of 1241 (the fahih in question calls the invaders al-Talar). According to this account, the Bashghirt are a great people whose king has a large army at his disposal and of whom the majority is Christian; among them there is also a multitude (Ar. diam', also "crowd", "mass of people") of Muslims who obthe law school of the imam Abu Hanifa. These Muslims pay a tax (divya) to the Christians, just the Christians pay a tax to the Muslims in lands of Islam. Of less value is a passage from the Nukhbat al-dair of al-Dimashki. This author also mentions the Bāshghird people, which he locates in south-east Europe, alongside the Madjar or Hungarians. He does not take account of the fact that these are two branches of the same people. It is quite likely that he meant by this means to distinguish, as had been done by Ihn Sa'id al-Maghribi, the Hungarian Muslims whom he calls Báshghird from the Hungarian Christians whom he calls Mādjar.

It seems that Islam was maintained in pre-Ottoman Hungary until approximately the year 1340, the period in which the Hungarian King Charles-Robert of Anjon (1308-42) compelled all those of his subjects who were not yet Christians to embrace

Christianity or to leave the country.

However, the Pechenegs, although converted to Christianity in the 14th century at the latest, retained until the end of the 15th century, even after the loss of their ancestral language (by this time they were speaking the Magyar language), some traces of Muslim culture. This is known from the work of A. Bonlinius, who has provided a vivid description of the Hungarian Pechenegs in his Rerum Hungaricarum Decadis, il. liv, p. 220, Hanover 1606. According to this author, "they wore long beards and long moustaches and . . . dressed in the Persian fashion, in tunics of silk that were ruffled by the wind".

(ii) THE OTTOMAN PERIOD

After the occupation of Belgrade in 1521, Sulten Süleymän I led three campaigns into Hungary in 1526, 1529 and 1532, but by these he did not extend the frontiers of the Ottoman Empire to the north of the line of the Drava and the Lower Danube. It was only in 1541, after the death of Janos Zapolya, that the Sultan occupied the fortress of Buda, In order to prevent the Hapsburg Ferdinand, who late claim to the whole of Hungary, from taking possession of it. In 1543 Süleymän launched another campaign against Vienna in accordance with his commitment as part of Franco-Turkish co-operation to attack the Hapsburgs from two sides. But the Turkish army suddenly stopped on its way to Vienna at the fortress of Esztergom because the Sultan had not received any reassuring news either about the activities of his fleet in the Mediterranean Sea or of the military operations of his French allies. So he had me content himself with occupying a few of the more significant fortresses in western Hungary, sc. Esstergom, Tata and Székessehérvár, and then he started back for home with his army. Subsequently, the beglerbegi of Buda and later the beglerbegé of Rumelia began to enlarge the Turks' base in Hungary in the form of a wedge against the Hapsburgs by occupying several other fortresses and castles, sc. Visegrád, Nógrád, Haivan, Temesvár, Szolnok, etc. The first phase of Turkish expansion in Hungary ended with Süleyman's last campaign, the occupation of Szigetvár and Gyula in 1566.

Administration in the Hungarian territories that

had fallen under Turkish rule was gradually organised. in the wake of the expansion, although the establishing of sandjaks did not take place immediately after the occupation of even more significant fortresses. The process of re-organisation in Hungary cannot have been in fast as was suggested by I. H. Uzunçarpili, who claimed that the Turks annexed the Hungatlan territory possessed by János Zapolya to the Ottoman Empire in 1541, converted it into the begierbegilik of Buds, which consisted of twelve sandials, and appointed the beglerbegi of Baghdad, Soleyman Pasha, to be its head (Osmanle farihi) ii, Ankara 1964, 344). It is true that the Sultan appointed Süleymin Pasha to be beglerbegi of Buda. This post, however, could not involve the government of twelve Hungarian sandiaks because, besides the territory of the sandial in Buda, which was just being formed under the protection of the strongholds of Buda and Pest, it was only Titel which was in Turkish possession north of the line of the Drava and the Lower Danube at that time. Therefore, the beglerbegilik of Buda had to be formed from sandfaks. which were south of the line of the Drava and the Lower Danube, i.e. Eszék/Ösek, Semendire, Izvornik/ Zvorník, Aladiahisar/Kruševac and Vulčitrin/Vučitrn. If these remote sandjaks had not been joined to Buda, it could have been governed only by a sandjakbegi in 1541.

Between 1541 and 1566 the Turks established the following sandjaks north of the line of the Drava and the Lower Danube: Buda (1541); Mohács (1542); Szeged and Istolni Belgrad, i.e. Székesfehérvár (1543); Eger (1544), although the fortress of Eger itself had not yet been occupied, only its vicinities; Esztergom, Hatvan, Nograd and Simontornya (1545-6); Siklós (1549); Koppány (1550); Becse and Beeskerek (1551-2); Görösgál, Szekszárd, Temesvár and Csanád (1552); Lippa, Arad and Szolnok (1552-3); Szécsény (1553-4); Veszprém (1554); Fülek (1555); and Gyule and Szigetvár (1566). In the meantime, they formed the beglerbegilik of Temesvár (1552) from the sandiags of Temesvár and Csanad (the latter including Beese and Becskerek), to which they attached the sandjaks of Semendire, Alachahisar and Vidin, and later the sandjaks of

Lippa, Arad and Gyula, respectively.

The backbone of the Turks' base in the central part of Hungary was the beglerbegilik of Buda, but its upkeep against the Hapsburgs was very coatly. According to the cash-book of the Treasury of Buda for the years 1559 and 1560, there were 10,300 Turkish troops in the fortresses belonging to the evalue of Buda, for whose pay and equipment an annual sum of 250,000-80,000 gold pieces had to be brought in from Istanbul, because the taxes and duties obtained in Hungary covered but one-third of their expenses. The transport of money from Istanbui to Buda was necessary not only in the decades that followed, but also in the 17th century. According to Pedewl, the annual tax-yield of Egypt, 300,000 gold pieces, was sent directly m Buda (Tavibh i Peleul, Istanbul 1283/1866, i, 36). The new campaigns also increased the expenses of retaining the Hungarian territories, and the burden which the newly-occupied fortresses imposed me the empire was clearly greater than the advantage they offered. Thus, e.g., when Eger (1596), Kanizsa (1600), or Várad (1660) and Ojvar (1663) len into Turkish hands, each of these fortresses had to be made the seat of a new beglerbegilik, so see greater forces could be concentrated for their defence in case of emergency. In accordance with their custom, the Turks formed new begierbegilike by a re-organisation of formerly-occupied territories. However, while earlier they able to extend the boundaries of the begierbegilike by further conquests (see e.g. the begierbegilike of Burla and Temesvár), they may no longer able to do so in the 17th century.

The decline in the military preponderance in the Ottoman empire is well-characterised by two episodes which happened in two phases of Turkish rule in Hungary, I the 16th and the 17th century respectively. In the first phase, when the Hapsburgs' envoy, Ferenc Jurković, appeared in a robe of state and with a sword on his side before Sinan Pasha, beglarbegi of Buda, in 1587, the Pasha had the envoy's sword broken pieces. In the second phase, however, when Gaspar Tassi, a deputy, went to Murtada Pasha of Buda in 1627 to lodge a complaint against the \$4\$ of Hatvan, the Pasha immediately ordered that the kādi be given 500 lashes me the soles without hearing any witnesses. The Turks' attacks in the 17th century were chiefly mere flare-ups of enthusiasm. During of them, the siege of Vienna in 1683, they displayed such military weakness that was soon followed by the coalition of western powers and the eventual liberation of Buda in 1686. Within a decade after this, the Turks lost nearly all their conquests in Hungary except the beglerbegilik of Temesvár, which they managed to retain until 1718.

The effect of the Turkish rule in Hungary on general European conditions is variously evaluated in the literature of the subject. According to a noteworthy statement by B. H. Slicher van Bath, the rise in meat prices in Europe after 1550, which was partly due to the growth of population, was primarily caused by the fact that the Turks had occupied Hungary and me the import of cattle from South-Eastern Europe had decreased (The agrarian history of western Europe A.D. 500-1800, London 1963, 204). It seems likely, however, that the rise in European meat prices was due to other factors, because, according to Turkish customs registers, that part of Hungary which under Turkish rule exported to the west 60-80,000 head of cattle yearly around the middle of the 16th century.

However prosperous cattle-breeding was in Hungary under Turkish rale, it was a negative phenomenon from the point of view of economic progress since it meant metura to extensive animalkeeping. The fields of a number of Hungarian villages destroyed in the Turkish wars lay uncultivated, deteriorated into pasture and were hardly fit for anything else than animal grazing. This explains how it was possible even after the Fifteen Years' War (2593-2608) for an English merchant to write the following words about the abundant cattle-stock of Hungary: "This Countrey doth much abound in cattle sufficeient to feed all Gormany, the store is m great, that they yearly sell to their neighbours 80 or 100 thousand Oxen" (Lewes Roberts, The merchant mappe of commerce, London 1637, 177). When evaluating this attractive figure, however, one has also to consider the fact that such significant towns in southern Hungary as Pécs and Tolna lost the greater part of their vineyards, the source of their former wealth. For example in Tolna, a town with 5000 inhabitants, where, according to Turkish financial accounts, a yearly of 6,800 hectolitres (about 150,000 gailons) of wine was produced in the 1560s and 70s, winegrowing completely lost its importance in the course of the 27th century. The worsening of the economic

situation — be traced on the basis of Turkish sources, not only along the Danube but also in the area of the River Tisza. For example, in the villages of Gyó and Tápé, two imperial hidssestates near Szeged, both the number of the Inhabitants and the amount of their agricultural production had dropped to one-half of the original figure between 1550 and 1670, although these figures could have doubled in 120 years.

The demographic conditions of Hungary in the period of the Turks can be fairly well estimated on the basis of the tabrir defterleri. After their first conquests, as soon as they had strengthened their posts in Hungary, the Turks started to make written records of the settlements within the sandjabs, which they established with rather vague boundaries. As was written in one of the Sultan's instructions to the sandjakbegi of Mohães in March 1545: "The state of the local settlements and the conditions of refand must be examined in the same way as in other provinces" (Istanbul, Topkapi Sarayi Muzesi Argivi, D. 12321, p. 142). The first registers made in the saudials of Mohacs and Istolni Belgrad in 1545-6 by Candatilzade Khaill Beg, who was specially in to Hungary with that task. Of these two labric deflecters, only the one of the sandiak of Moháes has survived to this day. In the same years, Khalil Beg prepared the registers of the sandjaks Buda, Esztergom, Nógrád, Hatvan, Szeged and Simoatornya as well; these tabrir defterteri and the timir defleriers compiled on their basis are all extant today. New registers III the sandjaks were usually made every ten years up to 1590. Later, however, the administrative organisation of the Ottoman empire became | loose that new registers were made only in the newly-occupied territories, while in other parts the old registers re-copied. This is evident from certain income figures; e.g. a timar's income in the sandial of Buda was exactly as many ables in 1676 as in 1890, although the value of money had considerably changed in the meantime.

In the first half of the 16th century, the Turkish takefr defterleri still presented a relatively favourable picture of Hungary's demographic conditions. In the town of Szeged, for example, where there were 1,449 families in 1522 before the Turkish occupation, 1,345 heads of family were entered in the first Turkish registor of 1546, i.e. the population of Szeged decreased by only about 100 families after the battle of Mohács and the first Turkish occupation. After the subsequent wars and devastations, however, the Turkis could levy the diving tax on no more than 315 heads of family in the same area in the last years of the century.

Of course, this does not mean that the greater part of the Hungarian population perished, because, is well-known, a large number of Hungarians escaped to territories of Hungary which had not passed under Turkish rule, As one can read in a Hungarian letter written = early = 1550: "The people of the land, especially in the country of Pest, left their homes in multitudes, seeking refuge in the counties of Zala and Somogy" (there had already been Turks in the county of Pest, but not in the counties of Zala and Somogy as yet). In spite of all this, there were relatively few Turks who came to settle down in Hungary. It is true that a few towns such as Esztergom, Visegrad and Nograd, were evacuated after their occupation for strategic reasons and were inhabited almost exclusively by Turks in later times as well. Besides such places, however, it was only in Buda, Pest, Vác,

Tolna and the area of Szeged that a few hundred Turkish families settled down.

Süleymän and his successors made no deliberate efforts to settle large numbers of Turkish families in Hungary as they did in the Balkan peninsula. Neither did Islam gain any ground. Today there are but few architectural remnants to evoke the memory of the Ottoman period, and this is not because subsequent wars destroyed them but because the Turks preferred transforming old buildings to constructing news in Hungary. Similarly, present-day Hungarian vocabulary contains very few Ottoman Turkish loan-words; spoken Hungarian has preserved only a faint memory of former Turkish rule.

(GY. KALDY-NAGY) AL-MADJARRA, the Galaxy or Milky Way. This remarkable celestial phenomenon was wellknown to the peoples of the Islamic world. Its popular assimilation to the traces of spilt milk seems to be of Greek origin (cf. to yake [Aristotle], o tou γάλουστος κύκλος [Euclid, Geminus], δ γαλουσίας [xuxloc] [Ptolemy], oyalatiac [xuxloc] [other authors]; see Liddell and Scott, s.zv.), whereas in the Near East the image of traces of lost straw, or chaff, prevails (cf. Pers. rāk-i kāhkaskān, Turk. samanyolu, etc., and already Syriac shbhila d-thebhna (A.D. 660). also colloquial Arabic darb al-tabbana, etc.; see Wiedemann [1], t f., and [2]; and Eilers [1], 108-11; [2], 45 f.; [3], 4; for the Syriac, Severus Sebhökht,

ii, ■ [p. 349]; xi, z.3 [pp. 392-3]).

In Arabic, the indigenous designation is al-madiarra, which is derived both by classical Arabic lexicographers and by modern scholars from the root di-r-r "to pull, or draw" and would designate a place, path where something is drawn (Ibn Kutayba, Anna? 123; al-Djawhari, in LA, iv, 129a; Ibn Sida, Mukhaşses, 8; al-Marzūkī, ii, 9; Ibn Manzūr [2], 173; Eilers [1], 117). The mediaeval Latin translator of the Arabic Almagest, Gerard of Cramona, generally retained the Arabic designation al-madiatra as almaiarati etc.; but in one instance he added gloss: id est area que mouetur, in which he understood al-madjarra as a drawer that can be pulled (cf. Kunitzsch, Der Almagest, 139). Occasionally there occurs in Arabic texts a confusion between the name of the Milky Way, si-madjarrs, and the graphically closely-similar word al-midimera, which is the Arabic version for the Greek constellation name το Θαμιατήprov, the Altar, Ara (see Kunitzsch, 203); cf., e.g., al-madiarra for al-midimara on a celestial globe by Ibrāhim b. Sa⁹d al-Sahil, dated 478/1085, described by J. M. Millas Vallicrosa, Assaig d'història de les idees fisiques i matemátiques a la Catalunya medieval,

i, Barcelona 1931, 55 if.; the same confusion of almadjarra for almedianra, in Les Immaires des Arabes. Teste arabe en vers de Moh'ammed El-Mogri, trad. et ann. par A. de C. Motylinski, Algiers 1899, 99 (no. 11) and n. 2, where the translator did not realise and correct the mistake; of, also ms. d of the Arabic Almagest in Kunitzsch, 346, no. 640. A literal Arabic translation from the Greek, in Ptolemy's Almagest, was al-felak al-labani (al-liadidadi b. Yūsul b. Na(ar), and al-da'ira al-mushabbal lawnuhā bi-lawn al-laban, m shortly, al-da'ira al-labaniyya (Isbāls b. Hunayn) (see Kunitzsch, Der Almagest, 139).

The Milky Way was known to the Arabs in their classical period; cf. a collection of classical and post-classical Arabic verses naming al-madjarra, in Wiedemann [1], 673-5 (see also Ibn Manzūr [2], 118 f.). In lexicographical texts, the positions of several fixed stars are described in relation to the Milky Way. Abh Hanifa al-Dinawari (d. 282/895) gave a description of the Course of the Milky Way in the sky as seen by the Arabs in their "pre-scientific" period (Abh Hanīfa, in al-Marzūķi, ii, 9 f.; tr. Wiedemann [7], 664-6).

Further, k - observed and mentioned by the Arabs that the position of the Milky Way I the sky changed in different seasons according to the annual revolution of the sky (Abû Hanifa, in al-Marzûki, ii, ro f. = tr. Wiedemann [1], 666-8; Ibn Kutayba, rag; al-Kazwini, 21 - tr. Ethé, 44). A late description based on personal experience was given around A.D. 1400 by Ahmad b. Madjid, the famous navigator of the Indian Ocean (see Ahmad b. Mādjid, 149 f.; tr. Tibbetts, 140). It should be noted that some of these non-scientific authors understand the Milky Way as a dense accumulation of faint stars that appears the observer's eye as a nebulous mass, a theory which seems to have originated from independent observations not influenced by the teachings of Greek philosophy (cf. 1bn Kutayba, 124; al-Kazwini, 2x = tr. Ethé, 44; Ahmad b. Mādild, 149 = tr. Tibbets, 140).

A scientific astronomical description of the Milky Way was given by Ptolemy in his Almagest (book viii, ch. 2), which became known in Arabic through a series of translations from the end of the and/8th to the end of the 3rd/9th ceaturies. Abū Hanlfa's description, however, apparently was not influenced by the Almagest, since III uses descriptive elements of pure Arabic origin only. Also, his description of the galactic circle begins and ends in the constellation of Scorpius, near the ecliptic, whereas Ptolemy's description begins and ends in the constellation of Centaurus, in the southernmost region of the sky visible III him in Alexandria.

Cosmological theories of the Milky Way were comvoyed to the Arabs by translations and paraphrases of Greek philosophical works, as, e.g., Aristotle's Meisorology (for the chapter on the Milky Way, al-Athar al-Tuluriyya, ed. Badawi, 12-15; ed. Petraitis, 23-6 [Arabic]; ed. Schoonheim, 66/67-70/71; ed. Daiber, 62 f.), and their commentaries. While Aristotle taught that the Milky Way is a vaporous phenomenon belonging to the sublumar sphere, other philosophers such as Democritus, and younger commentators as Olympiodorus, etc., believed the Milky Way to 📰 far out in space, similar 🖿 the fixed stars, we belonging to their sphere (cf. Petraitis, 23 (Arabic), n. 2; Daiber, 93-5). Muslim scholars apparently favoured these latter theories against Aristotle's one (see the texts cited by Wiedemann [1], 669-71, and Daiber, 93-5, and the following quotations from Ibn al-Haytham and al-Biruni).

Especially interesting are the scientific deductions of The al-Haytham (d. co. 432/1041), who arrived at the conclusion that the Milky Way does not form part of the air (the sublunar sphere) but must be far out in the space (see Wiedemann [1], 672, and the literature quoted there). Also, al-Birimi in his al-Kanun al-Massudi (written around A.D. 1030) says that, contrary to the teachings of Aristotle and his followers, al-madjarra is of the same height (above the earth) in the fixed stars because the moon and the planets are not influenced by it when crossing in front of it, as should happen if the Milky Way was below them, and because it shares all the peculiarities of the fixed stars as described by Ptolemy, via that it is found in their sphere and unvariably keeps the same relations in distance and shape just as the fixed stars do (al-Birûnî [2], iii, 992, 16-993, 1; nearly identical with this III the quotation from Barbebraous (d. A.D. 1286) in Wiedemann [1], 671).

(P. KUNITZSCH) MADJAZ (A.), a term in rhetoric, means

"trope" and, more generally, the use of a word

MADJĀZ

deviating from its original meaning and use, its opposite being habika ("veritative expression").

In Arabic literature. — The different modes of expression labelled as magica by the Arabic theorists — divided into twelve categories by Fakhr al-Din al-Rāni (d. 606/1210) without, however, following a consistent system of criteria (d. al-Suyūṭī, Mushir, ed. Cairo 1282, i, 171). A — refined and detailed version of this classifying system was put forward by al-Suyūṭī (d. 911/1504) (Ithān, ed. Calcutta 1856, 550 ff.). From the structural point of view, the madjāt systematology by al-Sukūṭāl (d. 626/1221), a younger contemporary of al-Rāni, is more satisfactory.

Al-Sakkāki offers five different binarily-divided categories of magica (Miftah al-ulum, ed. Cairo 1318, 134 Il.-9 II.; in detail 155-69). The two main categories **denoted** in linguistic and intellectual madids (highest and takit). The intellectual madids comprises expressions which attribute the effect of a deed not to its proper author but rather to a plecs of imagery or mediate one, a is shown in the instance, "their trade did not make a good bargain" (Kur'an, II, 15). The linguistic madiax is either lexicographically classifiable or relates to the context. The contextual madian comprehends ellipses which, for the remaining expression, entail a modification of the syntactical status. An instance of this is given in Kur'an, XII, Ba "ask the village (acc.)", whereas it should read "ask the inhabitants of the village [gen.]". The lexical tropes may be divided into those having a proper value of meaning and use and those not having it. The latter group includes the transference of generic names of parts of the body from one genus to another, as is shown in the use of "labium" for the camel's lip. The expressive madia: may be used to mean either a metaphor or some kind of metonymy; it merely depends on whether there exists a comparison or some less precise connection between the actual meaning and the mode chosen to express it. An instance for the latter may in found in the use of "band" for "benefaction", - the latter is brought about by the former.

The conceptual elements of this system date from a period anterior to al-Sakkaki, one of its most meritorious promoters being 'Abd al-Kahir al-Djurdiani (d. 471/1078). We owe to him the distinction between linguistic and intellectual madias (Asrar al-balagha, ed. Ritter, 342 ff., 376; see also his statements in Dald'il al-i'dies, ed. Khafadii, Cairo 1969, 286 ff.). The notion "inexpressive trope" is based on a classification of metaphors that goes back from al-Djurdian! (Assar, 29, II. 5 ff., 373 ff.) to al-Hatimi (d. 288/998) (al-Risdle al-mūdika, ed. Nadim, Beirut 1965, 69 ff., 90 ff.; cf. also 1571 ARA). Ibn Kutayba (d. 276/889) already pointed out that the metaphor constitutes the most important form of madide (Ta'wil muskkil al-Kur'an, ed. Sakr, 114). First attempts to classify tropical expressions were made by Abû 'Ubayda (d. 210/825) in his Küth Madjda al-Kur'da (ed. Sezgin, Cairo 8 ff., el. J. Wansbrough, Majas al-que'dn; periphrastic exegesis, in BSOAS, xxxiii [1970], 248-54); however, they correspond with those of al-Rarl than with those of al-Sakkāki.

The madids theory received its first impulse from the study of Kur'anic hermaneuties, scholars being guided by the want of m correct philological interpretation of the holy text. In its beginning, madid: man not mean "trope" in the proper sense of the word, but more generally denoted any turns of phrase that, from the semantic, lexicographical

or syntactical point of view, were not self-evident and needed explanation. An instance of this stage of the madjaz theory is represented by the Kiláb Madjaz al-Kur'an by Abú 'Ubayda (see Sezgin, GAS, i, 35 ft., 48).

Parallel to the purely philological studies, research work on Kur'anic hermeneutics undertaken by theologians, whose investigations to have had a still greater bearing - the development of the madian theory. All theological groups, in fact, resorted to the Kur'an in order to support their statements, since the text allowed quite contradictory interpretations. Hasan b. Muhammad b. al-Hanafiyya (d. cs. 100/719) had already pointed out in his anti-Kadari discussions that occasionally in the Kur'an an effect proper to God is ascribed in its cause to a created being, and he thus anticipated the notion of madias takit (cf. Van Ess. Anjange muslimischer Theologie, Beirut 1977, 105, 108 ff.). An instance of this phenomenon is given in the verses "The spring-time made the herbage come forth", the effect of bringing forth herbage not being ascribed to the Creator but to the spring (see AL-MA'ANI WA 'L-BAYAN]. If credence may be given to Ibn Taymiyya, the corresponding pair of expressions madjār-haķiķa equally had its origin in theological and not in philological tradition (et. W. Heinrichs, Literary theory, in Arabic postry, theory and development, ed. Von Grunsbaum, Wiesbaden 1973, 30, n. 50). The Mustavilis, for their part, took refuge in tropical interpretation in order to eliminate the anthropomorphisms of the Kur'anic representation of God (cf. Goldziher, Richtungen der islamischen Koranauslegung, repr. Leiden 1952, 110 ff.). It likewise happened that in discussions with other religions, attempts made to shift the difference from the mental to the verbal plane, thus making use of the madjas theory. Ibn Kutayba actually thought it convenient to deprive the Christian term "Son of God" of its shocklagness by taking refuge in a tropical interpretation (Ta'wil. roe, II. 5 ft.).

It was, however, due to the theological aspects of the Kur'anic magias that the question was raised how far tropical expressions might | valuable and useful. One of the major reproaches brought forward against the wood madias was that tropical language was likely to falsify the image of reality, Already Ibn Kutayba drew attention = this fact (Ta'wil, 132 f.; see also Suyütl, Ithan, 550, 11-10 ff.). it proved rewarding, however, to tackle the positive aspects of the problem, as tropical expressions used in the Kur'an were liable to express more clearly and completely the intended meaning than would have been possible by means of a veritative expression. A number of excellent single studies relating to the above subject were brought together by al-Sharif al-Radi (d. 406/1016) in his Talkhis al-bayan fi mudjāzāt al-Kur'an (see also the statements made by Tabana in al-Bayan al-'arabi, Cairo' 1968, 36 ff.). It thus happened that the discussion on madjāz was shifted into the field of interest of the inimitability of the Kur'an (i'dies al-Kur'an).

Bibliography: Shorter or longer treatises on madias are to be found in all manuals and studies relating in rhetoric or the rhetorical art since the 5th/11th century, but especially in the works of the school of al-Sakhäld (see also at-ma'anl wa'the avan). The madias literature equally include everything written on istifare; see particularly W. Heinrichs, The Hand of the morthwind, Wienbaden 1977.

(B. REHERRY)

In Persian literature. — The use of the term madids by Persian writers has always been subject the influence of the Arabic doctrine outlined above. A distinction between the borrowing on the hand and autonomous development on the other can in each instance only be made on the basis of extensive and chronologically differentiated data which are not yet available. For that reason, no more than a rough sketch of Persian usage can be given here and questions concerning the origin and the history of specific aspects must be left aside.

The first writer who dealt with madias = a rhetorical term was, to our knowledge, Shams-i Kays, a contemporary of af-Sakkaki's. He defined it as an inclusive category of figurative speech being opposed m the category of literal, "true", speech (hakikat). His definition also comprises the necessity of a common aspect (wadih-i 'alahat) providing a link between the figurative and the literal meanings of an expression by means of which the real intention of the speaker can be established. The most important type of magica is the metaphor (istifarat) which can be used in all kinds of speech. Another type consists of allegorical devices occurring especially in poetic descriptions such as the tenzone (managera) In which inanimate objects or animals are introduced as speakers in merchange of arguments (at-Mutdiam /i ma'dyir ash'ar al-'adjam, ed. Tehran 1338/1959. 365 ff.). A much complicated terminology is presented in the textbooks of the post-classical period, e.g. in the Haddyik al-baldgha of Mir Shams al-Din Fakir-i Dihlawi (1141-83/1728-69), a digest of which was made by J. Garcin de Tassy (Rhetorique et prosodie des langues de l'orient musulman, Paris 1873, see esp. 40 ff. and 66 ff.). Recently, a summary of later Persian theory has been given by Djalal al-Din Huma'i (Funûn al-baidghat wa şina'at-i adabi, Tehran 2354/1975, 247 fl.). Two technical terms among the many dealt with in these surveys deserve mention here. The presence of a clue or karina (also called karina-yi sārifa, as it "leads" the mind the intended meaning) is required to express the relationship ("alabat) between a madidz and the corresponding habibat. Such a clue is either implied in the context = specifically added, e.g. in the example shir-i shamshirzan in which the adjective points to the actual meaning of "valiant warrior", If the trope is not based on a similarity of form but on abstract relationships (between a condition and the place where it manifests itself, a whole and its parts, m cause and its effects etc.) it in called madjaz-i mursal ("free trope", according to the interpretation of Huma?l)

An especially Peraian use, for which the authority of the early lexicographer Fahhr-i Kawwās (fl. 100) 700/1300 in India) is invoked, restricts the application of madjās to metaphors based on terms which either refer to an accident ('arad) or to imaginary things (musawardt) (cf. al-Tahānawl, Kashshāf istilābāt al-funūn, Calcutta 1862, ii, 963 f.).

In Persian grammar, a connection of one substantive to another by means of the hasra-yi tdafa is called 'figurative' (idāfa-yi madjdsī) if it reflects only an estimation (itibār) of the speaker. This includes the idāfa-yi taṣḥbihi in which the particle. If the idāfa denotes a comparison (e.g. taṣḥm-i āhū, "an eye like that of a gazelle") and the idāfa-i isti 'āri (e.g. tlɪḥ-i adjal, "the sword of death") which implies a metaphorical personification (see further, M. Mu'an, Idāfa, Tehran 1341/1962, 140-52).

Outside rhetories and philology, bahika; and madias have been used frequently for binary ex-

pressions in mystical terminology. Real love (*iph*-i habibi), directed towards the Eternal Beloved, has as a counterpart "figurative" love (*iph*-i madiāti), which concentrates on another object but only as a temporary substitute for the true goal of mystical love (see for early instances Sanžii, Dienān, Tehran 1341/1962, 879; "Azīz al-Din Nasafi, Kiiāb Insān al-kāmil, Tehran-Paris 1962, 115 ff.). Similar terms were coined to indicate the distinction between well as the interdependence of the sphere of divine existence and the present world. Expressions wouldid-i madiāti, hasti-i madiāti or sarāy-i madiani reflect the view that the latter can be predicated to be in existence by way of a trope only.

(J. T. P. III BRUIJN)

In Turkish. - Although several neologisms, such as addeģiņimi and deģişmede have been proposed since 1928, this Arabic term continues to be in vogue in the sense of "trope" = "figurative language" as one of thousands of literary terms acquired from the Arabs and Persians by the Turks as they became practitioners within the Islamic literary tradition. In the process of borrowing, they also inherited much of the confusion and ambivalence that characterised the periodic definition and classification of the three divisions of the science of baldgha (q.v.). By the end of the Middle Ages, when the Turks began to formulate their tropological utterances according to the Islamic perception of figurative language, they also accepted the assignation of medias to the "expression" (bayan [q.v.]) division of the Islamic system of rhetoric.

Until III 19th century, the Ottoman Turks did produce any literary manuals of their own, preferring instead to refer to the standard Arabic and Persian texts or to their Turkish translations of these. This reliance on the works of their literary mentors were especially marked in the case of rhetorics, the productions of al-Diurdiani (d. 471/1078), Shame-i Kays (/l. 600-27/1204-30), al-Sakkāki (d. 626/1226) and al-Taftazani (d. 791/2389) [q.ov.] apparently amply meeting their need for reference works on this subject until the Tangimal period (1839-76). Thereafter, the new generation of Ottoman writers and teachers, now under strong European influence, began to create original works dealing with all aspects of literature. Reference works by literary innovators like Ahmed Djewdet Pasha [q.v.] and Ekrem Bey [q.v.], who wrote mainly for the new schools, and the efforts of their continuators since the Republic (1923), point to an understanding of the meaning and and of the trope that is more in keeping with the syntax and morphology of the Turkish language. This activity, however, did not entirely eliminate the problems of definition and classiffcation. Nonetheless, there is general agreement on the division of tropes into two major classes of madfáz-i mursal (synechdoche and variants) and istifára (metaphor and extensions).

(1) Mattiax-i mursal (Mod. Thish. kapsamlama addefisi) in which the objects featured in the figurative expression have a relationship that is not described in terms of direct comparison. This type of trope is itself broken down to several variants of which the most frequently encountered

a. 'umumiyya-khuşüşiyya, the particular for the general, genus for species, etc., and vice-versa, "Every sail on the Marmara is flying merrily." b. swualiyya, referring to the projected state of the object, "Light the firel"

c. hāliyya-mahalliyya, position and locale coujuncture, "Emerging from prayer, they went to the promonade area."

d. sababiyya-musabbabiyya, cause and means relationship, "This skop has carned much money."

(2) Istifara (séretileme) in which the comparative elements of the relationship between objects are stressed in various degrees. There is no uniform agreement to exact relationship and classification of these. The generally accepted two major divisions

a. istifara-i mușarraja (acth igraileme) or explicit metaphor, in which the comparison is achieved by direct reference to an object, "Our lions are off to the battlefield."

b. istifara-i makniyya (kapali igretileme) or implicit metaphor in which the comparison is achieved by reference to an attribute of an object without mentioning the object itself, "A cool atream sang lullabies,"

Each of the above divisions is subdivided even further on the basis of other pertinent considerations affecting, or affected by, the nature of the attributive relationship between the referrer and the referred

objects.

(J. STEWART-ROBINSON) MADJD AL-DAWLA, AND TALIN RUSTAM S. FAKER AL-DAWLA 'ALI, KAHE AL-UMMA, ruler of the northern Buyid amirate of Ray and Dibal (387-420/997-1029).

When Fakhr al-Dawla [q.v.] died in Sha'ban 187/August-September 997, his young son Rustam succeeded him at the age of eight (thus according to the anonymous Mudimal al-tawirlkh wa 'l-kisas, ed. Bahar, Tehran 1318/1939, 396, giving Rustam's birth-date m Rabi* II 379/July-August 989, and Ibn al-Athle, ed. Beirut, ix, 69, but according to al-Rudhrawarl, in Eclipse of the Abbasid caliphate, iii. 297, and Ibn al-Athir, ix, 132, at the age of four). Actual power was exercised by his mother as regent, the redoubtable Sayyida, who was probably the sister of the Marzban b. Rustam, ruler of Firthm [q.v. in Suppl, and also mawakness] will author of the Marsuban-nama (a man apparently inverted by 'Utbl into Rustam b. Marzban in his account of the capture of Shahriyarkub by Shahriyar b. Dara in 388/998, Yamini, with comm. of Manini, ii, 192); and the Buyid amir of 'Irak and Fars, Baha' al-Dawia [q.v. in Suppl.] was acknowledged during the latter's lifetime as supreme Bûyld ruler over the confederation, with his name appearing on Madid al-Dawia's coins.

The death of Fakhr al-Dawla and the accession of a weaker amir allowed the Ziyarid Kabus b. Wushmagir [q.v.] to return to his former lands in Gurgan and Tabaristan, and he could not henceforth be dislodged by the Büyids. In 397/2006-7 Madid al-Dawla attempted to break loose from the tutelage of his mother, but was captured by his brother Shams al-Dawls of Hamadhan and the Kurdish chief Badr b. Hasanûya [see gjasanwayii] and imprisoned for a year before his release and roturn to Ray; and in 405/to14-5 Shams al-Dawla was able temporarily

to occupy Ray.

Sayyida diod in 419/1028, leaving Madid al-Dawls totally unfitted for assuming the runs of the government after over 30 years' exclusion from the substance of power; the sources speak of his sensuality, so that his numerous wives and concubines gave him 30 children. According to Baybaki, Tabrikh-i Mas'adi, ed. Ghani and Fayyad¹, 263, the powerful and aggressive Ghaznawid Mahmud b. Sebüktigin had for long refrained from attacking Ray and Djibal because he regarded the region m effectively neutralised under a feminine de facte ruler. Now, with Madid al-Dawla unable to control the turbulent Daylami soldiery in Ray and with mounting public disorder there, the helpless amir unwisely appealed to the Ghaznawid sultan for help. With this ready-made pretext to hand, Mahmud sent westwards an army, which deposed and seized Madid al-Dawia and subjected Ray to a frightful sacking, the grounds for this, according to Mahmud's fath-name sent to the caliph al-Kādir, being the need to extirpate Muffazill, Isma'lli and other extremist Shi'l heresies which had flourished in Ray under Bûyid tolerance. Ray was now used as a base for Ghaznawid military operations in northwestern Persia. Madid al-Dawla and his son Abu Dulaf were kept in honourable confinement in India and then Ghazna by Sultan Mas'ad b. Mahmad, according to Gardiel, with the ex-amir eventually dying at Ghazna.

Madid al-Dawla enjoyed some reputation as a patron of culture and learning, probably a reflection of the continuing heritage at Ray from the celebrated vizier the Sahib Ibn 'Abbad's patronage of literature; he himself had had the privilege of having the philologist and grammarian Ahmad b.

Făris [sen san Fânta] as his tutor.

Encycl. Iranica, s.v. al-Balasani. MADJDHUB ("the attracted one"), in Suff literature the name for the representative of a type of piety which is chiefly of a passive nature (manfaid: al-Rundl), in contradistinction to the more active (fasil) "striding one" (salik), a characteristic which is expressed in numerous other pairs of opposition, like: mudjāhada-mushāhada, makāsibmanahib, makam-kal, murid-murdd, muhibb-mahbub, mukklis-mukhtas. While the madidhub, on the way to God, may abandon himself to be drawn by divine attraction (diadhba, diadhb, Persian hashish), the adlik depends on his own exertions (küshisk), which is, however, in the same way as the attraction, a gift (bakkshish) of God. Usually, mixed forms occur, as is clear from the works of Nadim al-Dlu-i Kubra [q.v.] and Nadim al-Din-i Daya, for whom the "strider" is the one who, while striding, is attracted gently, and the mudidhub the one who, while striding, is attracted intensely. Others, like 'Umar al-Suhrawardi, Mahmūd-i Kāshāni and 'Azīz-i Nasafi, speak of a "strider who is attracted" (salik-i madidhub) when the striding seem earlier in time, and of an "attracted one who is striding" (madjdhib-i sālik) when the being attracted came earlier in time. The general principle is that neither the who is merely striding, nor the me who is merely attracted, is qualified to be a skaykh and me lead others on the mysrical path, since the former has never arrived at his aim, while the second, as being only attracted, has never stridden along the path by himself. With regard to personal progress, it is true, the word of the Prophet holds good: "One single attraction by God is equivalent to the activity of men and dinn", but only the one who has personal experience of striding, its labours and dangers, is able to assist others in advancing.

In more recent literature in particular, madiahub is a frequently used extenuating and exculpating designation of eccentric ecstatics, love-maddened persons, holy fools, and despisers of the law. Occasionally, the term is also used as a nickname, like in

Ibrāhim-i Madidhūb (7th/13th century).

(R. GRAMLICH)
AL-MAD.IDHÜB, surname of the Moroccan
holy man whose complete name is Abû Zayd 'Abd
al-Rahmān b. 'Ayyād al-Şanhādji al-Faradji alDukkāli. He originally from Tit, in the district
of Azemmūr, but lived in Fās, where one of his
disciples was in particular Abu 'l-Mahāsin Yūsuf
al-Fāsi, whose great-grandson, 'Abd al-Rahmān b.
'Abd al-Kādir [see Al-Fāsi, in Suppl.] left behind a
work called Ibtiāddi al-kulūb bi-hādar al-gayāh
dbi 'l-Mahāsin ma-phayāhini al-Mahādirāhib (extracts

in ms. Rabat 522/5; Lévi-Provençal, Catalogue, 252). 'Abd al-Rahman al-Madidbüb died is the Charb in 976/1569 and we buried in Maknes. He is especially famed for me gnomic poetry which took the form of quatrains in dialectal Arabic [see MALHOH] and which, towards the end of the 19th century, attracted the attention of H. de Castries (Gnomes de Stdy Abder-Rahman el-medjedoub, Paris 1896). Basing himself this publication and on citations in various works, 'Abd al-Rādir Nūr al-Din has had lithographed in Algiers (at the beginning of the 1950s) al-Kawl al-ma'thür min al-shaykh 'Abd al-Rahman al-Madidhab, which contains 127 quatrains with a commencary in classical Arabic; they have been published, translated and commented upon by J. Scelles-Millie, Les quatrains de Mejdoub sarcustique (poète maghrébin du XVI+ siècle), Paris

'Abd al-Karin, Algerian

teacher and scholar, born in 1366/1848 in Flemcen and died in 1331/1913 in Algiers.

Following the example of his father who had lived for a long time in Morocco where he had studied and taught, especially at al-Karawiyyin [g.v.], before returning to his native city to practise there the duties of hadi, al-Madidiawi travelled to this country at a very early age. At Tangler and later at Tetouan he undertook classical studies which he completed at Fas a pupil of distinguished fulama", including Mawiky Muhammad al-Salawi, Muhammad b. al-Madani Gannun, Salih al-Shawi, Ahmad b. Suda and Diagar b. Idria al-Kattani. Returning to Algeria in 1869, in 1873 he man appointed mudarris at the al-Kattani mosque of Constantine, which he left in 1877 for the official madrass. of the town, where he spent more than twenty years. His very conscientious teaching was already complemented by personal scholarly work. Transferring to Algiers in 1898, he was in addition entrusted with the duties of smam and heapth at the Sidi Ramadan morque. His widespread knowledge and cultured personality attracted to him the affection of numerous disciples, among whom it is appropriate to mention in particular Hamdan al-Wanisi, who was to become the patron of 'Abd al-Hamid Ibn Badis, al-Mawlad b. ai-Mawhūb, a teacher at the madress and mufti of Constantine, 'Abd al-Karim Bāsh Tarzi, Hanast wer/ti of the same town, Hamma b. al-Darradil, Hanast sadi of Algiers, and Muhammad Saild Ibn Zakri, a teacher at the madrasa and Malik! mufti of Algiers.

A teacher by nature and by profession, al-Madidiawi revealed his views on educational issues in three monographs (see below). On the other hand, his tastes as well as the specialised responsibilities of the two chairs that he occupied in Constantine and Algiers led him to take an interest in the traditional disciplines of law and of religion. Deeply committed to orthodowy, he allied himself with scholars who, in the name of the Kur'an and of the Sunna, denounced superstitions practices, implous innovations (bids) and the popular demon-

strations encouraged by the leaders of the Safi brotherhoods. He also tackled with equal confidence such varied subjects as morphology, syntax, rhetoric, astronomy, cosmography, mathematics and economics. Through his writings, al-Madidiawi aims to present the image of an Glim of encyclopaedic learning. To this end, he introduces into his texts numerous and lengthy quotations not only from the Kur'an and from hadith, but also from the works of jurists, philosophers, historians, poets and even of obscure writers. Faithful in this respect m scholastic method, he demands will the ancient scholars more than simple references or entertaining curiosities. His borrowings have a relevance that goes beyond words and forms; he is indebted to the Arabo-Islamic tradition which provides him with the models for and thought, and he takes it upon himself to convey this tradition in its entirely to his contemporaries.

The corpus of al-Madidiawi's work comprises eighteen tities, of which the list is | follows: 1. legida al-mida allimin, Cairo n.d.; 2. Nasihal almuridin, Tunis n.d.; 3. Sharh Shawahid Ibn Higham, Constantine n.d.; 4. Shard manplimat Ibn Ghazi fi 'l-tawhit, Constantine n.d.; 5. Shark al-Madidiawi Sald mangitmat Muhammad al-Madirad (sic) al-Slawi, Constantine 1878; 6. Shark al-Lamiyya almudjradiyya fi 'l-djummal, 'Annaba 1894; 7. Shark busidat Muhammad al-Manzill al-Tūnisi, Algiera n.d.; 8. Nushal al-far/ fi 'I-ma'ant we 'I-sarf, Algiers n.d.; 9. (R. BENCHENES)

MAD-HD s. SA'ID, Sultan of Zanzibar, 1856-70, born cs. 1835, the sixth of his father's twenty-seven known sons, and of an Ethiopian mother. He married a kinswoman, Asha, and had one child only, Khamfura.

When his father, Sayyid Sa'ld, left Zanzibar for Maskat for the last time on 16 April 1854, he had appointed his second son, Khalid, as governor and successor in the event of his death. Khalid died in

November 1854, and shortly afterwards orders came from Maskat appointing Madild In his stead, thereby passing over three older brothers, Thuwayal (later Sultan of 'Uman), Muhammad (Governor of Sumayl), and Turki (elso later Sultan of 'Uman). At this time Madjid was about twenty-one years old, and from childhood had suffered from a mild form of epilepsy, which at times handicapped him as sulfan. Shortly after his appointment as governor, he was approached to denounce his father's treaties and edicts against the slave trade, but firmly declined. His sister Salma says that during his regency he "contrived to gain the goodwill of all by **mi** kind and gentle manners". At the beginning of his reign, the real power behind the throne was the British consul, Atkins Hamerton, and his death in July 1857 was a severe blow to Mādid. Fearing assassination, he took refuge on one of his warships, returning to the palace only after the arrival of Hamerton's successor, Rigby, un 28 July 1858. Very thortly after, Sa'kl's third son, Thuwayni, who had been designated sulfan in 'Uman by his father, attempted to gain control of his father's African dominions by sending an armed expedition. It was turned back at we by a British man-of-war. Next, ■ plot was uncovered to dethrone Mādjid and to replace him by his brother, Barghash. In October 1859 Mādjid ordered him to leave Zanzibar for Maskat; but, after being placed under house arrest, he managed to escape to a country palace known m Marseilles, where armed slaves and Arabs of the al-Karthi tribe rallied to his support. Mādjid then invoked the assistance of the British Navy. The palace was bombarded, and Barghash | back to Zanzibar, whence he was deported to Bombay.

in Markat, Thuwayni and insisted that his father's eastern African possessings were part of his beritage, He was able with justice to claim that for many years the government of 'Uman had been sustained by collected from Zanzibar, Madjid therefore agreed to m annual payment to Thuwayni of 40,000 Maria Theresa thalers ex gratia, but Thuwayni construed this as tribute. After Thuwayal's abortive expedition of 1858, Madid discontinued payment, denying any question of tribute. Eventually the dispute was submitted to the arbitration of Lord Canning, Viceroy of India. His award stated that Mādjid should be recognised as lawful successor to his father's African possessions; and that the ruler of Zanzibar should pay to the ruler of 'Uman an annual subsidy of 40,000 Maria Theresa thalers. He further stipulated that this payment should not in any way be construed to imply the dependence of Zanzibar upon 'Uman, The settlement and the independence of the two sovereigns was recognised by an Angio-French Declaration on 13 March 1862. Mādid paid the annual subsidy until 1866, when Thuwayal was murdered by his 500 Salim, declining thereafter to pay the subsidy to a particide. For two years Madjid remitted the annual payment to Bombay under protest, but this he refused to do after Salim's deposition by his kinsman 'Azzan in 1868.

Weak and procrustinating, Mādjid was greatly under the influence of a certain Sulaymān b. Alī, one of his ministers whom Mādjid's sister Salma describes as a dandy and a libertine. Rigby and his successors had great difficulty in persuading Mādjid to control the so-called "northern" Arabs, Arabs from the small principalities of the Gulf, who were determined to evade the treatles against the slave trade. A trade treaty was signed with the Hanse towns in 1859, and German trade was soon second

only to that with British India. It was through this connection that Mādjid's sister Salma succeeded in making contact with see of the employees of the German consulate, Heinrich Ruete, whom she subsequently married. In 1861 Mādjid led an expedition to reassert his authority in Pate, which had rebelled; but he failed in 1866 when there was a similar, but more determined, rebellion in Witu.

Madjid's decision that led to the foundation of Dar es Salaam, the present capital of Tanzania on the mainland, taken in 1862, has been obscured by differing claims. The French claim that the idea was initiated by the French consul is surely exaggerated. The British claim, originated by (Sir John) Kirk, is that Madild thought of it as "a place to retire to when consuls trouble him or when he is kicked out of the Island". These seem to leave out of account the facts that Arab, Indian and Swahili traders increasing in number of the malaland, and that the harbour of Dar - Salaam in its landlocked bay was far more convenient than the open roadsteads then in use at Bagamoyo and Mboamaji. Building to have begun only m 1865-6, and included a palace for the sulfan, parts of which still stand. Here, in September :867, Madjid gave a "dinner in the European manner" for the American, British, French and German consuls, apparently by way of a formal inauguration.

There are several descriptions of Madjid, notably by Richard Surton and Fr. Homer. He had a light complexion and pleasing manners, and generally resembled his distinguished father. He sat to hear causes and complaints three times a day, in a long, bare reception hall paved with black and white marble from Marseilles, and with some dingy chandeliers and "three rows of common wooded-bottomed chairs". There were French clocks and bureaux, cheap prints, gaudy china is shabby artificial flowers. The sulfan, nevertheless, took great interest, as III father had so broadmindedly done, in both explorers and missionaries. A learned ornament of the court who attracted even Burton's respect for his learning was the Shafi'l hadi, Shaykh Muhyi al-Din b. Shaykh b. 'Abd Allah al-Kahtani.

Madild died = 1870, and was succeeded by his brother Barghash [q.v.].

(G. S. P. FREEMAN-GRENVILLE) AL-MADJISTI [see BATLAMIYOS].

MADJLIS (A.), a of place from the verb dislass "to sit down" and, by extension, "to sit",

"to hold a session"; starting from the original meaning of "a place where sits down, where stays", thence "a seat" (J. Sadan, Le mobilier an Proche-Orient middival. Leiden 2976, index), the semantic field of madjils is of very wide extent (see the dictionaries of Lane, Dosy, Blachère, etc.). Among the principal derivative meanings are "a meeting place", "meeting, assembly" (cf. Kur'an, LXVIII, 12/11), "meeting, assembly" (cf. Kur'an, LXVIII, 12/11), "meeting, assembly" (cf. Kur'an, beld there", "a hall in which a professor's courses are given or sigued or judge's sentences delivered" (hence "praestorium, tribunal"), or (urther where the debates of an assembly take place (hence "council").

3. In Indian Shift usage

- 4. In the sense of representative institutions
 - A. In the Middle East and North Africa
 - ■. In Afghänistän
 - C. In the Indo-Pakistan subcontinent:

1. IN SOCIAL AND CULTURAL LIPE

From the pre-Islamic period, magilis designated an "assembly or council of the tribe's notables" [see BADW, III, c] and this institution is still alive [see e.g. J. Chelhod, Ls droit dans la société bédouine, Paris 1971, 55), sometimes under another name (see pjama'a; below, 4. B. In Aighanistan; pjiroa in Suppl.]. In various states of the Middle Ages, an elaborate governmental structure contained series of madjalis, councils given precise powers (see notably al-Kalkashandi, Subh, index, 421-3). This usage plainly justifies the adoption of this term to designate in the contemporary age any council (maditis al-baladiyya "municipal council", m. altrustra' "council of ministers", etc.), = elected assembly (m. ta'sisi "constituent assembly"), a chamber of deputies (m. al-numptab), a senate (m. alshupakh or al-a yan), etc. The historical account of the legislative assemblies and parliaments in the Muslim countries will be the subject of section 4 below, and the present notice will be limited to a brief survey of the madidlis which played a role in the social, religious and intellectual life of the Muslims of the Middle Ages.

The first to be considered is that of the sovereign who dedicated part of his activity to "public or private meetings (majlis, pl. majālis), where political and judicial decisions were adopted, plaintiffs, panegyrists and other visitors gathered, and questions of literature or law were debated—for this was also regarded as a normal function of the head of state" (R. Brunschvig, Hafsides, ii, 37). These sessions followed a ceremonial which varied according to the dynasties and the character of the monarchs.

The etiquette of the court under the Umayyads is not well-known, and it is not known exactly what respective place was occupied by the representatives of the different social classes regularly admitted to the caliph's madilis. For the 'Abbasid period, we possess a manual falsely attributed to al-Djabiz, the Kilāb al-Tādi (ed. Ahmad Zakī Pasha, Cairo 1914; French tr. Ch. Pellat, Le Livre de la cousonne, Paris 1954; cf. F. Gabriell, Etichella di corta a costumi Sasanidi nel Kitab abiaq al-mulūk di al-Gāhiş, in RSO, xiii/3 [1932], 197-247), which sets forth, mainly for the people and part of the aristocracy unfamiliar with the customs, the rules of royal protocol of the Sasanid court which it was proper to adopt, and supplies us with information derived from Islamic history only on the entertainment

MADJLIS

sessions. For the Fâtimids (see M. Canard, Le odefmonial fatimite et le cérémonial byzantin, in Bysention, axi [1951], 355-420), the information is detailed. The caliph habitually hold a public audience on Mondays and Thursdays each week and sat on a golden throng separated from these attending by a grill (shubbāk) and a curtain (sile) which was raised after he was seated. Among the title-bearers with public and private functions who had their places, according to their rank, in the reception hall, there must be noted the presence of a sahib al-madilis, a high-ranking cunuch entrusted with organising the session and advising the dignitaries as soon as the caliph had taken his place on his throne (al-Kalkashandt, Subb, ili, 480-8; cf. B. Lewis, Islam from the Prophet Muhammad . the capture of Constantinopie, New York, etc. 1974, i, 201-8). We also possess information on the status of the people admitted into the audience chamber: for Muslim Spain, e.g., it consisted of elements constituting the khassa [see AL-109 ASSA WA 't-'AMMA]; for Tunisia in the time of the Hafrids, R. Brunschvig, op. laud., il, 28-9.

In these public audiences, plaintiffs and petitioners were present, but poets and scholars who were admitted to the ruler's presence also participated, and for those who solicited the same honour it was an occasion to be introduced to this privileged circle by the mediation of someone already established at court, to recite m panegyric and receive an imme-

diate reward,

The crowning of this process was well on the way when the ambitious man was retained at the royal table after the public audience or at another time of the day. The majority of caliphs actually were accustomed to surrounding themselves with a group of nudamā? (pl. of nadim), companions who had in theory to respect quite strict rules, of which one gain an idea from the Kitib al-Tādj [11-20, tr. 39-48] and to possess a certain number of qualities and kinds of knowledge that al-Mas'ddi detailed in his Ahkbar al-samān (see Muridi, viii, 103-4 = \$\$ 3229-30).

A long account will not be given here of the entertalament evenings which many of He Muslim rulers organised regularly and in the course of which they gave themselves up to "pleasure" or fareb provoked by the music, singing and drinking. The Kitāb al-Tadi (31-9, tr. 59-66) enumerates those who, surrounded by women slaves and cunuchs, hid themselves behind a screen and those who showed themselves shamelessly to their familiars and to the musicians and singers; among lill latter, al-Rashid is said to have been the first to follow the example of the Sāsānids and establish divisions. This work makes no allusion in the presence of poets and story-tellers in these sessions, which was evidently distinguished from the meals of which al-Masfüdl speaks and during which a certain dignity surely reigned. As R. Blachère says with reference to Sayf al-Dawla (Motosabbl, 130), during intimate meetings known as madialis al-uns, "the cups were passed round, the social barriers fell, giving way to a semi-intimacy where protector and protegés treated one another with simplicity, at times even with familiarity", without too much casualness, it seems, Al-Mas adl (Muradi, viii, 102 = 4 3229) supplies and details on the conversations held in the magilis of al-Muctamid and mentions that their proceedings were recorded in writing; poetry occupied | Important place there, as al-Sull confirms, who, describing meeting of this kind around al-Radi (see Akabar ar-Radi billah wa'l-Multagt bilidi, French tr. M. Canard, Algiers 1946, I, 6e ff.), indicates the place of each of the guests designated by name, cites the subjects approached and reproduces the verses recited on this occasion.

This is not the place to dwell on the rôle of poetry considered as an instrument of government and propaganda by monarchs, always inclined to make use of the eulogies which were presented to them by versifiers of talent. Often skilled in stirring up rivalries, the caliph would put into competition poets, story-tellers, grammarians = fukuhā', to rejoice in the victory of some and snear at the discemiorture of others. The ruler's madilis also became a circle which J. E. Bencheikh (Les voies d'une création. Essai sur la poésie arabe à Bagdad dans la première moitié du III+IIX+ siècle, thesis. Paris 1971, 130; idem, Poétique arabe, Paris 1975, 22 II.; idem, Le cénacle poésique du Calife al-Mutamakhil . . ., in BEr.O, xxix [1977], 33-52) describes "a court of legitimation", adding that "the creator confronts there a well-informed prince, formidable men of learning, uncharitable colleagues; in thort, criticism is made immediately and pronounced without appeal. On the other hand, it plays a basic role in the diffusion of masterpieces; the scholars comment on them, the musicians inspired by them, the listeners spread their renown". These general considerations inspired by the study of limited period of the history of poetry in Baghdad are perfectly applicable to the majority of courts of Muslim sovereigns who were friends of letters and the arts to any extent and concerned about their reputation as patrons.

In addition, before even the dismemberment of the 'Abbasid empire was accomplished, parallel to the caliph's madilis, there were some literary groups directed by provincial governors and high dignitaries who had it at heart to gather around them, to their prestige, poets and scholars frequently attracted by ethnic or politico-religious affinities, but also for basely material reasons, for the isolated man of letters or scholar could only live sparsely, if he were without fortune; in any case, if he were not particularly ambitious, he had to appeal to patron, who, in default of the caliph, he could find in the provinces, then at the court of the dynasts who flourished from one end to the other of the Muslim world.

This necessity and undoubtedly prejudicial not only to the quality of the work at least of the poets, but also to their dignity, for they could not help but compromise themselves, to obey the tastes of the patrons and their entourage, and to adopt at times a politico-religious attitude contrary to their own convictions. In any case, so study of patronage the history of Arabo-Islamic civilisation (which remains to be undertaken, for it has only been so far sketched out, e.g. by R. Blachère, HLA, iti, 544-51) would be really instructive; based on the literary groups and salons in evidence from the Middle Ages to our own days, it would provide a global so the influence that the latter exercised on the evolution of literature.

 good for those who, at an inferior social level, stayed simply in the home of weil-to-do poets and writers and even in the shops of merchants who practised in their own way in form of patronage. So some manifelts were and still are constituted which are real literary salons, where good speech is honoured and extemporisation reigns.

When the person who "held session" was a professor, his madikis, which could possibly be transformed into a côterie, was the place (mosque, madrasa, personal home, etc.) where he dispensed his teaching; the same term designated the whole body of his audience, the session during which he dictated his course and, finally, the course itself; his lessons, once recorded by his pupils, were "published" most often under the heading amail "dictations" [see Tadels], but also at times madjālis (see Sezgin, GAS, if, 83-5); one of the most famous works of this category is the Kitāb al-Madjālis or al-Amāli of Tha Pab [q.v.]. (Ed.)

2. IN ISMÄTLT USAGE.

Here, madilis referred to a formal session of religious instruction, the place of it, and also to the lecture or sermon read in it by a da's [q.v.] to the faithful. These lectures were known more properly as wisdom sessions (madiālis al-hikma). In the Fățimid age, their preparation and delivery twice weekly was the official duty of the dai' 'l-du'at. Outside the capital Cairo, they were read by his deputies (newwish). The sessions were the occasion for the payment of a religious duty known as "the [fee for] confidential discourse (nadjwa)". According to al-Musabbihl (d. 420/1029), the davi 'l-duvai prepared the lectures, submitted them to the caliph for approval, and then read them separately to various groups of different sex, social and religious rank. Describing later Fățimid practice, Ibn al-Tuwayr states that they were drafted by the chief assistants (nuhabā') of the dā'i 'l-du'āt employed in the Dar al-Hikms and read by him, if possible, to the callph who would affix his mark of ratification (caldma) to the text. Collections of such lectures are extant, like the Ta'wil da'a'im al-Islam of Kadi al-Nu'man, the Madjalis Mustansiriyya, of 'Abd al-Hakim b. Wahb al-Mālidi! (wrongly ascribed to Badr al-Djamall), and the Madjalis Mu'ayyadiyya, containing 800 lectures of al-Mu'ayyad fi 'l-Din al-Shirazi (d. 470/1077; see on this work, Brockelmann, S I, 326). On the other hand, the Kitāb al-Magialis wa 'l-musdyard! of the Kacii al-Nu'man (d. 363/974) is a kind of account of sessions held with the caliph al-Mufaz (ed. H. al-Fakī, I. Shabbūb and M. al-Ya'lawi, Tunis 1978). In the post-Fatimid age, the Tayyibi dd' mudlak assumed the teaching function of the Fatimid day 'I-du'at, and collections of madjalis of some of them have also been preserved.

3. IN INDIAN SHIT TEAGE.

This term is especially used in the Indian subcontinent for the Shi's mourning assemblies held during Muharram to commemorate the tragedy of Karbajā'. These assemblies are organised in private homes or, more properly, in the imâm-bâiás [q.v.], where miniature replicas of al-Husayn's tomb at Karbajā', made out of paper or other material, kept throughout the year. The madilis, though dating to earlier times, acquired real prominence in the 12th/18th century with the impetus given | it by the Naumabs of Awadh or Oudh (1722-1856). Under these rulers, Lakhnaw (g.v.) or Lucknow, which was the seat of administration, became the undisputed centre of Shifi culture in India and a place where the madilis found its full development. Since then, the magilis has retained much of its traditional character. The central theme of the ceremony is the recital, in prose or verse, of the events connected with the martyrdom of al-Husayn, followed by lamentations and the beating of the breast, in which the whole assembly takes part. The service ends with the distribution of sherbet, sweets - food to all those present in the madilis. An important outcome of the institution was the emergence of individuals performing distinct functions in the madilis proceedings. As related by 'Abd al-Hallm Sharar, these included the hadith-hhwans (hadith reciters), recounting the virtues of the Prophet's family; the wahifa-AA "des (narrators of anecdotes), describing the misfortunes of those martyred at Karbala?; the marthing-hhwdne. (reciters of elegies), whose poetic narration of the events was accompanied by gesticulations and facial expressions; and the rea-kh as (singers of dirges), who were accomplished musicians. Among these various activities, the singing of dirges, in particular, enjoyed much popular appeal, despite its disapproval by the religious leaders. In its literary role, the madilis contributed to the development of the marthiya in Urdu, as illustrated by Anis (1802-74) and Dabir (1803-75), the recognised masters of that genre [see MARTHIYA, 4. In Urdu].

4. In the sense of representative Institutions

A. In the Middle East and North Africa

The terms Modilis (Arabic), and Medilis (Ottoman Turkish), Media (Modern Turkish) and Madiles (Persian), meaning "Parliament", appear in various word-combinations as indicated below. In Arabic, the synonym Barlandn (borrowed from the French) has also been in frequent use, as has Parlamento in Ottoman Turkish (from the Italian), Parlamento in modern Turkish (mostly used for parliaments outside Turkey) or Parleman in modern Persian (from French). Madilis (usually in Madilis alnumerab, or Madilis shird al-numerado) assumed this connotation in the 19th century, as the concept of parliamentarism became widespread, thanks to the impact of Western Influence on the Bast, without, implying parliamentary government. While it is not certain when the term was first used in this sense, its first official use appears to have been in 1866, with the promulgation of Khodive Isma'l's Budid pa-nipim-nămat madilis shirá al-numudh al-mirriyya of Radjah 1283 (see below, under (zvi) Egypt).

The following article attempts to outline and evaluate the advent and fate of parliamentarism in the Ottoman Empire, Republican Turkey, Iran, Arab states and Middle Eastern countries with Muslim **MADJLIS**

minorities, such as Israel and Cyprus. In certain countries, parliamentary bodies were convened in response to growing demands for political participation by individuals or groups impressed by Western patterns of democratic government, who hoped 📰 📖 such bodies as national instruments for obtaining (or preserving) independence, overall progress and especially for curbing absolutism. The above were established by local rulers, usually in response to popular demands. Sometimes, they were established by the local ruler on his own initiative, originally in an advisory capacity only; in this latter case, these bodies eventually showed greater political awareness and demanded more than anticipated. During the colonial period, especially in Arab areas under British and French control after the First World War, parliamentary institutions were set up by the foreign Power. Elsewhere, as in Iran and Turkey, they were established by independent régimes, generally during the first half of the 20th century. On the whole, the latter proved to be more durable than the former. However, when adapted to the social, economic and political realities of the country, all such parliaments did continue to function, even those which were colonial creations, as in Lebanon = the Maghrib.

Parliaments in the Middle East and North Africa, whether dating from the colonial or independent era, in general were modelled on Western patterns and functioned with varying degrees of effectiveness, especially during the first half of the 20th century. Most parliaments in Arab states were considered mainly consultative bodies by the government. In recent years, under the new, revolutionary, highly centrallsed régimes they have lost much of their effectiveness lafter having been challenged by Islamists and rightand left-wing groups). In many cases, party competition has | but disappeared and the role of parliament (if | extant) in the initiation of legislation and public policy-making has diminished, - have its representational attributes. In reality, parliaments in Iran and most Arab states—eagerly hailed by nationalist movements both as symbols of emancipation and desirable vehicles for political expression-had failed, largely because of their inability resolve or even regulate the sharp conflicts rooted in socio-economic, ethnic and political differences. Such partiaments had indeed identified with the status quo forces. On the other hand, that of Turkey, with a longer parliamentary tradition, has maintained its importance to date (1978).

In summary, parliamentary institutions in each of the countries discussed below have reflected the local political culture of the time. Their impact on national affairs, however, has been merely marginal in most cases, - parliaments in the Middle East and North Africa (Turkey and Israel excepted) have rarely provided political leadership, except through legislation. Their probable main function has been to legitimise the new states, moderate internal conflict by allowing argument and integrate diverse elements. Most Middle Eastern parliaments have succeeded only partially in carrying out these functions, especially the last one.

(i) The Ottoman empire

The first Ottoman parliament was inaugurated in 1877, although local parliamentary institutions had occasionally convened prior to that time in certain parts of the Empire, such as Egypt (see below), Earlier, in 1845, a General Assembly, or Meditis-i "unsimi, was convened in Istanbul by 'Abd al-Mediti, seating one Muslim and — Christian from each province. It met for two months, concerning itself with improvement of local matters. However, it could hardly be considered as more than a mere forerunner of a germine parliament. Ottoman reformists ("The Young Ottomans"), had indeed discussed the principle of representation, especially since the midnineteenth century; many thought of it as a cure for the Empire's ills.

The First Ottoman Parliament. Convocation of a parliament was one of the stipulations of the 1876 Constitution, granted by 'Abd al-Hamid II [q.v.] at

the instance of Midhat Pasha [q.v.] and his supporters. The Sultan convened a parliament for two principal reasons; firstly, Ottoman reformists and liberals were firmly convinced that a Western-style parliament, anchored in a written constitution, —— essential for curtailing absolutism and propelling the Empire on the road to its salvation; secondly, representatives of the European Powers, then meeting in the Constantinople Conference, would thus be impressed with the Ottoman Government's earnest desire to rule more democratically and guarantee individual freedoms more effectively.

The 1876 Constitution stipulated that parliament, or Modilis-i 'umumi, would comprise an elected Chamber of Delegates, Medilis-i meb alian and appointed Senate, literally . Chamber of Notables, Medilis-i atyan. The former Chamber, although intended to play the major role, was nevertheless limited chiefly to debating, since initiation of legislation was to be a prerogative of the Ministers who were not responsible to the Medilis; also, a Member of the Chamber of Delegates could initiate a bill only via the Grand Vizier's office, which then forwarded it for the Sultan's approval, while the Sultan retained the right of veto. Voting on the budget was the sole meaningful task of the Chamber of Delegates, and even this could be circumvented. Consequently, the Chamber's real importance was not in its powers, but rather, in its very establishment as a debating forum rendering it a possible restraint on despotism.

According to an iride dated 28 October 1875 (the draft of the electoral law was promulgated only in 1908), elections for the Chamber of Delegates commeaced in December 1876 and continued throughout the Empire for several weeks-with the noteworthy exception of Egypt, Tunisia, Montenegro and Serbia (these had special international status and were copsequently excused) and of Mount Lebanon (where the Maronites and Druzes refused to vote, lest it affect their special status). In theory, every 50,000 male Ottoman subjects were to elect one delegate. In practice, members of various administrative councils wrote in the delegates of their choice on the ballots, Muslims and non-Muslims alike (although the latter were subject to a quota). All ballots were checked at the provincial governor's office by a public committee headed by the governor himself; they were then counted and despatched to Istanbul for verification. Elections in the capital itself followed a slightly different procedure.

The iridic stipulated that the Chamber of Delegates comprise 130 Members. However, only 119 were elected and attended the first session; in the second, which commenced in December 1877—after new elections had been held—there were 113 delegates, including 55 who had attended the first session as well. All sessions convened in Istanbul, where the Chamber—along with an appointed Senate of 31 (4 others were appointed subsequently)—met from 19 March 1877 until 13 February 1878, when the Sultan dissolved parliament. It appears that 'Abd al-Hamīd II considered reconvening it, but then changed his mind; Parliament was not to convene again until 1908.

Senate meetings were closed to the public and little is known of them (other than that it debated several bills passed by the Chamber); sessions of the Chamber of Delegates were open, however. These dealt with foreign demands on Ottoman territory and subsequently with the Turco-Russian War—all with patriotic spirit They discussed bills presented by

ro36 MADJLIS

Ministers, passing a number of them with certain changes. Most significant were the Provincial Administration Law, the Municipalities Law and the Electoral Law for the Chamber. They debated finances (e.g. they sharply criticised the Baghdad Railway concession) and made pertinent observations thereupon to the Ministers. Their most noteworthy contribution, however, was most likely the constant stream of criticism of the Government's handling of the war, bureaucratic mismanagement and administrative corruption. These manifestations of an independent stand received coverage in the local press, which commented approvingly on their lively character.

Many Members of the Chamber of Delegates were former government officials, including several bers of the administrative councils supervising the elections. Socially, most seem to have been of the middle and upper middle classes, hence their interest in administrative reform and their conservative approach to most socio-economic issues. On the religious and ethnic levels, they were much more of mixed gathering. In the first session, there were 71 Muslims, 44 Christians and 4 Jews; in the second 64 Muslims, 43 Christians and 6 Jews. They belonged to various ethnic groups throughout the Empire: a contemporary observer counted ten: Turks, Arabs, Kurds, Greeks, Armenians, Bulgars, Albanians, Bosnians, Viachs and Jews. There was an even greater diversity of languages, though Turkish the official language of proceedings. Rich and poor, educated and uneducated, they were not unrepresentative of the Empire's overall population. Despite their disparate character, they succeeded in cooperating and in publicising personal, local and national grievances to such an extent that the Sultan was prompted to send them home.

Parliaments in the Second Constitutional Period. The 1876 Constitution was reinstated (it had never been officially abrogated) in August 1908, after the Young Turk Revolution; parliament was thus revived. The Committee of Union and Progress (CUP) [see 1771#AD WE TERAKK! DIEM'SYPETI] and other groups sought to assert themselves—and limit the Sultan's powers—via the Chamber. 'Abd allamid II re-inaugurated parliament in Constantinople on 17 December 1908; it functioned until April 1920, when the last Ottoman parliament was dissolved.

Elections were held according to an electoral law which modified the *irâde* of 28 October 1876 but retained the limited franchise and voting through administrative councils. The CUP was in conflict with other groups in the Chamber, which opposed it on either ideotogical or ethnic grounds (Greek members, for example). Still, it generally held an uneasy majority, useful during the historical meeting of Chamber and Senate, sitting as a single National Assembly (22 April 1909) which decided to depose 'Abd al-Hamld II after his counter-revolution had failed. This was one of the high points in the annals of parlia-

ments of the Second Constitutional Period. A partial result of this decision was the debate and subsequent passage of various amendments to the 1876 Constitution, rendering the Chamber an important component of the state. Concurrently, the once unconditional sovereignty of the Sultans was restricted; their prerogative to appoint Ministers and nominate others to high office became the right of parliament or the cabinet. Even the cabinet itself was made responsible, and to some extent subservient, to parliament.

During its early years, the Chamber debated and passed numerous laws, chiefly of a financial, administrative, or judicial character (list and maries may be found in Sarrou-see Bibliography); during the First World War, several laws of military significance were considered. However, the CUP itself, in firm executive control, strove to curtail the powers of parliament, achieving only limited results. The CUP enjoyed more success in passing legislation in the Chamber from 1909 onwards. It generally aimed at centralising the Empire's administration and strengthening their own position at its head. Examples - the Laws of: Vagabondage and Suspected Persons; Public Meetings; the Press and Printing; Associations; and the Prevention of Brigandage and Sedition. These were intended to curb individual as well as public opposition and to limit the freedom of the press. Such measures did not pass without determined opposition; the Chamber included a group which resisted these restrictions, along with the limitation of the Chamber's powers in favour of the Sultan, whom the CUP manipulated. In April 1912, new elections were held with the CUP obtaining strong support, reportedly by pressure and bribery. Yet another Chamber was inaugurated May 1914, which prolonged its tenure in April 1918 (by amending the Constitution), after its fouryear term had ended. However, in December 1918, Mehemmed VI dissolved parliament, Elections were held a year later; the new Chamber convened on 12 January 1920, adjourned itself in March and was dissolved = 11 April 2920. It convened briefly, again, in March 1921; however, for all practical purposes, the sessions of parliament in Istanbul had to an end.

The composition of parliament during the Second Constitutional Period was no less heterogeneous than in 1877-8. The nationalism of the Young Turk leaders had a market ethnocentric tenor, bolstered to a degree by their Islamic policy. Consequently, increasing preference was shown to Turks and Arabs in the elections, aithough the Turks, a minority in the Empire, constantly maintained an absolute majority in the Madilis. The CUP was suspicious of Arab and Armenian nationalism, on the one hand, and impatient with Greek and Albanian criticism within the Chamber, on the other. The following table (from Feroz Ahmad—see Bibliography) demonstrates this trend.

Bibliography: For the reconstructed records

Ethnic Representation in the Ottoman Chambers during the Second Constitutional Period

Year	Turks	Arabs	Albanians	Greeks	Armenians	Slavs	Jews	Total
1908	147	60	27	± 6	14	to	4	288
1912	157	68	18	15	13	9	4	284

(ii) Turkey.

Turkey's Grand National Assembly (GNA), or Türkiye Büyük Millet Meclisi, torged during Turkey's War of Independence, was soon given a legal basis; attention to legality has, in fact, characterised this body throughout its existence. Mustafa Kemal and his advisers were careful to maintain legal continuity: When the GNA opened as a Constituent Assembly in Ankara, on 23 April 1920, twelve days after the Chamber in Istanbul had been dissolved (see Ottoman empire, above), it comprised no fewer than 92 Members of the dissolved Chamber, including its eratwhile president (who now became vice-president of the GNA). Nevertheless, the GNA may be considered as a distinctly new institution. As early = January 1921, the GNA adopted provisional constitution for Turkey, entitled The Law of Fundamental Organisations, which vested all legislative authority and executive power in the GNA and charged it with governing the state.

The amendment of 29 October 1923 declaring Turkey mepublic and the 1924 Constitution institutionalised the above im a more detailed manner. All powers were centred in the unicameral GNA which was to be elected by universal male suffrage. The GNA would elect the President of the Republic, who in turn, would appoint the Prime Minister. The GNA reserved the right to approve the latter and his Cabinet, all of whom were responsible to it. The size of

the GNA remained fluid, adjustable to population fluctuations. Until 1945, the GNA housed (with brief exceptions) a single party, the People's Party (later renamed the Republican People's Party [see DIOMHORITYET EMALK FIREASI]; several experiments with including additional parties were short-lived. During the post-1945 era, several parties have vied for power in the GNA.

The 1961 Constitution (passed by a Constituent Assembly convened after the military intervention of 27 May 1960 and subsequently approved by a popular referendum on 9 July 1961) greatly resembled that of 1924, with certain modifications concerning the GNA. It became a bicameral body comprising a National Assembly (Millet Meclisi) of 450 members, elected for a maximum term of four years and a Senate (Senato) of 150 members elected for six years (with one-third renewed every two years). This Senate included 22 of the ex-officers who had engineered the 1960 intervention (and became Senators for life), another 15 appointed by the State President, as well as all surviving former State Presidents. The National Assembly was the more important body of the two, as Cabinets had to obtain its vote of confidence; in addition, it had the right to initiate and support legislation in the event of a dispute with the Senate. The powers of parliament and the cabinet considerable; however, a Constitutional Court, established at that time, was able to rule on the constitutionality of parliamentary laws and decisions (among its other powers).

There have been several changes in the laws governing parliamentary elections. Up to 1945, elections were indirect and thus liable to manipulation. Women were enfranchised in 1934. Between 1945 and 1950, with the transition to a multi-party system, the electoral laws were modified. In 1946, direct elections replaced indirect ones (first applied in the 1950 elections) and a secret ballot and public vote-counting was guaranteed. In 1950, supervision of elections passed from the executive to the judiciary. The simple plurality system continued until the 1960 military intervention, when a modified system of proportional tepresentation was instituted for elections to the National Assembly, According to the new electoral laws passed by the Constituent Assembly in April-May 1961, each of Turkey's 67 constituencies (identical to its administrative districts) was assigned its share of the 450 seats, proportional to its population. Each party received a number of seats relative to its vote in each constituency. In the Senate elections of 1961, the party winning the majority in a constituency carried all its seats (Istanbul and Ankara excepted). Since 1964, the Senate elections system was adapted to resemble that of the National Assembly. Since 1961, all Turkish citizens aged twenty-one or over (barring convicted criminals) could vote: candidates for the National Assembly had to be literate and aged 30 or over; for the Senate-university graduates aged 40 or over. Membership in the GNA was considered incompatible with service in the state bureaucracy, the armed forces or the judiciary. Democratisation of the electoral process was bolstered by the requirement that parties hold primary elections six weeks before voting-day and that party representatives participate in the supervision of the balloting.

Parliamentary history in the Republic of Turkey appears to be divided into three major periods: 1923-46, 1946-60, 1967 to date (1978). During the first period, the single-party era, general elections to the GNA bell in 1923, 1927, 1931, 1935, 1939

and 1943. The GNA was not only identified with the cadres of the People's Party but was, to a certain extent, = extension of the party itself, co-operating with it in single-minded effort towards rapid modernisation. The second period ranges from the beginning of the multi-party era until the first military intervention. General elections to the GNA were held in 1946, 1950, 1954 and 1957. This period witnessed the orderly transfer of power from the ruling party to the Democrat Party [500 DEMOKRAT PARTI], which obtained and kept a comfortable majority in the GNA for ten years (1950-60). While opposition within the GNA had been negligible during the first period, it was active indeed during the second. Although several smaller parties had a minor share in electoral competition and parliamentary contests, most of the campaigning was undertaken by the two mass parties, the Republican People's Party and the Democrat Party; their rivalry for power engendered a constant in parliamentary debates on legislation and general policy. The third period commenced with the establishment of a bicameral system under the constitution. General elections in the National Assembly were held in 1961, 1965, 1969, 1973 and 1977, general elections to the Senate in 1961 and partial elections in 1964, 1966, 1968, 1973, 1975, 1977 and 1979. The continued, this time between the Republican People's Party and the Justice Party (heir to the Democrat Party in many respects), although with three principal differences:

(a) The relative liberalisation of political party activities, initiated in 1961, enabled several radical groups to form legal parties, stand for election and enter parliament. Examples were: the socialist Workers' Party of Turkey, active since 1961, in parliament since 1965; the Republican Peasant's Nation Party (renamed Nationalist Action Party), active in its pan-Turk ultra-nationalist character and in parliament man 1965; and the strongly Islam-oriented National Salvation Party, active (under ■ different name) since 1970 and ■ parliament since 1973. All this reflected a diminishing of the national consensus and increased the difficulties of passing legislation, especially since some of the other parties broke up as well.

(b) For the first time in Turkey's parliamentary history, coalition cabinets were required in order to obtain votes of confidence in the National Assembly. While the Justice Party obtained an absolute majority in the general elections of 1965, and 1965, in those of 1961, 1973 and 1977 the Republican People's Party obtained only a relative majority (see table of Election Results below) and rather unstable coalition cabinets had to be formed. This hindered meaningful legislation in both Houses and encumbered policy-making in the Cabinet (although the parliament and cabinet still could—and did—move decisively in times of national crisis, ■ in Cyprus, in July 1974).

(c) Frequent elections were held; scarcely a year went by without an election for the National Assembly, the Senate or local authorities. Thus public excitement never abated; on the contrary, it increased, often to the point of physical violence. Indeed, violence appealed to several extra-parliamentary groups, small but vocal and active, supported by those who had despaired of obtaining speedy socio-economic and other reforms by parliamentary means, especially during the years of coalition government stalemate. Consequently, political processes in contemporary Turkey appear to continue

on two different levels, only one of which li centred in the GNA and follows the parliamentary rules-of-the-game; the other level is extra-parliamentary, radicalised and favours violence.

The GNA has attracted many well-educated persons; approximately 70%-80% of its members, in combined, had studied at the university. However, socio-economic and occupational composition of parliament in Turkey reflects more accurately the transition m a multi-party régime and the changes brought about by modernisation. The key-date for this process is 1930, as it was then that a counter-élite was largely substituted for the Kemalists, Analyses conducted separately by Proy and by Tachau (see Bibliography) have established that prior to 1950, the GNA comprised -in descending order-former government officials, retired officers, lawyers, merchants and businessmen, and educators. After 1930, the main groups-again, in descending order-were lawyers, merchants and businessmen (i.e., the groups with more experience in a competitive system) followed by former government officials and retired officers. Before 1950, a much larger proportion of the GNA came from the more developed areas in Western Turkey; since then, there has been a much more equitable distribution. In the sessions between 1927 and 1943, 63% or more of the membership had already served in parliament; since then, the proportion has dropped to below 50%, with new members entering not only for natural reasons but also thanks to new ideologies enjoying some popular support. The above indicates a broadening of the Turkish political élite, as expressed in the GNA, as well as a freer elite circulation and greater competition between rival élites, reflecting the growth of pluralism in Turkish society and the increase in its upward mobility during the multiparty eta. Electoral participation has been quite a crucial factor, as it has generally been rather large, between 64.3% and 89.3% (56.2%-81.0% for the Senate). Voting has usually been heavier in the rural, less-developed areas in Central and Eastern Anatolia, perhaps because of the influence of local landlords, This status-quo factor has been offset, however, by the considerable internal migration from village to town and city, on the one hand, and to a lesser extent, by the impact of Turkish workers returning from Europe, on the other. In recent years, the Justice Party and the National Salvation Party have been particularly strong in rural, less developed areas and bave consequently enjoyed electoral support there. The Republican People's Party, enjoying more electoral support in the cities, has benefitted in recent elections from population migration into the cities. It is not easy to predict how III this will be affected by the military intervention of 12 September 1980, one of whose first measures was dissolve both Houses of Parliament in Tarkey.

Notes: In 1961, elections were held for all 150 Senate seats that were earmarked for election (other Senators were appointed).

Since 1964, elections were held in about a third of the constituencies, for a third of those seats and for those that had become vacant.

The Nationalist Action Party was the new name of the Republican Peasants Nation Party since 1969.

(iii) Iran

No significant representative fastitutions existed in Iran until the 1906 Revolution, when the Iranian Parliament was established, reflecting the basic intention of the Fundamental Law of 30 December 1906 and the Supplementary Fundamental Law of 8 October 1907 (both principa) components of Iran's first Constitution) to curb the absolute monarchy of the Kadjars. These laws, largely patterned after the Belgian Constitution of 1831, provided for a National Consultative Assembly (Madilis-i shurd-yi milli), to which was added a Senate (Madilis-i Sinā) in 1949 (first meeting in April 1950). The former body was not only much older, but also far more influential in public life than the latter; it was empowered to discuss all national affairs, pass laws, approve the budget, grant concessions and ratify treaties. The all-Muslim Senate, half of whose 60 Members were nominated by the Shah, was largely intended as a check on the Assembly's powers.

Up to the 1978 revolution, the National Assembly was elected by universal suffrage, excluding the armed forces and convicted criminals but since 1963 including women, who might both vote and be elected. Election was by simple plurality in constituencies. A number of seats were earmarked for Armenians, Assyrians, Jews and Zoroastrians (but only a Muslim might be Prime Minister). In 1957, the number of seats was increased from 136 to 200; it was subsequently raised to 219 and currently (1978) stood at 268. The Assembly's term of office was extended from two to four years (the Senate's term was four years as well) in 1956. The last elections under the Shah's régime were those of 20 June 1975 for the 24th Assembly and the 7th Senate. These were held on one day, whereas formerly they had lasted for an and months. Furthermore, these were the first held under the singleparty system. In those elections, all Iranians aged twenty and above could vote in the Assembly elections im 173 constituencies; those aged twentyfive and up could vote for the Senate = well. There were 6,805,647 votes cast for the Assembly, about 51% participation; and 5,834,666 votes for the Senate in 30 constituencies, amounting to nearly 50% of eligible voters. Twenty women entered the Assembly and one the Senate.

The 24 Iranian Assemblies from 1906 to 1978 have had an uneasy and sometimes tumultuous history of in-lighting and of struggling with the Shah for power. The First Assembly began as a nationalist and reformist parliament, which improved fiscal controls and dealt with the administration of justice (including anti-bribery measures) and the organisation of municipalities and provincial councils. Muhammad "All Shah forcibly dissolved it in June 1908. The Second Assembly, elected in November 1909, moved in the same direction as its predecessor, reorganising the state bureaucracy, but passing laws == education, health and taxation as well. When it rejected = ultimatum from Tsarist Russia, it too was dissolved in December 1911. The Third and Fourth Assemblies which met during and immediately after the First World War were short-lived and achieved but little. Beginning with the Fifth Assembly, elected in November 1921, Iranian parliaments had to contend with the forceful personality of the new ruler Rida

Khān, who became Prime Minister in 1023 and the new Shah in 1925. Rida Shah banned all political parties and ensured the subservience of the Assentblies by influencing the elections, silencing potential opposition and circumscribing opportunities for reaching national prominence through the Assembly. Turnover decreased and capable, ambitious persons sought other avenues to power during the term of the Sixth until the Thirteenth Assemblies.

The abdication of Rida Shah in August 1942 immediately released suppressed energies and brought about the creation of political parties and groups and a flurry of Assembly activity. Constant bickering also characterised the Fourteenth Assembly, elected during wertime, which introduced many few faces (nearly half the Members). Unruly behaviour and lack of legislation caused the new Shah, Muhammad Rida Pahlavi, to convince parliament to grant him the right to dissolve the Assembly and add a Senate (1949). Meanwhile, nationalist fervour led to the election of a veteran Member of the Assembly, Muhammad Musaddik, as Prims Minister (1051). Muşaddik worked against the Shah, nationalised oil (which worsened Iran's economy for a time, ■ ■ brought about an international boycott) and alienated many of the Shah's sympathisers. Musaddik, however, enjoyed less certain support in the Assembly than he did amongst Tehran's population. His dissolving of the Assembly was countered by a pro-government coup, supported by pro-Shah forces. Muşaddik and arrested and political parties were banned.

More than half the membership of the Eighteenth Assembly, elected in 1954, was new. The Shah consolidated his power and Assembly Members were invited to join one of two court-sponsored parties. In 1961, the Shah dissolved parliament indefinitely and began to rule by decree (promulgating more than laws in two-and-a-half years). A popular referendum approved the Shah's impressive new plans for "White Revolution", calling for the re-distribution land, improvement of agriculture and industry, and increasing literacy. When a new Assembly was elected in September 1963, the High-i Iran-i Nuvîn party predominated. This party comprised technocrats and former civil servants; it supported the Court (probably having been initiated by it), identifying with the policies of the Shah and his Ministers. Later on, the Rastakhiz Party followed suit. This co-operation, which characterised all subsequent assemblies, was justified by continuous economic growth and an increase in military power.

In Assembly-Shah relations, the Assembly was in ascendance in 1906-25, when it was a partner in the comoval of the Kadjar dynasty and again in 1941-53, when a nucleus of its leaders even succeeded in temporarily exiling the Shah. The Shah subdued the Assembly in 1926-41 and again since 1954, mostly because of his prestige and central position, his executive control over legislative recruitment and endemic divisiveness within the Assembly. Even then, Muhammad Ridā Shāh has consistently praised the positive role and great importance of parliamentary democracy in Iran. In actual practice, the Assembly had had a long (although mixed) record in legislation, as well in criticism of the Cabinet and administration (although not of the Shah and

armed forces).

The character of the Madilis was determined by the electoral laws, by the bargaining which ensued, and sometimes by official manipulation, but even more so by Iran's socio-economic and political realities. Indeed, at least until the early 1960s, most political parties in the Madilis were recogainable by their affinity to the person of a leader, rather than their being held together by a cogest ideology. Socio-economic ties were, characteristially, more relevant. Originally, the electoral law institutionalised is situation, by stipulating that the Members of the Madilis were to be elected under a system of indirect balloting, which curtailed popular voting, placing it under the supervision of electoral committees representing six social groups (or classes, (abakāt): nobles, landlords, men 🗃 religion, businessmen, traders, and farmers. The 1963 Electoral Law substituted workers and peasants for the first two groups; nevertheless, several members of aristocratic families continued to be elected to the Madjlis. Other characteristics were, however, in less evident among Maditis Members: in general, Members of the Maditis had m be well-to-do; in 1906, they were required to be property owners and pay a minimum annual tax. Later on, it was still necessary to me a person of means, in order to assume campaign costs. In addition, they had to be somebow identified with the "Establishment" headed by the Shah and his Court-with the exception of the first few Assemblies. which were essentially revolutionary, and of groups in the Assemblies immediately following the Second World War, which included outspoken members identifying with leftist, ultra-nationalist and extreme religious factions.

The average educational level of Madilis Members has risen steadily: university degree holders made up 62% of the total in the 21st Assembly (1963-7). Landlord representation, although still strong, is declining against an lacrease in the members of the technical and free professions, with clear phasis former mid-to high-ranking government employees (69% of the membership in the 21st Assembly). Nullahs have all and disappeared from the Madilis in recent years. Even so, the Madilis rumains an elitist institution, although less so than the Senate. J. A. Bill (in his article, in Lenczowski-see Bibliography) has calculated that during the years 1906-67. the "Forty Families" of Iran have held, between them, 66 seats in the Senate and 410 seats in the Assembly. It is this élitism in membership that secured prestigious character for the Iranian Madilus and warranted-no less than the formal constitution -its participation in the conduct of public affairs. After the "Islamic Revolution" of 1979, the new

Madilis opened on 28 May 1980.

(iv) 'Irak.

The parliamentary history of 'Irak commenced virtually simultaneously with the inception of the British Mandate. Following the signing of the Anglo-Iraki Treaty of 10 October 1922, King Faysal I, in a Royal Decree dated 21 October, called for elections to Constituent Assembly. These elections were main two stages during 1923 and the first Constituent Assembly, numbering 1903 members, was inaugurated by Faysal on 27 March 1924. The Assembly's main task was to ratify the 1922 Treaty, to draft an Organic Law—approved by Faysal on 21 March 1925—and to adopt an Electoral Law. When this was accomplished, the King dissolved the Assembly.

The Organic Law and the 1924 Electoral Law regulated between them the elections to the Chamber (Maglits al-nameab) and the functions of parliament. Elections were to melt beld by administrative departments, in two degrees, with every 20,000 male citizens, aged 20 or over returning meltector. Barred were criminals, the insane, those not paying minimal state or local tax, policement and soldiers—unless on leave. The Electors, aged 25 or over, elected the Members of the Chambers by simple majority vote, one Member for every 250 Electors. Provision was made for the election of minority ethnic groups in three of 'Irāk's constituencies, me follows: one Christian and two Jews in Baghdād; two Christians and one Jew in Mosul; one Christian

and one Jew in Başra.

The Organic Law—the basic for 'Irāk's first constitution—established a bicameral parliament (Madilis al-umma), partially based on the British model, consisting of a Chamber of Deputies (Madilis al-nawwib) and a Senate (Madilis al-al-yōn). The former was elected, as above, for four years; its membership, originally 88, was increased to ro8 in 1935, 118 in 1943 and 135 in 1952. The Senate was appointed by the King for eight years, with half the Senators concluding their term of office every four years (they could be reappointed). The number of Senators, at first, was not to exceed a quarter of the Chamber's size. Deputies had to be aged 30 or over, Sen-

ators to or over. Both Houses were supposedly equal, although only the Chamber had the right to pass the budget and vote on mo-confidence motion in a Minister or the entire Cabinet. Both Houses passed legislation although it was generally initiated in the Chamber, through several standing committees; joint sessions resolved disagreements. Both Deputies and Senators enjoyed parliamentary immunity. The Cabinet was to be made of Deputies and/or Senators; no Minister could serve more than six months without being (or becoming) a Deputy or Senator. Parliament was to convene in Baghdad for four months a year, from November to the end of February (in practice, it frequently sat for longer pariods, due to unfinished business).

In July 1923, Fayşal nominated the first Senate and convened it together with the recently-elected Chamber for an extraordinary session. Since then, parliamentary life has been characterised by a great deal of controversy. One type of conflict was between the Chamber and the King-first Paysal and then his son, Ghazi (since 1933). The two attempted to influence, if not manipulate, the general elections held in 1928, 1930, 1933, 1935 and 1937, in order to ensure a more compliant parliament; they then tried to assert their power, in defiance of the Chamber. The Chamber invested no little effort in asserting itself against both the King and the British, who were suspected of plotting meperpetuate and even enhance their special status as Mandatora of 'Irak.

Later on, another type of conflict envolved political and socio-economic grounds. In 'Irāk, as in Syria and about the same time, the two-degree electoral system favoured the influential landowners and their urban allies. Furthermore, the constituency system often helped the same families and groups to obtain perennial representation. With the advent of political parties, chiefly after the Second World War, the power of the established, conservative circles within the Chamber was challenged. Heated arguments were carried - concerning the internal socioeconomic situation and 'Irak's foreign policies towards Arab states and international alignments, Most effective decision-making in 'Irak took place outside parliament-to a greater extent, perhaps, than in certain other Middle Eastern states. This continued even after 'lrak had formally obtained its independence in 1932. While parliament was characterised by haranguing, the King and the Cabinet of Ministers continued to be the true foci of power, with the British still very influential; since the mid-1930s the military became increasingly involved in politics as well. While the parliament's low status owed more in the then-prevalent political oulture in 'Irak than to anything else, certain corrective steps, principally of a formal nature, were attempted, especially in electoral reform,

During the early 1940s, electoral reform had been increasingly suggested as malliative; the Chambers elected since 1939 appointed committees to debate the subject. In 1946, make electoral law for the Chamber was promulgated. Essentially, it was based on the 1924 Electoral Law, although it modified constituency zoning, increased the representation of ethnic minorities (six Christians and six Jews) and imposed legal restrictions on the arbitratiness of local officials supervising the elections. It did not, however, transform the two-degree system to non-degree system was vociferously demanded by those desiring the morratisation of the popular vote; this was achieved only by a 1952 decree, later

incorporated into the Electoral Law of 1936. The 1932 decree set membership in the Chamber at 135, including eight Christians (but no Jews), re-dividing 'Irâk into 72 constituencies. The decree also insisted upon secret ballots and regulated the ways and means

of electoral propaganda,

Considering the electoral reforms of 1946, 1952 and 1956 as a whole, one tends to attribute them, at least in part, to the increasing pressure of Traki political parties on public life. Of moderate consequence before the Second World War and banned during the War itself, parties were permitted to function once again in 1946; old and new alike increased their activity, both in and out of parliament. Concomitantly, the Government and its supporters, obviously considering these parties as rivals, took steps to limit their chances of success in the elections and their power within the Chamber. Various parties boycotted the elections of 1947, 1948 and 1952. The January 1953 elections were particularly unsuitable for free voting: several parties were banned, the press severely censored and martial law imposed in Baghdad. The mood was such that only 57 soats were contested; the others were filled without opposition. As a result, Nürl al-Saad's Constitutional Union Party came within one seat of winning an absolute majority.

Opposition to suppression and repression by the government became pronounced among various political parties and groups; Kurdish strongholds in the north, Shi'ls in the Lower Euphrates Valley and residents of the main cities and environs of Beghdad, Mosul and Basra, Political and socio-economic ideologies within and without parliament concerning 'Irak's joining a Western pact (later named "The Baghdad Pact"). The Government decided on new elections, which were duly held on 9 June 1954. These were the first direct elections to be held with Trak not under martial law, thus allowing free electioneering by all major political parties. Although the balloting was not secret, the Constitutional Union Party, still the largest parliamentary group, obtained only 50 seats, losing its majority; but all conservative groups together still managed to obtain a majority (counting many independents); however, the Government considered this situation unsatisfactory and dissolved the Chamber after less than two months, bolding me elections on 12 September of the same year. With most parties split over the issue of boycotting the elections, only 13 out of 135 seats were contested. Consequently, the Opposition was heavily defeated; only 7 out of the 32 Opposition Members of the Chamber elected in June were returned again in September. Many, perhaps most of the independents elected in September were partial to Núr! al-Sa'id's policies. The Cabinet enforced its position by issuing, = 22 September 1954, an Association Ordinance. This effectively banned some political parties and restricted the activity of others.

Holding three general elections within twenty months and eliminating much of the opposition from the Chamber of Deputies, the Government succeeded in making most opposition extra-parliamentary. The above Association Ordinance drove many civilians and soldiers underground. The 1954 Chamber was even less representative than several of the preceding ones, so that in the following general elections, on 5 May 1958, only 27 seats of the then-expanded Chamber of 143 were contested; the press hardly reported the voting, which was very sparse, in any case, even though women were entranchised

for the first time. Consequently it is hardly surprising that when the military revolution occurred afterwards, on 14 July 1958, none to the Government's assistance.

With the end of the monarchy, the 'Iraki parliament passed into history as well. One of its last acts had been to approve the Arab Union of Trak with the Hashemite Kingdom of Jordan, on 13 May 1958 (the Union's constitution provided for a joint parliament with zo delegates from each component). The Arab Union, too, disappeared with the 14 July revolution. During the following years, succeeding governments and their spokesmen repeatedly mentioned the establishment of some sort of parliament, but no practical steps towards this end have been taken. A National Council of the Revolutionary Command, formed soon after the revolution, has assumed both executive and legislative functions: its title has changed, but its powers have not. The Provisional Constitution of 27 July 1958 mentioned no parliament. The Interim Constitution of 29 April 1964 spoke of vesting legislative power in a National Assembly. However, this has remained a dead issue so far. A law promulgated on 14 December 1964 amended the constitution with the aim of instituting an advisory body for legislation (each member to be elected by 70,000-100,000 inhabitants). In February 1967, the Government issued = electoral law, with the (unfulfilled) intention of holding elections before May of the same year. When it became effective on 16 July 1970, the Provisional Constitution of September 2968 had me amendment which mentioned the eventual convening of a National Assembly, On 15 November 1972, President al-Bakr issued a National Charter-the basis for a permanent constitution-which once again spelled out the intention of having a roo-member National Assembly, to be nominated by the Revolutionary Command Council. The latter did indeed approve a law instituting such an Assembly in July 1973. It was to be elected by the various political, economic and social organizations in Trak and would legislate in all non-military and non-security matters. 'Irak's 1974 Constitution repeated this intention. Such Traki leaders = "Abd al-Karim Kāsim in 1962, "Abd al-Salām 'Ārif in 1965, Prime Minister al-Bazzāz in 1965 and others promised to restore parliament—but to no avail. The Revolutionary Command Council retained all executive and legislative powers.

Revolution leaders of republican Trak have hesitated to restore parliament at least partly because of its very modest success during the monarchy. Parliamentary history in 'Irak may be divided into two principal periods: before and after independence in 1932; however, its character comained essentially the same throughout both periods. Elections appear to have been mismanaged a such a extent that relations between Chamber and Cabinet anything but productive of healthy criticism. None of the 59 Cabinets serving from 1921 to 14 July 1958 was ever brought down by a no-confidence vote. A principally landed oligarchy, mostly conservative in outlook, generally supported preservation of the status quo. Political parties, to the extent that they were allowed to run in parliamentary elections, were sometimes corrupt and frequently ineffectual within the Chamber. Indeed, many important decisions were made outside the Chamber, with obvious results for the future of parliamentarism. in Trāk. Only on 20 June 1980 were general elections held in 'Irak for a National Assembly. For 250 seats, 840 candidates ran. This was, however, intended

MADILIS

to be mainly a deliberative body, with the final decisions remaining with the Revolutionary Command

Council staifed by the Bath.

Bibliography: The minutes of the Constituent Assembly have been published m Madimarat mudhākarāt al-maditis al-tabisis al-Urāķi, i-ji, Baghdad 1925. Parliamentary debates in the Chamber of Deputies have been published regularly in the official Madilis al-numerab—al-dawra alintikhābi yya . . . mahdar al-dialsa . . . (v) Syria.

The history of parliament in Syria is a turbulent one, not uncharacteristic of this country's political culture in recent years. Indeed, the Syrian parliament has been both magent of and a contributor to the politics of instability. At first, parliament dependent upon relations with the authorities of the French Mandate; then, after complete independence was achieved at the end of the Second World War, it became subject to political virissitudes: constitutions have been proclaimed and abolished and parliaments convened and dissolved.

When Paysal entered Damascus in October 1918, with the declared intention of setting up an Arab government, a Syrian Congress was convened, holding three sessions between 3 June 1919 and 19 July 1920. This first experiment at parliamentarism in Syria even considered the draft of a constitution (atthough it did not have the opportunity to approve it) providing for a bicameral legislature (among other stip-

ulations). Its work was cut short, however, by the armed intervention ill the French forces, which instituted the Mandate over Syria.

The parliamentary history of Syria under the French Mandate centres around the struggle between Syrian nationalists, who desired a constitutionallyguaranteed parliament endowed with independent powers, and the French authorities, who sought to limit them. At first, the French authorities experimented with Representative Councils in the various "states" of Syria. Elected in two degrees, these Councils were regarded by Syrian nationalists as partial and even subservient to the French. The 1925-7 revolt convinced the French of the need to reach some accommodation with the Syrlans. In February 1928, the French Righ Commissioner Ponsot charged a moderate provisional government with holding general elections for a Constituent Assembly, These were held in April and the Assembly first on 9 June. It elected a leading nationalist, al-Atasi, as its Speaker and a draft-Hashim commission of 27 to prepare a constitution. The nationalists, although not clearly in the majority, were the only group well-organised in a National Bloc (al-Kutta al-wataniyya). They inscribed their own views into the Constitution, which was approved by the Constituent Assembly in August 1928. The French objected to several paragraphs, but the Assembly stood firm. The High Commissioner therefore adjourned the Assembly, in February 1929, sine die and dissolved it in May 1930. He then proceeded in his own to proclaim the same Const |tution, with a few minor changes.

Among its other provisions, the 1930 Syrian Constitution established a fo-member unicameral Chamber of Deputies (Madilia), elected every four years and meeting in two sessions of two-and-a-half months annually, from mid-March and from mid-October. Voting in two stages, each adapted to Syria's administrative divisions, resulting in quite an accurate representation of local, religious and socio-economic interest; it also assisted a wellestablished oligarchy in obtaining and maintaining control of parliament. Every Syrian male aged 20 years or over was able to vote and every literate Syrian male aged 30 years or over could be a candidate. The number of seats in the Chamber increased over the years according to Syria's population growth. The Chamber's duties were: to legislate, elect the President of the State (for a five-year term), approve the budget and vote confidence in the Government.

The first Chamber, elected in March 1932, met on 7 July of that year. The main subject of dispute between nationalists and moderates concerned relations with France on the nature of Syrian statebood. The Chamber was adjourned again in November 1933 and dissolved in 1934. Only in November 1936 were general elections held. The Chamber was to consist of 86 members, of whom 16 were to represent minority religious denominations and another represented Bedouin tribes. The National Bloc had overwheiming majority in the Chamber, which convened in December. They elected Hāshim al-Atasi = State President. The Chamber's most important achievement was to approve a treaty with France, signed by both the Syrian Cabinet and the French High Commissioner but never ratified in Paris. Hopes for Syrian independence were dashed once again-and nationalists both within and without the Chamber reacted accordingly. In July 1939, the High Commissioner suspended the Chamber

again, as well as the Constitution, in view of the tense international situation.

The Second World War, in particular the fall of France, strengthened the hand of those Syrians striving for independence. After the Free French and British forces had occupied Syria and Lebanon in 1941, General Catroux, representing de Gaulle, proclaimed Syria's independence on 28 September. Early in 1943, the Franch, surrendering to nationalist demands, restored the Syrian Constitution of 1930 and ordered general elections. These were held in July and resulted in an overwhelming victory for the National Bloc, now led by Shukri al-Kuwwatil. The new 124-seat Chamber met on 17 August electing al-Kuwwatill State President, One of the main tasks of this Chamber was to bring about a full French retreat spelling total independence.

The vicissitudes of Mandatory Syrian parliaments continued in independent Syria as well. The first Chamber of independent Syria was elected in May 1947 and sat until dismissed by Colonel Husni Za9m. who seized power at the end of March 1949. The 1947 Chamber, increased in membership to 140, was elected according to the new Electoral Law of 29 April 1947. which provided a seat for every 6,000 voters or fraction thereof exceeding 3,000 (in reality, only 135 members took officel. A local journalist, Habib Kahhala, reported later (in his Dhikrayat na'ib) that this very mixed parliament was merely "a bundle of contradictions" in social composition, organisation, literacy and dress. This certainty could have applied to its ethnic make-up also, for representation took into account the mosaic of minorities. Representation of the National Bloc, which had had a majority in the 1947 Chamber, dwindled to a mere 24 out of 135 seats, while the opposition commanded 53 and the independents 58 seats. Distribution of representation by district and religious denomination was as follows (based on George Haddad-see Bibliography):

The Syrian Chamber of 1947, According to District and Religious Denomination

District	Muslims	Christiant	Dynaes	Jeurs	Total
Damascus	24	4	_	I.	29
i llims	- 6	2	_	_	8
Ḥamā	5	jr.	_	_	6
Alappo	30	7	_	_	37
Hawrán				_	. 5
Djabal al-Durûz	_	I	3		4
al-Lādhikiyya	16	2	_		18
Euphrates	II	_	_	_	11
al- <u>Di</u> azlra	6	E	_		7
Bedouin Tribes	10	_	_	_	10
Total	113	16	3		135

Further analysis indicates that the Muslim members comprised too Sunnis, 12 'Alawis and one Isma'll, while the Christians consisted of seven Greek Orthodox, two Greek Catholics, two Syriac Orthodox, one Armenian Catholic, two Armenian Orthodox, one Armenian Catholic, one Maronite and two other Christians.

The electoral decree of to September 1949 stipulated a seat in the Chamber for every 30,000 inhabitants, or fraction thereof exceeding 15,000 and lowered the voting age meighteen. Nevertheless, membership was set at 114—100 Muslims and 14

Christians-thus modifying the overall ratio only ineignificantly. This Christian presence in the Chamber (and in Syria in general) most likely prevented the Chamber from proclaiming Islam as state religion in the 1950 Constitution, adopting instead a formula which established Islam as the religion of the Head of State (essentially repeating the text of the 1930 Constitution). No less significantly, in the November 1949 elections Syria proved to be the first Arab state to enfranchise women (albeit only those holding at least an elementary school certificate). In November 1949, elections were held for a Constituent Chamber, rapprochement with 'Irak being one of the main electors! The National Bloc and several other parties boycotted these elections, suspecting the military of mismanaging them. The People's Party thus achieved a plurality of 50 seats, while another 5 seats apiece were won by the Republican and by the Renaissance Party respectively and another 54 (nearly half of the total membership) by independents. The most useful task of this Constituent Chamber was most likely the drafting and subsequent approval of a new constitution on 5 September 1950, following which the Constituent Chamber became the Chamber of Deputies,

The 1950 Constitution did not differ essentially from that of 1930, insofar in the legislature was concerned. The unicameral Chamber of Deputies was to be elected every four years by direct universal suffrage of Syrians aged eighteen and over; candidates, however, had to be male. The Chamber was to sit twice a year for in total of five-and-one-half months in public sessions (unless otherwise decided). Legislation was the Chamber's prerogative (although it could also be initiated by the State President). The Chamber elected the State President for a five-year term; Chamber interpellations and votes of confidence controlled the Cabinet, whose Ministers could be Members of the Chamber. All Members enjoyed parliamentary immunity.

Adib al-Shishakii, the Colonel who had engineered the third coup d'état in 1949, dissolved the Chamber on 29 November 1951, sensing correctly that it could hamper his dictatorship. Under his guidelines, draft for m new constitution was prepared and approved by m popular referendum on to July 1953. The 1953 Constitution strengthened the Executive at the expense of the Legislature. The three principal limitations on the attributes of the Chamber were: (a) The Chamber no longer elected the State President; (b) The Constitution abolished the post of Prime Minister and made the Cabinet responsible to the State President alone; and (c) The Chamber was to convene from October to February only; during the remainder of the year, a token Chamber, composed of 25 % of its total membership, would deliberate and legislate.

Under the provisions of this constitution, elections to a new Chamber are held on ■ October 1953. Suffrage was universal: any Syrian citizen aged 18 and over could vote and any Syrian citizen aged 25 and over could stand for election. One member would be elected for every 30,000 inhabitants. Not unexpectedly, Shishakil's own party, the Arab Liberation Movement, obtained 72 out of a total of 82 seats; one of the remaining seats went to the Syrian Social National Party and another nine to independents. However, the 1953 Constitution and the 1953 Chamber remained only brief episodes in Syria's parliamentary history. After Shishakil's downfall on 25 February 1954, the Chamber of 1949,

dissolved in 1951, re-convened. One of its first acts was to re-establish the 1950 Constitution and restore the parliamentary regime in Syria.

General elections were hald again, on 24-3 September (with a new round, for undecided seats, on 4-5 October) 1954, for a new Chamber of 142 members: 126 Muslims-including 9 Bedouins-and i6 Christians. This time, however, no special seats were earmarked for any religious - other groups. Apart from dealing with internal issues, this electoral campaign was largely concerned with Syria's joining · Western-inspired defence treaty. The elections themselves were characterised by their free atmosphere; secreey was enforced for the first time, The results were m follows: People's Party-50, mil Badh-zz, National Party-19, Popular Syrian Party-z, Cooperative Socialist Party-z, Arab Liberation Movement-2, Communists-1, and independents 64 (or 45% of the total membership). The Chamber met in November 1954 and functioned until Syria's union with Egypt in February 1958; it came closer than any preceding Chamber to completing its four-year term and legislated energetically. It ceased to exist with the establishment of the United Acab Republic, when Syrians sent 200 of the joint parliament's 600 members to Calro (see Egypt, below).

After Syria seceded from the UAR, on 28 September 1961, its separate parliamentary life was soon restored. General elections were held on 1-2 December, with a simultaneous referendum on a new provisional constitution (approved by a 97.6 % majority). Voting for the Chamber was secret and free; despite Egyptian appeals to boycott the elections, participation reached 63 %-the highest in Syrian parliamentary elections. The outcome was again a sharplydivided Chamber, lacking a comfortable working majority: the People's Party received about 22% of the vote, with 14 % for the National Party (heir to the National Bloc), besides 32 % independents and several smaller groups. The Cabinet, based on broad right-of-centre support in the Chamber, aimed in rescind the nationalisation decrees and the agrarian reform of the UAR era. Displeased military groups repeatedly intervened in politics, leading to the dissolution of the Chamber, at the end of March 1962 and then to the seizure of power by the Ba'th Movement, in March 1963.

The Ba'th, in power since then (despite factional strife and personal changes), has altered perceptibly the structure and functions of parliament, rendering it subscribent to the Executive. At the beginning of the Bath regime, a National Council of the Revolutionary Command (al-Madilis al-wateri lihiyādat al-thawra) === established, comprising military officers. Under a provisional constitution, this council-both executive and legislative-exercised the real power. In 1964, it me renamed The National Revolutionary Council (NRC) and was expanded to members, mostly civilians: ranking Bath officials, five members of the former National Council of the Revolutionary Command, five representatives of the military, 14 trade unionists, 13 peasants, seven women representatives, seven representatives of the teachers' union, five selected from the free professions, two university professors and 17 "progressive citizens". NRC, Syria's parllament, could enact laws (its main function), pass the Budget, amend the constitution, supervise referenda and elect in five-man Presidential Council-the principal executive body. In February 1966, NRC was expanded from 95 to 134 members, ousting 30 and adding 69, thus changing the balance of power. Two weeks later, a military coup by Saiāh al-Djadid put an end to this experiment and dissolved NRC; legislative authority was henceforth vested in the President's office and in the Cabinet. However, on 1 May 1969, a new constitution was promulgated by the Regional Command of the Ba'th. This stipulated the establishment of a People's Assembly (Madjis al-Sia'b), to be elected for more four-year term, by a method to be determined. Its main attributes were to be the drafting of more permanent constitution, approving laws, debating the budget, ratifying agreements and treaties, electing the State President, and interpollating Ministers. This constitution, however, was never put into practice.

During the rule of Hafix al-Asad, from 1970 to date (1978), the character of the Syrian parliament was changed to suit mm more the socialist ideology of Asad's faction within the Ba'th. Under the amended Provisional Constitution of 1971—promulgated m permanent on 31 January 1973—legislative powers are vested in a People's Assembly (Madilis al-24a'b), comprising 173, then 186 and finally (since 1977) 195 members, elected by popular associations and trade unions, with the provite that at least half of the members be peasants and workers. The People's Assembly is elected every four years

by secret ballot in constituencies, convening for three sessions annually. In theory, the People's Assembly passes all laws; the State President, who may veto its laws, must nevertheless submit to the Assembly's will if it passes the me law again by wo-thirds majority. In addition, the Constitution grants the People's Assembly the following powers: to approve the candidate for Presidency of the Republic, debate government policy, withdraw confidence from Ministers, approve the budget and ratify all foreign agreements and treaties concerning state security. In practice, the Assembly has generally limited itself to discussing matters of internal relevance, displaying little if any independence of the Executive. The Syrians were not unaware 🖿 this: In the 1973 and 1977 elections for the People's Assembly, only a small part of the eligible voters participated.

The People's Assembly nominated by Syria's President, Hāfiz al-Asad, in February 1971, consisted of 87 Ba\(^1\)thists, or just over half of the total 173; another 36 represented the General Union of Peasants. In the Assembly elected on 25 May 1973, the Ba\(^1\)thists numbered at least 111 out of \$\mathbb{m}\$ total 186, while another 46 labelled themselves independents; 97 of the total number of seats had been earmarked for peasants and workers. In the Assembly elected on 1-2 August 1977, Ba\(^1\)thists numbered 125 out

MADILIS

of a total 195; another 36 labelled themselves independents, and m of the total number of seals had been earmarked for peasants and workers.

The history of Syrian parliaments is not easily divided into distinct periods. Nevertheless, it may be divided into three main eras: (a) The French Mandate, during which time the Chambers were distinguished by the struggle for Syrian sovereignty and independence; (b) Independence, when Chambers were marked by even deeper internal strife with determined efforts by the Cabinet and the party (or parties) to gain power, at the Chamber's expense, against equally determined opposition; and (c) Dependence, first on Egypt, during the UAR years, then on the guidelines set for it by the Bath-military coalition which governed Syria after the UAR broke apart. One may conclude with some justification that the role of parliament in Syria has diminished, from to the other, at least regarding its impact on public decision-making,

Syrlan parllamentarians were characterised by factors besides distinct and religious denomination (which were relevant during the first two eras of the Chamber). An investigation of these periods based on Winder-see Bibliography) concludes as follows: (a) Parliamentarians were youthful-the median age (at time of entering each Chamber) was between 39 and 46; this was perhaps chiefly due to a fairly large turnover; (b) The proportion of Members with university education rose consistently, reaching 48 % of the Chamber in 1954; there was also a steady rise in the proportion of those exposed to Western culture, particularly with respect to facility in foreign languages; and (c) With regard to occupations of members, rural landlords have continuously comprised the largest single group; the tribal-notable group me regularly second third in size. Together they dominated the Chamber and generally appeared to form a conservative, pro-status quo force. Lawyers were, no doubt, an important group, gradually increasing in size and becoming second only to the landlords. On the other hand, very few Members were either 'ulama' or military officers.

(vi) Labanon.

The Lebanese parliament was first initiated by the French Mandatory authorities in 1922. It intended to support the Mandate, but gradually became independent and attracted various leaders of public opinion, thus enabling it to work for independence during the Second World War. Its weakness, however, became increasingly more apparent since the achievement of Lebanese state-hood in 1943 and of complete independence in 1943—when the French departed and all responsibilities of government passed into Lebanese hands.

Although the Lebanese parliament contributed only modestly to policy-making and was inefficient as a check on both the executive and the bureaucracy, it has been an integral part of the political system monetheless. Its powers have been hampered constantly by the lack of public manner on central issues, the personal character of politics, the important role of religious communities and the peculiarities of the electoral system. These constraints have hindered the Lebanese parliament from fulfilling the role of conflict-resolution; rather, it has assumed a role of conflict-accommodation which, in practice, frequently meant conflict-postponement.

Lebanon's Constitution, unwritten guidelines (usually called the "National Pact" of 1943), government structure, parliamentary system and elections, as well as many of the laws, are peculiarly suited to an involved complex of rivalries and based the desire to maintain an equilibrium between them with at least a semblance of consensus. The electoral system in particular has harmonised with traditional pluralism. Constantly relying on the need for compromise, the Lebanese parliamentary system has consequently displayed weakness. Checks and balances are considered essentially desirable in democratic regimes. However, distribution of key positions in Lebanon among various religious denominations, although allowing for much-needed compromise, does not necessarily ensure amouth effective functioning either within without parliament.

The character of the Lebanese parliament was essentially determined early during the French Mandatory period. In March 1922, the Mandatory authority instituted a consultative Representative Council of 30 members, to be elected in two degreevoting by male suffrage. Seventeen of its seats were carmarked for Christians and 13 for Muslims. Thus representation by denominational groups became institutionalised in the legislature; it was soon to be the main organisational feature of the entire public administration. A second Representative Council was elected in 1925. Two days after the promulgation of the 1926 Constitution, it became Lebanon's Chamber of Deputies. A 16-member Senate (seven of them appointed by the State President, the others elected; was established to check this Chamber; the two houses fused in IQ27.

In 1926, the Representative Council adopted a constitution which, an amended, has essentially remained in force to date. The main provisions concerning the legislature were as follows: in addition to the Senate, elected for six years, a Chamber would be elected, in two degrees, for four years; its two annual sessions would be of two and two and one-half months duration, respectively. The formal powers of partiament were legislation (which could also be initiated by the executive); approving the budget and taxation; electing the State President, for three years (since 1929—for six years); supervising the

Cabinet (by interpellations and no-confidence votes) and amending the constitution.

The unicameral body, the Chamber of Deputies (Madilis al-nuwwab) still kept its partly-appointed character for some time, undoubtedly in order to ensure compliance; between one third and two-fifths of the membership was appointed by the Lebanese President and Cabinet. Since the 1943 general election, the entire Chamber is elected. The final denominational ratio in parliament dates from 1943, the year when the Chamber set It at 30 Christians and 25 Muslims and Druzes. This ratio of 6:5 has remained unchanged, although the actual numbers have varied. There were 55 members after the 1947 elections (the first after the evacuation of the French), followed by 27 (1951), 44 (1953) and 66 (1957). The number of members was set at 99 for the 1960 elections and did not change for the 1964, 1968 or 1972 elections (no elections were held in 1976, due to the civil war). The following is the official, pre-determined breakdown by religious denominations.

Denominational makeup of the Lebanese Chamber (1960, 1964, 1968 and 1972 Elections)

Christians		Muslims Druze		Grand Total
Maronites Greek Orthodox Greek Catholic Armenian Orthod Armenian Catholi Protestant Smaller groups		Supplies Shifts Druges	19	
Total	54		45	99

This ratio no longer reflects the demographic breakdown of Lebanon's population (the last census was taken before the Second World War). This has been only partly offset by frequent changes in the number of electoral constituencies and the resultant re-zoning. Since 1960, these have corresponded to the state's administrative districts; a serious attempt has thus been made to represent Lebanon's regions fairly and still keep the religious denominations reasonably happy. Each district now elects from two to eight Members of the Chamber (the only single-Member district is \$aydā) according to a pre-determined breakdown by denomination (roughly reflecting the assumed ratio). For example, the district identical with the city of Tripoli elects four Sunnis and one Greek Orthodox. Similarly-composed slates of candidates (in the above example, of four Suraits and Greek Orthodox) run against each other. Single candidates may also compete, although they have consistently met with little success. Every eligible voter in the district, whatever his denomination, votes for the candidate or slate of his choice, provided he observes the denominational breakdown prescribed by law. An obvious advantage of the system is that, on the one hand, it compels candidates to ally themselves with others from different denominations and on the other, to show moderation and reirain from antagonising any particular denomination in the district. A possible drawback in that many Members of the Chamber im rather tame individuals who have run - compromise candidates. Political parties competing in these elections are under the same constraint in forming slates of candidates by denominations, thus possibly limiting their activities.

Emphasis on a denominational "key system" has

served as an obstacle to structural political change -for better or worse, depending mone's viewpoint. It has also bred antagonism, hardly mitigated in Chamber by the above electoral arrangements: lovalty to affiliation to a religious denomination is only one variable in parliamentary politics. When Members do not vote by religious denomination, they take sides according to the local interests of their constituencies. There are also ideological differences in the Chamber, of which the longest-standing has been support for Lebanon as a separate political entity versus a union or federation with one or more Arab states. Furthermore, there is competition among the political parties, which frequently, although not always, are identified with the respective denominations; in the 1960s, only one-quarter to one-third of the Members were officially affiliated to parties. Within the wide scope of denominations, one finds smaller, fendal-loyalty groups as well. Personal partim are also often identified with denominations (chiefly Christian) as are several ideological ones, such m the Phalangists or Progressive Socialist Party; the Bath and several others, however, are not so, identified.

Under the aggregate pressure of denominational, local, ideological and party competition, as well as personal rivalry, the Lebanese Chamber has been fracile and cautious-and consequently limited in policy-making. It expects that a good share of the decision-making and executive policies | carried out by a Cabinet, whose Ministers are drawn from the Chamber and which works closely with the State President. Even legislation has been a lengthy and sometimes inconclusive process, although its overall record is impressive; during the years 1953-72 the Chamber passed a rob bills (or an average of ros annually). The Chamber has often skirted divisive issues, at least insofar m decision-making is concerned. On the whole, its role appears to have been chiefly deliberative; argumentation in the Chamber displays a high level of competitiveness, within the framework of political and cultural pluralism. However, this has afforded satisfaction only to the participants themselves rather than to those Lebanese who have no access to it and m disenfranchised groups, such as the Palestinian refugees, who have been largely instrumental in using extra-parliamentary, increasingly violent ways to make themselves heard. By 1975 they had succeeded in fracturing the delicate minimum concerning Labanese polity and shattering the precarious status-quo of which the Chamber had been both an exponent and an advocate. It is symptomatic that two earlier serious national conflicts—in 1952 and 1958—were settled by the Chamber's agreeing on the election of a State President. During the civil war (since 1975), the Chamber has met several times, in order to elect a new State President (in June 1976); it has accomplished little else, however, not really succeeding at resolution of the conflicts which keep violence alive. Its inability to agree on action in urgent issues has prevented the Chamber from taking a stand, also, — an important suggestion of President Farandjiyya (in maporth — 14 February 1976). He then suggested altering the Muslim-Christian ratio in the Chamber from 5.6 — 1:1; the Chamber, however, has not even debated this.

The socio-economic composition of Lebanese Parliaments has had little to do with the rate of voter participation. While countrywide participation has usually been between 50 and 6r per cent (women were enfranchised in 1953), rural turnout has regularly been proportionately higher than the urhan, possibly is recruitment by landowners and local leaders. In addition, rural districts have had a slight relative edge in the seats allocated them in the Chamber. The reason seems to be that the Lebanese Chamber is an exclusive club, reserved in practice for those with better-than-average education who can afford the registration fee and campaign expenditures. Indeed, every slate of candidates includes at least one who finances the campaign; he iii generally morosperous businessman hankering for political power (incidentally, this has provided an avenue for the nouveaux riches to penetrate the power system, avoiding a cleavage between the political and economic élites). The outcome, however, has been that the well-to-do generally represent the poor. Even among the former, however, there are meaningful differences in socio-economic make-up, as the following table (based on Hudson and Harik, see bibliography) indicates:

The shift is most interesting: landlords comprised the largest single group between 1943 and 1953; lawyers predominated in 1957. The business and professional groups made up more than half the membership between them. Otherwise stated, the top political flite in the first decade of the Republic failed to hold its own in parliament; the typical Member of the Chamber nowadays is me educated person of upper or middle income, actively engaged in business, law or some other free profession.

Bibliography: The minutes of parliamentary proceedings have been published regularly, since the 1940s, in the official Madjits al-musualb—aldam al-tashrifi (Beirut). The laws passed in parliament have appeared in the official al-Madjinula al-kadilha li 'l-kawanin al-Lubndniyya. The periodical publication al-flaydt al-niyabiyya, issued since 1924, comprises original material about parliamentary debates as well as research the Lebanese parliament. (vli) Jordan.

The Emirate of Transjordan, carved out by 'Abd Allah in 1921 and recognised by the British such in May 1923, has displayed strong British influence in its parliamentary structure and procedure, both during the Emirate itself and in the subsequent independent Hathlimite Kingdom of Jordan (further: Jordan).

As early as July 1923, 'Abd Alish formed by decree a Committee to prepare an electoral law for a representative assembly. The law was ready in June 1924, although the entire Assembly project was postponed, reportedly due to British discouragement of the idea. In October 1926, m group of notables was convened to prepare another electoral law, meeting with similar results. More tangible progress was achieved, however, after the Anglo-Jordanian Treaty was signed on 20 February 1928. In accordance with

1054 MADJEIS

this Treaty, an Organic Law was promulgated on 16 April setting up a Legislative Council (Madilis tashri'i), as M elected for three years by two-degree male suffrage. It mm to consist of 16 Members, with guaranteed representation for the Christians (3), Circassians (2) and Bedouins (2). There mm no Cabinet responsibility towards the Council. Laws passed by the latter required the approval of both the Emir and the British Resident, while the Council could not override the Emir's veto.

Despite repeated protests by nationalists that the Council was in affect merely consultative and unrepresentative of the people, it remained the basic instrument of parliamentary activity until 1946. In actual practice, it demonstrated greater independence than had been anticipated. The first Council demanded and obtained lumunity and freedom of debate for its Members and was dissolved by the Emir on 9 February 1931, when it refused to approve the financing of the Desert Patrol. The lesson was not lost and the following four Councils appear to have been considerably less oppositionist towards the Emir.

Following the new Anglo-Jordanian Treaty of 22 March 1946, which recognised Jordan's independence with 'Abd Aliah as its King, a new constitution and an appropriate electoral law were promulgated. The constitution provided for a bicameral National Assembly (Madilis al-umma). The Chamber of Deputies (Madilis al-nuwwill) was to consist of 20 Members (22 Muslims, 4 Christians, 2 tribal representatives and 2 for the Circussians and Sheshans), elected by all male Jordanian citizens aged 18 or over. Candidates had I be at least 30 years of age; they were required to deposit a sum of money which would be forfeited in test of failure to be elected. The Senate (Magilis al-alyan) was to number precisely half the membership of the Chamber and was to be appointed by the King, for eight years, from among meet mature persons (at least 40 years of age), with half the Senators completing their terms every four years (as in 'Irak).

General elections were held 20 October 1947, over the objections of nationalist circles that the King retained too much power under the 1947 Constitution and the Cabinet was not responsible to the Chamber. The only party running, the government-sponsored al-Nahda ("Revival"), obtained 4 seats; other seats were won by independents, also identified with the Establishment. In general, this Chamber—dissolved 2 January 1950—was no different in character 1111 tone from the Legislative Councils it had superseded.

More substantive change occurred after Jordan's annexation of m part of the West Bank in 1950 and the granting of citizenship (including the franchise) to its inhabitants. Since then, the political history of

Jordan has been largely the struggle between an embattled monarchy and its Palestinian subjects. One of the fronts of this struggle was the Chamber (a cautious nomination policy prevented clashes in the Senate), practically the sole forum for uninhibited criticism and unhampered propagands. General elections were held on 11 April 1950, with high voter participation, reportedly about 70 %. With the increased number of eligible voters, the Chamber's membership was increased in 1950 to 40, equally divided between East Jordanians and West Bankers. The latter also obtained 7 seets in the Jordanian Senate, whose membership was expanded to 20. The system favoured East Jurdan by minimising representation of the more populous West Bank. Nevertheless, the West Bankers-who were more politically-conscious and less attached to the Royal House than the East Jordanians-ultimately altered much of the Chamber's character. Most of the Chamber's West Bankers introduced an ideological dimension both into electioneering and the Chamber's deliberations through their relations with political parties. This was so even when those parties were not legally permitted to run, which was virtually the general practice (since 1957, all parties have been banned). The following table illustrates the party affiliations of Members of the Chamber during the first twelve years after the enfranchisement of the West Bankers [based on Abu Jaber, see Bibliography).

The first Chamber to comprise West Bankers (Jordan's second since independence) had a nucleus of six or coppositionists, all West Bankers who, although a minority in the Chamber, often took the lead in the debates. Briefly stated, this Chamber behaved much as did the first Legislative Council in 1931. It refused to pass the budget and consequently was dissolved by the King in May 1951, with new elections called for 📺 August. Although 'Abd Allah was assassinated on 20 July 1951, the August 1951 elections were held on time (with a voter participation of about 50%). In the new Chamber, the Opposition was even stronger and numbering about 14 of the 20 West Bankers. It was also more vociferous and passed a new constitution on I January 1952, which made the Cabinet (singly and jointly) responsible to parliament: a two-thirds majority no-confidence vote in the Chamber was to result I the dismissal of the Cabinet. Furthermore, the 1952 Constitution provided for legislation in both Houses and a joint session in case of disagreement; the King's veto could be overriden if each House re-adopted the law by a twothirds majority. Foreign treaties and financial agreements were to be ratified in parliament. Immunity was reaffirmed and interpellation of Ministers introduced.

Parties in the Jordanian Chamber 1950-1961

Party	Second Chamber 20/4/50-3/5/51	Third Chamber 1/9/51-22/6/54	Fourth Chamber 17/10/54-25/6/56	Fifth Chamber 14/10/56-20/10/61
National Socialists	ro	£1.	1	II
Communists		2	2	3
Ba' <u>th</u>	2	3	_	
Arab Constitutional		9	17	4
Community (al-Umma)		1	_	1
Muslim Brethren	_		4	4
Liberation (Takele)	_	-	3	E.
Independent Candidates	z6	E4	15	E4
Total	40	40	40	40

The increase in the legislature's powers and concomitant curtailment of those of the Executive were noteworthy, even though in practice King Husayn and the Cabinet frequently succeeded in circumventing these constitutional provisions during the turbulent years which followed. Nevertheless these provisions remained a frame of reference for the Opposition, which were demanded and passed a constitutional amendment that established a simple majority (instead of two-thirds) as sufficient for a vote of no-confidence. Alarmed, the Palace dissolved the Chamber in January 1954, and reportedly rigged the general elections of 16 October 1954 (in which participation was about 57%). This election brought in more compliant Chamber: (half of the Members of the previous Chamber were defeated and only 3 out of 18 Opposition Members were re-elected). Consequently, about 35 (of the 40) Members were loyal to the Government; much of the opposition became extra-parliamentary, with foreign elements allegedly inciting mob violence.

The general elections of 21 October 1956 almost entirely concerned foreign issues, and brought in the most radically nationalist Chamber until then. Most matters involved a traditional, pro-Western orientation versus a Pan-Arab (i.e., pro-Egyptian) policy. The King, favouring the former trend, won this contest of ideologies and succeeded in replacing some of the more radical Menibers of the Chamber. Meanwhile, the Chamber's membership had been raised to 50 and that of the Senate to 25. Elections to all subsequent Chambers were reportedly influenced by the Government and the Chambers were considerably more conservative politically. Although not always docile (several had to be dissolved). Chambers generally did find a modus vivendi with King and Cabinet.

In the general elections for the Sixth Chamber, held on 22 October 1961, only about a tenth of the electorate participated. Under the new Electoral Law of 22 May 1960, the Chamber's seats had been increased to 60 (with 10 earmarked for Christians and 2 for Circassians) and the Senate's III 30 (in both cases, half of the seats were earmarked for West Bankers). However, only 20 seats were contested in the 1961 elections. The Chamber was dissolved in 2 October 1962; general elections for the Seventh Chamber were held on 24 November. These elections were freer in nature and about 70 % of the electorate participated. The Chamber was still politically moderate, perhaps due to the official ban on political parties. Still, it was bold enough to bring down the Cabinet in April 1963 and was consequently dissolved. During this period, the Basth had taken over in both 'Irak and Syria, firing the imagination of Pan-Arab nationalists in Jordan as well. Elections for the Eighth Chamber were held on I July 1963 and for the Ninth on 15 April 1967. Both elections yielded fairly conservative Chambers, probably the result of mani pulation, with 21 and 7 candidates, respectively, returned unopposed.

Since the Six-Day War of June 1967, there have been no parliamentary elections in the Israeli-held West Bank, although some West Bankers visited 'Amman and assumed their seats in both Chamber and Senate several times, Since 1967, the ratio between East Jordanians and West Bankers has been maintained through the tactic of having Members decide how to fill vacant seats. Husayn has continued to appoint Palestinians to the Cabinet, although the leey Ministries have gone to East Jordanians. Lately, seeking to broaden its popular East Bank represen-

tation, the Jordanian Cabinet—acting on instruction from King Husayn—decided (* April 1973) to amend the state's electoral law in order to grant women both passive and active voting rights for the Chamber. Keeping Jordan's options open concerning its future relations with the West Bank, the Chamber—on the King's initiative—passed a constitutional amendment which empowered the King to dissolve the Senate as well and III postpone general elections for II period of up to one year. On 5 February 1976, the two Houses were called upon to approve another amendment, empowering the King to postpose the elections sinc die and, meanwhile, to reconvene parliament required.

However, the semblance of a king governing in consultation with his people had to be maintained. On 13 April 1978, Husayn requested his government to enact m temporary law, providing for m National Consultative Council to assist the Executive. The new Council, nominated Governorate by Governorate, ought to comprise legal and competent persons, representing various public sectors. On 17 April, a coyal decree promulgated the law instituting the National Consultative Council (al-Madilis al-majani al-istishari). It stipulated that the Council would be composed of 60 nominated Members, and women, Jordanians, aged 30 or over, not simultaneously employed elsewhere, nor Senators. Its duties were to study and discuss all draft laws and advise the Cabinet before it approved them. The Members of the Council had full authority to demand explanations from the Ministers, on any subject, and to speak freely. The Council would be formed every two years. The King had the right to dissolve it at any time, or relieve - Member of his position. The Council was to be dissolved automatically when the suspended parliament was revived, after were elections.

There are apparently three main periods in Jordan's parliamentary history. During the first, when the country was still called Transjordan, the Emirate's Legislative Council was generally compliant with 'Abd Allah's wishes. During the second, commencing with independence and the annexation of the West Bank, the Chamber of Deputies (although not the Senate) witnessed the growth of a real Opposition. The Opposition, comprising part of the West Bankers' contingent, was concerned less with socio-economic affairs than with essentially political ones, chiefly relating to foreign policy, such as the non-recognition of Israel, a tougher border policy and the strengthening of Jordan's relations with one or more of the Arab states. The third era begins in 1967, when Jordan rules the West Bank no more and West Bank connexions with the parliament in 'Amman, although still extant, become weaker and less frequent.

The character of the Jordanian legislature has been markedly conservative, particularly during the first period, although later on as well, due to the regulation that gave the right-of-vote to tax-payers only. The Legislative Councils elected between 1931 and 1946 always comprised the same people (or their relatives)—all belonging to thirty six leading families. In the Chambers of Deputies elected between 1947 and 1967, despite the addition of the West Bankers and the increase in the number of Members, only 230 individuals, representing 183 prominent families, occupied the available 437 seats (details correct only for candidates originally elected, not for replacements).

This explains why the socio-economic character of the Chambers in the second period varied but

little. As to the educational level, West Bankers surprisingly had only a slight edge over the East Jordanians in the Chamber, perhaps because the latter sent some of their best men there (the less educated from amongst the Bedouin). Even these differences disappeared by the mid-1960s with the overall increase in the educational level of the Chambers, as illustrated in the following table (based on Abu Jaber—see Bibliography).

Comparison of the level of education of members of the Second and Fifth Jordanian Chamber of Deputies

Level		d Chamber 50-1951	Fifth Chamber 1956-1961			
Elementary	5	12.5%	3	7.5%

(vili) Saudi Arabia.

Saudi Arabia has not yet established anything resembling a parliament, although the matter has been occasionally mentioned among the ruling circles as something to be dealt with in the future. The King has delegated authority to various councils and committees, although no representative institution has been set up to date (1978). The King retains most powers and is m Madjits unto himself (as vividly described in Time, 29 May 1978, p. 23). The Ministers, headed by the King, fulfill the function of a legislative as well as executive body. A Ministry of Justice op-ordinates laws and regulations with the injunctions of the sharifa.

(ix) Kuwait.

Independent since June 1961, Kuwayt soon began to introduce some changes in the paternalistic, absolute rule of its Amir. In 1938, a Consultative Assembly we been established. Although headed by the Crown Prince and mostly nominated, it voiced criticism of foreign concessions | Kuwayt. It was dissolved alterwards because of anti-British sentiment expressed by its nationalists. Following a decree of the Amir on 26 August 1961, an electoral law, decreeing a Constituent Assembly, men issued me 7 October 1961, granting the franchise to all literate male citizens aged 21 or over; candidates were to literate male citizens, aged 30 or over. Elections held that December for seats in the Constiuent Assembly; Ministers constituted the other members. The Assembly first met on 20 January 1962 and drafted a constitution, promulgated on 11 November.

The constitution provides for a National Assembly (Madilis al-umma), elected every four years, comprising 50 members. The right to vote is granted to literate male citizens aged 21 or over, with ten constituencies each electing five members. Candidates stand as individuals (as no political parties are allowed); they must be male citizens aged 30 or over, The Assembly is in session eight months per year. The main powers of the National Assembly are legislative (although the Amir has the right of veto), discussing general policy and ratifying foreign agreements. Members enjoy parliamentary immunity. Ministers are responsible singly before the Assembly and collectively before the Amir alone; this means that the Assembly cannot topple the Cabinet by a no-confidence vote. Both this and the right-of-veto reflect the paternalistic attitude of the Amlr towards the National Assembly.

The first elections were held on 23 January 1963, then in January of 1967, 1971 and 1975. The electoral base was very narrow, only about 50,000 Kuwaiti citizens having the right to vote. In every Assembly, several members formed an opposition, noted for its leftist views, to the Amir and his government; although a minority, they were usually educated, articulate and active, often demanding more powers for the National Assembly. In April 1963, they requested abrogation of the defence arrangements with Great Britain and capprochement with Egypt or Syria. In December 1965, seven opposition members resigned from the National Assembly, protesting limitations on individual liberties and me the Kuwayti press. Late in 1972, an opposition group succeeded in persuading the Assembly to refuse the ratification of Kuwayt in the Oil Participation Agreement. The Amir, who had had enough of such activities. suspended the constitution and the National Assembly on 29 August 1976.

(x) Al-Bahrayn.

The Shaykh of al-Bahrayn beld both executive and legislative powers until independence was declared in August 1971. Soon afterwards, IIII Amir announced his intention to draft a written constitution. After some consultation, he promulgated a decree on so June 1972, establishing a Constituent Assembly for the drafting of a constitution; a later law, promulgated on 16 July, specified the manner of election to the above Assembly. It was to comprise 22 members, elected in II districts by all male citizens aged 20 or over, excepting the military, the police and criminals; candidates had m be aged 30 or over and literate. In addition, the Assembly was to include another ten members nominated by the Amir and his Ministers. Both the above laws closely followed the Kuwayti model, m did the subsequent constitution.

Elections for the Constituent Assembly me held on a December 1972, after a fairly heated campaign in which candidates appeared to consider seriously statements by the Amir concerning the advantages of democracy. This mood probably helped bring about the very large voter participation of 88.5%. Efforts by leftist groups to influence the electorate falled, while moderate, conservative candidates generally succeeded in these elections. The Shift minority cast bloc-votes for candidates of their own denomination. Consequently, elected members were mostly Shiff (14 out of 22), young (12 of the 22 were under 39 years of age) and well-educated (8 of the ma were university graduates and another 2 had studied at universities for two years or more). The AmIr and his Cabinet, always cautious to maintain the Sumil-Sh!"I balance, corrected the above ratio by their own nominations (so that the Assembly comprised 21 Sunnis and 21 Shiffs).

The Constituent Assembly, which was first convened on 16 Decamber 1972, approved a constitution in June 1973—essentially the draft submitted by the Cabinet, although several additional safeguards for constitution and Assembly were worked in. This constitution provided for a National Assembly (al-Madjlis al-matant) of 30 elected members (the second legislature was to have 40) and no more than 12 Ministers, to be elected every four years. The Assembly's powers were mainly legislative, although one of its attributes men the authority to grant concentration.

sions concerning the natural resources of al-Bahrayn. The first election to the National Assembly, held on 7 December 1973, was even livelier than the Constituent Assembly campaign. About 250,000 people had the right to vote. The number of constituencies had been increased from 8 to 20, half of which elected two members each and the other one member each. Not unexpectedly, this gave rise to charges of gerrymandering. The issues ranged from socio-economic (women's suffrage, unemployment, inflation) religious (Shi is versus Sunnis) to political (various ideologies competed, although parties were banned). A count of those sympathetic to the nationalists and the socialists indicates radicalisation in the make-up of the National Assembly, as compared to that of the Constituent Assembly. Consequently, the December 1973 Assembly displayed Independence towards the Amir and even criticised his policies; therefore, the Amir dissolved the Assembly on 26 August 1975. By 1978, it had not yet been re-convened.

(xl) Kajar.

The Shaykh of Katar maintained all executive and legislative powers until 2 April 1970, when a provisional constitution was promulgated (even before Katar became independent). This provided for Consultative Assembly (Madilis al-shurd), comprising 33 members: 30 elected, 3 nominated by the ruler (in practice, from his own family) and ten Ministers. Katar was divided into ten constituencies, each electing four members, the ruler himself ultimately selecting three out of each four. Candidates had to be born Katar citizens, aged 24 or over, with m criminal record. No political parties were allowed, elections were meant to be personal. The Consultative Assembly is elected for three years (with the option of another three-year extension). It meets eight months per year (with at least one meeting each month) and is to deliberate and pass laws submitted to it by the Cabinet; to approve the budget; and to discuss overall policy-making in Katar.

Katar became an independent Amirate in September 1971; manended Provisional Constitution was promulgated in April 1972. On 23 April, the Amir nominated the first Consultative Assembly. In May 1975, its term was renewed by the Amir for another three years. It appears to have consistently obeyed the Amir. The only constraints over his powers man Islam and family relations.

Bibliography: Katar-Wizarat al-ma'arif, Nahdat Katar, n.p. 1964, 17-22; Peaslee", ii (1966),1280-1; Sadik and Snavely, 136-8; Blaustein and Flanz, eds., Constitutions..., zi (1973): Qatar; Albaharna, xxxix ff.; Anthony, 75-6; Nyrop et alii, op. cit., 258-63; D. E. Long, 34-

(xii) United Arab Emirates.

The United Arab Emirates, m federation of seven former Trucial Coast principalities [see AL-MARAT AL-GRABINYA AL-MUTTARIDA in Suppl.], was established, after protracted negotiations and some initial difficulties, on a September 1971. A provisional constitution was agreed upon on 18 July 1971 and extended for another five years in November 1976. This

constitution and other agreements declared that although the patternalistic rule of each Amir was to continue, matters of federal interest to be settled by the Supreme Council (al-Madjits al-afid) of the Amirs, aided by appointed federal Cabinet.

Legislative authority was vested in the Federal National Assembly (al-Magifis al-majors al-a-la), comprising 40 members delegated by the seven states according to the following distribution:

Abû Zabî	8
Dubayy	- 8
al-Shārika (Sharja)	6
Ra's al-Khayma	- 6
^c A <u>di</u> mān	4
Pu <u>di</u> ayra	4
Umm al-Kaywayn	4
Total	40

The mode of selection we left to each member state (in practice, they me nominated by the respective Amirs). The Assembly's term is years; sessions commence each November and last for six months. Its main functions are to debate the federal budget and drafts of laws presented to it by the federal Cabinet. The Cabinet must inform the Assembly about international agreements. Voting is by simple majority and Assembly Members enjoy immunity. The President of the United Arab Emirates—who has continuously been the Amir of Abū Zabī—may dissolve the Assembly.

In actual practice, the Federal National Assembly is merely a consultative body, debating mostly matters of internal interest to the federation. Its character is largely determined by the fact that all members are appointed by the Amirs, who select males from their own families or from among the community of wealthy merchants and businessmen, interested in preservation of the status quo. In addition, the powers of the Federal National Assembly are limited, in practice, by the fact that each state legislates individually according to the giarf's. Abū Zabi even has an Advisory National Council (al-Madilis al-istighari al-wafant) of its own, comprising 50 nominated members, although with no meaningful power.

(niv) Yaman.

The Yemen Arab Republic (formerly Yemen, sometimes referred to as North Yemen) has had a fairly recent and brief parliamentary history. Under the Imamate, the Imam was an absolute ruler, subject to the Kurban and the shart a. He alone held executive, legislative and judicial powers and there were no representative Institutions. Although Yemen joined with Egypt and Syria in a United Arab Republic on 8 March 1958, it did not send any representatives to the National Assembly of the UAR in Cairo. The revolution of 26 September 1962 gave birth to the Republic and touched off a six-year civil war. The republicans promulgated their first constitution on 27 April 1964, which also provided for a Consultative Assembly to be selected from among Yemen's learned men for a three-year term. Its main tasks were to be passing laws and advising the government in public policy. During the civil war, however, this constitution me not put into practice.

Since March 1963, Yemen had a legislature, the 45-member consultative National Council, nominated to afford a fairly wide occupational and geographical representation. It comprised 20 that had furally, 9 'uland', I more persons with formal education and 8 merchants. The Council's first task was to elect the President of I Republican Council —who was also to be State President, and head of the republican government at San'a'. In the ———— of 1970, its membership was increased to 63, including

ra Royalist representatives.

Several provisional, Islam-oriented constitutions were drafted, beginning with the one promulgated on 3 October 1962. The permanent constitution of 28 December 1970 described Yemen as "an Arab Islamic state", with the shari's as the second of all legislation. It established second to consultative Assembly (Madilis shard), as a legislative body to supervise the Executive. The Assembly comprised 159 members, of whom 139 were elected and 20 nominated by the Executive. Voters had to be at least and candidates, 25; the Assembly's term set at four years.

The first elections to the Consultative Assembly held in February-March 1971, without the participation of political parties (banned in the Republic). Elections were two-degree: villages and

tribes selected their representatives, which then elected 139 Members of the Assembly. After nomination of the remaining 20, the Assembly met to select a three-man Presidential Council—which, in actual practice, was responsible for nearly all major decisions, while the Consultative Assembly offered advisors to when about a document to the consultative Assembly offered advisors to when about a document to the consultative assembly offered advisors to when about a document to the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultative and the consultat

vice only when asked to do so.

After a bloodless military coup in San's?

13 June 1974, the Military Command Council suspended both the constitution and the Consultative Assembly; a new, provisional constitution was promulgated, granting the Military Command Council both executive and legislative powers. Nevertheless, the Consultative Assembly was re-convened in November 1974, under the pressure of tribal chieftains, then suspended again in September 1975, without much achievement. Its critics argued that it had been a forum for self-interested cliques, with no real understanding of national development. Brief and unstable in its history, parliamentarism in Yemen appears to lack a firm foundation to this

very day.

(xv) South Yemen.

The People's Democratic Republic of Yemen (sometimes called South Yemen) was established on 30 November 1967, upon the departure of the last British troops from Aden. This withdrawal followed the failure of the British to bring about a Federation of South Arabia between the Colony of Aden and the former Protectorates bordering it. The issue had been botly debated in the Legislative Council, the only apparent representative institution in the Colony of Aden. Inaugurated in 1947 as mentirely nominated body, it was changed in 1955 to include acelected element-largely because of pressure by the Aden Association (a group formed in 1950-1 to promote greater Adenese participation in the government, which consequently advocated independence). In the 1955 elections, 4 of its Members were elected; and in 1959 and 1964, 12 (out of 24).

The Front for the National Liberation of South Yemen has ruled the new state since 30 November 1967. Soon becoming the sole legal party and renamed the National Front, its General Command circulated a draft of a constitution in order to obtain reactions; in November 1970, this constitution promulgated. It vested legislative powers the Supreme People's Assembly (Maddis al-the's al.

1060 MADILIS

454) of 101 members, elected for three years. Of these, 86 were to be elected by all those aged 18 m over, through local councils, under the supervision of the General Command of the National Front, and another 15 by the Trade Union Federation. A quota reserved for manner among the 86 (though they could run independently as well).

The formal powers of the Supreme People's Assembly mee fairly wide-ranging; election of the state President and Cabinet; debating and passing of laws, including the budget and development plans; ratification of international agreements and the anouncing of a state of emergency. Members enjoyed parliamen-

tary immunity.

As the local councils required for the elections were not in existence in 1970, m provisional Supreme Peoples' Assembly was nominated by the National Front, It first met between 31 July and 4 August 1971, in order to elect certain state officials, as directed by the National Front. Insofar as can be ascertained, this nominated Supreme People's Assembly has continued to meet regularly, passing laws presented to it by the Cabinet and debating and approving economic plans. However, the Assembly's constant subservience to the National Front has minimised its effectiveness considerably. The first elections in South Yemen to the Supreme People's Assembly held is 18 December 1978; it is not known whether its powers versus the National Front have changed since.

(xvl) Egypt

Egypt was the first part of the Ottoman Empire to experiment with parliamentary bodies (in 1866). Earlier, in 1829, Muhammad 'All had instituted a Consultative Council (Madilis al-mashwara), although it was merely an advisory board, meeting only once a year, [ama'il was the first to endow Egypt with a Western representative assembly modelled on European parliaments, even though he undoubtedly intended it to remain solely advisory. This body, the "Assembly of Delegates" (Magilis shard alnumerab) was constituted in November 1866 by Kbedivial decree (for the text of this decree,

Bibliography-Hudūd wa-nişāmnāmat madilis shārā al-numerab al-misriyya). The 75 members, Egyptians aged at least 25, were 🖿 be elected for three years, indirectly, as befitted a partially-illiterate population; in addition, it enabled the Khedive to exercise better control over the results. This intention was also manifested in the paragraphs prohibiting Delogates from receiving petitions, limiting them to debate over purely internal affairs and to proffering advice on projects submitted to them by the Khedive's Council of Ministers (Madilis al-muzerd"). In any event, all decisions had to be ratified by the Khedive, who nominated the Assembly's President and Vice-President and had the exclusive right to convene, adjourn and dissolve it. The Assembly's name was changed Madilis al-numbab at the end of Isma'll's rule, although its functions underwent no essential changes. These Assemblies were convened for several weeks per year, most likely in order to impress Egypt's creditors—especially the European Powers-with the supposed liberalconstitutional views of its ruler. However, the general ferment in Egypt in the late x870s and x880s led to the Assemblies demanding segreater share in decision-making, which they did obtain in February-March 1882. Soon afterwards, however, the Assemblies were adjourned, during the events leading to the British armed intervention; they merer convened subsequently.

Soon after the British Occupation, Lord Dufferin issued a special report suggesting the institution of a Legislative Council (Madilis shara al-kamanın) and a General Assembly (al-Diam'iyya al-'umumiyya), both of which functioned from 1883 to 1912. The first was to consist of 30 members of whom 14. including the President, were to be appointed by the Khedive and his Ministers; the other to were to be elected for 6 years by indirect bailoting. It would debate (but mi initiate), legislation and discuss the budget. The second in to consist of eighty-two members, including the Ministers, the Legislative Council and another 46 members elected for 6 years from among candidates over 30 years old, literate and who paid | least [E. 50 per | in direct taxes. The first body met 5 times per year and the second-at least once every two years to debate more important matters, including new taxes. While these partly-appointed bodies were less representative than the Assembly of Delegates, they mill a greater share in approving government expenses.

These bodies were superseded by a unicameral Legislative Assembly (al-Diam'iyya al-tashri'iyya), according to a Fundamental Law, issued on r July 1913, initiated by Lord Kitchener, then Great Britain's Consul-General in Egypt. In addition to the Ministers and 66 elected members, this Assembly was to include another 17, nominated in order to guarantee minimal representation for the Copts, Bedouins, merchants, physicians, engineers and teachers. Elections were to be indirect, with candidates aged at least 32, literate and paying a minimum amount of taxes. The mandate of the members was to be for six years, with one-third of the membership renewed every two years. Most important amongst the prerogatives ascribed to the Legislative Assembly that no new law could be passed before it had been debated and no new tax imposed before it had been duly approved. The Assembly met several times during 1914, although its convocation postponed again and again following the outbreak of World War I and it never recenvened subsequently.

The Constitution of 19 April 1923, superseded by a less liberal one on 22 October 1930, was reinstated on 12 December 1935. Essentially modelled on the 1830 Belgian Constitution, it provided for a monarchy largely in control of parliament. The latter was to be bicameral, comprising an Assembly of Representatives (Madilis al-nuwwab) and a Senate (Madilis al-shuyāth). The former was to be elected for five years by indirect balloting; candidates to be at least 30 years old and literate. Two-fifths of the latter were appointed and three-fifths elected by indirect balloting. The term of office was tea years, with half of the Senators, appointed and elected alike, leaving every five years. Senators had to be at least 40 years old and enjoy a certain social and economic status. The King and either House had the right to initiate legislation. Every law had to passed by both Houses; the King had the right of veto, although it could be over-ridden by a twothirds majority. The Assembly had a slight advantage over the Senate in discussing the budget and voting confidence in the government; however, unlike the Assembly, the Senate could not be dissolved, but merely ajourned.

Attempts by King Fu³ad (see fu³ho AL-AWWAL) to increase his prerogatives at the expense of Parliament—despite opposition by the Wafd Party—culminated in his promulgating a new constitution, by Royal Decree, on 22 October 1930. The new constitution raised obstacles to parliamentary censure, increased the proportion of appointed Senators from two to three-fifths (60 out of too) and empowered the Executive to legislate during the parliamentary recess. In addition, the Assembly of Representatives could not initiate financial laws, while the King could do so. Modifications in the electoral law favoured the King and his supporters; the number of Representatives was reduced from 235 to 150.

The 1923 Constitution was reinstated, on 12 Decamber 1935, with all its former parliamentary attributes; it remained in effect until the Revolution of 23 July 1952. The constitution was formally abolished on to December 1952 and political parties disbanded on 13 January 1953. Since April 1954, the new régime had declared repeatedly its intention to return to form of parliamentary rule. The new constitution of the Republic of Egypt was promulgated on 16 January 1956 and approved by a popular referendum. It provided for a 350-member unicameral National Assembly (Madilis al-umma), to be elected every five years by general, secret and direct balloting, controlled by the National Union (established in May 1957 and the only political grouping permitted). For the first time, women mem granted the passive and active franchise, although voting was compulsory for males only. Voters had to be aged 18 or over, with no criminal record; candidates had to be 30 or over and literate. Some 2,528 candidates filed papers, although only 1,318 were approved after a screening by the National Union, including | out of the 16 female candidates (of the 5, two were elected—the first women to serve in any Arab parliament). Elections were held on 3 July 1957.

Most, although not all legislation was vested in the National Assembly; legislation was, in fact, its only significant attribute. It first met from July 1957 to February 1958, when the United Arab Republic (UAR) of Egypt and Syria was established. The 1957 parliament was dissolved and a new provisional constitution for the UAR was promulgated on 5 March 1958, providing for a joint National Assembly, to be convened in Cairo, with 400 Egyptian and

200 Syrian members. The first UAR National Assembly, mostly nominated by Djamäl 'Abd al-Näşir [q.v. in Suppl.], duly met on 2x July 2960. Its powers and tasks approximated to those of the 1957 National Assembly, although legislation continued to be promulgated largely by presidental decree.

The joint parliament was dissolved when the UAR broke up on 28 September 1961. The 1962 founding of the Arab Socialist Union (as successor to the National Union) and the Constitution of 25 March 1964-which later was the basis (with a few modifications) for that of 1971-determined anew the prerogatives of parliament. The new National Assembly first met on 26 March 1964; its first act was to ratify the provisional constitution. It met regularly and was renamed The People's Assembly (Madilis alska'b) in May 1971. Its 350 members we elected for five years, by general, secret and direct balloting in 175 constituencies (two members in each). Candidates must be approved by the Arab Socialist Union: at least half of those elected must be peasants (owning 📺 more than 25 acres of land) and workers. Another to members are nominated by the State President. Members enjoy parliamentary immunity, although they may be deprived of their seats by a motion of twenty members and a subsequent vote of two-thirds of the Assembly. The President of the Republic, his Ministers and members of the Assembly may initiate legislation. Proposed laws studied and screened in parliamentary committees and subsequently submitted for voting in the plenary.

The most recent People's Assembly elections to date (1978) - held - 28 October 1976, with a second ballot on 4 November for those candidates who did not obtain 51 % of the vote in their constituencies in the first round. There were about 9,500,000 registered voters; participation was compulsory for men and optional for women. There were 1,531 candidates, of whom were than half were running for the first time. About 56% of all the candidates were independents, while concerning the others, a novel situation had arisen. The Arab Socialist Union was then, officially, still the only party allowed to contest the elections. In 1976, however, it served more as organisational framework, within which several parties were competing with one another (a situation legalised, post facto, by the June 1977 Party Law). In 1976, these were the Arab Socialist Party of Egypt (centrist) the Socialist Liberals (right-of-centre). and the Patriotic Progressive Unionist Alignment (left-of-centre). In the first round, the first 280 seats, the second 12, the third 2, and independents 48. After the remaining I seats men decided, in the second round, the State President appointed another to Members (all of the Arab Socialist Party of Egypt), and several independents and others crossed the lines; the final allegiances were up follows:

The Arab Socialist Party of Egypt 312
The Socialist Liberals 11
The Patriotic Progressive Unionists Alignment 3
Independents 34
Total 160

On 29 June 1977, the People's Assembly adopted the new Party Law, liberalising the situation within limits and legitimising certain groups, which had previously been forced to act claudestinely. The debate within the Assembly became livelier, regarding both legislation and policy-making, and frank criticism was expressed more frequently. The government, however, remained socure in the Assembly's support. On 22 July 1978, President Anwar al-Sādāt

announced the formation of his own party, the National Democratic Party, which 306 of the Arab Socialist Party Members in 1888 People's Assembly joined on 21 September 1976. Following this merger, the National Democratic Party became the ruling party in the state and in the People's Assembly subsequently winning 18 handsome majority in the 7 June 1979 general elections to this body).

The history of parliamentary institutions in Egypt may be divided into three principal periods. The first, from 1866 to 1914, is the stage of experimentation with Western parliamentary models, advising the ruler and largely dependent on him (or on the British Occupation, after 1882), with no political parties playing any significant role. ******** second, from 1924 to 1952, represents the closest approach in Egypt = multi-party representative body, debating policy, passing legislation and in frequent conflict with the executive, particularly until Fu³ad's death and Färük's accession in 1936. Even so, during this period, only one parliament completed the fiveyear term allotted m it (1945-50). The Wafd Party, victorious in the Assembly in the first elections (1924) with 150 out of 211 members, frequently (although not always) repeated its victories, thus compelling the King to dissolve parliament. The third period, from 1957 to date, represents a move towards the single-party parliamentary model (with a reported turnout of over 90% of the voters and nearly 100% support), generally subservient to the executive power of the President of the Republic. This has been particularly evident since 1967, when the Assembly empowered the President in the Republic to issue laws by decree, indefinitely. During the late 1960s, some 6,000 such laws were issued annually. However, the situation has changed somewhat since the Assembly elections of October-November 1971, particularly due to the relative liberalisation of the regime under Anwar al-Sadat-one sign of which has been the renewal of multi-party activity. Consequently, opposition to State President is being voiced more freely now (1978) and the standing of the People's Assembly has risen, even though it has to its credit few crucial policy-making decisions.

Due to the limited role of parliament | the decision-making process, Egyptian parliamentarians can hardly be considered a very important component of the country's political élite, except, perhaps, during the multi-party era. Nevertheless, the socioeconomic make-up of Egypt's Assemblies may serve as an indication of its its in the balance of power. To some extent, this has been determined by the electoral system-indirect balloting in the first period, which facilitated the decision of public functionaries. Indirect balloting during the multiparty period, subverted by the power structure and the wealthy (as Egyptians were the first to admit), enabled constant re-election of the politicians and the rich. The single-party controlled election system under the Republic enabled those trusted by the new régime to enter parliament.

While no definite studies of the socio-economic composition of the Assemblies are available, some incomplete data confirm the trends influenced by the electoral system. In the first Assembly, elected in 1866, there were 58 'wmdes out of a total membership of 75; the proportion of 'umdes decreased from one Assembly in the other. Since 1924, parliament has become more broadly representative, although landowners, businessmen and professionals (chiefly lawyers) played an important and possibly decisive role. In the Republic, the Assemblies of the late 1950s

and early 1960s comprised a relatively large proportion of lawyers, businessmen, bureaucrats, officers and landowners, but very few workers and peasants. For example, according to the calculations III H. Hopkins, 332 ff. (see Bibliography), the Assembly of 1957-8 comprised one-third lawyers and businessmen, nearly one-third senior civil servants, ex-Ministers, former officers and landowners, and about one-third village 'umdas and shaykhs-but very few peasants and even fewer workers. This situation was reversed by legislation in the Assembly elected in 1964, where only 76 members—out of a total of 360-had served in previous Assemblies. Out of the 350 elected members, about 114 had registered m fallāķin and another 75 m workers. Other groups academics, journalists, lawyers, physicians and Bedouins-numbered considerably fewer. The Christians elected were under-represented (one Copt and Greek); this was partially corrected by alloring 8 out of the 10 appointed seats to Christians. Since 1964, more than half (actually, 50 % to 60 %) of the membership has comprised workers and peasants, although few indeed hold important positions (such | Ministers or chairmen of parliamentary committees).

Bibliography: The records of the Sessions of the Legislative Council, starting with 24 November 1883, were published as al-Hukuma al-Misriyya. -Madilis shūrā al-kawānin, Madimū'ai mahādir dialect sanal . . , n.p. 1884-. Those 🔳 the Assembly of Representatives, starting with 15 March 1924, were published as al-Dawia al-Misriyya -Magilla el-nuwwäh, Magimu'at madabit deur al-in'ikid ..., Cairo 1924-, while those of the Senate, starting with the same date, were published as al-Dawia al-Misriyya-Madilis al-Shuyükb, Mademil'at maddbit dawr al-in'ibad . . ., Caito 1924- Indexes of these were printed, entitled Thṣā' 'an a'māl al-madilis fl dawr ..., Cairo. The internal rules of procedure of these parliaments were printed severally as al-La'ika al-dakhiliyya, Cairo, while the laws passed appeared in the Journal Officiel du Gouvernement Egyptien, Cairo, and the debates themselves were issued as supplements to the above Journal. In the Republican pariod, the Egyptian parliament has published the projects of law, the debates of its Legislative Committee and the final text of the laws, as approved, in the plenary sessions-e.g. Djumbūriyyat Mişr al-'Arabiyya, - Madilis al-sha'b-al-Ladina al-tashrifiyya, Kanun istifamar al-mal al-'Arabi wa 'l-adinabi wa 'l-manafik al-hurra, Cairo 1974. (xvii) Sudan.

Sudan's parliamentary history commenced later than that of Egypt and several Maghrib states; the Anglo-Egyptian Condominium, set up in 1899, did not provide for development of any meaningfully representative institutions. It was only in September 1943 that the British authorities, aware of rising nationalist sentiment, announced their intention of setting up an Advisory Council (Madilis istisheri), comprising 18 members elected by all of Sudan's northern districts; another a elected by the Chamber of Commerce; and I others nominated by the Government General (to secure representation for social and economic groups). The Governor-General himself was to be the Council's president; the civil, financial and legal secretaries were to be full members. The Advisory Council was inaugurated on 15 May 1944, despite the protests of Egypt, which had me been consulted and of some Sudanese, who criticised its partially-nominated character, its being restricted to advisory functions and the exclusion of representatives from southern Sudan. Nevertheless, in retrospect, the creation of the Advisory Council may be seen as the first serious

British attempt to terms with Sudanese nationalism.

After the end of the Second World War, Sudanisation proceeded swiftly and comprised representative bodies - well. A joint British-Sudanese administrative conference met for several months during 1946 and 1947, suggesting the foundation of a Legislative Assembly and Executive Council, based largely on the British model. As the Egyptian government was reductant - commit itself to a project which endangered its future ties with Sudan, the British went ahead alone and m 14 June 1948 authorised the governor-general to promulgate an ordinance establishing the above institutions. According this ordinance, the Legislative Assembly (Deam's year iashri'iyya), elected for three years, was to represent all of Sudan; the inclusion of the south in the Assembly === a significant step in Sudanese integration. it provided for 52 elected members to represent the north and another 13 to represent the south. The governor-general could nominate up to to members; several were to present the executive. Of the 63 elected members, to would be elected directly in towns and the others by indirect elections in the of the Sudan. Voters must be Sudanese, male and aged 25 or over; candidates must be Sudanese, male and aged 30 or over. An Executive Council (Madilis tanfidhi), comprising between 12 and 18 members (at least half of them Sudanese), headed by the leader of the Legislative Assembly, was to supersede the governor-general's Council. The governor-general still retained important powers: vetoing decisions of the Executive Council, the right | legislative by ordinance, and excluding certain matters from the Legislative Assembly's competence. Nevertheless, Sudan's parliament had into its own. The elections held in November 1948 were boycotted by political parties favouring union with Egypt. The first Legislative Assembly met on 15 December 1948, with the Umms party -favouring self-determination for the Sudan and unicable relations with the British—in the majority. Another influential group was that of the north Sudan tribal chieftains-self-styled Socialist Republicans.

The first Legislative Assembly, using both Arabic and English, debated economic matters, such as the Budget, local affairs, labour legislation and the introduction of Arabic in the administration and education of southern Sudan. Its most immediate concers, however, was relations with Britain and Egypt in the context of Sudan's own political future. A "Self-Covernment Statute" was enacted by the Legislative Assembly on 23 April 1952, providing for an entirely Sudanese Cabinet responsible to m bicameral parliament—a Chamber of Deputies (Madilis al-numeals) and sonate (Madilis alshuyuhh); the governor-general would retain some authority on internal affairs particularly in public services and in southern Sudanese matters-and exclusive powers in foreign relations. After initial atrong opposition, Egypt eventually accepted the Statute. In the Anglo-Egyptian Agreement of 1953. however, Egypt made a bid for popularity in the Sudan against the British and suggested several modifications in the Statute, which the British could not reject. An elaborate plan was worked out for a maximum three-year transition period from self-government to seif-determination. This provided, among other arrangements, for m specially-elected Constituent Assembly to decide between complete independence for the Sudan and links with Egypt. An internal commission supervised the elections to this Assembly, in November-December 1953. Voting was by constituencies; voters had to be 2x over and resident in their respective constituencies for a period of not less than six months. The National Unionist Party on a decisive victory in both Houses (5x out of 97 seats in the Chamber of Deputies and 2x out of 30 elected seats in the Sonato).

The new Sudanese parliament, meeting = Constituent Assembly (Madjiis ta'sisi), was convened on 1 January 1954. The majority National Unionist Party, formerly assumed to favour union with Egypt, correctly interpreted the mood of the country and gradually changed direction. On 19 December 1955, the Chamber of Deputies declared Sudan's independence; the Senate declared its support three days later. A transitional constitution, largely based on the 1952 Self-Government Statute, was adopted and the Republic of Sudan proclaimed at January 1956. The struggle for independence gave way to translating sovereignty into practical terms, which meant parliamentary debates and decisions mannerous issues, including relations between North and South Sudan. Sudan's parliament was rather hampered by a spirit of factionalism, expressing itself through groups leaving the political parties and forming strong me rapprochements.

Parliament was dissolved == 30 June 1957. General elections were held between 27 February and 9 March 1958, with the number of Members of the Chamber of Deputies raised from 97 to 173, to be elected by constituencies of 50,000-70,000 inhabitants each. The Senate remained the same: 50 members of whom 30 were elected. The new parliament met on 20 March 1958 with the Umms party holding 63 seats; it formed a Coalition Cabinet with the People's Democratic Party, a group which had broken away from the National Unionist Party. The disparity between these two partners, the constant bickering between the other factions and rumours of corruption in high circles discredited both parliament and government. The military, led by Ibrāhlm 'Abbūd, thereupon seized power on 17 November 1958. Among its first acts were to suspend the transitional constitution, ban political parties and dissolve parliament. The work of the Legislative Assembly ceased; moderate legislative powers me granted to a Central Council, twothirds of whose members were elected by provincial councils and one-third nominated by the President of the Republic. The Central Council's term of office was two years; the first Council, which convened on 15 November 1963, served a shorter term, as less than me year later, in October 1964, civilian rule was restored following a popular revolt.

The selections held in northern Sudan during April-May 2965 were based on the 1958 Electoral Law, with a few modifications, most important of which were: institution of a unicameral legislature (the Senate was done away with), reduction of the voting age from 21 to 18, and enfranchisement of Fighting in the south led to postponement of elections March-April 1967. Now that independence had been achieved, the main issues were the state of the economy, the character of Sudanese society and the question of the south. In 1965, the Umma Party achieved the largest plurality (92 seats) in the north, while the National Unionist Party was second with 73. The other parliamentary groups were much smaller and the Legislative Assembly (meeting again as a Constituent Assembly) included 18 independents as well. A coalition cabinet of the

two largest parties, supported by the People's Democratic Party and the Muslim Brethren—all four forming so-called United Front—was characterised by friction among the partners and among the various party components. Disagreements were so frequent and serious and parliamentary work was so hampered that the Cabinet decided to dissoive the Assembly in February 1968.

General elections were held in April-May, 1968 for an enlarged Assembly, seating 215. The National Unionist Party and the People's Democratic Party had merged into a Democratic Unionist Party and obtained for seats; the Umma Party obtained 73. Other seats went to smaller groups, including to independents. Again, the two largest parties formed a coalition cabinet suffering from essentially the same discord as the preceding one. Efforts at approving m permanent constitution failed and bickering prevailed. It may against this background of disillusionment with parliamentary democracy that the "Free Officers", led by Colonel Diastar al-Numayri, seized power by a bloodless coup = 25 May 1969. The constitution suspended, the Legislative Assembly dissolved and all parties banned. The government which had seized power soon vested all executive and legislative powers in a ten-man Revolutionary Command Council, nine of whom were military officers.

It took some time until the new military regime of the Democratic Republic of Sudan felt secure enough to experiment with parliamentary institutions. On 12 August 1972, al-Numayri announced that a People's Assembly (Madilis al-shab) of 207 members would draft a new constitution, after which it would disband and new elections would be held, based on the constitution. In September-October 1972, 175 members were elected and another 32 nominated by al-Numayrl including 13 women. On 12 April 2973, the first permanent constitution was approved by the People's Assembly; it became effective on 8 May 1973, superseding the 1954 provisional constitution. The first People's Assembly, acting as a legislature, was elected-according to the 1971 Constitution under the supervision of the Sudanese Socialist Union, the only legal party. Candidates for the Assembly aominated by the Sudanese Socialist Union; they had me be men bers of the party, Sudanese citizens aged 21 or over, literate and not deprived of their political rights. The Assembly itself is elected for a four-year term and sits for at least six months annually. Constitutionally, it has vast legislative powers, it may approve the budget, confirm the government's action and vote no-confidence (by a two-thirds majority). The Assembly elected in 1974 comprised 250 Members: 125 were directly elected from geographical constituencies, 70 elected by occupational organisations (workers, businessmen) and popular associations (youth and women's unions), 30 by provincial People's Councils, and another 25 (no more than 25 % of the total) nominated by the State President. The Sudanese Socialist Union has been very active in the Assembly elected in 1974 and is responsible for legislation and general policy.

The cease-fire agreement of April 1972, ending a 17-year civil war between North and South, granted Southern Sudan its own, separate Assembly. First meeting in April 1974, it enjoys wide autonomous powers; the head of its Executive Council is the Vice-Fresident of the Republic. Southern provinces also send delegates to the People's Assembly in Khartum.

Sudanese parliamentarism has been too brief for any detailed evaluation. Commencing with a stage of preparation and guidance by the British, the bicameral legislature got off to a fair start, although it was rather hampered both by the north-south dichotomy and by factional blokering. Its development has been twice interrupted-first between 1958 and 1964, then since 1969. Both interruptions the result of military interventions-led to the establishment of unicameral legislatures, subservient to the respective heads of the military regime, although still indicating perhaps that parliamenturism had struck sufficient roots in the Sudan so as not to be wholly eradicated. This is also confirmed by the fact that all parliamentary elections held under civilian rule were generally carried out smoothly and fairly.

Bibliography: The minutes of the debates and the voting in the Legislative Assembly were published 🖺 Khartum, in Arabic and English, from October 1949 to May 1952. They were superseded, since 1953, by two separate series: a weekly, entitled al-Barlaman al-Saddni, Mulahhhas almusawalat al-ushili-Magilis al-numah; and a less regular one, entitled al-Barlaman al-Sudámi, Mulahkha; mudawaidi madilis al-shuyikh. Both were published in Khartum, in Arable and English. (xviii) Libya,

The Kingdom of Libya stablished = 24 December 1952, largely as a result of the inability of the Great Powers to agree on the future of this area, which had been vacated by a defeated Italy. Prompted by the United Nations, a 60-member National Constituent Assembly (referred to Diam'iyya wataniyya or Madilis ta'sisi) of Libya met, beginning 25 November 1950 and resolved, on 3 December, that Libya should III I federal kingdom under the Amir Muhammad Idris, henceforth called King Idris I. By October 1951, it had also adopted a constitution, considering that the new state was made up of three rather disparate components-Tripolitania, Cyrenaica and Fezzan. Strong rivalry existed between the first two: Tripolitania me the most populous, Cyrenaica the base of IIII Sanfisiyya (q.v.) and of its then leader, Libya's Idris I.

The constitution provided for legislative assemblies in each of the three provinces and for a federal National Assembly (Madilis al-umna). The latter was bicameral and consisted of: (a) The Chamber of Deputies (Madilis al-numeds), directly elected on the of one member per 20,000 main inhabitants aged 21 or over (candidates had to 🖿 📺 years 🖿 over and literate). The first Chamber comprised members: 35 from Tripolitania, 15 from Cyrenaica and 5 from Fezzan. (b) The Senate (Madiliz aitheyeth, comprising 24 members aged to or over, equally divided among the three provinces: four Senators mem nominated by the legislative assembly of each province and the remaining rz by the King, The main task of the National Assembly was to enact legislation on issues of national significance, such as foreign affairs (local matters were essentially left to the respective legislatures | the three provinces). The King, or either House, could initiate legislation, although the privilege of initiating financial laws remained with the Chamber alone. The King could vote legislation and dissolve the Chamber at his own discretion. The Chamber's usual term was four years and the Senate's eight, with half the latter leaving every four years. Ministerial responsibility was to the Chamber only, where m two-thirds majority was required for a no-confidence vote.

On 7 April 1962 and 25 April 1963, legislation was passed in both Houses of the National Assembly to alter the 1951 Constitution and change Libya from a federal to a unitary state, based on its ten administrative districts instead of on its three provinces (which thus lost their special privileges). All of the Senate, rather than half of it, was to be nominated by the King. The Chamber was to be elected as formerly, although women were enfranchised and the number of seats are response to nationalist pressures for a unitary rather than federal state and an expression of the government's desire to decrease local and provincial rivalries and conflict between the National Assembly and the King and Cablost.

The first elections = the Chamber were held on 19 February 1932 (based on the Electoral Law of 6 November 1951). The principal issues were relations with the Arab States and the Western Powers. Candidates opposing the King and the me regime grouped together in a National Congress Party, on Tripolitania and supported by Egypt; its platform was strongly nationalist and opposed foreign bases in Libya. Elections were held on time in all constituencies, despite rioting. The National Congress Party won in and around the city of Tripoli, but lost elsewhere. Forty-six out of the 55 Members of the Chamber supported the King and government; the National Congress Party obtained only 7 seats. The first duly elected National Assembly convened in Benghazi on 25 March 1952. Subsequently, it met regularly and was concerned with debating and passing legislation. Although Assemblies were generally compliant, not infrequent criticism of government internal and external policies voiced, particularly in the Chamber-frequently expressed by interpellations.

The successive general elections of January 1936, January 1950 (with secret balloting imposed the whole state), October 1954 (with women voting for the first time and the number of constituencies increased to 193) and May 1965 (after King Idris had dissolved the Chamber on 13 February 1965) were

on personal (or family) competition basis (as political parties were not permitted to function legally). In the 1965 elections the number of constituencies was decreased to 91; all successful candidates were apparently pro-government—16 ran unopposed.

One of Libya's main problems during the first two decades of statehood was a lack of personnel trained in the skills required for running the state. Nevertheless, the many skilled Libyans serving in the National Assembly or its administration sufficed to cause Mulammur al-Kadhdhafi to annul the constitution and dissolve the Assembly after his coup of I September 1969 (the Assembly was, obviously, also one of the bases of power of the King he had deposed). All executive and legislative authority was vested in the Revolutionary Command Council. Libya's provisional constitution, promulgated by the new regime in December 1969, reaffirmed that the Rovolutionary Command Council of the Libyan Arab Popular Republic (as the state was now called) holds sovereign power and is to promulgate laws and decrees. Al-Kadhdhaff declared, in January 1971 and has reaffirmed since his intention of convening a legislative assembly, but has not done so to date (1978). This postponement is compatible with his views, as expressed in his Green book, that parliament is not sufficiently representative and that direct participation by the sis preferable. A National Congress (al-Mu'tamar albasemil) of the only legal party, the Arab Socialist Union, represents trade unions, professional groups and popular associations. Its mein task is to debate the ideological premises of the regime and ratify its policy decision. However, this 618-member body, established by decree on 13 November 1975, has to date apparently convened in January 1976 only, Since then, it was to be in cold storage. Instead, again following the principle of direct participation, al-Kadhdhāff has been convening (once or twice per year) "General Assembly of the People". First cailed in March, 1977, this 970-member Madilis is selected in 178 constituencies by popular councils and trade unions. It is officially supposed to discuss all policy-matters, but in effect it approves (and legitimises) the decisions of the Libyan leadership.

Libya's parliamentary history, which came to an end with the abolition of the monarchy in Septembar 1969, was brief, but not necessarily a total failure. The National Assembly's greatest merit was in its assisting King and government in welding to gather Libya's disparate mean into one unitary state. During its first decade, at the very least, it also curtailed the Monarch's autocratic tendencies. The ban on political parties and, since 1965, the almost complete subservience of the National Assembly Ming and Cabinet, minimised whatever significance the Assembly still had in public life and paved the way for those who eliminated it in the military coup.

(xix) Tunisia.

Under French rule, Tunisia had experimented with several French-imposed semi-representative

advisory institutions. The Consultative Conference (Conference Consultative, Hay's istightriyya), established in 1891 (with defined powers since 1896), comprised only Frenchmen, elected by universal direct suffrage since 1905; from 1907 on, they were joined by 16 Tunisians, nominated by the French Governor General (Risident général). At first, the French and Tunisians met together, and later (since 1910) separately. The main task of the Consultative Conference was to advise concerning the budget.

In 1922, the French replaced the Consultative Conference with the Grand Council (Le Grand Conseil de Tunisie, al-Madilis al-Kabir li 'l-Iyala al-Tunisiyya). Elected for six years, it comprised two sections possessing equal rights; one of 56 French members, elected by the French in Tunisia and the other of 41 Tunisians, elected by other Tunisians. The task of the Grand Council was to discuss the budget; in case the two sections differed, the decision rested with an Upper Council (Conseil Supérieur), comprising the Governor General, several Ministers and ranking secretaries, as well as seven members from each of the Grand Council's two sections. The Grand Council could also raise and discuss any economic or financial matters, but not political or constitutional ones. Although the powers of the Council were limited and minimal, the Vichy Government was still wary and abolished it on at November 1940, transferring its authority to a Consultative Committee (Comité Consultatif) of 5 Frenchmen and 5 Tunisions.

After the end of the Second World War, the Grand Council are re-established; its make-up and powers were altered on 15 September 1945. After then, it comprised two sections, French and Tunisian, each numbering 53 Members elected for six years. The franchise for the French section was extended to include all Frenchmen and Frenchwomen in Tunisia, aged at least at (candidates-at least 25), with direct voting and proportional representation. The franchise was also somewhat extended for the Tunisian section as well, including III Tunisian males aged at least 25 (candidates-at least 30), who either paid direct taxes, were war veterans, or had completed secondary school. Voting was in two stages. Although the Grand Council essentially remained concerned with economy and finance, its powers were increased to cover advising the government all legislation—although the government could still bypass it in urgent meen Even so, the Grand Council was not convened from the end of 1952 until 1954, when its powers were slightly extended.

Tunisian nationalists were obviously not happy with the limited powers III the above-mentioned Conference, Council and Committee, nor with their selective representation, which disenfranchised many Tunisians and afforded preferential voting to the French minority. As early as 1921, the Destür Party demanded the creation of a representative assembly, to which Ministers would be responsible. When the Neo-Destur was set up in 1934, it demanded the establishment of such an assembly as an instrument of national sovereignty and for limiting the arbitrary government of the Bey or of France. Consequently, the Neo-Destür rejected the reforms suggested by the French in March 1954. These reforms provided for a legislative assembly, including French representatives, with full powers in social and economic matters, to be elected by universal suffrage. Under the pres- of the Neo-Destür and more radical nationalists i by Şâlih ben Yûsuf, the Bey signed a decree, establishing a Constituent Assembly, on 29 December 1955.

The Neo-Destür, a "dominating party" (in Duverger's sense) has continued since to consider itself as the instrument of "national will". Hence in order to dominate the 98-seat Constituent Assembly (al-Madilis al-Kaumsi al-Ta'sisi), it insisted on an electoral imm (promulgated on 6 January 1956) which would favour it over smaller parties and groups. All Tunisia was divided into 18 constituencies: and the slate of candidates obtaining a relative majority of the vote in each was considered as "winner take-ail".

Complete independence was the main issue in the 25 March 1956 elections to the Constituent Assembly. The National Front, led by the Neo-Destur Party. won an impressive victory (597, 813, out of a total of 610,989 votes, = 97.84 %). Consequently, it induced the Assembly to pass regulations granting considerable parliamentary powers iii the Assembly, Its Bureau and six committees. Adoption 📰 🖿 regulations enabled the political bureau of the Neo-Destur to control the proceedings of the Assembly efficiently and to delay the formation of any meaningful opposition within it. The wide and often unanimous support of the Assembly was skilfully exploited by the Neo-Destur, especially by its leader, Habīb Būrgība, who was also the Assembly's first Speaker; in April 1936, he left this post to become Prime Minister. The party utilised Constituent Assembly support to extend the powers of the Assembly beyond those of the Bey, his government and the French, on the one hand, and to achieve full independence for Tunisia, on the other. The Constituent Assembly increasingly considered itself sovereign; one of its most significant steps - to proclaim the republic on 25 July 1957. No less significantly, it established the norms for future Assemblies, both by its own practice and by adopting the June 1959 Constitution.

This constitution grants the National Assembly (Madjlis al-umma) wide powers, limited, however, by the very of Tunisia's presidential regime: the State President is elected by universal suffrage and neither in the various Ministers are responsible to the National Assembly. The National Assembly is elected in constituency voting for five-year terms by all Tunisian citizens aged 20 or over (candidates must be 30 years or over). In theory, it is the only legislative body and its members snjoy parliamentary immunity. However, the State President also has the right to initiate legislation—taking priority over the Assembly; he may also enact decrees while the Assembly is in subject to the Assembly's subsequent confirmation). Thus, further restrictions are imposed upon the Assembly's legislative prerogatives.

The National Assembly elections of 8 November were, in many respects, similar to the 1956 Constitnent Assembly elections. Once again, a National Front led by the Neo-Destür rap without serious petition. However, Tunisia was independent in 1959 and women were enfranchised for the first time. Separate polls determined the composition of the Assembly and elected the President of the Republic. The National Front won in the Assembly and Bürgiba was elected President. All 90 Members of the National Assembly belonged to the Neo-Destar Party or were independents sponsored and supported by it. As a result, main policy decisions were initiated and controlled by Bürgiba and the party in the 1959-64 Assembly; in this respect, the National Assembly in Tunisia may be considered as an extension of the Neo-Destür Party, renamed the Socialist Destür

Party in October 1964. However, as Tunisia achieved full independence and secured its place in international relations, internal affairs increasingly took precedence, and wide divergences of opinion became apparent in the Assembly, both because of the various interests represented in the single party and because the Assembly could not help but be influenced by the extra-parliamentary demands and reactions of those socio-economic and political groups excluded from the official political game.

Much of the above holds true for subsequent National Assemblies in well. In the Assembly elected ■ November 1964, the Socialist Destûr Party again held all go seats in majority of the outgoing Members of the Assembly including its only woman, were re-elected). The 2 November 1969 National Assembly elections (increased in ros seats) were essentially a repetition of earlier ones, with heavy voter participation and the election of the party's own candidates, even though the issues debated at this time chiefly concerned the government's economic policies, which had led to considerable controversy. Consequently, economic problems occupied much of the attention | the National Assembly elected in 1969. The results of the elections of 3 November 1974 to the Assembly (increased to 112 seats) were no different from previous ones. The party obtained all seats, although 71 of its Members were elected for the first time, including many representatives of the younger generation. Concurrently, several Members who had opted for a more liberal political and economic régime, thus opposing the line of Bürgiba and the party leadership, had been dropped from the candidates' list.

Although there is no detailed statistical breakdown of the Members of all National Assemblies in Tunisis, available material indicates several characteristics, As mentioned above, all Assembly members were selected from within the single party; the top party leadership-identical with Tunisia's political leadership-had occupied the Assembly. The first National Assembly, elected in 1959, comprised 12 members of the party's political bureau, | Ministers, the director of Burgiba's Cabinet, I former Ministers, 4 former governors, the secretary-general of the Noo-Destir youth and 7 former and then current party political commissioners. Members of that Assembly were remarkably well educated: 3r had graduated from French universities, and another 25 from modern secondary schools; thus 56 out of the go had will a good French education. Most of the others had had traditional education; only one was illiterate. Professionally, the Assembly comprised 15 lawyers, 15 businessmen, 14 manual or clerical workers, 12 professors, 12 farmers, 7 physicians, 6 school teachers, 5 senior civil servants and 4 others While later elections obviously introduced new members, the essential characteristics of the Assembly elected in 1959 have not changed substantially.

The parliamentary history of Tunisia since the 1950s indicates that the Constituent and then the National Assemblies have generally been of secondary importance to the single party. The latter has been the real focus of most important decisions, even in legislative matters. The Assembly's work is scheduled by its Bureau, usually after due consultation with the party. Assembly control is minimal, mearly all its work is done in committees; on the average, only fifteen plenary meetings take place each year, mostly to approve legislation submitted by Bürgba. On the whole, the Assembly has displayed doctle subservience, rarely demonstrating a will of its own or even

reflecting differences of opinion within the party itself.

Bibliography: The regulations passed by the Grand Council (and some of the speeches) were published annually, since 1922, as al-lyala al-Tūnisiyya—al-Ḥimāya al-Fransāwiyya, Takārir al-madilis ol-kabir lill-Lydia al-Tanisiyya, Prom. 1956 to 1959, the proceedings of al-Madiks al-Kawmi al-Ta'risi, and, since 1959, those of Madilis al-Umma, have appeared in Arabic (all in Tunis). For later years, the bi-monthly Maghreb, published in Paris since 1974, frequently has a "rubrique législative". See also M. Dauphin, La conférence consultative funisienne. Parla toto: E. (xx) Algeria

The French, who ruled Algeria from 1830, introduced several moderately-representative institutions on 23 August 1898. The decrees established the Financial Delegations (Les Délégations financières) intended to represent economic interests—which existed until 1945. The franchise changed several times, while candidates consistently had to MI French citizens aged 25 or over, residing in Algeria at least three years. All were elected for six-year terms, half of them leaving every three years. Two of the three Delegations comprised 24 European Members each; a third, with 21 (later 24) non-European Members, included six who were nominated. Each Delegation was concerned solely with its own economic interests. Delegations served in madvisory capacity only, concentrating on the budget. United into one body by a decree in 1918, their powers remained unaltered. During 1945-1947 they were transformed into # Financial Assembly (L'Atsemblee financière) of 37 elected members with broader representation but the same essential capacities.

The Financial Assembly was obviously unsatisfactory to proponents of Algerian nationalism, particularly during the period following the Second World War. All legislation was still passed by the National Assembly in Paris or by the French Governor-General in Algeria. Pressured by Algerian nationalists and by its own Algerian and French Members, the National Assembly in Paris approved a new Statute for Algeria (Statut Organique l'Algèrie, or al-Kānān al-asāsi), setting up an Algerian

Assembly on 20 September 1947.

This Statute provided for an Algerian Assembly (al-Madilis al-Diaza'irl) of 120 Members, elected for six years with half renewed every three years in two separate "colleges" of 60 members each. The franchise me granted to French citizens of legal age (although participation of Muslim women me deferred) in two-stage constituency voting. Candidates were subject to the mean criteria but had to be at least 23 years old. Members of the Assembly enjoyed parliamentary immunity. The Assembly was to convene in Algiers, for three sessions per year, each lasting not longer than six weeks (probably to prevent it from becoming too powerful). Much of its work was to be done in six committees. As legislation for Algeria remained the prerogative of the National Assembly in Paris, the Algerian Assembly's function was chiefly to apply-with modification-French laws and regulations to Algeria. The Algerian Assembly could also transmit its proposals to the National Assembly in Paris.

The first elections to the new Assembly under the Statute were held in April 1948, with partial elections in February 1951 and January 1954. It soon became evident that the Statute satisfied no one; it was too much for the local French and too little for the Muslims. Nationalism, expressed in moderate to extreme anti-French terms, was the main issue in the elections. Nevertheless, the Nationalists obtained only 16 seats in the 1948 Assembly and even fewer in subsequent elections—perhaps because the two-stage voting, the constituency-system and the enfranchisement of French citizens only favoured upholders of the status quo, supported by the French Administra-

tion. The three Assemblies devoted much time to economic and financial matters-particularly Algeria's annual budget; they were also responsible for instituting social security throughout the country. However, debate moved increasingly towards politics, largely a result of the rise in nationalist, anti-French campaigns, now impelled into extra-parliamentary activity after the total failure of the nationalists in the 1954 elections. This appears to the main reason for the Assembly's dissolution on 22 April 2956. Algeria's sole parliamentary representation remained in the National Assembly in Paris alone, which (in 1957-8) was concerned with drawing up a new constitution for Algeria, providing for a Federal National Assembly, However, this concept never put into practice, because if growing unrest and violence in Aigeria.

Parliamentary life revived only after the end of the war in Algeria; the Evian Agreements spelled out the necessity for electing = representative assembly. A Constituent National Assembly was elected accordingly on 20 September 1962, first meeting on 25 September. Its powers included legislation, promulgation of a constitution and selection of provisional government. It comprised 196 Members, about one-third of whom had been guerilla leaders and another 16 European Algerians. The 60-Member Front for National Liberation (known by its French acronym-FLN) dominated the Constituent Assembly, which had elected Ahmad Ben Hella Prime Minister, and dedicated only part of its time to legislating, as Ben Beila and the government were busy decreeing laws. However, the Constituent Assembly did initiate a fruitful exchange of opinions. with free criticism, meeting increasing disapproval from Bella and his close advisers. Thus there was a marked difference between the level of tolerfor the opposition during the first year of the Assembly, presided over by liberal-minded Farbat 'Abbas and during the second, when others presided. In the second year, political debates became increasingly infrequent and most attention was focused on economic matters, in which there were fewer

differences of opinion.

Elections to the National Assembly took place in September 1964, in accordance with the August 1963 Constitution, approved by popular referendum = 8 September. This aimed at legitimising personal rule in Algeria, - well - the predominance of the party over the National Assembly. The constitution declared FLN as the only legal party and consequently empowered it to control the National Assembly. It provided for a unicameral National Assembly (al-Madjiis el-watant), seating candidates endorsed by FLN and duly elected by m general, direct vote for five-year terms. The Assembly and the State President to initiate legislation; the latter exercised direct legislation under certain circumstances. The Assembly was also supposed to control the governmeat's policy-making. Ministers were responsible to the Assembly's committees, whose members could interpellate them. Members of the Assembly enjoyed parliamentary immunity. According to a new electoral law, adopted in the Assembly 25 August 1964, the number of seats was reduced from 194 to 138, which proved useful to the FLN government in eliminating members who were considered oppositionist. Nevertheless, about 43 % of the Members were indeed re-elected. This Assembly, however, was short-lived and its achievements unspectacular, as more and more laws were promulgated by Presidential decree. Bürnedyen's coup of 19 June

1965 resulted in the suspension of both the 1963 Constitution and the National Assembly.

In June 1975, Bümediyen announced his intention to hold elections for memorepresentative assembly. Algeria's new constitution, approved by a popular referendum on 19 November 1976, provides for a National People's Assembly, to be elected for a five-year term by direct secret and universal suftrage III the proposal of the single Party's leadership. A number of seats is to be reserved for representatives of peasants and workers. Legislation is to | the prerogative of both the Assembly and the State President, although only the latter may introduce bills mational defence. The Assembly is bold two annual sessions of not more than three months each, while its sub-committees meet regularly. Members are to enjoy parliamentary immunity. A National People's Assembly has not yet been elected to date (1978) and the Council of the Revolution, headed by Bürnedyen, is the state's supreme executive and legislative organ.

There is only meagre data available on members of the various parliamentary bodies in Algeria. During the pre-independence era, most were middle-class and were frequently identified with circles cooperating with the French and interested in preservation of the status quo. More specific data are available for the post-independence Constituent National Assembly, which sat for two years, between 1962 and 1964. Among its 194 members, 15 were of European origin; to were women. The average age was 39—fairly young mailiamentary bodies go. Its occupational breakdown was as follows:

On the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of th

Occupational breakdown of 183 of the 194 Members of the Algerian Constituent Assembly, 1962-1964 (%)

Military	18 %	Students	to%
Free Professions	18	Workers	7.2
Morchants	14	Party cadres	4
Teachers	12	Salaried	3.2
Peasant-farmers	10.6	Officials, clerks	2.6
		Total	90.69

(Source: Anisse Salah Bey-see Bibliography).

The "military" component was madirect result of the Algerian war; some had probably had madificrent background initially. The proportion of merchants and clerks seems high for a revolutionary Assembly. Those representing the free professions, must the other hand, comprised materially small group; apparently, however, some of the military had formerly been professionals. In any event, it must a well-educated body; some 25% of the Members had had university education and many others secondary school training. More than 75% spoke French, which was consequently the language used in the Assembly.

Algeria's parliamentary history falls into two main periods: the colonial era, until 1956, when the nature of the Assemblies, determined by the French, remained largely consultative, although some autonomy was acquired gradually; and the brief experience in independent Algeria, with the Assembly controlled by and largely subservient to the FLN.

Bibliography: The parliamentary debates (generally held in French) have been published in the Diligations financières Algériennes, Débats and, later, in Conseil du Gouvernement, Débats. These were superseded, during 1948-1962, by Assemblés, Journal Officiel... Débats... compte rendu in extenso des séances. During 1962-1965, this appeared weekly as Assemblés Nationale, Journal Officiel...

(xxi) Morocco.

Under the French Protectorate, Morocco was an absolute monarchy, in which the Sultan and the French (particularly the latter) ruled without any parliamentary institutions. A first step forwards parliamentarism was taken by the Protectorate in 1919, with the establishment of a Government Council (Conseil de Government), comprising the representatives of the French in Morocco; local Moroccans joined during subsequent years. From 1926 on, the Council comprised three French sections (colliges), elected by economic groups (agriculture, commerce, industry) and one, nominated Moroccan section. The Council served only as a debating forum and its decisions were purely advisory.

Assembly on 12 Novembre 1056.

The powers of the Consultative National Assembly, amplified by a royal decree on 27 November 1956, were clearly advisory. The Assembly meets twice year, in spring and autumn. Most of its work is carried out in four (three since 1958) committees comprising between 12 and 24 members each (every member may belong to one committee only). The Assembly's regular term I two years, although the King may prolong it (in 1958 III was prolonged by six months) and Members enjoy immunity. Since the Moroccan Cabinet preceded the convocation of the first Assembly, the Ministers were neither part of the Assembly, nor responsible to it, although the Memhers of the Assembly could interpellate them. Ministers responsible to the King alone, who succeeded in imposing will on the Assembly thanks to both the definition of its powers and to

his own standing and prestige. Hence there were large pro-government majorities in practically every vote all important matters during the Assembly's first two years. Only during its third year were there signs of growing independence—and even increasing criticisms and opposition, probably reflecting the overall political climate outside the Assembly. This seems to have led Muhammad V to allow the Assembly to die a natural death in May 1959; its term was not renewed, nor did the King convene another Assembly during his reign.

Muhammad V's son and heir, Hasan II (mounted the throne in 1961), contributed to the course of parliamentarism in Morocco. On 2 June 1961, the new king promulgated # Fundamental Law, which mainty # declaration of principles. This # enhanced by Morocco's first constitution, prepared by a commission and submitted by Hasan II to # popular referendum on 7 December 1962. Some 80% of those eligible voted, with a heavy majority # favour

(3,705,732 versus 111,879).

The 1962 Constitution provided for a bi-cameral legislature—a Chamber of Representatives (Chambre des Représentants, Madjiss al-numerab) and a Chamber of Counsellors (Chambres des Conseillers, Madiles alneustasharin). The former was to be elected for four years by direct universal suffrage and the latter for six years (with half the membership changing every three years)—by and from colleges consisting of local assemblies (two-thirds of this body) and chambers of agriculture, commerce and industry, artisans and trade-unionists (one-third). Both Chambers debate policy and legislate, although the Chamber of Representatives has greater authority. For example, the latter may bring about the resignation of the Cabinet by a vote of cansure (Ministers and nominated by the King, who has also the right to dismiss them). While the Representatives have greater authority, legislation in both Chambers is hampered, in practical terms, by their meeting for only two annual twomonths sessions. Furthermore, the King may withhold approval of laws indefinitely and may submit laws for popular referendum without prior consultation with the two Chambers, Members of both Chambers enjoy parliamentary immunity.

Although the 1962 Constitution was criticised by both traditionalists and modernists in Morocco as being too modern or too traditional, respectively, it remained in force for several years; the first Him Chambers were elected following its provisions and those of a subsequent Electoral Law.

Elections to the 144-seat first Chamber of Representatives were held on 17 May 1963, following a simple majority system with single-member constituencies, of which 117 were rural. There were 694 candidates running; each was required to deposit ross dirhams (then about \$ 70), to be forfeited if the candidate obtained less than 5% in his constituency. About 73% of the 4,650,000 eligible voted. The Front for the Defence of Constitutional Institutions, a pro-King and pro-Government group, won 69 seats, four short of mabsolute majority. Next two nationalist groupings, the Istiblai with 42 and the National Union of Popular Forces with 28, together equalling the number of seals obtained by the Front, with Independents holding the remaining 6 scats. Elections = the 220-seat Chamber of Counsellors were held on 13 October 1963; the Front for the Defence of Constitutional Institutions won decisively with 107 seats, the Istibial received II seats, and independents another 2. Hasan II opened the first Moroccan parliament on 18 November, relinquishing the post of Prime Minister which he had filled until then.

The achievements of the 1963 parliament were not particularly remarkable and ended abruptly In June 1965, with the declaration of motate of emergency by Hasan II (all within the framework of the constitution). There followed a pause in parliamentary activity, restored by the 1970 constitution published by the King on I July. It was reportedly approved by a 98.7% majority in a popular referendum held on 24 July. These official figures are questionable, however, as many have indicated the strong opposition of most parties and many organisations to the new constitution, largely caused by its differing from that of 1962 in that it further strengthened the powers of the King at the expense of the Prime Minister and parliament. According to the 1970 Constitution, the King was empowered to amend the constitution at will, promulgate decrees in almost any matter (even to declare war) and reject parliamentary bills and requests. Conversely, the nature of parliament was altered; it was now to be a unicameral Chamber of Representatives of 240 seats: go elected directly, 90 by members of local councils and 60 elected in two-stage voting by chambers of commerce and industry (including professional and workers' groups), all elected for alx-year terms.

As most parties boycotted the 21 and 28 August 1970 elections to the Chamber of Representives, the majority of candidates were independents supported by the government. Many candidates were returned unopposed and the government claimed huge participation despite the boycott. The Chamber comprised 158 independents (nearly all pro-government), 60 members of the pro-government Mouvement Populaire and 22 belonging to other parties and groups. The Chamber achieved little during its two-year lifespan and was sharply criticised from many quarters, prompting Hasan II to promulgate yet another constitution.

Morocco's third constitution was promulgated on 10 March 1972, following a popular referendum which approved it on a March. It was slightly liberal regarding parliamentary powers; two-thirds of the unicameral Chamber of Representatives (of 264 seats) were to be elected by direct, universal suffrage and only one-third by two-stage voting of local councils as well as professional and employees' organisations. The Cabinet was made responsible to both the King and the Chamber. Nevertheless, the King's position remained pre-eminent, particularly as he had postponed the holding of new elections several times, ruling by decrees in the interim.

Under the 1972 Constitution, elections to the Chamber of Representatives on 3 June 1977. For the benefit of illiterate voters, each party was allotted a specific colour for its ballot. Some \$2.36% of those eligible voted, independents, mostly pro-Government, held 14 seats and Islibial candidates, 49; the pro-Government Monvement Populairs held 44 seats and other groups 30. The King enjoyed comfortable majority of his supporters in this Chamber, which he inaugurated on 14 October 1977.

The characteristics of Moroccan parliamentarians have not yet been studied in detail. Both the will of the Sovereign and subsequent electoral laws ensured that all Morocco's regions were represented, with rural areas favoured somewhat. Many of the Members were young: according to official figures, about 40% of the Members of 1963 parliament and 60% of those of the 1970 Chamber, were between

25 and 40 years of age. When nominating the Members, the King and his officials strove to strike some balance among political parties, non-political leaders, economic and social groups and diverse occupations. In November 1956, the occupational distribution was as follows: free professions - 10, agriculture - 19, commerce and industry - 17, workers - 16 and religious personalities - 5. In fater Chambers the distribution appears to have been more diversified.

Independent Morocco's bither-and-thither experience with parliamentarism at first continued the tradition of the French Protectorate in nominating the whole institution, then moved towards elections, although the King did preserve his special powers in both the written constitutions and in the practice of imposing a two-stage electoral system (for at least part of the membership) on parliament, ensuring the election of a largely-compliant body. Legislating by decree, without the benefit of parliamentary participation, completed the circle of the King's powers vis-i-vis the elected Chamber. This is all the more remarkable in light Morocco's multi-party system.

(xxii) Mauritania

The Islamic Republic of Mauritania, independent since 1960, had already experience of a legislative assembly under French rule. Since 1925, the Governor-General of the Afrique Occidentale Française or AOF (of which Mauritania was part) assisted by an appointed advisory council, functionally representative of the federation's major interest groups (military and civil servants, businessmen, Africans). Meaningful measures concerning representative bodies in Mauritania were introduced, however, only in 1946, part of the new French policy in the region. Representation was then provided three levels: (a) Territorial: a General Council (Conseil

Général), called the Territorial Assembly (Assemblés Testitorials) since 1952, has had extensive control over the budget, although it functioned solely in an advisory capacity on any other farse. In Mauritania, it first comprised 20, then 24 members, divided into two sections (colleges)—the first (6, then I members) elected by Europeans and the second (14, then 16 members), by Africans. They were reorganised into one collège in 1952; (b) Federal: Meuritania sent five delegates, elected from its General Council (Territorial Assembly) to the AOF's General Council; and (c) National (French): Mauritania elected a dépull to the National Assembly in Paris. The winner of the legislative elections of November 1946 was elected by 6,076-or about two-thirds-of all votes cast. Several weeks later, Mauritania's first General Council was elected. In 1947, the General Council's French section duly elected a Sonatour to the French Senate in Paris and its African section a representative to the recently established Assembly of the Communauté Française.

The 1946 French Constitution gave the right of vote to but a few; members of certain local associations, trade unions and co-operatives, government officials, wage earners, owners of registered property and war veterans. Consequently, few were eligible to vote in the 1946 Mauritanian elections. In 1947, the literate were added and in 1951, heads of households and mothers of two or more children. The following table indicates the sizable increase in the number of eligible voters.

By 1936, the franchise was universal, so that the population was not unprepared for the new Loi cadre.

The Loi cadre of June 1956 bestowed a larger measure of autonomy = France's overseas territories, vested in respective elected Territorial Assemblies and in Councils of Government (Conseils de Gouvernement), comprising senior French officials and Ministers elected by the Assembly. Each Territorial Assembly could formulate its own policies in such local affairs as agriculture, forestry, trade, health and primary and secondary education. In Mauritania's first elections to IIII Territorial Assembly, held on 31 March 1957 (the first held under universal suffrage), the Mauritanian Progressive Union (Union Progressiste Mauritanienne) won 33 out of the Assembly's 34 seats, obtaining 252,898 out of the 272,474 votes cast. This party represented both the administration and traditional attitudes, m well as tribal chieftains; it had already participated in the 1952 election to the General Council (Territorial Assembly), winning as out of 24 seats. It was led by Mukhtar Ould Dadda, a lawyer-turned-politician who was to lead Mauritania to independence and serve as its first president.

Mauritania's heavy "yes" vote in the De Gaulle referendum of 28 September 1958 signified its approval of the Constitution of the Fifth Republic and its autonomous membership in the new Communauté Française. Mauritania's Territorial Assembly was converted into - Constituent Assembly (Diam'lyya la'sisiyya), on 28 November 1958, with the task of drafting a constitution. Prepared by former administrators, the Assembly approved and promulgated a constitution on 22 March 1959, providing for a 40-seat Legislative Assembly (Assembles législative, Diam'syyo tashri'syya), = be elected for five years by direct, universal and secret voting. The Assembly was to meet for two sessions annually, not exceeding two months each. Its powers were mainly legislative, although it also elected the Prime Minister, who in turn appointed the **e** of the

Registered voters, and votes cast in Mauritania in elections for the National Assembly in Paris, 1946 and 1951

Cabinet. Miniaters were responsible to the Assembly, which could bring the Cabinet down by no-confidence vote. Members enjoyed parliamentary immunity. The first elections to the Legislative Assembly membed on 17 May 1959, with some 326,000 out of about 373,000 participating. This time, the Mauritanian Progressive Union, renamed Parti du Regroupement Mauritanian (since 1958), captured all 40 seats.

After negotations with France, the independence of the Islamic Republic of Mauritania was proclaimed on 🔳 November 1960. A new constitution, required for a sovereign state, was adopted by the Assembly on 20 May 1961 by a vote of 31 to 2, with one abstention. The 1961 Constitution-amended in 1972—was basically a modification of the former one, adapted for a presidential régime. It established the office 🔳 a state president, absorbing that of the prime minister, strengthening it at the expense of the Assembly. The 1961 Constitution provided for a 40-seat National Assembly (Assemblée Nationale) (50-seat since 1971 and 70-seat since 1975), elected for five years, legislating only in a limited number of areas, including the budget. The Assembly venes for four-month session per year. It cannot pass a vote of no-confidence in the President or the Ministers (although it may impeach them). Ministers are responsible to the President but not to the Assembly. The President has priority in legislation and right of veto, but cannot dissolve the Assembly.

In the early 1960s, the Assembly produced muchneeded legislation, such = the establishment of an adequate judicial system for Mauritania (1963), It also discussed policy, sometimes displaying an Independence of spirit which caused considerable friction between the National Assembly and President Ould Dâdda. The latter succeeded in strengthening his position, however, particularly since a constitutional amendment was passed, institutionalising the Mauritanian Progressive Union as the only legal party. Since this action of his, it is the single party (led by Ould Dâdda), rather than the National Assembly, which has served in the main focus of power in Mauritania and dominated its politics. This has been at least partly motivated by Ould Dadda's intention to use the party as Mauritania's main vehicle for modernisation, as traditionalists still have a strong hold in the National Assembly.

Consequently, in the general elections for the National Assembly held on May 1965, the party, whose name had been changed to Mauritanian People's Party (Parti du Peuple Mouritanian, Hish al-gla'b), won all 40 seats; it obtained 445,644 votes or 92.1% of the 447,660 valid votes east (out of a total of 482,305 eligible to vote). Such results were repeated in the general elections for the National Assembly, held on 8 August 1971, when the party won all 50 seats, obtaining 502,547, out of 502,945, valid votes cast (nearly 100%). Again, in the general

elections held on 26 October 1975, the party won all 70 seats obtaining 99.9% of all valid votes cast.

In February 1976, Mauritania participated with fourteen other African states, in Agadir, in the establishment of a Union of African Parliaments (Union des parlements africains), whose avowed aim was "to strengthen parliamentary institutions by improving the functions of representative democracy". Mauritania was represented in this body by one of the Union's Vice-Presidents, 'Abd al-'Aziz Sall, President of Mauritania's National Assembly and by Muhammad Fail, who entered the Union's Executive Committee. Mauritania's own parliament, however, was suspended following the July 1978 military coup.

Not much is known about the socio-economic composition of the National Assembly, although the 1965 Assembly reflected the administrative character of the single party; 39 out of the 40 members were civil servants. There is every reason to believe that this group has continued to predominate.

The parliamentary history of Mauritania falls into two periods: until independence, the Assembly was virtually led by the French, who even had a special collège within it to protect the interests of France and French settlers. Since independence, it has been dominated by President Ould Dådda and his single party, generally (although not invariably) serving in a rather docide manner.

Bibliography: The minutes of the debates were published, always in French, as Conseil Gentral, Proces-Verbaux, 1946-52; Assembles Territoriale, Procès-Verbaux, 1952-8; Assemblés Ligislative, Proces-Verbaux, Nouakchott 1959-60; Assemblie Nationale, Journal officiel des débats, Nouakchott, 1960-. (nxiii) Israel.

Israel in one of the few Middle Eastern states with a sizable Muslim minority sharing in its parliamentary life. Upon the establishment of the State, on 14 May 1948, Israel had a population of about 156,000 Arabs, out of some 750,000 people; on 1 October 1978 there were approximately 590,000 (including those in East Jerusalem) out of a total population of 3,708,300. With some variation, the Arabs generally comprised some 70% Muslims, 20% Christians and 10% Druzes (all the above statistics refer to Israel proper and not to territories held by Israel since 1967. Inhabitants of those territories refuse to opt for Israell citizenship and coasequently may not vote in its parliamentary elections),

All Israeli citizens aged 18 and over may vote in elections for Israel's unicameral, 120-seat parliament, the Kinest. Elections are universal, direct, equal, and secret; the entire country is considered as me constituency and voting is by proportional representation, so that every vote counts. Israel's Arabs have indeed participated heavily in all nine general elections held in 1949, 1951, 1955, 1959, 1961, 1965, 1969, 1973, and 1977. In all except the first (1949) and ninth (1977) elections, their participation has been relatively greater than that of Jews, reaching me peak of 92.1% of those eligible to vote in elections for the sixth Kineset (1965). Rural Arab voting has consistently been heavier than urban.

Slates of candidates are usually put forward by the political parties. Arabs, like Jews, vote for the state of their choice, frequently those comprising Arab, or Jewish and Arab, candidates, generally seating between 6 and I Arabs in each Kineset. Arabs connected with the Establishment through left-of-centre parties such as MAPAI [later the Labour Party) and MAPAM have become Deputy Ministers, like Sayf al-DIn al-Zu'bl and 'Abd al-'Azīz al-Zu'bī, or Deputy Speakers of the Kêneset, like Sayf al-Din al-Zubl. Those active in the Communist Party have been prominent in the Opposition, During the past twenty years, Arab electoral support for the Communist Party has increased, probably due to the success of the nationalist Arab image created by this party. The following are the percentages of Arab votes for the Communist Party, out of the total Arab vote, in recent Köneset electious: 1959 - 10%; 1961 - 22%; 1965 - 23%; 1969 -

29%; 1973-33% (about 48,000 votes); 1977 48% (about 70,000 votes). This party, formerly strongly principally among Christians, has made considerable inroads among Muslims and Druzes in recent years. As aresult, its representatives in the Kineset have increasingly claimed to speak for all Israel's Arabs and have frequently insisted upon using the Arabic language there (Israel has two official languages—Hebrew and Arabic).

Most (although not all) of the Arab Kenesel Members connected with the Establishment have been farmers; one was Bedouin shayhh. Those voted in Communists, however, have generally been townspeople. All have been—or have become—professional politicians. The education level of Arab Kenesel Members, like that of Jewish ones, has risen from one legislature to the next; the Arab contingent has increasingly comprised journalists

and writers.

Bibliography: The deliberations of the Kineset are published, verbatim, in the Digrey ha-Këneset, in Hebrew; and in Mahadir al-Kniset, in Arabic. The laws passed there - printed, in Hebrew, in Sefer ka-Hubbim; in Arabic, in Kitab al-Kawanin; and, in English, in the Laws of the State of Israel. The immediate results of parliamentary elections are published by the Central Bureau of Statistics, Jerusalem, in Riskumot -Yalkuş ha-Pirsumim and, later, in detail, in special volumes entitled Results of election to the Knesset (Hebrew and English). (axiv) Cyprus

Cyprus is another Middle Eastern state with a large Muslim minority; although estimates vary, the Turkish community there numbers close to 20% of the island's inhabitants—the second largest after the Greek community.

The Island was a part of the Ottoman Enipire from 1571 to 1878. One of the first measures of the British, after they had taken over Cyprus in 1878. to institute some form of representation for its inhabitants. Their first experiment, in August 1878, was m nominated Council of 4 to 8 members, with official and unofficial appointees in equal numbers. Soon, however, in the March 1882 Constitution, promulgated by an Order in Council, a more representative Legislation Council was appointed. This could initiate discussion in certain matters, although some financial matters were not within its competence. The Legislative Council comprised ra elected members (o Greeks and 3 Turks) and 6 appointed members, generally officials, with the British High Commissioner or another senior official presiding and having a casting vote in case of a tie. The members were elected within their respective communities. On 6 February, 1925, the membership was increased to 24: 12 Greeks, 3 Turks, and 9 officials. The British intention appears to have been to 🔤 able to offset = collective vote of the Greek majority against the Turkish community. In practice, however, the British officials voted almost regularly together with the Turkish members. This led to no little frustration on the Greek side and to its increasingly introducing extreme politics into the Council, chiefly in its support for Enosis, which the Turks (with frequent British support) opposed with equal determination. Consequently, the Legislative Council, instead of serving for accommodation, sharpened the inter-communal coullict; instead of being a training ground for self-government, it promoted inter-communal strife. The fact that three languages were officially used (English, Greek and Turkish) was no help, either. On 12 November 1931, following disturbances on the island, the Legislative Council was dissolved, all legislative authority being vested since in the Governor, aided by a six-man Executive Council. As from 1933, the Governor was assisted by a handpicked Advisory Council of five Cypriots-4 Greeks and a Turk, nominated and merely consultative.

After the end of the Second World War, the British appeared to be more inclined towards granting the Cypriots limited self-government. A Constituent Assembly was convoked by the British on Il November 1947, to discuss Il new constitution. Of the 40 invited, only 18 attended, including 7 Turks and 1 Maroutte; because of Greek Cypriot opposition, within the Assembly and without (and some Turkish Cypriot reservations, too), the Assembly was dis-

solved on 12 August 1948, with the matter left pending. In 1954, 1956, and 1958, mm British proposals for a constitution for Cyprus were rejected by the Greek Cypriots.

The Zürich Agreement of February 1959 and its ratification in the London Conference of February 1960 provided | legal and constitutional basis for the Republic of Cyprus. The 1960 Constitution has a marked bi-communal character, institutionalising and legitimising Greek Cypriot and Turkish Cypriot interests. It ensures bl-communal participation on all levels of government, at a ratio of 70% for the Greek, and 30% for the Turkish community. The Cabinet has 7 Greek, and 3 Turkish, Cypriots-who may be Members of the House. Legislative authority wested in a House of Representatives, elected for five years; it is made up of 35 Greek Cypriots and 25 Turkish Cypriots, elected within their communities. The Speaker of the House is a Greek Cypriot, the Deputy Speaker | Turkish Cypriot. While the President of the Republic (a Greek) m the Vice-President (a Turk) alone may initiate financial bills, the House discusses them. The House's powers are limited further by the absolute right of veto of the President and Vice President in foreign affairs, defence and security, well by the establishment of separate communal Chambers of the Greek Cypriots and the Turkish Cypriots, which have competence in all religious, cultural and educational matters, and by the decisions of the communal courts in matters of personal status. Both Greek and

The first House of Representatives according to the pre-independence Electoral Law of 3r December 1959, in multi-member constituencies; each community voted only for its own candidates. The first elections the House of Representatives were held on 3r July 1960. Those to the Communal Chambers were held on 7 August; the Turkish Cypriots elected, to all the 15 scats of their Chamber, the National Front of Fazil Küçük.

Turkish are official languages.

From the start, Turkish Cypriots stood fast for protecting their constitutional rights, while the Greek Cypriots argued that their rivals were taking an unfair advantage of the constitution. Constant friction continued in the House and other levels of government, sometimes reaching crisis dimensions, As with the Legislative Council a generation earlier, the House of Representatives served to emphasise discord rather than accommodate conflict. Without the moderating British presence, however, legislation slowed down frequently and policy debates turned to bickering. Deadlock sometimes ensued, and in November 1963 Makarios, the State President, proposed various constitutional amendments; the main ones were to **a** away with the separate voting of Greeks and Turks in passing certain laws, and to abolish the privilege of the State President and Vice-President, separately, of vetoing legislation. The amendments were energetically rejected by the Turkish Cypriots, who argued that the amendments would undermine the régime. When disturbances, late in 1963 and early in 1964, prevented the Turkish Cypriots from attending the House, the Greek Cypriots passed the above amendment, anyway, on 23 July 1965, modifying also the 1959 Electoral Law to make voting general, instead of by communities. The Turkish Cypriots rejected all the above and the joint House of Representatives ceased to exist, becoming a Greek Cypriot body. The Turkish Cypriots reacted by boycotting the House and instituting their own "Turkish Cypriot Transitional Administration" (December 1967).

MADILIS

General elections for the House of Representatives were hald on 5 July 1970 (the former House, elected in 1960 for five years, had had its term prolonged, annually, by Presidential decree). The Turkish Cypriots, on the same day, elected their rs Representatives to the House, These, however, continued to boycott the House and, together with the 15 Members of the Turkish Cypriot Communal Chamber, formed a joint 30-Member Chamber, part of the Turkish Cypriot Transitional Administration. After Turkey's military intervention in July 1974, an Autonomous Turkish Cypriot Administration was established, with an Executive Council and a Legislative Assembly. Following the decision, on 13 February 1975, to create a Turkish Cypriot Federated State in the whole area under Turkish control, ■ 50-Member Constituent Assembly (Kurucu Mecks) we elected in the same month, comprising 25 Members III the joint Chamber and another 25 Members selected by various organisations. This body prepared m new, separate constitution for the Turkish Cypriot Federated State, which was approved with a large majority, by a popular referendum, on I June. Elections for the President and for the first 40-Member Legislative Assembly (Yasama Meclisi) were held on 20 June 1976. The National Unity Party, led by Raul Denktas, obtained 30 seats, the Communal Liberation Party 6, the Populist Party and the Republican Turkish Party 2 each-

The parliamentary history of the Turkish munity in Cyprus falls into three main parts. Under British rule, the Turkish Cypriots sat—from 1882 until 1931—as a minority group together with the Greek Cypriots — the British, usually voting with the British for what they saw as their special interests. In the independent Republic of Cyprus, from 1960 to 1963, they sat with the Greek Cypriots in a House of Representatives, as a minority group, but with special safeguards for their community. Since 1963, first in their own area in the Republic, later in what they consider the Turkish Cypriot Federated State, they have maintained their own, all-Turk.

representative institutions.

Bibliography: The Public Record Office (London), under CO 59, has the manuscript Minutes of the Legislative Council, 1878-1895, as well as the printed ones, 1895-1930. Information about elections, bills of law, and the laws themselves, issued by "The Officer administering the Government ... with the advice and consent of the Legislative Council", were printed in The Cyprus Gazette (Nicosia). A "schedule" of all the laws appeared annually in the Cyprus Blue Book (Nicosia). The Turkish Communal Chamber-later, the Turkish community-has been publishing, since the early 1960s, a Special News Bulletin (daily, Nicosia). See also W. J. (J. M. LANDAU)

B. In Afchanistan.

Afghänistän has known two distinct types of representative assembly, the divings and the madilis. Their origins, development and functions are quite different and they me best discussed separately.

The direct is a tribal council operating is all levels from the family upwards and reflecting the collective authority of the group over the individual. At the lowest levels its membership comprises all adult males; at higher levels various units are represented by men chosen primarily on the basis of seniority, but also for skill in negotiation or family reputation. Diviga decisions represent a consensus, weighted according to age and reputation. The functions of the divigo embrace all matters, but especially the resolution of disputes within the group and the relations of the group with outside organisation. The authority of the diirgs depends upon the distribution of power within the group concurred. In state affairs, two varieties of disrga were employed. One was the permanent council of chiefs, members of the royal family and other notables, which was consulted frequently on all matters of state business and which offered detailed advice, References to such an institution under various are common from the time of Ahmad Shah Durrani [q.v.] Abdall onwards. The second, usually known as the Loya Dirga, dealt with the most important matters. It was a much larger body, including all men of influence in the region or country, and it was usually summoned to deal with one issue alone and subsequently dismissed. It was called in cases of succession where the legitimacy of the claims of a candidate to the throne were in doubt and where some broad expression of national endorsement was required. In 1747 Ahmad Shah Durrant Abdalt was elected ruler by a direge of Abdali and Ghalzay tribal chiefs and religious figures; in August 1880 Abd al-Rahman [see 'ABD AL-RAHMAN КНАК] 🚃 chosen by an assembly of tribal chiefs; and in February 1919 Aman Allah [q.v. in Suppt.] was proclaimed amir by a gathering of tribal chiefs and notables at Kabul. Bacca-yi Sakaw legitimised his claim to the throne through the "dama" and in March 1929 was challenged by his rival, Nadir Khan, to submit his claim to a national direct of all Afghan tribal chiefs. In September 1930 Nadir Khan himself secured confirmation of his own claim to the throne from Loya Dirga of 286 notables. The Loya Dirga was also used to obtain national approval or confirmation of major policy decisions. According to Munishi Sultan Muhammad, for ordinary purposes "Abd al-Rahman (like his predecessor, Shir 'Ait) employed an advisory council of saiddrs, khans and multis, but in time of war, or other national emergency, 'Abd al-Rabman sought the advice and assistance of a murch larger assembly (Loya Dirga) of notables and mullis. In 1915 Habib Allah [q.v.] was reported to have called a Loya Dirga to discuss Afghan foreign policy during the First World War, although when the ruler determined to adopt an unpopular policy of neutrality he changed the meeting into a great darbds, summoned to hear his decision, not to discuss it. In 1921 Aman Allah summoned a Loya Dilrga, the decision of which formed the justification for the issue | the 1923 constitution, which in turn was submitted to the approval of another Loya Djirga. As well as set-

ting other permanent bodies (including the Darbar-i 'Ait, an assembly of elders chosen in the manner of the Loya Diirgs to review the work of each year), the 1923 constitution provided for the summoning by the ruler at his discretion of a Loya Dilrga. Aman Allah made en of this provision. In July 1924, following the Khôst [q.v.] rebellion, a Loya Djirga was called to amend the constitution; and in August 1928 another one, 1,000 strong, was called for a similar purpose and to hear Aman Allah's plans for reform. In 1941 . Loya Djirga was called to endorse Aighanistan's foreign policy in the Second World War following the Allied demand for the expulsion of German citizens; and in 1949 and 1955 Loya Diirgas (possibly representing only certain tribes) were called in connection with the Pakhtanistan dispute. The constitutions of 1964 and 1977 were also submitted to Loya Dirgas for approval. In keeping with its inclination towards parliamentary democracy, the 1964 constitution considerably reduced the role and importance of the Loya Djirga. The Loya Djirga of January-Pebruary 1977, which considered the new constitution and elected Muhammad Dawild President of the Republic of Afghanistan, provides good evidence of the development of the Loya Djirga and its continuing importance as a major source of legitimation. In the Presidential proclamation of 28 December 1976, which announced the summoning of the Djirge, it was stated that "in accordance with the conventions of society Loya Djirgas in the course of the history of Afghānistān have been convened sensitive and important occasions and have deliberated vital national issues". The Loya Diirga was described m supra-parliamentary body. Article 65 of the 1977 constitution defined the composition of the Loya Djirga, which was represented as "the supreme manifestation of the power and will of its [Aighanistan's] people". The 1977 Loya Dirga consisted of elected representatives, members of the government, members of the central committee of the only political party, the high judicial council, the constitutional drafting committee, military officers, and other persons appointed by Presidential decree. The Dirga sat for twenty-six sessions and made several amendments to the constitution before finally approving it [see further paraga in Suppl., in particular, for the institution 🚃 the Indian side of the Frontier].

The institution of the madikis proper has a much shorter history. Until 1923 Alghanistan knew only consultative councils appointed by the ruler from among the notables. The 1923 constitution provided for three national bodies: - council of ministers; the Darbar-i 'Ail; and an advisory council, half nominated and half elected. The state council was the first Afghan institution which possessed some likeness to a Western parliament, but its role was severaly limited, and it seems to have played an insignificant role in Afghān public life. The 1923 constitution also provided for regional advisory councils, m innovation continued under Nadir Shah. The 1931 constitutions provided for a twochamber Parliament; the Upper House or Madilis-i A'yan consisted of twenty or more flater limited to forty-five) "experienced and far-sighted persons" approved by the king; and the Lower House or Madilis-i Shura-yi Milli consisted of 116 (later 173) representatives elected for a three-year period. In form, the Afghan parliament bore a strong resemblance to the European institutions upon which it was, no doubt, modelled, although in his defence of the constitution Nadir Shah argued (in the manner of

the Islamic modernists from the time of Namik Kamal onwards) that the Aighan Parliament was derived from the early Islamic precept of consultation which, he claimed, had survived in Afghanistan in the form of the dirgs, which he described as "regular governmental channels of the people of Afghānistān". Between 1931 and 1964 eleven Aighān Parliaments met, being chosen every three years as provided in the constitution. With the exception of the seventh, so-called "Liberal Parliament" (1949-52), all functioned as rubber stamps for government policy. The group of liberals in the seventh parliament did attempt to interrogate ministers and agitated for greater parliamentary power, but the government eventually reacted sharply and imprisoned the liberals. Parliament thereafter reverted to its former docile role. The 1964 constitution also provided for a two-chamber parliament, chosen for a tour-year term. The Upper House (Meshrano Diirga) consisted of eighty-four members, partly appointed and partly elected; the Lower House (Wolesi Djirga) consisted of two bundred-and-sixteen elected members, Two Parliaments met during the so-called constitutional period: the first (twelfth) sat from 1965 to 1969 and was notable for the presence of vocilerous radicals in it and for its attacks on the government of the period; and the second (thirteenth) which sat from 1969 to 1973 showed a smaller number of radicals (traditional leaders having apparently decided that membership of Farliament conferred more power than formerly and exerted their influence to obtain election themselves) but maintained mappearance of hostility to the governments, although their criticisms were of a conservative rather than a radical character. Throughout the constitutional period, Parliament saw its role in destructive rather than constructive. The 1973 revolution brought the parliamentary period to an end. The constitution of February 1977 larticles 48-64] provided for a single-chamber parliament (the Milli Djirga) elected for four years from men nominated by the single National Revolution Party (Hisb-i Inhilab-i Milli). Half of the parliamentarians were to be peasants or workers. The Mill Djirga was due to meet for the first time in December 1978, but the April 1978 revolution supervened and, for the time being, has brought to med the experiments of Afghanistan with parliamentary government.

Bibliography: For constitutional aspects, see the bibliography in Dustur: a survey of the constitudions of the Arab and Muslim states, Leiden 1966, 59. An English translation of the constitutions of 14 February 1977 was provided in the Kabul Times III 5 March 1977-16 March 1977 and reprinted by the Afghanistan Council of the Asla Society as Special Occasional Paper . 7. A preliminary draft was published in Kabul Times 29 January 1977, which issue also contained a list of all members of the Loya Djirga. There is no good study of the tribal institution of the djirga. C. In India, Pakistan and Bangladesh.

Under British rule in India, Muslims were involved in two forms of assembly. There were the sessions of the various Muslim organisations, the most important of which were those of the All-India Muslim League, founded in 1906, in which major matters concerning Indian Muslims were discussed and resolutions passed. But for most of its existence the League was not a particularly representative organisation; support was limited in the main to landlords and professional men from provinces where Muslims were in minority, 'alama' refused to join, Muslims preferred to support the Indian National Congress, others supported regional organisations of Hindus and Muslims like the Unionist party in the Pandjab me the Krishak Proja Samiti in Bengal, The League's fundamentally limited appeal emphasised in the general elections to the legislative councils in 1937, when it won a mere ros out of 489 seats reserved for Muslims. Only in the years 1937-47, as the meaning of Congress government was revealed and as the League began to campaign for a Muslim homeland of Pakistan, did the organisation were to win the support of most Muslims and its sessions to embrace their views. The extent of this support was demonstrated in the general elections to the legislative councils in 1945-6, when the Leagus won 439 out of 494 scats reserved for Muslims.

The second form of assembly in which Muslims participated was the system of legislative councils which the British began to introduce in the second half of the 19th century. These operated at two levels, there being a legislative council for the whole of India and a legislative council in each province. When, from the beginning of the 20th century, the British began to make elections the main way of choosing council members, Muslims demanded special to protect them against Hindu majorities, which they feared. Each time the franchise was extended and council powers were increased, that is in 1909, 1919 and 1935, Muslims were given separate electoand, where appropriate, extra seats to take of their "political importance". Each time the result was to raise the Muslim proportion of seats above their proportion of the population where they in a minority, to reduce their number of seats where they formed a large majority of the population, was to destroy the possibility of a majority of seats where they formed a small majority the population, notably in the key provinces of Pandjåb and Bengal. Up ■ 1937, although quick ■ defend Muslim interests when they saw them

threatened, whether it was the matter of moneylending in the Pandiab or local schools in the United Provinces, Muslims did not in general operate in council politics from a specifically Muslim platform, tending to belong to supra-communal groupings of landlords, local interests or nationalists. But all changed after the Indian National Congress formed governments in seven out of eleven provinces following the 1937 elections and the prospect of independence began to loom during World War II. Now Muslims realised that they must either support the Indian nationalist cause or follow the Muslim League. Most chose the latter course. Between September 1942 and March 1947, helped both by the mistakes of me nationalist leadership and the skill of its own, the League was able to form governments in the provinces of Sind, the North-West Frontier Province, Assam, Bengal and the Pandjab.

After the partition of the subcontinent, 40 million Muslims remained scattered in minorities throughout the provinces (now known as states) of independent India, except in Kashmir where they formed a large majority. The new indian constitution, promulgated in 1950, abolished the old Muslim safeguards of separate electorates and reserved seats; the law forbade any political appeals in the basis of religion. Nevertheless, distinctively Muslim political parties persisted; the relics of the pre-independence Muslim League survived in Kerala and spread to the northern states in the 1960s; in 1957 the Madilts Ittibad al-Muslimin revived in Hyderabad and a decade later was petitioning the Government of India for the foundation of a purely Muslim state on India's eastern coast; in 1964 the Madilis-i Mushawarat was formed to press for specifically Muslim concerns through the political system. But, beyond winning a few seats and striking the occasional bargain with other parties at state level, these communal parties had little in promoting Muslim interests or winning large-scale Muslim support. Most Muslims have entered both state assemblies and national Parliament as members of the Congress Party, which | to be seen, among the unsatisfactory alternatives available, as the best protector of Muslim interests. Indeed, so firm has been Muslim support that it has been recognised mone of the main sustainers of Congress dominance in Indian politics since 1947. The weakening of their support is marked down as a major cause of the Congress's defeat in the general elections of 1977; the return of their support as a cause of its victory in the general elections of 1980.

In the Muslim state of Pakistan, we are concerned less with Muslim representation in assemblies than with the fortunes of assemblies themselves. At independence there were the old provincial legislatures inherited from the British period, and these elected a Constituent Assembly whose task was to frame a constitution for the new country and at the same time to act me a national legislature. Framing a constitution proved immensely difficult. Amonest the many problems were those of balancing the claims of East Pakistan, where a majority of the people lived, against those of West Pakistan, and finding an appropriate place for Islam in the country's constitution. The Assembly worked with much rancour and increasing slowness. When in 1954 it moved to curb the powers of the Governor-General, he replied on 24 October of that year by dismissing the Assembly and declaring a state of emergency. In June 1955 the provincial legislature elected a second Constituent Assembly and on 29 February 1956, nearly nine years after independence, the Assembly adopted Pakistan's first constitution which provided for a federal and parliamentary system of government with a strong centre, adult franchise and direct elections. There was to be one house of Parliament and its members were to be divided equally between East and West Pakistan [see DUSTOR xiv]. General elections were proposed for 1958, but they were not held. Politicians squabbled. Faction, violence and corruption were rife. The public lost all respect for political institutions. On 7 October 1956 President Iskandar Mīrzē, under pressure from General Ayyub Khan, declared martial law, abrogated the constitution and dissolved all legislatures. Thus democracy lost its first struggle with authoritarianism in Pakistani life. In the first eleven years of its existence, the National Assembly met for a mere 338 days and passed only 160 laws. For the test of the time, the executive had unrestricted power and issued 376 major ordinances.

Z08t

On 1 March 1962 President Ayyub Khan promulgated a new constitution, which provided for two provincial assemblies, one for East and one for West Pakistan, and a National Assembly of 156 members whose seats were equally divided between the two wings of the country. Members were to melected by a college of 80,000 "Basic Democrats" who had been directly elected by the people. The first meeting of the National Assembly was convened on I June 1962, but from the beginning it met with power(ul opposition in the country. As political parties were forbidden, and as all executive and much legislative power was in the hands of the President, the Assembly seemed less a forum for democracy than a weapon. of dictatorship. Eventually, opposition grew m great that Ayyūb Khān **m** forced to declare martial law in March 1969 and to dissolve the Assembly. Agitation continued. On 25 March 1969 the Commander-in-Chie!, Yahyā Khān, took over power from Ayyūb Khan and abrogated the 1962 constitution. On 28 November 1969 he reaffirmed pledge to restore parliamentary government and announced that general elections would be held on the basis of one man, one vote, in autumn 1970 to elect | National Assembly to draft a constitution. Parity between the East and West wings of the country was now abandoned; on the basis of its population East Pakistan could now control 56% of the seats. On 7 December 1970 Pakistan held its first general elections. The 'Awammi League won 160 out of 262 seats in East Pakistan and therefore had potential majority in the National Assembly. On t March 1971 Yahya Khan, under pressure from the West Pakistani leader, Zulfiqar Ali (Dhu 'l-Fikar 'All) Bhutto, decided to postpone the National Assembly, and events were set moving which led to the transformation of East Pakistan into the new state of Bangiadesh in December 1971.

In 1972 the National Assembly of the now truncated Pakistan began to meet and agreed that the country should have a federal and parliamentary system of government. There must be four provincial assemblies and two houses of Parliament, a National Assembly and a Senate. This, the first constitution framed by a directly elected assembly, was adopted on 10 April 1973 and came into force on 14 August. The National Assembly was dominated by the Pakistan People's Party whose leader. Zulfiqar Ali Bhutto, resigned the presidency of Pakistan to become Prime Minister. In 1977 Mr Bhutto called Pakistan's second general elections for March. His party won 155 of the National Assembly's 200 seats. Soon it became evident that the elections had been

rigged on a huge scale. The nine opposition parties which had coalesced to form the Pakistan National Alliance refused to accept the results, launched a mass movement to press for Mr Bhutto's removal and for fresh elections supervised either by the Judiciary or by the Army. On g July the Army took the leaders of both sides into "protective custody", declared martial law and dishanded the national and provincial assemblies. The Chief Martial Law Administrator, General Zia-ul-Haqq (Diya' al-Hakk) promised elections for M October. They were postponed. He promised elections again for 17 October 1979. They did not take place. Now, General Zla-ul-Haqq has promised to establish a government of people's representatives who are to be chosen through the "Islamic mode".

In Bangladesh, a Constituent Assembly met on 23 March 1972 which comprised those members who had been elected from Bangladesh to the Pakistan National Assembly and the East Pakistan Provincial Assembly in the general elections of 1970. On 4 November 1972 the Assembly adopted a constitution which provided for a Parliament (Jatiya Sangsad) of one house. Three hundred members were to be directly elected by universal adult suffrage, and a further fifteen seats were reserved for women who were to be elected by the members of Parliament. General elections were held on 7 March 1973 in which Shaykh Mulceb-ur-Rahman (Mudjib al-Rahman)'s 'Awammi League won 291 seats. But then, by means of a series of amendments passed between 1973 and 1975. Mulesb-ur-Rahman changed the constitution, creating a presidential and one-party system in which all the powers of government were concentrated in the President, and the power of the legislature to control the executive was virtually destroyed. On 15 August 1975 an army faction killed Shaykh Mujeeb, Martial law em declared, Parliament was dissolved, Shaykh Mujeeb's subversive constitutional amendments were repealed and elections promised for 28 February 1977. These elections were eventually held = 18 February 2979 and produced a majority in Parliament for the Bangladesh National Party, the party of General Zia-ur-Rahman (Diya) al-Rahman), Chief Martial Law Administrator and President.

ROBINSON)

MADJLIS AL-SHURA, the name given to extraordinary, ad hoc consultative assemblies in the last century-and-a-helf or so of the Ottoman empire. While it had long been customary in the Ottoman Empire, and in earlier Islamic states, to hold special consultations about urgent matters [see MASHWARA], such meetings appear to have become especially frequent among the Ottomans between the Russo-Ottoman War of 1182-88/ 1768-74 and, roughly, the abolition of the Janussaries in 1241/1826. Referred to by a variety of synonymous torms, such as medilis-i shurd, dar al-shura, medilis-i meshweret (or müshanere), or endjumen-i meshweret, these assemblies were convened ad hoc as need arose, and included a variable list of high-level officials: the grand wesir, the should til-Islam, the military commanders, top scribal officials, and perhaps others. The place of meeting was also variable: the palace, the Sublime Porte (Bab-t 'all [q.v.]), the headquarters of the sheyhh iil-Islam (bdb-1 maghikkat [q.v.]), military headquarters in the field, or even provincial administrative centres. The increased frequency of such consultations clearly reflected the gravity of the crises of the time; it may have been related, too, to the decline of the old system of diseas (q.c.)-meaning, in Ottoman usage, conciliar bodies, rather than government bureaux. The pattern of convening consultative medifises continued to some degree until the end of the empire (Devereux, 37-8, 45-6, 96-7, 243-4; Davison, Reform, 348-9, 354, 356, 353, 368, 393-4;

Pakalin, OTD, iii, 361; Findley, 245).

Ottoman histories of the late 18th and early 19th centuries provide many accounts of consultative medilises [e.g. Wāsll, i, 99-102, 175-7, 316-9; ii, 9-10, 12-4, 18-9, 21-2, 46-7, 85-6, 204-5, 135-6, 175-6, 221-2, 235, 238-9, 294-6; Shanizade, I, 61-6, 199-201; il, 96-102; ill, 198-9; iv, 2-5, 37-8, 155-8, 201-4; Diewdel, ii, 242-3, 276-8; ili, 35-47, 53-6, 74-5; iv, 154-60, 187-95, 289-91; vi, 52, 53; vii, 28-9; ix, 180-1, 300-2; k, 17-20; xi, 95, 186-7, 272-5; xii, 147-51, 158-9; Mehmed Esfad, 14-15; Lutil, I, 291-2; v, 172; cf. d'Obsson, vii, 228-31; Shaw, Old and new, 73-5). These accounts contain some of the most vivid documentation available for any facet of Ottoman history. Often, they include what purport to be extended quotations from the particlpants. The remarks may be quite heated, and are sometimes expressed in plain language sharply in contrast with the normal style of the author who quoted them. It is not impossible to find different accounts of the same assembly, in which m given remark will be rendered in "plain Turkish" according to one author, and in highflown Ottoman according to another. In recounting an assembly of 1808, for example, Diewdet Pasha commented on the "reckless" (lā-ubāliyāne) way in which 'Alemdar Muştafa Pasha then grand werir, expressed himself. Diewdet went on to quote the 'Alemdar as using the plainest of language to say that his earlier action had been mistaken (gidi<u>sh</u>imiz yolsuz ve bili<u>sh</u>imir yadil<u>sh</u>; Djewdet, ix, 5). Shanlzade's earlier history recounts the same assembly, but there the same remark is "translated" into Ottoman (sülükümüs 'ayn-i khaja' ve fehm-i likādīmīz wehm-i bi-ma'nā olub: Shānizāde, i, 63). At moments like this, senses that the published accounts of the assemblies have their source in minutes that were taken at the meetings, were full enough to record at least some of what was said verbatim, and were preserved in the archives. Wasif seems to confirm this, albeit laconically, in introducing an account of an assembly of 1182/1768-9 with the statement that he was transcribing the 'copy of the assembly" in full (suret-i medilis 'ayul ile bu mahalle hayd olundi: i, 316-7; here, the "copy" itself is sketchy by later standards).

The issues laid before the councils were characteristically ones that the sultan and grand wesir could not decide, or did not wish to take responsibility for deciding, alone. The sessions appear normally to have begun with the reading of instructions from the sultan and other documents relevant to the issue. Discussion would then begin, with the highestranking participants apeaking first. Lesser figures were typically reluctant to speak their minds following of such weight as the grand weste or the केरप्रके धी-Islam. Given the insecurity of officials in relation to the sultan and their superiors, and given the traditionally very narrow scope of consultation, there was reason for hesitancy. Still, it was common to urge the participants to speak, with strong reminders about the sultan's commands for consultation and about the seriousness of the matter under discussion, and with promises not to hold anyone's statements against him after the meeting (Diewdet, ili, 37-8, 332; Iv, 360; vii, 28-9; ix, 302). Such assurances did not allay all fears. Yet lively debate could ensue, particularly when the issue at stake meant the choice between peace unfavourable

terms and war with almost certain prospect of defeat. At such moments, the proceedings could become highly dramatic. The theykh #1-Islam might become so agitated that he would threaten to take a gun in hand and set out on the dishad himself (Shankade, iv, 201; of. Djewdet, iii, 40). The senior military men would answer such effusions with sober talk of what war really meant for a state in the position of the Ottoman Empire (Diewdet, iii, 38, 42). Certainly, one of the tensest consultative assemblies occurred at Topkapi Palace in 1241/1826, just prior to the declaive strike against the Janissaries. With the sultan himself hesitating due to uncertainty ____ the outcome, it was an impassioned speech by one of the participants that incited him to rush into the chamber where the mantle of the Prophet (ht/ska-yi short) [q.n.]) and other relics were kept, bring out the banner of the Prophet, turn it over to the grand weste and sheykh ül-Islam, and thus symbolically faunch the attack (ibid., xii, 158).

In general, the accounts of the medilises of the late 18th and early 19th centuries convey a number of interesting points about what such assemblies were supposed to be and do. On a comparative note, first, it is worth comment that Shantzade 'Ata' Alláh (d. 1242/1826) aiready knew enough about parliamentary institutions to compare the Ottoman consultative assemblies with what sound like bicameral parliaments (Shanizāde, iv, 3). Probably by design, Shanizade onutted references to the legislative function in the assemblies of the "well-ordered states" (diwel-i munistama), but he did give a recognisable account of such features as popular election iii members, majority rule (hukm-raghleb), and membership in two "classes", described m government servants and agents or representatives of the subjects (hhademe-yi dewlet we wilkela?-i rallyyet). This compariof Ottoman assemblies with those of the West is of particular interest as an early illustration of a theme to which later writers often returned [see ag 0x1]. As for Shanlzide, his point in making the comparison was to argue-with appropriate reference to the authority of the sultan and the sunna of the Prophet—that Ottoman assemblies ought not m be as large as those of the states he was describing. He argued that some of those invited to participate in the larger of the Ottomen assemblies had nothing to add to the discussion. In fact, the issue was not so simple. Particularly in the problems at hand grew more threatening, the Ottomans discovered a variety of needs, of which meet reinforced, but others conflicted with, the tradition of a narrow scope of consultation.

One of the first concerns to emerge out of the consultative assemblies of the late 18th century was for greater care in maintaining the confidentiality of proceedings. At first, it appears that there had been little to have the councils meet in closed session (Djewdet, ii, 243) = otherwise maintain secrecy. By the 1780s, however, great had developed over this point. Participants were sometimes made to swear secrecy. Threats were invoked upon those who divulged what they had beard or later criticised decisions they had supported in council (ibid., iii, 35, 43, 332; iv, 188, 360; Vi, 135; X, 18). Mahmud II carried out such a threat on at least occasion, by exiling Kećedjizáde fizzet Mollá, father of the future grand weris Fuad Pasha, for criticising a measure that he had not opposed in

assembly (see fizzer nolli).

Perhaps the most striking procedural trait of the consultative medilises of this period was the demand that the participants arrive their decisions in "unanimity of opinion" (illifat-1 arrive equivalent expressions; Waşif, i, 177, 317; ii, 14, 235; ShānIzāde, i, 62, 64; Diewdet, iii, 28, 43, 333; iv, 360; v, 270; vi, 5, 10; ix, 3; x, 18; xi, 201). "Consensus" would perhaps be a more exact rendering of what me really desired. Still, the idea of "unanimity" is a striking sign of desire to maintain unity of decision me while broadening participation in decision-making. This desire, like the need for secrecy, would have suggested keeping the consultative assemblies small in size.

By the time of Mahmud II, however, there were clearly situations where it seemed necessary to enlarge the councils, or even use them as means for mobilisation of mass opinion. One example of this occurred in 1223/1808, when the grand weste, 'Alemdar Mustafa Pasha, himself one of the provincial a'vdn, held a great assembly in Istanbul, to which he invited not only high officials of the central government, but also other provincial notables, to conclude an agreement between the a yan and the sultan (ShānIrāde, i, 62; Diewdet, fx, 3; Lewis, 75-6; Shaw and Shaw, 1-3). In the 1820s, with the outbreak of the Greek Revolution, there were medilises to which unusually large range of military officers and even such non-officials = the agents (ketkhiida) of various guilds were summoned (Shānizāde, iv, 2, 37, 201); these were the assemblies that Shanizade criticised as being too large. By this time, however, the concerns of the government had clearly extended beyond secret consultation into mass mobilisation of Muslim opinion. The "crowded" (djon iyyabii) assemblies contributed to this purpose by making, or legitimating, decisions that were communicated to the populace through the non-official participants, or by such other means as dispatching circular orders to local officials or sending out public criers [milnād]; Shānlzāde, iii, 203-6; iv, 201-4; Djewdet, xi, 272-5; xii, 159; al-Shihabi, Ta'eikk, i, 102-3).

Appeals to Muslim solidarity are a special fihistration, finally, of perhaps the most important feature of the medilises: the emphasis on Islamic ideals and values. Such appeals were a general theme of traditional Ottoman culture; even so, they appear particularly prominent where the consultative assemblies concerned. It is surely no coincidence that these important assemblies were designated by the mm shara [q.v.] or its derivatives, m that Ottomens were quick to cite hadith in support of the consultations or the procedures followed in them (Shinizāde, iv, 3; Diewdet, iii, 35). More important was the role of the 'silemd' in the modifises, and the taken to verify the conformity of decisions to the short'at (Wasti, i. 317; ii, 13; Shanfzade, iii, 199; iv, 37; Diewdel, lii, 41, 43; Iv, 156, xil, 149-50, 158, 263-6). That the problems confronting the assemblies could challenge the 'uland' in their capacity as legal scholars became clear on at least one occasion when, in 1227/1811, the faiwd emini [q.v.] found that since there was no clear traditional response (naki-i sarih) on an issue, he would have to by analogy (hiyās [q.v.]; Shānizāde, ii, too; ci. Djewdet, iii, 43). The statement is a harbinger of a later theme of Islamic reformism (cf. A. Merad, 151AB, iv. 152-4). A more conspicuous harbinger of the perception, which gradually emerged in the assemblies, that the problems under discussion was threats, not just to the Ottoman state, but ## the "heart of Islam" (beydayi isidmiyye) or the entire Muslim community (diumta-yi timmet-i Muhammad) and would require its combined efforts in response (Shānlzāde, ii, 99-100; iv, 202; Djewdet, z, 19; xi, 273).

During the Tangimat, both this Islamic emphasia and the medilis-s chara itself, quickly faded as features of Ottoman decision-making. The reasons for the decline of the Islamic emphasis must include the political consolidation of the new civil-bureaucratic élite, as well in the alienation of the leading 'ulemá' from policies that it seemed impossible, after the Gulkhane Decree of 1255/1839, to rationalise in terms of defence of the empire as me Islamic state. It is significant in this regard that Djewdet Pasha, who trained as an 'dim prior to his transfer into the civil bureaucracy and who was politically quite conservative, was consistently critical of the capacity of the 'ulema' to contribute to the medilises that we have been discussing. If Diewdet's oploion is debatable for the period before the 1830s, it points to a problem in relations among governmental elites, and to a feature of policy, that was unmistakable thereafter (Diewdet, fii, 38; iv, 195, 261-2; v, 27-35, 231; xii, B2-3; Heyd, 63-96; Findley, 61-3).

As for the apparent decline of the medifis-i third, on the other hand, there are signs that this signifies, not a loss of interest in consultation, but rather an adaptation and institutionalisation of the deliberative medifis in a variety of settings. The fact that the term medifis from this time on virtually supplanted the term Alwan as a designation for conciliar bodies suggests that the frequent medifises of preceding decades indeed form the major link through which the Ottoman diwin tradition evolved into the 19th century.

As early as 1832, then, we find a military council (shard-yl 'sakeri; Levy, 479-89). A key moment in the proliferation of councils occurred in 1838, when, as part of melfort to abolish the grand vizierate and redistribute its powers, Mahmud II set up two councils, the Consultative Assembly of the Sublime Porte (dar-i abara-yi bab-i 'ali) and the Supreme Council | Judicial Ordinances (medilis-i wild-yl akkām-i 'adliyyo'). The latter was supposed, like the imperial diman of earlier times, to | the palace (Luffl, v, 106-8, 178-9; vi, 92-6; Kaynar, 198 (f.; Shaw, Legislative councils, 54-7; Findley, 142). Following Nahmūd's death in e255/e839, the grand vizierate mm quickly restored; and the various ministers (wirle), whom Mahmud had begun to appoint m European example in the mid-1810s, were grouped into a "council of ministers" (medilis-i witheld) or "privy council" (medilis-i khārs). The shaykh ill-Islam also served as a member of the cabinet. Of the two councils created in 1838, only the medilis-i mold-yl ahkām-i 'adliyye survived. It assumed the function of drafting the new legislation called for under the Gülkhane decree. It also served as the highest court for trying cases under the new legislation. Thus the meditis-i wdid embarked on a long evolution, in course of which it turned, in 1868, into the Council of State (shard-yl dewlet [q.v.], later the Danistay of the Turkish Republic). In the late Ottoman period, the council of state was the most important civil administrative body after the council of ministers; it also normally retained toplevel responsibility for administrative justice (Shaw, Legislative councils, 57-84; Findley, 172, 174-6, 247-50, 307-9).

The early history of the meditis-i walk, as well that of the military council created in 1832, also included important steps in the development of Ottoman ideas of conciliar procedure. Procedural

regulations for the medilis-i walk, dating from ca. 1255/1839, began by citing problems experienced in earlier deliberative assemblies. The document went on to require changes such as circulating documents on important issues prior to meetings, requiring those who wished to speak to sign up in advance and speak in order of signing (thus without regard to rank), and-most important-taking decisions by majority approval (ektheriyyet-i drd1), rather than by unanimity. At this point, Western ideas of parliamentary procedure, known in some measure at least since Shanizade, began to be incorporated into Ottoman practice. The fact that a French translation of the new regulations for the medilis-i wälä reached the British embassy almost immediately may be sign of direct European influence on their formulation (Kaynar, 206-8; Levy, 480-1; Findley, 198-9, 385 n. 129).

As the council of state took shape, the Tangimat also witnessed an unprecedented proliferation of smaller, specialised medilises, many of which subsequently disappeared. In part, this is because they served as committees to perform new tasks for which, up to that point, there were no permanent administrative agencies to assume responsibility. Some of the specialised medilises evolved into such agencies. This is clearly how the Ministry of Trade and Agriculture emerged; traits of the pattern also appear in the formation of the Ministry of Justice. In other cases, medilises continued to supplement the regular bureaucratic apparatus where it remained thinly developed (Findley, 176-7, 179, 181, 245, 253). The clearest example of this is the local administrative councils, first created in 1840 and ultimately known as medilis-i idare. These administrative councils were originally intended to supplant the diwars of the kadis, at least in the roles that these had acquired in local administration, as well as the dinains of the provincial governors. Emulation of conciliar institutions created under Muhammad All in Egypt and Syria may also have stimulated the development of the Ottoman local councils [Heidborn, i, 164-6; Macoz, 87-107; Russell, i, 159, 322-3, 325-8; Guys, :43-9; Barker, i, 144-8, 316-7; Davison, Advent, 98 lf.; Inalcik, Tanzimai'ın uygulanması, 623 fl.; idem, Application of the tanzimat, 100-1, 107-10; Kornrumpf, 44-57; Ortaylı, 13 ff, 42 ff.). As organised in 1840, the councils included not only the local officials and religious leaders, but also indirectly-elected representatives of the notables. These councils were thus the first Ottoman governmental institutions to include representatives of the people as a matter of system. In 1261/1845, there was was an experiment-clearly following an Egyptian model-with the convening of a consultative assembly in Istanbul, to which each province of the empire was to send two delegates. The Istanbul assembly of 1845 had no sequel in the years immediately following, but the local administrative councils became permanent fixtures. Since they exercised not only administrative functions, but also local responsibility for cases tried under the new legislation of the Tangimat, they also represented the startingpoint of an important organisational development of a different kind; the emergence of what eventually became the distinct system of nijāmiyya courts [see MARKAMA, 2. The Ottoman Empire excluding Egypt. ii. The Reform era]. Even m the mipdmiyys courts became separate from the local administrative councils, they retained marks of their origins in being known, until the 1860s, medilis or divin, rather than makkeme (Düstür!, i, 610-12, 615-18; Heidborn, i, 226 n. 57), and in continuing until the end to be collegial bodies.

In terms of elaboration of the underlying organisational form, the most important of the organisational progeny of the Ottoman medilis-i shark was the Ottoman parliament. The link to the earlier councils appears both in the Ottoman name for the parliament, medilis-i 'umilmi [see mappus. 4 A. In the Middle East and North Airlea, section il and in the adoption, which Shanlzade had anticipated, of the concepts of shara and meshweret to refer to parliamentary government. The parliament also represented the ultimate extension among the Ottomans of the representative principle first introduced in the total administrative councils. In this sense, whatever the shortcomings of the Ottoman parliaments, their emergence indicates the extent to which the scope of political participation, or at least the demand for it, had continued to broaden since the convocation of the consultative assemblies of the 18th century.

Organisations like the Ottoman medilis-i shire and its derivatives appeared in other Islamic political centres well. In Egypt, Muhammad 'All Pasha was as attached to conciliar deliberation as he was to the centralisation of ultimate decisionmaking. Under him, the development of conciliar institutions advanced to the point that the dimons a term referring in Egypt to administrative bureaux-were sometimes displaced by councils with corresponding functions (Deny, 33-4, 108). This happened with his civil and military councils (medilis-i 'Alt-i mülkiyye, medilis-i dishadiyye). The former of these also known by designations including the terms meditis-i shard or meditis-i meshweret and was in existence from 1240/1824-25 to ca. 1254/ 1838. As with some of the Ottoman councils, the responsibilities of this council included matters of administrative justice (sbid., 108-9; Lane, i, 141-2). Muhammad 'All also had a "cabinet" referred to m the skurd-yi kkapsa (Deny, 109, 151). Beginning in 1245/1829, there was an annual "general assembly", including leading officials, together with provincial notables and the leading "ulema". This assembly was known by a variety of names, such modilis-i 'umumi, diem'iyyet-i 'umumiyya, medilis-i moshword (or shara), and endjumen-i meshwerd (ibid., 110-1). There was also a "comprehensive and regular system of local councils", at least in Syria and Palestine, while they were under Egyptian control in the 1830s (Ma'oz, 90; al-Shihabi, Ta'rikh, Ii, 72; idem, Lubnan, iii, 865; Rustum, li, 358, no. 3204). The local councils of Egyptian-ruled Syria mak have provided a model for the Ottoman local administrative councils. Subsequently, under the Khedive Isma'il (1863-79), when Egypt acquired a "parliament", it was known as the madilis shira ainumerab. It was in fact an advisory assembly of delegates, most of whom were local notables. This assembly did not attempt to assume any active role before 1879 (Deny, 515-7; Schölch, 27-30, 77-88, 93-4, 173-85, 188-96, 207-8, 234; see also MADILIS. 4 A. In the Middle East and North Africa,

Kādjār Iran also eventually acquired consultative assemblies resembling, and to some degree inspired by, those of the Ottoman Empire. Like Mahmād II before him, Naşr al-Din Shāh decided in 1858 to rule without = prime intinister (safr-i a'sam). Instead, he appointed = six-man council of ministers, = well 2s--a year later-two advisory councils, a madilis-i thūrā-pi dowlatī and a larger maslahat-

sections v. Syria, zvi, Egypt.

hidna. Illi were expressly intended to give larger numbers of people a chance to participate in affairs of state (Bakhash, 4). Of these two assemblies, the madilis-i ghūrā-yi datelati had a membership of higher standing and was expected in some sense to make decisions, while the masiakal-hhane was to do little more than generate ideas and recommendations. Much in the earlier Ottoman medilis-i shurd, however, the members of the councils concentrated iguring out the shah's wishes and expressing their opinions in the same terms (ibid., 91-3). It is not clear how long either of these two councils functioned; but by 1871, Nasr al-Din Shah was moved to reinstate the office of sadr-s at sam, assigning it to Miraa Husayn Khan Mushir al-Dawle, ambassador to Istanbul ca. 1859-70 and an important conduit for ideas acquired there (ibid., 43-9). Just prior to this appointment, the shah also created a new deliberative assembly, known as the day alshara-yi hubra, appointing to it a number of individuals who had served in the earlier councils. In 1872, Mushir al-Dawla went on to reorganise the ministries and set up a cabinet, the derbar-i afpam (ibid., 93-4, 96-7).

Over the years that followed, the "cabinet" and the dar al-shara went through many changes. The dar al-shara we best an approximation of the Ottoman council of state (shara-yi danta). Yet it suffered in that both its membership and the purpose of the consultative processes that were supposed to occur in it remained ill-defined. Ten years after the creation of the dar al-shara, its members were still unclear to whether they were empowered to initiate legislation. Not surprisingly, the dar al-shara taded into oblivion in the early 1890s (ibid.,

138, 152-65).

In the long run, then, the development of consultative assemblies proved less extensive in Kādjār Iran than in the Ottoman Empire. It should be noted, however, that the meaning of the term medilis-i shārā eventually expanded in Iran, loo, to refer to parliamentary institutions. By the 1890s, Mirza Maikum Khān [q.v.] was expounding the concept of a "great national consultative assembly" (medilis-i shārā-vi hubrā-vi milli) in his journal Kānān. This was to be a representative body with powers of legislation and budgetary review [ibid., 337-39; cf. Algar, 236]. The Iranian parliament created after the revolution of 1906 was in fact known as the medilis-i shūrā-jimilli [see Madjāts. 4 A. Ist the Middle East and North Africa, section iii, Irani.

MADILISI, MULLI MURANMAD BARIR, knows also as 'Allama MadilisI and MadilisI-yi Thank (1037-1110/1527-98), an authoritative jurist, a most prolific hadily collector, an unprecedentedly influential author in the world of the Twelver Shia. He was also a distinguished expert in bibliog-

raphy, a well-read man in Islamic philosophy and mysticism, and an active authority in politics, social and judicial matters during the late Şafawld period. He belonged to a distinguished clerical family; his father, Muhammad Takl, mostly referred to as Madlisl-yi Awwal [q.v.], his ancestors well as his descendants, have been mentioned among men of knowledge.

Madilisl, in line with his family tradition, became "cager for learning various Islamic sciences and noble branches of arts right from ..., early youth" (Muhammad Bakir Madilisl, Bihar el-anwar, i, Tehran 1887, 3). He successfully studied Islamic subjects such as fish (jurisprudence), usul al-fish (fundamentals of jurisprudence), commentary of the Kur'an, kalam (theology), philosophy, mysticism, etc., under his father and many other professors such as Sayyid Amir Sharaf al-Din al-Husayni al-Shülastäni (d. 1060/1650) and Hasan 'All al-Tustari (d. 1075/1664); the names of eighteen of his teachers and other authorities who granted him certain certificates are given in Husayn Nuri, al-Fayd al-hudsi fi tardjama al-'Allama al-Madilisi, Tehran 1887, za-za (attached to the first volume of the old edition of the Bibar). At a certain point in life, however, Madilisi decided to abandon all those fields of knowledge which had then become popular, and to concentrate only on the study of prophetic traditions which were, in his belief, beneficial for him in the bereafter, though they had then a depressed market (kāsid) (Bihār, i, 4).

Henceforth, Madilisi devoted the most part of his life not only to lecturing on the Shiff subjects to the students, whose number at times exceeded one thousand (ai-Fayd, 13-8; in this book, only forty-nine of them are introduced with some hibliographical information), but also to collecting the scattered and forgotten Shi'l hadiths and to compilling them into various Arabic and Persian books. His main work in this field is the immensely voluminous Arabic book Bihār al-anuar whose outline he sketched out in 1970/1959 and completed its compilation ca. 1106/1694. He also wrote books in Persian, mumber of these being translations of different sections of the Bibar. His aim in writing in Persian, as he bimself repeatedly mentioned, was to make the prophetic traditions easily accessible to "the masses of believers and common Shifa" who had "no familiarity with the Arabic language", hoping that his works "may give life to the hearts and spirits of the dead-hearted people" (Muhammad Bäkir Madilial, 'Ayn al-hayat, Tehran 1952, 4). In his efforts, in fact, Madilisi un quite successful because his Hath al-yakin alone reportedly converted 20,000 of the Syrian Sunnie to Shiffsm (Muhammad b. Sulayman Tunakabuni, Kişaş al-'ulama', Tehran n.d., 2051.

Madilisi had very close relations with at least two of the Safawid monarchs, Shāh Sulaymān (d. 1106/1694) and Sultān Husayn (d. 1125/1713). In compiling his book, he received effective financial and other types ill support from them, and in return he praised those rulers and dedicated several of his books to them. In reference, for instance, to Shāh Sulaymān, he used many phrases of ill hyperbolic nature (Muhammad Bāķir Madilisi, Haydt al-kulāb, i. 1869, 3; the second volume of this book is translated into English by James L. Merrick under the title of The life and religion of Mohammad as contained in the Shee'ah tradition of the Hydl-ul-kuloob, Boston 1850]. He used also highly eulogistic expressions for Sultān Husayn (1806, for instance,

Muhammad Magilisi, Zdd al-ma'dd, 1903, 2-3). In 1008/1686. Madilisl was appointed as the officlat Shaykh al-Islam by Shah Sulayman. Madilisl's title was changed to Mulidbashs on Sultan Husayn's accession to the throne in 1106/1694. While bolding these highest, institutionalised clerical offices, Madilisi "personally undertook all proceedings of law and legal matters" (Husayn Nori, Musiadrak al-wasā'il wa-musianbaj al-masā'il, iii, Tehran 1903, 408). He used his power and influence to suppress anything which appeared to him as heresy and infidelity. He ordered the Indian idols of Isfahān tobe demolished in 1098/1686 (al-Fayd, 3) and "suppressed the agressors and transgressors who were adherents of sectarianism and innovation, and were enemies [of the right religion], especially the heretic Sülls" (Yüsuf Bahrani, Lu?lu'at al-bahrayn fü 'I-ididaat wa-taradiim ridial, Nadiat o.d., 55). These "aggressors and transgressors" also included Zoroastrians and the Sunnis (L. Lockhart, The fall of the Safari dynasty and the Afghan occupation of Persia, Cambridge 1958, chs. 3-4, 6).

During the last four years of his state position. under Sultan Husayn, Madilisi was practically the actual ruler of Iran. With his vast power and influence in the country, he undertook so strict a religious policy against the Sunnis that, in some authors' opinion, it expedited the Aighan invasion of Iran in 1135/1722 (cf. inter also Hamid Algar, Shisism and Iran in the eighteenth contury, in T. Natf and R. Owen (eds.), Studies in eighteenth contary Itlamic history, London and Amsterdam 1977, 288-302, 400-3). It II Interesting to note that Madilisi wrote his famous Bakk al-yakin when the execution of his anti-SunnI policy was about to reach its culmination. In this book, written one year before Madilisi's death (1110/1697), he clearly declared the first three Sunni caliphs, i.e. Abu Bakr, 'Umar and 'Uthman, to be hypocrites and unbelievers who deserved God's curse (Tebran 1958, 154-278, 519, and passim).

There is no doubt that the culture and tradition. of Twelver Shiftsm enjoyed an unprecedented florescence through Madilist's efforts, and the influence of his teachings and practices on later generations common believers as well as derical circles and leaders-is undeniable. One of Madilist's fundamental teachings is that the Shira should have full respect for the rulers. He emphatically warns that anyone "who despises the kings" will suffer abasement; he says that "one who does not obey the kings, has not in fact obeyed God". He also reminds his audience that "the hearts of the kings and those of all mankind are in the hands of God; one must have regard for all tyrannical kings and other oppressors, and it is even compulsory to exercise dissimulation before them, to prevent [oneself] from their harms, and to expose [oneself] to their wrath" (Aym al-haydt, 560-?).

Among the distingulahed clerical leaders who, following Madiliel's teachings, had regard for the tyrannical kings by not opposing their oppressive rule and never despising them was Shaykh Murtadā Anṣāri (d. 1281/1864) [q.v. in Suppl.], whose aloofness from state affairs to have been taken as a sign of his asceticism (Hasan Khān Shaykh Djāniri Anṣāri, Ta'rīkh-i Isfahān va Ray hama-yi diahān, Tehran 1943). One may also mention Shaykh Muhammad Tekt Iṣfahān, known as Āka Nadjalī (d. 1332/1913) [q.v. Suppl.) a good exampte of those Shifi religious leaders who followed Madjiisī's pattern of strict religious policy by putting heavy

pressures upon religious minorities in Iran (cf. inter alia Abdul-Hadi Hairi, art. Aga Nafafi, to appear in Encyclopaedia Iranica). It is not, therefore, unexpected to see that the latter cleric made strenuous efforts to propagate in favour of Madilist's ideas by translating into Persian, summarising and publishing several volumes of Madilist's books (Khanbaba Mushar, Mu'allifin-i kutub-i tapl-yi fársi va 'arabi az agház-i čáp id kunün, il, Tehran 1961, nos. 198-203).

Madilisi's thoughts, teachings, and practices, however popular and influential, have not been secure from the criticism made by a number of Shift religious thinkers since Madilisl's time. MIr Lawh! [q.v.] for instance, accuses him of the distortion of the sense of some hadiths, and suggests its reason to have been either ignorance or wordly interests (Muhammad Mir Lawhi, Kifayat al-muhtadi fi ma'rifat al-Mahdi, ms., no. 1121, Faculty of Theology, Mashhad, 21-2). 'Abd al-Hayy, another contemporary of Madilisi, criticised him particularly over the Friday Prayer which Madilist and his father had revived (Muhammad Bāķir Kh"ānsārī, Rawddt al-djannāt fi ahwal al-sulamā' wa al-sadāt, Tehran 1947, 131) and which 'Abd al-Hayy, inter alies, believed that in the absence of the Twelfth Shl'i Imam should not be performed. He also criticised Madilisl because "he authorised every imbecile and wicked person to transmit hadith on Madilisi's authority" ('Abd al-Hayy Radawi Kashani, Hadikat el-Sara, Arabic ms., Madilis Library, no. 3770, p. 110]. A Persian Suff of the Kadjar period believed that Madjlish was inconsistent in his ideas (Muhammad Ma'sum Shirazi Ma'şûm 'All Shah, Tara'il al-haha'ih, i, Tehran 1960, 279 ff.). In reference to some of the hediths, quoted from Bihar, which indicate the Shiff Imams' humiliation at the bands of contemporary caliphs, - Persian author of our time writes that if any person trusting Madilist bappened to read some of Madilisl's writings he (or she) would certainly lose his (or her) belief in the ShIT Imamate. This author is deeply disturbed by the fact that the custodians of Shi'lsm have been able to tolerate and pass in silence over these types of "terrifying insults" that Madilisl has reported against the infallible Shiff Imāms ('All Sharlfati, Taghayyu'-i 'Alawi va taghayyu'-i Şafawi, Tehran 1971, 189-99).

Since the late 19th century, Iran has experienced a number of anti-government movements, all of which were led by the clerical leaders. The 'nlamd's active participation in the Persian Constitutional Revolution of 1906-11/1324-9 (Abdul-Hadi Hairi, Sheism and constitutionalism in Iran: a study of the role played by the Persian residents of Iraq in Iranian politics, Leiden 1977) and their unquestionable leadership in the Islamic Revolution of 1979 (Hamld Rühani, Barrasi va takilli az nahdat-i Imám Khumayni day Irdn, Kum 1979) were certainly in sharp contradiction with Madilisl's teachings. Although the Sulama, rose against the political establishments in these revolutions, they man in reality, may say, to have revolted against the legitimacy of many

of the legacies of Madilisi.

Bibliography: No comprehensive and critical study of Maditisi's life and work seems to have been yet undertaken. The most informative available biography of Madibist is al-Fayd, written in 1302/1884 and mainly based on Ahmad b, Muhammad 'All Bihbahānl's work still in manuscript entitled Mir'dt al-ahudl-i gjahan namd, Persian ms., Madilis Library, no. 5551; this valuable, original book, written between 1220/1796 and

1225/1810, E skilfulty outlined in Abdol Hossein Haeri, Fihrist-i kitābkhāna-yi madilis-i skūrāyi milli, xvii, Tehran 1909, 6-19. Madilisl's own books may well be rated as **mil** best sources m information concerning his thought m well as his links with the Safawid monarchs. Over 50 Fersian books as ascribed Magilist, and 23 Arabic books are also listed under his name, all In al-Fayd, 6-9. Madjlisl's major work III the Bibar, which was first published in twenty-five large volumes in Tehran in 1305-15/1887-97, and a new edition of it has recently appeared in zzo volumes (Tehran 1956-72). This edition, however readable, finely printed and handily accessible, is not only devoid of any notably valuable editorial work, but since - pagination of the old edition is given in the new edition, the researcher has to face certain difficulties in collating the references to and quotations from the old edition with the sees one. An extremely useful alphabetically-arranged guide to the Bihar is 'Abbas Kumml's Saftnat al-bihde wa-madinat al-hiham -"I-diadr, i-ii, 1943, but its abbreviation systems apply only to the old edition. Some of Madilisl's books have been translated into other Islamic languages; many of his books have also been published, but only forty-five of them are listed in Mushar, Mu'allifin, il, nos. 23-42.

(ABBUL-HAD! HAIRI) MADJLISI-YI AWWAL, MURAMMAD (1003-70/1594-1659), a prominent Shiff religious leader and author of the Safawid period.

Originally, he was on his mother's side from

Diabal Amil (southern Lebanon) because, according to his son Muhammad Bāķir Madilisl [q.v.], Darwish Muhammad b. Hasan al-Amili, a great muditakid of Diabal Amil, was his maternal grandfather (Muhammad b. 'All Ardabill, Diami' al-rumdt, ii, Tehran n.d., 351); the latter was also called Natansi from his stay in Natanz, north of Isfahan, for a certain period of time (Mubsin al-Amin al-Rusayn) al-'Amill, A'yan al-Shi'a, xxx, Damoscus 1949, 371-3). Muhammed Bākir Kh ansāri [q.v.] has held that Madilist-vi Awwal's place of origin also on his father's side was Diabal 'Amil because Shoykh 'Abd Allah b. Djabir, a muditahid from the same region, is his paternal cousin. This view, however logical and acceptable, seems difficult to combine with the fact that Madlisi-yl Awwal's son and great grandson claimed descent from Abb Nusaym Ahmad b. 'Abd Allah of Isfahan (d. 430/1038) (Rawdet al-diennet fl aheedt al-'nlame) = 'l-sedet, Tehran 1947, 74-5, 130; see also Nama-yi danizhwaran-i nasirt dar sharh-i hal-i shishsad tan m danichmandan-i nami, vii, Kum n.d., 1-21). At any rate, he himself was born in Ardastan, north-east of Isfahan, and brought up and lived in Isfahan (Wallkuli Shāmlū, Kişaş al-Khāhāni, photographed ma., no, 69, Faculty of Theology, Mashhad, 370); and owing to the above-mentioned personal and familial background, he sometimes called himself "al-Istahani al-Natanzi al-'Amili' (Mubammad Taki Mudilist, Laudmi'i şahibbirani, i, Tehran 1913, 363).

Having been born into such clerically distinguished family, he began his religious education very early in life. He himself writes that at the age of four he knew about God, prayers, paradise and hell, and used to preach to children according to the verses of the Kur'an and passages of the haditas which his father had taught him (MadilisI-yi Awwal, Laudmi', new edition, Tehran n.d., i, 903). He studied with remarkable steadiness under a number of teachers, including Bahā' al-Din al-'Āmili and 'Abd Allab b. Husayn Shushtart. He writes, at the of sixty: "I spent over fifty years of my life in doing research on the traditions of the Prophet (Muhammad) and me those of the infallable lanams ... First of all, I read the ordinary books written m theology [kaldm), fundamentals of Islamic jurisprudence (usul), and jurisprudence (fibh); secondly, I studied whatever [works] our Twelver "uland" and others had compiled" (Muhammad 'Ali Kashmiri, Nudiūm al-samd' fi tarādiim al-tulamā', Kura 1974, 61). Madilisi-yi Awwal seems to have begun to be exceptionally prolific towards the end of that fifty-year period, because he wrote his voluminous work Rawfal al-muliable within approximately two years, i.e. from es. 1063/1652 to 1064/1653 (Nudjum, 63; cf. also Muhammad Taki Madilisi, Rowdat al-muttakin si shark man ta yahduruh al-sakih, 1973, i, 1-3; this book is being published in many volumes, the twelfth of which appeared in 1979), and translated a substantial portion of it into Persian during the years 1065/1654-1066/1655 (Landmi', i, 363, and ii, Tehran 1906, 409).

Madilisi-yl Awwal has been recognised as of the outstanding ShII muditabide who, after the accession of the Saiswids to power, began to promulgate the ShII hadilis, especially in the Persian language. He in fact enjoyed good relations with the Saiswid monarchs. In of his own writings, Madilisi-yl Awwal describes a dream he saw while visiting the shrine city of Nadial. He tells us that in his dream 'All b. Abi Talib urged his immediate

return to Islahan in order to prevent the confusions which 'All told him would follow the death of Shāh 'Abbās I (1038/1528). Madilisī-yi Awwal, therefore, returned to Isfahan a few months earlier than originally planned; the dream was told by one of his friends to Shah 'Abbas's heir to the throne, Sām Mirzā (later Shāh Safi) (Kh *ānsāri, Raudāi, 131) and must have played a role in the strengthening of his ties to Shah Saft (d. 1052/1642). The extent of Madilisi-yi Awwal's intimate friendship with another Safawid monarch, Shah 'Abbas II (d. 1077/1666), be seen by the fact that, upon the latter's request, he translated his Arabic commentary on Ibn Babuwayh's Man la yahduruh alfakih lato Persian. The Arabic title of the book is Rawdat al-muttakin ("The garden of the pions") which addresses itself to the people of piety, whereas Madilisi-yl Awwal not only dedicated the Persian version, with a great deal of highly eulogistic expressions, to the Shah, but also changed its title to Lawami'-i phhibkirant ("The shimmerings of the invincible and just king"), a title that does not honestly represent the contents of the book written on the ShI'l hadiths (Landmit, was edition, i, 4-ro).

Madilisi-yi Awwal has been described by many of his biographers as a Sull, and a number of his books also attest this fact [cf. inter alia, his Taphwih al-salikin, 1893; for a list of his other works, Muhammad 'All Mudarris Tabrizi, Raybanat al-adab fi tarddjim al-ma'rdfin bi 'l-hunya aw allațab, iii, Tehran 1950, 460-2). However, his famous son, Muhammad Bäkir, and many other authors who considered Sulism as heresy, have attempted to exonerate him from any truly mystical ideas or practices, and some of them have questioned the authenticity of Madilisl-yi Awwal's authorship of those mystical books which have been ascribed to him (Nudiùm, 59-64). Muhammad Bāķir writes that his father had close associations with the SQEs during the early part of his life and that he tactically pretended to be a Suit in order III lead them to the right path. Towards the end of his ille, however, he found his efforts to have been useless and henceforth he openly turned against the Sulls and even declared them unbelievers (Muhammad Bälgir Nadjaff Yazdı, Sharh-i kitab-i iYikadal-i İslam bi balam-i Allama Madilisi, Tehran 1975, 393-4). Muhammad Bakir's statement, however important and thoughtprovoking, may well be questioned by the fact that his father's Lawame, written ■ late = 1065-6/1654-5. that is to say four years before his death, contains many favourable references to Sulism (cf. 1-2, 38, 44, and passim in the new edition of vol. i; for an interesting discussion on this particular subject, consult Muhammad Ma'şüm Shirazi Ma'şüm 'Alī Shab, Tera'ik al-haha'ik, i, Tehran 1960, 258 (l.).

Madilisi-yi Awwal's deep ties to Süfism also demonstrated by the spiritual stages he was known to have attained and by his asceticism, which became proverblai. He, despite his close friendship with a tyrannical ruler such as Shah 'Abbas II, claims to have established certain relations with the Shiff Imams and the Prophet Muhammad, who gave his sanction to the path Magilisi-yi Awwai was pursuing (Lawami', new edition, i, 1-2). With regard in his attitude towards 'All b. Abi Talib, Madilisiyi Awwal points out that while paying wisil to the shrine of 'All in Nadjal and "becoming occupied with an earnest spiritual striving (mudiahadat), many things which weak intellects cannot bear were unveiled to (mukāskafāt) through the blessing of that honourable [Imam]" ('Abbas Kummi, Faud'id al-radawiyya fi ahudi 'ulama' al-madhhab al-dja'fariyya, Tehran 1948, il, 444).

MADJMA' TLMI

(i) ARAB COUNTRIES.

Madima', pl. madiam', lit. "a place of collecting, a place in which people collect, assemble, congregate" (Lane 1/2, 459), became in the second half of the 19th century, as madima' 'timi, a technical term for Academy of Science, madima' al-lughs being an Academy of (Arabic) language. There is thus a close relationship between both kinds of madima', since the striving for science takes place in m Arabic language made capable of it.

Whereas madilis (q.v.) had been the current term in earlier Arab civilisation for (the place of) an informal literary gathering and developed the meaning of "council", madima and sadi came to be used in the second half of the 19th century for private academies and cenacles or clubs which met to discuss language and literature as well as other problems. The rise of such scientific and literary mediamic and namadi is connected with al-Nahda al-'arabiyya, "the Arabic renalssance". The rise of Arabic as an official language in Egypt under the Khedive Isma'll (over against Turkish); its development in Lebanon, Egypt and elsewhere with a new style of writing, expanded vocabulary and simplified grammar, with translations from western languages; the development of journalism with its needs to write in a clear and easily understandable language; the extension of the reading public and its social background; and of the progressive modernisation of thought and its direction towards hitherto unknown subjects and problems: all these and other factors were posing a challenge to the classical Arabic language (al-tarabiyya al-fusha). On the me hand, they gave impulses for its further development; on the other hand, they meant a crisis for the fixed forms which the classical language had taken. These turned out to be inadequate for modern use, and consequently there was a threat to the language. The crisis had a religious aspect, inasmuch as classical Arabic became desacralised and demystified. This was less critical for the Christian than for the Muslim Arabs, whose religious scholars, seeing Arabic = the language of the Kur'an, opposed such a modernisation of the language. Among Muslims, the call for islah or reform in language is consequently parallel to that for islab in religion. It was, however, the modernisation of society itself which finally forced such a modernisation of language. The problem of how to develop Arabic without abandoning the fushe as an essential part of Arabic culture may be considered to have been at the basis of the foundation of madidmit and namadi, which in the beginning were of a private nature. This implied a confrontation between what were called "progressive" and "conservative" views of the Arabic language.

Faris al-Shidyāk appears to have been the first person to suggest founding an academy for the Arabic language (in ca. 1870). The idea was taken up by others and supported and even promoted by journalists who, for professional reasons, were in need of a "modern" Arabic. This call for m academy of language had, hesides its linguistic purposes, political and cultural aspects. It aimed at m rehabilitation of Arabic and the Arabs after three and m half centuries of Turkish domination, and represented the redis-

covery of a common cultural heritage and a common language of discourse. In the nahda, there was a clear parallel between linguistic and political aspirations, which and directed first against the Turks and later against the British and French. Moreover, openness existed towards modern science and instruments of knowledge and their assimilation in Arab society. These aspirations, together with the religious aspects, gave to all discussions on science and language a particular acuteness.

(t) Private madjāmis

Several private madiantic of language and acholarship arose as a consequence, though their existence was short-lived. In Beirut, al-Madima' al-Yimi al-Sharki was established in 1882 with the co-operation of Faris Nime (1856-1952). In Egypt, the Institut d'Égypte founded by Napoleon in Alexandria in 1707 and transferred to Cairo in 1859 stood m the model for different madjamit in Cairo. Thus a madimat existed there in 1892-3 due to the initiative of Shaykh al-Sayyid Tawfik al-Bikri (1870-1933). An equally short existence was enjoyed by Diam'yyat tarkiyat al-lugha al-'arabiyya founded by Ibrahlm al-Yazidi! (1847-1906), Djurdji Zaydan (1861-1914) and Shaykh Muhammad Rashid Rida (1865-1935), Former students of the Dar al-"Ulum, like Hifn! Nasif (1855-1919) and 'Atif Barakat Bey, founded the Nddt Dar al-'Ulam in 1907 with the explicit purpose of "Arabising" foreign words. This circle disappeared, as well = a similar nddl which was founded by Fathi Zaghlūl (1863-1914) around the same time, The same fate overcame the Ladinal al-musicialatal al-cilmiyys tounded by Ahmad Hishmat Pasha when he was Minister of Education, and of which Abmad Zaki Pasha (1860-1934) was prominent member. A madima' founded by Lutil al-Sayvid (1872-1963) [q.v.] in 1927 and presided over first by Shaykh Salim al-Bishr? (1832-1917) and then by Shaykh Abu 'l-Fadl al-Djizāwi (1847-1927) existed from 1917 until 1919 with 28 members, among whom Persian, a Syrian Christian and | Jew. From 1921 to 1925 there existed a madimat in Cairo which was presided over by Idria Raghib Bek. Mansur Fahm! (1886-1939) and Taha Husayn (1889-1973) were counted among its members. It had as its explicit purpose the composition of a modern Arabic dictionary; but this was abandoned in 1925 because of the lack of official support.

(2) Official madjamis

(a) Syria. On ■ June 1919, the Arab government of King Faysal I in Damascus requested Muhammad Kurd 'All to found and organise an Arab Academy which would replace the Shubas diada al-ma'drif which been founded on 2 February 1919. This was an off-shoot of al-shuba al-ald hi 'l-tardjama wa 'I-ta'llf established some two months earlier. The first meeting of al-Madime' al-'Unit al-'Arabi, which had been organised on the model of the Académie Française, took place on 3 July 1929 in Damascus, where it was established in the Madrasa 'Adiliyya. Later, a section was established in Halab (Aleppo). The Academy consisted at that time of eight members and a president, and it administered the Didmi' Suriyya (where courses were given in Arabic) from 17 June 1923 until 15 March 1926. Its constitution (nisdm asdef) was recognised officially on 8 May 1928 and published in vol. 111 (1932) of the Madjalla of the Academy (pp. 765-8); its "house rules" nisam dahhiil) followed - the recognition of the constitution. Constitution and house rules have

subsequently been amended. Administratively, the Academy depends on the Ministry of Education, but it has financial autonomy. In 1960 a fusion took place with the Academy of Arabic Language in Cairo.

Besides the active members (samilan), whose number is fixed at present at fifteen, there are corresponding members (murdsilais) without a fixed number. All members and the president are elected and then appointed by the head of State. Wellknown presidents were Muhammad Kurd 'All (1876-1953), 'Abd al-Kädir al-Maghribl (1868-1956) and Mustala al-Shihabi (1893-1968). The president, vice-president and permanent secretary have the direction of the Academy, The Academy has published the Madjallat al-madjma' al-'ilmi al-'arabi siace Rabit II 1339/January 1921 at first as monthly and since 1949 as a quarterly. Besides the journal, which has a wide scope of interests, the Academy publishes separate articles and text editions. In addition, it organises lectures (muhādarāt) and sends representatives to congresses, etc. abroad. It does not publish special word lists = the Academy in Cairo does. The Academy also administers the Dar al-Kulub al-Arabiyya (al-Zāhiriyya) founded in 1296/2878 in Damascus, the historical Archives and the Museum of Antiquities.

Article One of the constitution of 1928 describes the task of the Academy (Madjalla, xii [1932], 765) as being to guard and perfect the Arabic language, and to research into the history of Syria and the Arabic language. The fuplat and its principles are to be a starting point and norm, since that is the noble language (lugia sharifa) of the Kurlin and of classical literature, and Arabic is the common patrimony of all Arabs. The sims of the Academy are more specifically:

i. To preserve the language (al-muhājaṇa 'alā salāmas al-lugha), in particular from the dialectal language, loreign orthography, archaisms and incoherences;

ii. to protect purity of the language (almuhāfata 'alā fasāhat ai-lugha) against foreign (dalhu) terms and style figures (a'didmi); and

ili. to adapt the language to modern needs.

Bearing these aims in mind, the Academy can be of assistance to authors and translators as far as their use of language is concerned. Unlike the Academy in Cairo, the Academy in Damascus does not consider its decisions with regard to new general scholarly terms to be definite: they preferences [tardithat] or propositions (ithindhat) which are submitted to others. The articles in the Madjalia are published under the responsibility of their authors, not of the Academy.

Most of the work of the Academy is done in committees (lidian), of which three have been in existence since beginning: the administrative committee, the linguistic and literary committee (lading lughawiyya adabiyya), and the scientific and technical committee (ladina filmiyya fanniyya) which has as its task the spreading of science and the arts in Syria. Later, more specialised committees were added: for general principles (al-usul al-amme), for the dictionary (al-mardiam), for the journal (al-madialla). for the neologisms (wade alfa: 'arabiyya diadida), and for the dialects (al-lahadidt). The committees work in closed sessions (dialasat khāssa), either according to plan which is fixed at the annual meeting of the Academy, or in response to a particular problem. As an example of the latter, one could mention the project to anquire about words which are not found in the great Arabic dictionaries (al-halimát ghayr al-hámúsiyya). Representatives of particular professions and groups can be consulted by the committees. Once a year, there is an sanual general meeting, with both closed (dialasit 'amal hhūssa) and plenary (dialasit 'amal 'āmma) sessions where all members together with notable figures (al-a'yān) and men of letters (al-udabā'). In 1960 the name of the Madjalla became Madjallat nadima' al-'arabiyya—Madjallat al-madjma' al-'arabiyya—Madjallat al-madjma' al-'arabiyah albigan,

As to the work which has already bean done, Rachad Hamzaqui characterises attitude of the Academy as trying to maintain the status quo, while introducing reforms where needed. Subjects which have been treated include questions of orthography; (simplification of) grammar; and the banishing of dialectal Arabic. Important work has been performed on modernising the Arabic vocabulary by means of istinbal (resurgence of pure ancient Arabic words). ishtikāh (derivation by means of hipas or analogy conforming to given awads or schemes), next (composition of words) and tarib (borrowing from foreign languages), in this order of precedence. No definite solutions have been offered for the problems of orthography, grammar and dialectal Arabic. The fact that the fusha was taken morm could not but restrict in advance the possibilities and means of the modernisation of language as it was striven after.

(b) Egypt. On the initiative of King Fu'ad I and the Senate (Madilis at-Shuy@kh), the Minister of Education in 1928 requested that three reports be submitted by Lutff al-Sayyid, Ahmad Hafis 'Awad and 'Abd al-'Aziz al-Bishri concerning the creation of an official Academy, and this led to its foundation in 1932. This was accelerated by a previous suggestion made by King Fayşal [of Trak (1883-1933)-who had already established the Academy of Damasous in 1919-presented by Núri al-Sasid to the Islamic Congress held in Jerusalem in December 1931, to establish an Islamic University in Jerusalem as well as an Academy of the Arabic Language in Csiro. The Madima' cl-lughe al-'arabiyya al-malaki was then founded independently by a royal Decree of 14 Sha'ban 1351/13 December 1932, when Muhammad Isa Pasha was Minister of Education in the cabinet of Isma'il Sidki Pagha, which we been in power since the promulgation of the Constitution of 22 October 1930. The text of the constitution of the madima' which was promulgated was modelled on the Academie Française, dating from 1629. Its specific tasks included guarding the integrity of the Arabic language and adapting it to the needs of present-day life. In order to achieve these aims. the Academy was to compose dictionaries and word lists, compile a historical dictionary of the Arabic language, carry out studies - Arabic semanties and study modern Arabic dialects in Egypt and other Arab countries. The Academy was also to treat all those subjects which the Minister of Education submitted to it with the aim of developing the Arabic language. There would be twenty active members on an international basis. The first active members would be nominated directly by the King, Subsequently members would be elected and then nominated by royal decree, or by decree of the head of state. In addition me the active members, there would be corresponding members. The president of the Academy was to be selected by the Minister of Education from a list of three names chosen by a majority of the members, and then nominated by decree of the head of state.

A royal decree of 16 Diumādā II/6 October 1933 appointed the first twenty members: ten Egyptians, among them three Azharites, one Christian and Jewish scholar, five European orientalists and five acholars from other Arab countries. Some opposition came from religious and conservative circles, and in particular, the presence of five orientalists on the list gave rise to fervent discussions. In the press, protests were made against both the methods and the results of the work of the mustashrikan with regard to the Arab-Muslim world; they were also thought to be collaborating with Christian missionaries against whose activities in Egypt # press campaign was carried out. As a result, A. J. Wensinck (1882-1939) was replaced as a member by E. Littmann (1875-1958), Authors like Muhammad Farld Wadidl (Nür al-ıslam, iv [1352 A.H.], 599-607) attacked Wensinck because of his articles on Ibrahim and the Kasba in EII (cf. OM, zili (1933), 394-5). Besides orientalists, Egyptian scholars like Tähä Husayn and 'All 'Abd al-Razik, who had opposed traditional conceptions of language, culture and religion, were also attacked. Seen in wider perspective, attacks orientalists reflect a zeal for total arabisation; though their vast knowledge was recognised, they were not seen as being loyal to the cause of Arabic language and culture and Arab self-affirmation in general during the period concerned. Such attacks notwithstanding, within the Academy the European orientalists-A. Fischer (1865-1949), H.A.R. Gibb (1895-1971), E. Littmann (1875-1958), L. Massignon (1883-1962) and C. A. Nallino (1872-1938) -- worked together successfully with the arabophone scholars, although from 1962 onwards non-Arabs could only be corresponding members of the Academy.

The first session of the Madamas took place on 14 Shawwal 1352/30 January 1934, after which the "house rules" were established and the chief officials were chosen. Presidents successively Muhammad Tawfik Riffat Pasha from 1934 until 1944, Luțfi al-Sayyid from 1945 until 1963, and Taha Husayn as his successor until 1973. Permanent secretaries of the Academy were Mangur Fahmi (2886-1959) from 1934 until 1959, and Ibrahlm Madkiir (b. 1902) from 1960 onwards. The administration is carried out by m administrative director (al-musăkib al-idâri). After 1938, the name of the Academy was Madimo' Fu'dd al-Awwal li 'I-lughe al-'arabiyya. In 1955, this was changed officially into Madima' al-lugha al-'arabiyya, As a result of the Egyptian-Syrian union of 1958, the two Academies of Cairo and Damascus were joined together in 1960. Their new constitution gave internal autonomy, a moral personality (shakksiyya i'tibariyys) and mautonomous budget to the Academy; the Minister of Education, however, became then the supreme president (al-ralis al-alis) of the Academy. Its aims were extended toward unifying scientific terms in Arabic, reviving the Arab heritage of learning and stressing its links with the other cultural heritages of mankind, furthering the development of the language in general and in particular its orthography, and simplifying its grammar. The conclusions reached by the Academy should be applied and brought into practice by the Ministry of Education. Later, the Minister of Culture became Honorary President of the Academy. The number of its members rose to 60: 40 Egyptians and m representatives of other Arab countries. Apart trom its committee meetings, the Madime' holds a weekly meeting for its Egyptian members and annual conference which is also attended by corres-

ponding members from elsewhere. Whereas the first generation of Academicians consisted of man of a broad culture in language and literature, following generations tended to be more specialised in particular fields such as the sciences, mathematics, law, medicine, shart's, history, geography and paychology. As a result, later decisions taken by the Academy could imply more radical innovations. Besides the great general meetings, a madilis almadimat was established to carry out the decisions of the Academy and to divide the work to be done among the committees. The two Academies of Cairo and Damascus received a permanent tariat in Cairo, al-maktab al-dd'im. Notwithstanding the fact that the Académie Française is the model for the Egyptian Academy, there - some interesting differences: the Egyptian Madimat's pan-Arab and also international character, its annual moetings, and its functioning as an Academy not only of language but also of arts and sciences make it comparable to the Institut de France. Its stress on the fushā implies that classical Arab humanism, transmitted by the pure Arabic language, should be conserved.

Most of the actual work is done by special committees: of finances (ladjust al-maliyya), of general principles (l. al-upul al-lamma), of mathematics (l. alrividity (dt), of physical and chemical sciences (l. alfullim al-fabl'typa me 'l-himiyya'), of biology and medicine (i. "ulum al-kayāt = "l-fibb), of social sciences il. al-fulium al-iditimā (iyya), of letters and arts (l. al-dddb wa 'l-funds), of the dictionary (l. almu'djam), of the dialects (I. al-lakadjāi), of the journal (I. si-madjalla) and of the library (I. bhisanat al-kutub). In their sessions, specialists in various fields we be invited a experts whenever a Academicians are not sufficiently competent. As the number of specialisations has grown, the number of committees has increased and sub-committees have been founded where needed, well technical committees. The committees submit annual reports to the President of the Academy; they should keep moreover records of their meetings (manddir al-dialacat). The conclusions of the committees are provisional until they have been presented to and adopted by the general meeting of the Madima'. Members can publish their work outside the responsibility of their committee or of the Academy; a special part of the Madialla is reserved for this purpose. The Minister of Education always been very much alert as to the consequences of the decisions taken by the Madimac for schoolbooks.

Special mention should be made of the precious collection of pards (gissaid) which have been prepared for the historical dictionary and for the dictionary of technical and scientific terms. Massignon used to lay great stress = this project and the need for a correct organisation of the cards, but it took some time before the system me introduced. August Fischer, whose project of a historical dictionary of the Arabic language was officially accepted by the Academy in 1938, made some 100,000 cards of his private collection available, which were transported from Leipzig to Cairo, but were neglected after his death in 1949. The cards for the scientific dictionary and for the historical dictionary have been differently organised; they have been placed in rooms not accessible for the public, and apparently they have been filled out only partially. In 1948 an office of registration (makteo al-tasgiil) was established with the task of classifying all terms accepted by the

Academy.

The Academy has acted as patron for certain works and book publications, and it has given awards to certain manuscripts of quality which could be published as moonsequence. The Academy has minternational audience and merpresented at International conferences dealing with the Arabic language. It has contributed to the organisation of the Union of Arab Academies and to that of the Arab Scientific Union.

In its efforts to adapt the Arabic language to the demands and needs of modern times, it has paid attention primarily to problems of vocabulary and, in particular, to the creation of neologisms. Studies of grammar and especially of morphology serve in part to facilitate this work and to contribute to the making of modern dictionaries. Compared with this, studies on orthography, phonetics, dialects, syntax and stylistics have been less prominent. Work has concentrated on semantics and the grammar of the fuskd; the conservative members have always tended to defend at all costs the integrity and parity of the language. Members try to avoid an accumulation of synonyms. The rule has been established prefer whenever possible one term to two or more if a neologism has to be made, or otherwise-if it is not possible to find one Arabic term-to proceed by means of a literal translation of the foreign term. Another rule is to study anything which could simplify Arabic writing as well as the rules of syntax and morphology. In particular, the Ministry of Education stresses the need for simplification of grammar. The interest taken in dialect studies derives from the desire better to know the Jusha, so that a decision can be taken about the integration of the dialectal Arabic. Attention has been given to the transliteration of foreign words, starting with geographical Throughout the discussions, the history of Arabic grammar, the place of the Kur'an as a norm for the Arabic language, and the role of linguistic norms as such, have come up again and again. Although some attempts have been made to propose a simplification of orthography for the purpose of printing, problems of writing and orthography, like those of phonetics, have hardly been dealt with. Most important has been lexicography (al-mu'diamiyyat) and the technical procedure of composing dictionaries; this has entailed, besides the creation of neologisms, the evaluation of data of classical lexicography. Through its dis-cussions since 1934 the Madina' has established a sort of linguistic idinal for Arabic, though the discussions themselves have taken place in a non-systematic way.

In the conclusion of his study about the Madima' al-lugha al-arabiyya, R. Hamzaoni observes two features by which it distinguishes itself from other academies. In contrast to the Academies of Damascus and Baghdad, it concentrates completely on the Arabic language, and in its decision-making it tries to arrive at a linguistic idima" of its members before giving any authoritative statement. As in the Academy of Damascus, the work of the Academy of Cairo takes its departure from the fugha and aims to ensure a cultural and linguistic continuity from the beginning of Arabic literature until the present day. This often leads to a purist stand, making to defend the 'arabiyya against encroachments by foreign languages, in particular modern western This approach to the modernisation of the Arabic language will of Arabic culture in general leads compromise solutions and the rejection of any radical solutions which may be proposed.

Among the major publications of the Madima' ailugha al-'orabiyya 🚃 al-Mu'djam al-wasil (2 vols., Cairo 1960-1) and Mucdiam alfas al-Kuras (3 vols., Cairo 1953) m dictionaries; five volumes of Makadir al-dislassit (1936-48), four volumes of the subsequent al-Buhülh wa 'i-muhidardi (1959-62) as reports on the work being done and papers read by Academicians; the Madimil'at al-mustalahdi al-'simiyya wa 'lfanniyya, of which eight volumes appeared between 1959 and 1968, and specialised listings 🗐 neologisms created by the Academy for particular fields; finally, the Madiallat madimat al-lughe al-tarabiyya from 1934 onward m the regular journal of the Academy. One special volume published of al-Mu'djam al-lughawi al-ta'rikhi (florf al-kamza ila abad), the project of the historical dictionary initiated by August Fischer but later abandoned (Cairo 1387/1967, 53 pp.). Two specimen volumes were published of the great al-Mu'diam al-lughawi alhabir meant to be an Arabic Larousse Encyclopedique: Harf al-hamea-akki (Cairo 1956, 519 pp.), and Mawadd min hasf al-hamsa (Cairo 1381-2/1962-3. 155 pp. in typescript). Several studies - the Cairo Academy have been published, in is shown in the Bibliography below.

(c) "Iride. The history of al-Madima" al-Ilmi al-Iridei goes back in 1945 when a ladjuat al-Ilmi al-Iridei goes back in 1945 when a ladjuat al-Ilmi multi-landium as "I-madir was established in the Ministry of Education in order to expand the sphere of scientific activities in "Iride and to keep up with such activities in the more developed countries. Due to the initiative of Muhammad Rida al-Shabibt and in collaborators, amongst them Fādil al-Pjamālt, al-Madima" al-Ilmi al-Irāki was founded by the government in 1947 and organised by the Ministry of Education. Its aims were more far-reaching than those of the preceding Committee in mentioned in Article is of the Regulations of the Iraq Academy (no. 62, 26 November 1947): Madjalia, i [1950], 10):

 (i) to maintain the purity of the Arabic Language and seek to adapt it to the demands of the arts and sciences, and of the affairs of modern life;

(ii) to undertake research and writing in the fields of Arabic literature, the history of the Arabs, the history of the peoples of 'Irlk, their languages, sciences, and civilisation;

(iii) to study the part played by the peoples of Islam in the propagation of Arabic culture;

(iv) to maintain in safe-keeping — Arabic scripts and documents, and revive them by publishing them according to the latest scientific methods; and

(v) to undertake research in the modern arts and sciences, encourage original writing and translation in these fields, and promote the spirit of scientific enquiry in the country.

The Madimas clearly wanted to provide an impetus to the scientific mahda in Irāk, as had been the purpose of the Madima' in Damascus, founded after World War I, for the scientific sahda in Syria. On 25 June 1949 (no. 40), ten Articles were promuigated as an Amendment to the Regulations. The first meeting of the Madima' was held on 12 January 1948 and up to 30 June 1930, 66 sessions were held as well as 150 committee sessions. At this stage, there were ten active members, all 'Irakis, At the beginning of 1949, the Madima' was considered to be a government body, and since by law the accumulation of ministrial or parliamentary functions with any other state positions and forbidden, several members had to leave the Academy; later that year Fādil al-Diamāli and Matta 'Akrāwi left Itak on official duty and had to be replaced by others, though they remained honorary members of the Academy. At this stage also, we corresponding members were elected, both among firalif and among Egyptian, Syrian and Lebanese scholars; four western orientalists also became corresponding members, A. Guillaume, H. A. R. Gibb, W. Marçais and L. Massignon.

The activities of the Academy in Bashdad consisted from the beginning both of purely internal activities and of activities directed towards the outside world: giving public lectures, bringing about publications, allocating funds in order to support the publication of books and awarding prizes for essays on particular subjects fixed by the Academy. Since 1950 it has published the Madjallat al-madimas al-filmi al-firakt on a yearly basis, to which Academicians and other scholars have contributed on a number of scholarly subjects. The public lectures organised by the Academy may be published in its Madjalla or separately. Rach issue also contains . number of book reviews. In 1950 the Academy was able to acquire a printing-press. In its internal sessions, the Academy has established a number of new scientific and technical terms which published in part in the Madialla and in part on separate lists sent to various Ministries at their request, It should be noted that 'Irak during the early years did not yet possess a university, the University of Baghdad being established only in 1958. Well-known Presidents of the Academy have been Munit al-Kadi from 1949 onwards, Muhammad Ridā al-Shabibi from 1958 onwards, and Abd al-Razzak Muhyl al-Din since the later sixtles, Yusuf 'Izz al-Din being its permanent secretary since that time. The Law no. 49 of 1963 introduced certain changes the Regulations of the Academy.

The Academy has continued to hold its regular sessions and committee meetings and also to give financial assistance to the publishing of books and to acquire books for its library as well as microfilms of manuscripts. In 1970 the library counted 25,000 books, more than 300 periodicals and some 400 manuscripts on microfilm. It had developed a card-index system, assigned prizes to winners of poetry festivals and participated in inter-Arab conferences - cultural subjects. The Academy also gave its opinion - cultural treaties which 'Irak was concluding with other countries. The Academy was liberal in giving its publications to numerous official institutions and personalities in the country and abroad; it gave assistance to students and acholars, photographed manuscripts from public and private libraries. Members participated in Committees for the Protection of Monuments, for a Translation Programme, etc. At present the Academy has active members (not exceeding lifteen Traki scholars), associate members, honorary members and corresponding members, the last two categories including both Trak! and other nationalities.

(d) Merocco. Although not a madima' in the formal sense of the word, a similar institution in Rabat may be mentioned. After the first Internation.

■ Congress on Arabisation held in Rabat in 1961, a Bureau Permanent de l'Arabisation === established in Rabat and recognised by the League of Arab States in 1968. Subsequently, this became the Bureau de Coordination de l'Arabisation de la Ligue des États Arabes ■ Rabat, which was integrated in the ALESCO (Arab League, == the pattern of ■ regional UNESCO) in 1971, its definite regulations being established in 1973. Since 1964 this Bureau has published al-Ligia al-'arabi, with lists of acclogisms

and further articles of linguistic interest; it also publishes specialised listings of terms in particular fields with the Arabic, French and English equivalents. The members of the Bureau participate in meetings of the Academies in Damascus, Cairo and Baghdad. In its work on the modernisation of the Arabic language, the Bureau de Coordination de l'Arabisation de la Ligue des États Arabes follows less conservative lines than the established Academies and appears to work more efficiently. Finally it should be noted that by a salfr (dahir) of 24 Shawwal 1397/8 October 1977, the king of Morocco created a royal academy (al-Ahádimiya al-malakiyya), which consists of 🔳 members, 30 of which have the Moroccan nationality while 30 are foreign correspondents. The statutes of the academy have been published in al-Bahth al-filmt, xxviii (1398) 1978), 125-44.

A Union of Arab Academies was founded in Cairo

on 30 March 1957, by Decree no. 1319.

(II) IHAW

The establishment of the first Iranian language academy (Fashangisida-i zabda-i Irda) resulted from developments representing two separate but related types of concerns, both stemming from the advent of modernisation in the early 19th century, and resulting in the double nature of the activities of the two academies. These two sets of developments were: (a) the desire for purifying Persian from the foreign (mostly

Arabic) words, and (b) the need for new words created by the introduction of new concepts (technical and general). The history of the language academies and related events can be divided into five periods:

(1) Historical background (up to 1921).

(2) The immediate setting (1921-33). (3) The first Forkangistan (1935-41).

(4) Between the two Farkangistans (1941-70).

(5) The second Farkangisian (1970-

(1) Historical background (up to 2921). to write in a Persian devoid of Arabic words go as far back as at least the 4th/10th century. In recent times, the opposition to foreign words was triggered by nationalism, and was strengthened by the relative loss of the status of Arabic as part of the educational curriculum. The first manifestation of this opposition in recent times appeared in the 19th century, when a number of writers and poets wrote in Fdrsl-yi sara "pure Persian", and some of them promoted it through research on the subject. These efforts continued, and became increasingly more extensive as time went on. During the same century, a new factor was introduced by the need for words to designate concepts brought in by modernisation in ever-increasing numbers. When the two factors overlapped, a three-sided debate developed: Should the new concepts be called (1) by their European names; or (2) by Arabic names (already in use in the Arabic-speaking countries or Ottoman Turkey, or to be coined in Iran itself); = (3) by native Persian words (existing = to be coined)? In practice, (z) was used most often, and (3) least often, especially at the earlier stages. In addition, a number of loan translations were introduced.

(2) The immediate setting (1921-1935). Rida Shah Pahlawi took over the government in 1921, and became king in 1925. Because of the encouragement of nationalism by the me régime, and the emphasis the glories of ancient Iran, the debate on the foreign elements in Persian gained greater prominence. Opposition to loanwords grew and became more serious as their numbers increased. The debate spread to newspapers and journals. The government, and several of its agencies, also became involved, issuing public orders as well 🖿 internal memoranda, forbidding the use of European words and names, and even ordering that Persian writings on store signs should be made more prominent than anything in foreign scripts. Foreign words were considered "worse than a foreign army", their 🚃 a "literary disaster". The subject came up in parliamentary debates, and Rida Shah himself took a direct personal interest.

Rida Shah launched a series of reforms, mostly in the outward aspects of life, and practically all conducive to the importation of Western objects and Western institutions. This resulted in a greater need for new words. The need for coining new terms, often in combination with the interest in purification, led to the formation of a number of groups, which differed in longevity, efficiency, and their impact on the language. The first such group seems to have been the Andjuman-i Ilmi (Scientific Society), formed in the 1920s. In November 1924, the Ministry of War, in consultation with the Ministry of Education, formed a group made up of several high-ranking officers from the Shara-yi All-vi Nijām (Supreme Military Council), as well as civilians from both ministries, charged with coining military terms. The words haudpayed "airplane", Malaban "pilot", furudgah "airport", and others adopted by the group are now well-established in the language. There were other groups. The longest-lived and bestorganised was the Andjuman-i Wade-i Lughdt wa Istilahat-i 'Ilmi (The Committee for Coining Scientific Terms), founded by Dr. Isa Sadik at the Dar al-Mu'allimin-i 'Ali (National Teachers' College), since renamed as Danishsara-vi 'All, of which he had just been appointed dean. This student committee, under a faculty sponsor, adopted a constitution, with a set of principles and guidelines. Active from February-March 1933 to September-October 1040, it adopted about 3,000 terms in all, of which some 400 are said to have become fully-accepted. This committee continued its work even after the establishment of the first Farkangistan.

in 1935, the Ministry of Education founded the Akādimi-yi Tibbi (Medical Academy), whose membership was made up of a number of well-known physicians and scholars. The group passed a constitution which listed to types of activities for itself, including the coining of medical terms. It was this group which adopted the word farkangistan for "academy". (Farkang, originally meaning "politeness, knowledge, education", etc., and also "dictionary". In recent decades, it has come to be used also in the sense of "culture", and in the 1930s it replaced the Arabic Mastrif in the more of the "Ministry of Education". More recently, in the name of the newlyfounded "Ministry of Culture", it has been used in the sense of "culture", and the compound Amarish wa Parvarish has replaced it in the me of the "Ministry | fiducation".)

(3) The first Farhangirlan (1035-41). By 1934. the efforts to purify Persian of its foreign element had acquired the proportions of movement. Starting mostly in periodicals, it spread to the various government offices, and to major department of the Madilis. A widespread hunt was on for "pure" Persian words to replace many common Arabic words. The words were found in dictionaries as well as other sources, including the Skdh-nāma. Articles written in Fdrsi-vi sara were accompanied by glossaries, without which readers would have been at a loss, but nevertheless correspondence in this style was often unintelligible. Difficulties often arose in intra-governmental communication, since each person felt free to use "pure" Persian words which he had found, and there was little or no common ground among the many enthusiasts,

Ridā Shāb Pahlawi visited Turkey in 1934, where movement for purifying Turkish from Arabic and Persian words was afoot, supported by the government of Kemal Atatürk, on whose order the Turkish Linguistic Society had been founded on 12 July 1932 (see section 3. below). Upon Ridi Shih's return to Iran, approached by a number of purification supporters, he ordered a committee to be selected in the Ministry of War to adopt Persian equivalents for military terms. The Army Staff had already adopted native Persian equivalents for a large number of military terms, which had been reported to the king and put in use. These included the words afsar "officer" and artisk "army", both now established terms (and both objectionable from the etymological point of view).

The Ministry of Education, which was opposed to the movement, tried to subvert the new committee. Within a few hours after the committee's first meeting, Prime Minister Muhammad 'All Furush'l, an experienced politician and a respected scholar, and unsympathetic to the cause of purification, recruited for the task by the equally unsympathetic Ministry of Education, suggested to the king that a group of acholars be commissioned to study the matter, and to prepare the way for the establishment

of an academy (farhangistán).

Article II of the constitution specifies the responsibilities of the Farkangistän in twelve items. Items 1, 2, 4-7, deal with collecting, adopting, and coining words. Items 8-11 concern literature. Item 12 calls for "inquiry into the reform of the Persian script". Refarences to purification of Persian are mild, and almost casual: Item 2 states that the words to be chosen "in all domains of life" should be Persian "as much as possible". Item 3 states the responsibilities of the Farkangistän as "pruning (pirástan) from the Persian language inappropriato foreign words".

The Farkangistan held its first moeting = 2 June 1935, chaired by Furughi. Other ordinary (paywasta) members present included Muhammad Taki Bahar [q.v.], 'Ali Akbar Dihkhudā (q.v. in Suppl.), Abu 'l-Hasan Furüghi, Badi' al-Zamān (Furüzāniār), Husaya Gulgulab, 'All Asghar Hikmat, Mahmed Hisabi, Sa'ld Nafisi, 'Abd al-'Azīm Karib, Ghulam Ridā Ra<u>sh</u>īd-Yāsimī, 'Īsā Şādiķ, Şādiķ Ridāzāda Shafak, Husayn Sami'l, Hasan Wuthük, III others. Among members added later were Ibrahlm Pür-Dāwūd, 'All Akbar Siyāsī, 'Abbās Ikbāi Āshtiyānī, Muhammad Hidjāzi, Muhammad Kazwini, Ahmad Bahmanyar and Djaläl al-Din Huma'l. Among the associate (mábasia) members elected at various times were the Iranian novelist Sayyid Muhammad Ali Djamalzāda, and m number of foreigners, including Professors A. Christensen (Denmark), Heari Massé (France), Jan Rypka (Czechoslovakia) and Muhammad Hasan Haykal (Egypt).

The Farkangisian adopted its internal by-laws on 4 August 1935, and later slightly modified them. Other by-laws were adopted later. The internal by-laws called for the establishment of seven committees. Although the designations of these committees, and the description of the tasks of the Farkangistan found in its constitution, set down a wide variety of tasks for it, in practice it spent all of its time and energy in adopting Persian words to replace foreign

words,

According to its constitution, the officers of the Farkangista's consisted of a president, to be appointed by the king, and two vice-presidents and two secretaries elected for two years by a majority of the ordinary members. The first president was Premier Furüght. He resigned as premier in few months later and after that did not attend its meetings. In March-April 1936, Hasan Wughük succeeded him.

Rida Shah was disaatistied with the speed with which the Farkangistan was progressing, and ordered it to be reorganised. This reorganisation took place on 28 April 1938. Several members were added; and three members, including Wuthak and Dihkhuda, man removed. The presidency of the Farkangistan was henceforth to be given to the Minister of Educa-

tion. The first president under the new system was 'All Asghar Hikmat. He was succeeded by Isma'll Mir'at three months later. Mir'at's presidency lasted until September 1941. The committee structure also was changed. Of a total of eight committees, five were charged with colning terms. The work of the Farhangistin was now practically restricted, both officially and in fact, to the coining of terms.

Not everyone was in sympathy with the aims and the activities of the Farhangisian, Indeed, its founder, Furnight, himself apparently became involved in it more to keep those whom he considered extremists from controlling it than to help the purification movement. In fact, in a public lecture he gave a few months after the Farkangistan began work, he tried to correct what he considered mistaken ideas about the organisation's work; e.g. the idea that it was m "word-manufacturing plant", and that its raison d'être "purging Persian of Arabic words completely". In March-April 1937, the Farhangistan published an expanded version of this lecture under the title Piyam ba-Farkangislan ["Message to the Farhangistan"]. Throughout this message, he stressed the importance of Arabic for Persian, and preached moderation in the attempts to purify Persian, and patience in introducing new Persian words and reviving old ones.

The first Farhangistan was active for little more than six years (though it continued to exist on paper until ca. 1956). During this time, it invented, revived and adopted over 2,400 words. These words were widely circulated in the press and III book form. The largest number of the words were technical terms in banking, medicine, zoology, arithmetic, geology, physics, botany, geometry, and government. In addition, it adopted Persian equivalents for Arabic expressions used in Persian; e.g. nameds for diadid al-ibidity "newly built". It also changed some place names, mostly from Arabic or Turkish to Persian; e.g. Muhammara was changed to Khurremshahr, Anzali to Pahlawi. In their forms, the words adopted by the Farkangistan tall into several categories: (a) simple words; augul "parasite"; (b) compounds, e.g. pâyán-náma (from pâyán "end" + náma "letter") "thesis, dissertation (for a college or university degree)"; (c) words made with affixes, e.g. dadgah (from dad "justice" + -gah, a suffix of place) "court"; bdedáski (from báz-, a prefix comparable to the English prefix re- + dath, past stem of the verb "to have") "detention". A few of the Farkangisian words were European loanwords; e.g. min "mine" from French mine, Most of them, bowever, were made up of native Persian elements, and can be classified in several categories: (a) old words revived, e.g. pisishk "physician"; (b) old words given new or specialised meanings, e.g. dawar (originally "judge") "arbitrator", ara ("'value") "[loreign] exchange"; (c) assignment of different meanings to members of a doublet (or triplet, etc.), i.e. the different phonological forms of what me historically a single word, e.g. 4gth! "secret police": agaht "advertisement"; (d) differentiation of meaning among a set of synonyms or near-synonyms, in the geological terms down "epoch"; dawra "peciod"; dawran "era"; ruzgar "age"; (e) in a few instances (mostly in place names), a slight change in the form of an existing word making it more Persian in appearance, e.g. from barantina to karantin "quarantine", from niyarat (orig. Arabic "pilgrimage") to Ziyār (an obsolete Persian masculine name); (f) in a few cases, Persianising the spelling of a word, mostly in place names,

e.g. from fifth to tilfan 'storm', from Tihran to Tihran. Some Fashangistan words were loan-translations. There were three types of these: (a) a simple Persian word given a mm (additional) meaning on the model of a foreign word, e.g. čang, meaning "chitch" given the additional meaning of "clutch" of mear; (b) meompound Persian word formed on the model of a foreign compound and given the meaning of that compound, e.g. nahhusi mash "prime minister", modelled on the English prime minister; and the river named Siyah Ab, from the Turkish Kara Sū, literally "Black Water"; (c) a word made with an affix in similar fashion, e.g. bi-nām "limited company", modelled on the French anonyme.

Many Farkangisian words have never been commonly accepted; e.g. andera "accumulator" (in physics), blaindid "normal", platina "capsule". Some words, however, have clearly come into common use: terms dealing with governmental administration (including names of the various ministries, departments, etc.); names of cities and

towns; and a few scientific terms.

A number of words coined by the Farkangistân, presumably from native Persian elements, are questionable, or clearly wrong from the points of view of semantics, grammar metymological history, as pointed out by several scholars. Thus ashabo "floor (of a building)" is Aramaic; hidwar "east" was used by classical writers in the sense of "west" as well as "east"; dastgir kardan was chosen for "to capture, arrest", its derivative dastgir for "municipal assistanca". All in all, some of the words coined by the Farkangistân show imprecision, unfamiliarity with, or disregard of, Persian grammatical rules, especially rules of word formation, and an absence of consistent principles and methods.

The Farhangistan's words created problems for the people, parity because of the large numbers of new words introduced at short intervals, parity because they were not always fully explained, parity because of the inherent difficulty of substituting new (and often unfamiliar) words for those well-established in the language through centuries of use. Sometimes

the new words were misused.

(4) Between the two Farhangistans (1942-70). During the Second World War, Ridā Shāh Pahlawl abdicated in September 1941, three weeks after Iran was occupied by the British and Russian forces. With the support of the powerful ruler removed, the Farhangistan lost its vigour. Its opponents now became active, denouncing it openly in the press. The Farhangistan reconsidered some of those of its adopted words to which objections had been made. The Ministry of Education issued memorandum authorising the return to traditional mathematical terms which had been replaced with newly-coined words in school books.

After the occupation, Furught once again became the President of the Farhangistan December 1941 or January 1942. He died on 26 November 1942, and the presidency went to Husayn Samff, Adib alsaltana. After his death in January-February 1954, no successor was appointed to the presidency. The Farhangistan ceased to exist even in paper, despite continued occasional attempts to revive it. In the meantime, the need for new terms grew because of expanding education, increased translation activity, etc. After a time, in number of groups were organised was hemseforth to be given in the Minister of Educator the purpose, but most were short-lived and non-productive.

The inactivity and later disappearance of the Farhangisten did not for long weaken the movement for purification. After Rida Shah, the debate on purification me revived, with the opponents once again becoming active and vociferous. They included 'Abbas Ikbāi Āshtiyāni and Wahld Dastgirdi, whose journals, Yadgar and Armagada respectively, published attacks the Farhangistan. The major spokesman for the opposition was Sayyld Hasan Takizada [q.v.]. The chief advocate of language reform-not the same as purification-was Sayyid Ahmad Kasrawi [q.v.], who, however, disagreed with the majority of the proponexts of purification. Both of men became active in this area during Rida Shah's reign. They exerted their greatest influence after his abdication, however, and for this miles it is appropriate and convenient to discuss them at this point, Sayyid Hasan Takizāda was a well-known, widely respected, influential politician, diplomat, and scholar. In 1935, he had attacked purification in an article published in the journal of the Ministry of Education. His reference to "the intervention of the sword in the work of the pen" as being "contrary to the taste and dignity of Iranians" was taken = an insult to the Shah, and the article was cut out of the issue and replaced. This paper was reprinted in 1942. On 24 February 1948, he gave a lengthy lecture entitled Luxum-i hify-i Farst-yi fasih ("The necessity of preserving eloquent Persian") at the Danishsara-ye "All (National Teachers' College) in Tehran. Almost three-quarters of it is given to the question of Arabic words in Persian. Among the points he made = that many Arabic words in Persian had been "naturalised"; that expulsion of Arabic loanwords was a "malicious attempt = the Persian language and Iranian nationality" and would impoverish the language; that purifying Persian would gradually cut off Iranians from the neighbouring Muslim nations; that Arabic was an extremely rich language; that words for new concepts should preferably be borrowed from "the me familiar, easier Arabic words common in Egypt and Syria or ... there common in old Persian books". Finally, he believed that choice of new words should be left to writers, and that "legal and coercive force must not enter it".

The major proponents of purification since the discussion grew serious in the 1930s included <u>Dhable</u> Bihrāt (d. 1971); Abu 'l-Kāsim Āzād Karāgha'' (d. 1946); and Ahmad Kasrawi Tabrīzi (1890-1946). Kasrawi was the most active of the purification advocates, and the most enduring. He was also the most relentless in ignoring the Farkaugisiās and its instructions <u>must</u> in its heyday during Riḍā Shāh's

reign.

Kasrawl was a historian, a linguist, and a jurist. In the early 1930s he also became m advocate of farreaching social change in all areas of culture. It was in close connection with his extensive writings and lectures on Iranian society and its ills that he pursued. language reform. Kasrawi believed that, through centuries, Persian had come to be a language fraught. with problems in all its aspects, including grammar and semantics. The foreign element in it was only one problem. On this subject, he disagreed with those who advocated purification on nationalistic grounds, and those who opposed it on religious grounds. He argued that each language should have its independence, and that its borders should not be left open indiscriminately to foreign words, as Persian has for many centuries been left open to Arabie words. He believed that uncontrolled importation of Arabic words into Persian has been more responsible than anything

else for the current decayed state of Persian-both its vocabulary and its grammar; and this decadence has harmful psychological effects on the speakers of Persian. On the Arabic words in Persian, he believed that those Arabic words that were common Persian, and for which no native Persian equivalents existed any longer should be retained; that, except for scientific terms, words should be invented, but people's usage should be followed; that needed new words should be coined from Persian meterials (by compounding and affixation); that Persian words selected should be correct; that they should be so formed to make possible the derivation of other words from them; that there is need to find a Persian equivalent for each and every foreign word, since many of the latter words were superfluous; that each word should have only meaning; and that each meaning should always be expressed by the same words, thus aliminating synonymy. Furthermore, he repeatedly emphasised that the question of language reform was a scientific matter and that to undertake such a reform was scientific endeavour, requiring certain qualificatlons.

Like Takksada, Kasrawi was opposed to the establishment of an academy. He felt that language reform should come about through the efforts of writers, who should improve their styles, and thus provide models for the people at large. Kasrawi, however, would permit the establishment of an organisation for cointing and selecting scientific and technical terms.

(5) The second Farhangistan (1970rawl was assassinated in March 1946. For the next twenty years or so, there was a virtual lull in the debate on language purification and reform. The first break in the full was a lecture by Dr. Muhammad Mukaddam of the University of Tehran in December 1963, and an interview with him published in 1966. Mukaddam believed that Persian was poor in technological and scientific terminology, but me fully equipped to meet its needs; that Persians should not, was frequently suggested, confine themselves to the language of their literary classics; that, contrary to the suggestion made by many, full use of analogy should be made in the coining of words; that Persian's own resources should be used for the purpose; that the otherwise very simple Persian language has become confused by the Arabic forms in it, resulting in numerous mistakes made even by university students; and that, again contrary to the claim of many, coining words from Persian resources would not cut off Iranians from other speakers of Persian, since no one was advocating the replacing of Arabic words with Persian in the writings of the past-that, in fact, the other Persianspeaking peoples should welcome the new terms which Iranians would be making available to them,

Soon, discussions III language reform began to appear in the daily press (e.g. Kayhān), and in journals, such as Wabiā, Yaghmā and Talāgh. In 1970, the Ministry of Culture and Art sponsored a conference for discussing the Persian language, held on October 28-30, in Tehran. At the opening session, a message was read from Muhammad Ridā Shāh Pahlawi, in which he announced that he IIIII already approved the constitution of the Imperial Foundation for the Farkangistāns of Iran, which was III be established. He said that the constitution provided for a Farkangistāns i saāāns Irān ("Language Academy of Iran"). On the last day of the conference, the Minuster of Culture and Art presented the members

of thet Farkangistān to the Shāh: Dr. Sādiķ Ridāsāda Shafak, Husayn Gulgulāb, Dr. Mahmud Hisābi, Dr. Tisā Sadīķ, Dhebīb Bihrūz, Djamāl Rida?, Mubammad Mukaddam, Yahyā Māhyār-Nawwābi, Muştafā Mukarrabi, Marshal All Karīmiū and Sādiķ Kiyā, who was appointed president of the body by imperial order.

In his message, the Shah referred to the old Far-hangistān and to the mount one man expansion of the old one. Four members of the new one (Gulgulāb, Şadīk, Hisābī and Shafak) had been members of the old malso. Another member, Bihrūz, had served on of its committees. President Kiyā mount for many years been a collaborator with Mukuddam in language-reform activities.

The new Farkengistan differed from the old main that it was to be an of several such organisations. The Farkengistan: Humar wa Adab ("Academy of Art and Literature") man founded soon afterward. However, the Language Academy was the main focus, received the greatest financial support, and became very active.

The new body had an elaborate organisation, consisting of a Council, made up of the ordinary members; four Pundhidadis (Research Centres); = library; = phonetic laboratory; and a secretariat. The four Pundhidadis were: (1) Wishs gustariat (Adoption of words); (2) Wishs put Farsi (Persian words), which was charged with "collecting Persian words and showing the capabilities of this language in making words"; (3) Zabanha-yi bastari wa mijana wa guvighta-yi Irania (Old and Middle [Iranian] languages and Iranian dialects); and (4) Dastari zaban-i Farsi (Persian grammari. The first of these centres has been the most active. It began with 13 groups, each responsible for terms in a specific field or fields. By the end of 1975, they had proposed 30,000 Persian equivalents for some 15,000 foreign words.

One feature of the procedure followed by these groups is the publication of lists of words for which Persian equivalents we being sought, in monographs entitled Pighnikad i plumă čist? ("What do you propose?"). These monographs are distributed worldwide. The proposals received were to be considered when deciding on new terms, which were to be approved by the Shah before becoming final.

As far as their forms and etymological histories are concerned, the words adopted by the second Farhangistaln are by and large similar to those adopted by the first one. Several points are worth mentioning, however: (1) greater and bolder use of affixation and compounding; (2) greater consistency among the various adopted words; (3) greater leadency to revive obsolete = archaic words unknown to the majority of Persian speakers; (4) formation of words from Middle and Old Persian bases; e.g. pardis "park" (ct. Mod. Pers. firdaws "paradise", and English paradise, and its cognates in other European languages); pardiza "campus" (related to the preceding); and (5) insistence on replacing some quite common words; e.g. mihras for milmar "architect"; dawhh ah for dawfalab "candidate"; farhihhtarl los farhang, āmusi<u>sh</u>-wa-parwari<u>sh</u> for la^tlim-wa-larbiyat 'education'; pargir for muhif and piramin "environment"; etc.

CONCLUSION

A brief comparison between the old and the new Farkangistán might be useful: (1) The new one is a far more serious undertaking—as evidenced in its elaborate organisation and procedures. (2) Its work is not

confined to word-making but covers the entire language. (3) Its members, as group, believe in their work, while the old one was organised and at least at first controlled by people (e.g. Furûghl) not in sympathy with language purification. (4) Its members and those outsiders working with them professionally highly qualified than their predecessors, in linguistics and other relevant fields. (5) It is a more open operation, in that it consults the public, or at least the scholarly community. (6) Its work is more systematic, and its procedures more elaborate.

As for the future of the academy, and of language purification, it is difficult to predict after the February 1979 overthrow of the monarchy by a revolution with strong religious overtones. The Farkangistān is now inactive, if not in fact defunct. If the atmosphere prevaiting during the first offer months of the new régime continues, any undertaking of his type would most likely discontinue, at least be weakened and restricted. Under such conditions, the activities of any language academy would very likely be confined to the coining and

adoption of technical terms.

Bibliography: A short history of the two language academies and similar organisations in Iran and of language reform is provided in M. A. Jazayery, Farhangistân: la Academia Irania de la Lengue, Mexico City (forthcoming), which contains a comprehensive bibliography. A shorter account, from somewhat different perspective, will be found in his article The modernisation of Persian vocabulary and language reform in Iran (forthcoming). For a list of the persons writing in pure Persian from the earliest times, see 'A. A. Hikmat, Parsi-yi naght, Tehran 1951, where examples of such writings m given. See also M. Ishaque, Modern Persian postry, Calcutta 1943. Information on the various terminology and purification groups is found in Muhammad Muhlt-Tabataba'l, Nigabbani-yi zaban-i Farsi, in Yazhma, xxiii (1971), 569-75; Muhsin Shāmlū, Tabilhhi wadi-i lughat dar Iran, in Wahid, ■ (1968), 834-8; and in the Jazayery monograph cited above. On the committee at the Danishsard-yi 'Ali, see 'Isa Şadik, Yadgör-i 'wwr, Tehran 1939-75, ii, 105 ff. The constitution and internal by-laws of the Forhangisidn, lists of its members and committees, and of words adopted up to 21 March 1942, are found in Wathaha-yi new ki ta pāyān-i sāl-i 1939 dar Farhangistān padhirufta shada ast, Tehran 1973 (repr. of the original 1942). A brief analysis of the words approved by the two Farkangistāns is given in Jazayery's book and in A. Shakoor Ahsan, Modern trends in the Persian language, Islamabad 1976, 111-30. On the developments between the two Farhangistans, see also Luxum-i hifr-i Farst-yi fasih, in Yadgar, vi (1948), 1-40. On Kasrawl, see now (in addition to Bibl. in the article, s.v.), Niwishtaha-yi Kasrawi dar samina-yi sabin-i Fdrsi, ed. Husayn Yazdaniyan, Tehran 1979. For manalysis of Kasrawi's views on, and methods of, language reform, see Jazayery, Yaddashiha-yi dar piramun-i hushishha wa andishaha-yi Kasrewi dar ramina-yi saban, which appears on pp. 11-47 of that book in lieu of introduction. On the second Farhangician, see Jazayery's monograph and article cited at the beginning of this bibliography, the Ashan book cited, and the publications of the Farhangislan itself. The latter include Farhangistan-i saban-i Iran: hadaf, sarman, westfa, rawish-i fattaliyyat, Tehran 1972, and Pishnikād-i shumā tist monographs of which four were published, Tehran 1972-6. Samples of its adopted words found in Barābarhā-yi Fārsi-yi barhhi az wāghahāyi dmunishi, Tehran 1974.

(M. A. JAZAYERY)

(iii) TORKEY

There are two academies in Turkey, the Society for Turkish History and the Society for the Turkish Language, both set up on the initiative of Mustala Kemal Atatürk [q.e.], who supervised their work closely until his death in 1938, whereupon nearly all his estate was divided evenly between them. Both during and after his lifetime, these academies closely followed his views on the interpretation of Turkish history and the reform of the Turkish language respectively. In brief, they maintained that the Turks were an ancient people, connected with Anatolia since the oldest times, with a language of their and responsible for major contributions to world civilisation. The operational results of this approach, which the academies were expected to foster, were to be an increase in pride among Turks regarding their past and their language and the will again to play a role in world civilisation through rapid modernisation.

The Türk Tarih Kurumu (TTK) or the "Society for Turkish History" had as its predecessor Türk Tarihi Tetkik Heyeti or "Committee for Research into Turkish History", founded in 1930. In 1931, this was succeeded by the Türk Tarihi Tetkik Cemiyeti or "Society for Research into Turkish History", whose own name was changed to Türk Tarih Kurumu

(meaning the same) in 1935.

The scope and goals of the TTK were to study the history of the Turks and of Turkey and to publish and disseminate the results of this research. The following methods were suggested for attaining these objectives: 1. Research and investigation of sources relating to the history of the Turks and of Turkey. 2. Translation (into Turkish) and publishing of these source materials. 3. Convening of congresses for discussion of new findings and other scholarly topics. 4. Despatch of scholars (individuals of groups) for investigation of documents which shed light upon the history of the Turks and of Turkey. 5. Cooperation with local and foreign scholarly institutions regarding the study and publication of relevant material.

The TTK, organised like other academies and fearned societies throughout the world, is housed in its own building in Ankara, with an impressive library (including archival materials, 901 manuscripts, 189 microfilms, 172 photocopies of manuscripts, numerous local and foreign journals and 73,166 books and offprints, by late 1979) and its own printing press. It serves as the centre for the TTK's manifold activities, which include research, lectures, exhibitions and international congresses -convened approximately once every five years since 1932-as well as publication of the proceedings of these congresses under the title Türk tarih hongresi sunulan bildiriler (later renamed Turk tarik hongress bildirilers), along with numerous other works. The TTK's conception of Turkish history is maximalist; one of its first publications was a fourvolume textbook for secondary schools (lise), emphasising the overall history of the Turks (and Turkic peoples) throughout Asia and their contributions to weeld civilisation. The 347 scholarly booksmany of which comprise several volumes—published

by the TTK up to late 1979 indicate the Society's wide-ranging interest in the history of the Turks and Turkey (and to mlesser extent, in world history as well). It has published critical editions of historical documents and other archival materials, well as studies in archaeology and history, with emphasis - the Ottoman and Turkish periods and especialty on Atatürk's role, although also considering the history of art and folklore in Turkey. A few of these books were intended for a general readership. In addition to its bibliographies of historical research, the TTK publishes a scholarly quarterly, Belleten (1937.) and a twice-yearly collection of documents, Belgeler: Twek Tarik Belgeler Dergizi (1964-).

The Türk Dil Kurumu (TDK) or the "Society for the Turkish Language" was preceded by the Dil Heyeti or "Language Committee", established in 1929 to coordinate and advance—on a more institutionalised level—the language reform which had commended one year earlier upon adoption of the Latin alphabet. In 1932, with the government's blessing, the Committee expanded and became the Türk Dill Tetkik Cemiyeti or "Society for Research into the Turkish Language" whose name — changed in 1934 to Türk Dill Araştırma Kurumu (meaning the same, but very obviously displaying the switch from Arabic to Türkish roots). In 1936, its name was finally abbreviated to Türk Dil Kurumu.

The scope and objectives of the TDK were revised several times. Their clearest expression may perhaps be found in the Society's 1943 statues: z. To purify the language of foreign accretions and to Turkify it (tilekçeleştirmek), 2. To collect Turkish words used in Turkey and elsewhere and publish them in dictionaries of the Turkish of Turkey and of Turkish dialects. 3. To prepare and publish relevent linguistic works along with the above dictionarles. 4. To examine ways and means of coining new words and to prepare a basic grammar of Turkish and a comparative grammar of Turkish dialects. 5. To draw up lists of technical terms for schools and universities and to prepare a dictionary of such Turkish terms. II. To collect and publish popular proverbs. 7. To investigate the Turkish language from its earliest times and to compare it with other languages, in order to prepare etymological dictionaries, 8. To study documents relating to the Turkish language and the development of other languages, with special reference to their vocabularies and the coining of www words, 9. To study modern linguistic works and to translate them into Turkish.

The TDK, likewise organised similarly to other learned societies, has its more building in Ankara which houses its large library (about 25,000 volumes, 150 different periodicals, 600 manuscripts, 33 microfilms and over 100 volumes of photocopies of 48 books, in 1980) and serves as beadquarters for its multifaceted activities in linguistic research. The best-known of these activities has most likely been the coining of new words and terms to replace those of Arabic Persian origin. While many of these geologisms are indeed words of Turkish and Turkic origin, some are wholly original coinages. These new terms were subsequently filtered into the school system and the press. Since the end of World War II, however, this process has become more moderate. Starting with 1932, the TDK has convened scholarly congresses once every two or three years, which are attended by both local and foreign linguists and educators. The results have been published as Türk Dili Kurultayı (later known = Türk Dil

Kuruliays). Other publications consist of 467 books and brochutes (by July 1980) dealing with the following: studies and lectures on language "purification", new spellings, Turkish and general linguistics, Turkish dialects and proverbs, lists of new terms for various areas, dictionaries of Turkish (including a historical "Thesaurus") and certain other Turkle languages (Kirghiz, Uyghur, Yakut and Cuvash), several blographies (of Atatürk and others), literary works and sources for the Turkish language, bibliographies and the following periodicals: Turk Dili Araştırmaları Yıllığı-Belleten (annual, 1953-), Turk Dili: Turk Dili Tatkik Comiyeti Billteni, renamed Türk Dili Belleten (monthly, 1933-50), superseded by Türk Dili: Aylık Dergi (monthly, 1951-),

By a law passed on rr August 1983 (published in the Resmi Gazzie, no. 18138, dated 17 August 1983), the Türk Tarih Kurumu and Türk Dil Kurumu, along with the recently founded Atatürk Kültür Merkezi (the Atatürk Culture Centre), have been united in a new, state-sponsored Academy, entitled Atatürk Kültür, Dil ve Tarih Yüksek Kurumu (the Atatürk Culture, Language and History Higher

Organisation), located in Ankara.

(J. M. LAKDAU)

(iv) INDIA.

Under the auspices of the Muslim University, Aligarh, and in imitation of the Academies of Damascus, Cairo and Baghdad, the al-Madjma' al-'llini al-Hinds was founded in 1399/1976, aiming mainly at expanding knowledge of Arabic in India; furthering studies on the literature, history, sciences and civilisation of the Arabs; publishing valuable manuscripts; publicising the work of Indian scholars; and stimulating the intellectual spirit of the country.

The Academy comprises twelve active members (Similân) of Indian nationality, 28 corresponding members (muzāmilân) representing the Arabophone countries (Syria, Saudi Arabia, Iraq, Jordan, Palestine [sie], Egypt, Lebanon, Morocco and Kuwayt) and 15 other corresponding members chosen from the Arabists of Iran, Pakistan, USSR, Germany, Great Britain, France, Hungary, Italy and the

Nethorlands.

It publishes twice-yearly a journal, Madiallat al-Madina' al-'Ilms al-Hinds, whose first issue, dated 1396/1976, appeared at the end of 1978 (see the review in Hamdard Islamicus, ii/2 [Karachi 1979], 103-12).

(ED.)

MADINUN (A.), pl. madiānīn, possessed, mad, madman; the passive participle of dianna, "to cover, conceal", passive, dianna, "to be possessed, mad, insane".

Its meaning and usage have been closely related to belief in the Dinn (q.v.). In pre-Islamic Arabia, soothsayers were believed to have received messages from the disas during ecstatic experiences, after which they delivered oracles in short, enigmatic of rhymed prose called sadi' (see xkmin), and poets were believed to have been inspired by their individual diam, similar to the Greek idea of Muses [see SHA*18]. Soothsayers and poets were both said to be madinun, literally "dinn-possessed" = "inspired by the dires". The term madinum occurs eleven times in the Kur'an, where its exact, original meaning is not certain, but its usage is significant for the later history of the term. It refers explicitly to Muhammad seem times and probably alludes to him in the other contexts, where episodes in his life seem to be projected into stories about Moses (XXVI, 27, LI, 39) and Noah (LIV, 9) and into the general statement that each of God's Messengers was accused of being a sorcerer (saluir) or madjinin (Ll, 52). In four of the seven contexts where madinan refers explicitly to Muhammad, it occurs in accusations against the Prophet quoted from his opponents: "O thou upon whom the Reminder has been sent down, thou art madinan" (X V, 6); "Shall we abandon our gods on account of a poet (shafir) madinan?" (XXXVII, 36); "They turned from him (i.e. Muhammad) and said, 'One who is tutored, madinain' " [XLIV, 14]; "When they hear the Reminder they say, 'Surely he is madinien'" (LXVIII, 51). In the other three contexts God responds to these accusations, assuring Muhammad and his companions: "Thou art neither a soothsayer (Adhin) nor madinain" (LII, 29); "Thou, by the bounty of thy Lord, art not

madinum" (LXVIII, 2); and "Your comrade is not madinila" (LXXXI, 22). In the Kur'an the term madinion, always in the singular, functions sometimes as adjective and sometimes as a noun. It occurs only in Meccan passages, only in the context of accusations made against Muhammad by his opponents (and against earlier Messengers by theirs), and only in contexts involving the question of the source and process of revelation. The primary meaning of madjous in the Kur'an seems to be "djinn-possessedia djinn-possessed person (like the ancient Arabian soothsayer)" or "inspired by the djinnfa person inspired by the djinn (like the Arabian poet)". Muhammad's opponents in Mecca, seeing the similarity between the form of his messages and the sadi oracles of the soothsayers, argued that his messages were not revealed by God but were inspired by the divine. In response to this charge, the Kur'an develops some interesting counterarguments. Identifying the alleged disna inspirers "satans" (shayaita), the Kur'an states in LXXXI, 25, that Muhammad's messages are "not the speech of a pelted satan (staytan radiim)", and XXVI, 210-12 adds: "The satans have not brought it down. It would not suit them, nor are they able. Indeed, they have been removed far from [even a chance of] hearing it." These two passages allude I the ancient Near Eastern shooting-star myth, the Kur'anic versions of which deny that disnu or satans (both terms occur in these accounts) are able to obtain messages from Heavenly Council to bring down to man. When they try to eavesdrop at the gates of heaven they me peited and driven away with flaming stars (see XV, 16-18, XXXVII, 6-10, LXVII, 5 and LXXII, 8-11). On this myth, see Ibu Hisham, 130, tr. Guillaume, 90; P. A. Eichler, Die Dzehinn, Toufel und Engel im Koran, Leipzig 1928, 30-1; and for hadith references, Wensinck, Handbook, 59. Another Kur'anic argument against the accusation that Muhammad was madinum involves two accounts in which it is reported that diene overheard him reciting the Kur'an and became believers (XLVI, 29-32, LXXII, 1 ff.). That is, Muhammad did not get his messages from the disan; they received the Kur'an from him (see Ibn Higham, 281, tr. Guillaume, 193 f., and for hadith references, Wensinck, Handbook, 59 1.).

Whether madistic had secondary meanings in the Kur'an for Muhammad and his contemporaries is difficult to say. In his English translation of the madinun passages, Richard Bell (The Qur'an, Edinburg 1937-9) sometimes renders this term as "mad" "crazy", and "madman" (see, a.g., XXVI, 27 (v. 26 in Boll], XXXVII, 36 [v. 35 in Bell], and LI, 39), thus giving the term some of the various meanings It has in later usage. In the Kurlan, madness is associated with "satans", in accordance with the ancient Semitic concept of demon-possession (see VI. 71), and, since evil mischievous diinn are identified in the Kur'an = satans, it is possible that madinan had this connotation for Muhammad and his contemporaries. But the maginum contexts argue against this interpretation since they never respond the accusation that Muhammad was madimin by defending his sanity, but always by affirming that the revelation came from God and not from the disser in satans. The classical commentators on the Kur'an offer little assistance on this question, usually failing to explain the term altogether. Where al-Baydawl does explain madjuan he interprets it "inspired by the diam" (e.g. in his comments == LI, 39), == he at least connects it with the process of revelation (e.g. in his com-

ments on XV, I and LXVIII, 2). An analysis of cognate expressions in the Kur'an also offers little new understanding III the concept maginum. In late Meccan and early Medinan contexts, madisus was replaced by the expression bibl djinnat= (see VII, 184, XXIII, 25, 70, and XXXIV, 8, 46). This change of terms could be interpreted as a change or development of ideas within the Kurban, but this possibility is unlikely since the two expressions seem to be synonymous (cf., e.g., md sakibukum bi-madinun, in LXXXI, 22, and mā bi-sāhibikum min djinnatin, in XXXIV, 46). In contexts where madinus functions as a noun (e.g. XLIV, 14, LI, 39, 52, and LIV, 9), its meaning seems to be identical with the expression radiulas bi-hi disanatas in XXIII, 25, i.e. both seem to mean "a dinn-possessed person". Where al-Baydawi explains bi-hi djimnai** (e.g. in XXIII, a5) he simply gives the synonym diunan, which has the same range of meanings (cf. al-Zamakhshāri on the same verse).

One striking fact about the history of the usage of madinum is that Muslims adopted the concept and gave it widespread currency, assuming it to be Islamic because it occurs in the Kur'an, whereas in fact the term never occurs in the Kur'an as an Islamio concept, but always as an idea of Muhammad's Meccan opponents that is simply quoted and responded to there. (The frequency of occurrence of this pre-Islamic concept in the Kur'an might be explained by the fact that in all cases except the Noah context it serves as a rhyme-word, and thus a convenient term to me in contexts involving accusations made against Muhammad by his Meccan opponents and in contexts involving affinities between Muhammad's situation and that of earlier prophets.) Meccan parts of the Kur'an frequently reflect pre-Islamic Arabian concepts, such as belief in the existence of dinn and deities other than Allah. When the Islamic world-view developed within the Kur'an, and when required Islamic beliefs and practices were introduced in a series of late Meccan and early Medinan credal statements, of these pre-Islamic concepts, such as belief in the existence of deities other than Allah, came to be explicitly rejected, while others, such as madinan and belief in the existence of the dinn, simply ceased to mentioned in latter parts of the Kur'an [see A. T. Welch, Allah and other supernatural beings; the emergence of the Que'anic doctrine of tawkid, in Inal. of the American Academy of Religion, xlvill4 [1979], 733-53). Still, the concept medinen, along with magic, sorcery, soothsaying and other related phenomena that were a vital part of the Arabian world-view of Muhammad's time, became part of popular Islamic belief and practice, and these have remained so in modern times (see e.g., E. W. Lane, Manners and customs of the modern Egyptians, London 1836, chs. x-xii; E. Doutté, Magis et religion dans l'Afrique du Nord, Algiers 1909; D. B. Macdonald, The religious attitude and life in Islam, Chicago 1912, lectures 1-5; E. A. Westermarck, Ritual and belief in Morocco, London 1926, i. chs. iv-zi; C. Saouck Hurgronje, Mekka, Leiden 1931, 99-103). The concept madjusts occurs occasionally in the classical literature, with the same literal meaning as in the Kur'an. In the hadith literature, al-Bukhāri, Şakik, Pisam, 16; Muslim, Sahih, Dium's, 46, and Hudas, 22; and J. Robson, Mishhat al-masabih, Lahore 1965-6, 515, 1260 f. Al-Tabari records an account in which Muhammad is reported as saying he leared he had become either m poet or a dinn-possessed person (madings), but then Gabriel appeared to him and

Informed him that he was a prophet inspired by God (Ta'rikh, I, 1150; tr. A. Guillaume, The life of Muhammad, London 1955, 106). For a contemporary defence of belief in the dism and their influence on man by the al-Azhar scholar, Sayyid 'Abd Alfah Husayn, see his al-Dinn fi disker diamit abuill elegian, Cairo n.d. The Islamic philosophers and see scholars such as Ibn Khaldun rejected the concept madinum at related to the world of the dinn (see Macdonald, Religious attitude, 130 ft.). In later uses, association of madinum with the dinn has sometimes been lost as this term has come to mean simply "mad" or "insune".

(A. T. WELCH)

MADINUN LAYLA, "the date of Layla", or Madinun Bani 'Amir, the name given to the hero of a romantic love story, the original form of which could date back as far as the second half of the 1st/7th Century.

1. In Arabic literature

This imaginary character (acknowledged as such even by some Arab critics; see Aghdul, ed. Beirut, ii, 6, 11) has been furnished by the raudi with an ism with a complete genealogy; Kays b. al-Mulawwah b. Muzāhim b. Kays b. 'Udas b. Rabī'a b. Dja'da b. Ka'b b. Rabi'a b. 'Amir b. Şa'şa'a, but according to the evidence, although this filiation could be accepted from the starting point of Kays b. 'Udas, the latter does not have a son named Muzāhim isee lbn al-Kalbl-Caskel, Diamhara, Tab. 101, 102, 105). Furthermore, various other less common was have been given to him: al-Buhturi b. al-Dia'd, Mahdi b. al-Mulawwah, al-Akra' or Kays b. Mu'a(lh (Aghāni, il, 8). Al-Djāhiz splits the character into two parts by distinguishing between a Madinus of the Banu 'Amir and a Madinus of the Banu Dia'da (Bayde, i, 385, iii, 224, iv, 22), where Dia'da is a descendant of 'Amir. As for his loved one, she is given the following genealogy: Layla bint Sa'd b. Mahdi b. Rabi'a b. al-Harish b. Kath b. Rabita b. Amir.

The content of the romance, insofar as it can be extracted from the ancient versions, is relatively simple and commonpiace. However, from the start, two opposing traditions have been current: according to one version, the two young people spent their youth together, tending their flocks in the Diabal al-Tawbad (which belonged, however, to the Muhārib; al-Işfahāni, Bilād al-'Arab, 182; cf. Yakut, s.v.); according to the other, Kays meets Layla by chance at a gathering of women, and the offect in him is devestating; he kills his camel as a contribution to the feast, but when a certain Munazil arrives, the women turn their attention to him, and only Layla, who shares his emotion, takes an interest in Kays. Subsequently he asks for her hand in marriage, but her father has already given her away in marriage to a certain Ward b. Muhammad al-'Ukayll. Gripped by the most violent anguish, Kays loses his reason and sets out to wander halfnaked, refusing nourishment and living among wild animals. His father takes him on a pilgrimage to make him forget Layla, but his madness only intensifies. He does, however, have moments of lucidity when he talks of his lady-love and composes verses which he recites those curious people who have come to thim. Until his death, he encounters Layla on only one further occasion.

It is difficult to establish the origin of the story. According to a remark in the Aghâni (il, 7, 10), the initial author would be a young Umayyad who, under the pseudonym of Madinun, disculated some stories designed to introduce verses in which he sang of his ill-starred love for his cousts. This identification is, however, isolated, and in any case, the poet is anonymous. The fact that historical individuals such - Nawfal b. Musähik, governor of Medina in 83/702, are mentioned in the traditions relating m the adventures m Kays, suggests that the latter came into existence at about this period, but this is all that can be said me the subject. The author, or rather the authors of the verses attributed to this Madinun and the introductory or explanatory tales, will always be unknown, and it may simply be supposed that these creations - owed to the desire of the Arabs of the North, represented by the 'Amir b. Şa'şa'a, to show that unhappy love affairs were not the prerogative of those of the South, the 'Udhra in this instance, and that they were capable of producing the equal of a Dianill al-'Udhri [q.v.].

From the moment that verses and althor concerning fictional characters achieved normative status, it is not hard to imagine the role played by inventive parrators and sundt whom al-Asma'l (in Aghani, ii, 6) also accuses of having concocted this novel, which is included in a long series of imaginative works and fictionalised biographies of which the Fibrist supplies a detailed inventory (ed. Cairo, 425-6; cf. M. F. Ghazi, La litterature d'imagination, in Arabica, ivi2 [1957], 174-8). The story of Madinua and Layla, like many tales of the Middle Ages, has never obtained a definitive form. It is true that transmitters of tradition like Ibn Da'b, 'Umar b. Shabba, Ibn al-Kalbi or al-Zubeyr b. Bakkår, must at a quite early stage have set down in writing the more or less numerous and disparate elements, but independent akhbas continued to circulate orally and to be enriched according to the taste of the narrators, Evidence of this process is furnished by a study of the sources for the recension of the Aghani (ii, 1-78) which, after that of Ibn Kutayba (al-Shift wa 'l-shu'ara', 355.64 - ed. Shākir, ii, 545-36), is the most ancient and the most developed. Abu 'l-Faradi, in order to bring a successful conclusion to his enterprise, which aspires to be a complete, if not coherent history, takes effective precautions to shield himself from the critics by citing opinions for and against the historicity of the character, then combines, without regard for chronological order, a series of oral and written sources which have been inventoried by I. Y. Kračkovskiy, in an article published in Russian in Leningrad in 1946 and translated into German by H. Ritter, in Oriens, viii/t (1955), 1-50 (Die Frühgeschichte der Erzählung Macnun und Laila in der arabischen Literatur; cf. Sezgin, GA5, ii, 390).

The story of Madjuun and Layla seems to have taken precedence over the majority of others of the same genre towards the end of the 3rd/9th century or the beginning of the 4th/10th; the fact that numerous verses taken from it set to music, plus the importance attached to it by the Aghan, leave no doubt that the vogue which it subsequently

enjoyed was not an entirely we development. In the Arabic literature subsequent to the Aghani, the abbote of Madinun recur in a number of works of adab, in particular in those which concern famous communes (like the Taryla al-amode of Dawad al-Antāki, ed. Beirut 1972, i, 97-128), but little is known of independent monographs, apart from the Dizda and two works which have yet to be edited: the Nushat al-musamir fi dhike ba'd akhbar Madinun Bani 'Amir, by Yūsul b. al-Hasan al-Mibradi (d. 909/1503) and Bast al-sami' al-musamir fi akhoar Madinun Bant 'Amir, by Ibn Talan (d. 953/1546), It is remarkable, but not entirely unexpected, that the story of Madinum ma-Layla should have inspired po literary work in Arabic in the Middle Ages; in fact, it is not until the present day that we sees the theme exploited by several dramatists: Ibrahlm al-Abdab (J. M. Landau, Etudes sur le thédire 🔳 la cinéma arabes, Paris 1965, m. 39), Salim al-Bustani (ibid., = 161), Abū Khaili al-Kabbāni (ibid., no. 406), whose works do not seem to have been performed, or man printed; the Rivayat Madjuus Layla by Muhammad Mundil Khayr Allah, on the other hand, has been performed in Alexandria and published in 1808 (and 2004?; Landau, no. 304); the most celebrated work in this connection is the Madisus Layld by Ahmad Shawki (Landau, no. 517; tr. Arberry, Cairo 1933; see also R. Rubinacci, in vii [1957], 9-66; A. Boudet-Lamotte, Ahmad Samqi, Damascus 1977, 275-82).

It is not known whether it is necessary to place at the end of the and/8th century, since there is no mention of him in the Fibrist, a certain Aht, Bakr al-Walibi, to whom is attributed a recension of the Diván of al-Madinun of which a considerable number of manuscripts exists, containing or not containing akkbar (see Sezgin, GAS, ii, 392-3) and which has been the object of some fifteen mediocre publications and of more scientific edition by Ahmad Farradi in Cairo (1958). It is evident that the content of this Dîmân cannot be considered as the work of a single poet, especially as there has been a tendency, as ai-Djāhiz observes (in Aghāni, ii, 10), to attribute to Madjaun Layla the verses of any unknown poet where reference is made to a Layla; furthermore, the homonymy with Kays b. Dharth has certainly caused confusion. At all events, R. Blachère, who has analysed this Divar (HLA, iii, 658) considers that it "cannot be regarded - occupying an insignificant place in the study of archaic poetry".

Vadet, L'espris courtois en Orient, Paris 1968 368-78; Sezgin GAS, ii, 389-94 (extensive bibl.).

In Persian, Kurdish and Pashto literature

The poems of Madinun and the tales of his love Layia (commonly named Layil in Persian) also became a part of the Persian literary tradition, where they were used in various ways. Quotations of Arabic lines of poetry ascribed to Madinun quite frequently in Persian prose works. He was reckoned to be one of the great poets of love (cf.

e.g. Manucihri, Diodo, ed. Tehran 1347/1968, v. 1052) and was celebrated for his ghands. References to him and Layll appear already in the works of many poets before the time when Niganii wrote his epoch-making poem on their love story. Manūčihrl [q.v.] (d. ca. 432/1040-1) compared in descriptions of nature the rain-clouds, "weeping meaningfully" to the eyelashes of Madinan and the lightning, "laughing without meaning", to Layif's lips (v. 1727); the eyes of the former and the cheeks of the latter to two constellations (v. 1830). The two names also associated with items of material culture; according to Anwarf [q.v.] (fl. middle of the 6th/12th century). . bench (suffa) in the hall of one of his patrons had many mad lovers as Layli (Diwin, i, Tehran 1347/1968, 345); Khākānī [q.v.] (d. 595/1199) saw in a harp (česg) the she-camel of Layli uttering the complaints of Madinun (Diede, ed. Sadidiad). Tehran 1357/1978, 144, 476).

These examples show that, at least initially, the romance me not specifically related to mysticism, although, as we know, the Stills used it as an exemplans from the ardioth century onwards (cf. Ritter, in Oriens, vifi [1955], 49 f.). To a religious poet like Nasir-i Khusraw (5th/11th century), the subject matter was reprehensible because it symbolised merely mortal love and frivolous poetry (cf. Diman, ed. Tehran 1348/1969, 355, 455). Its development into one of the most popular themes of the Sull tradition, dealt with in innumerable works written in Persian and in many other languages, needs still to be investigated. The growing importance of ghazal poetry and the theory of love to the mystics since the 5th/12th century has undoubtedly furthered this process. Yet Madinun and Layli were also to the later coets just one pair of exemple out of several others like Mahmud and Ayaz, Farhad and Shiria (cf. e.g. Häfiz, Diewin, ed. Kazwini-Ghani, Tehran 1320/1941, 29, 38), or the Greek lovers Wamik and 'Adhra (cf. e.g. Mas'ud-i Sa'd, Dimin, Tehran 1339/1960, 198; Sana'l, Dimin, Tehran 1341/1962, 495, 854). According to Dialal al-Din Rumi, Madinun belonged together with Farhad and others to the archetype of "lovers who took to the mountains and the desert because of love" (Filit and file, Tehran. 1348/1969, 30).

The akhber were a rich source of illustrative anecdotes to writers and poets. It was drawn upon by Ahmad-i (ihazālī (Sasaini), ed. H. Ritter, Istanbul 1942, 43, 45) and subsequent writers on the theory of love. Among the authors of mystical mathanasi poems, Farid al-Din 'Attar deserves special mention (cf. H. Ritter, Day Macr der Sasie, Leiden 1955, 730 f.).

In 584/1188 Nixâml of Gandja composed at the request of the Shirwan-Shāh Akhsitān the mathuawi Layii = Madjaām in the metre kasadi-i musaddas-i ahksab-i mahdjai with about 5,000 bayis. This was the third part of the set of poems known as the Khamsa [q.v.]. The theme was chosen for the first time as the subject of a Persian narrative poem, but the precedent of the treatment of = similar subject of Arabic origin existed in 'Ayyūgil's Warka u Gulahāh.

Niţāmi states in the introduction to his poem that he accepted the assignment with some hesitation. At first, he doubted whether this tale of madness and wanderings through the wilderness would be suitable for a royal court (ed. Moscow 1965, 41 ff.). He adapted the disconnected stories to fit the requirements of a Persian romance. They pointed together into a coherent narrative which describes

the development of m frantic love affair from the scene of the first meeting of the two lovers till the death of Maginun m m grave of Layll. In some respects, the Bedouin setting of the original has been changed under the influence of urban conditions more familiar to the poet and his audience: the young lovers become acquainted at school; the generous Nawlal is a prince in the franian style rather than an Arab official. Nixāmī added a second pair of lovers, Zayn and Zaynab, in whom the love between the main characters is reflected. It is Zayn who in a dream sees Maginun and Layli united in paradise m the ead of the romance.

Several other features mark this new adaptation of the comance. Specimens of nature poetry were used to emphasise, symbolically, important points in the development of the plot: a description of paim bush in spring where Layii sits in the flower of her youth; of the night at the moment of Madinun's deopest despair; of autumn at the time of Layll's death. Much attention is given to Madinun's rôle as a poet. In several places, ghasals are quoted in the text, which in metre and rhyme are adjusted to the prosodic characteristics of the mathaawi. It is quite evident that, to Nigami, the subject matter was not least interesting because of its emblematic possibilities. His poem is, therefore, a didactic work as well as a narrative. The former quality is noticeable in the frequent esides containing reflections on such themes as ascetism, the vanity of this world, death and, of course, love in its various aspects, including its transformation into mystical love. Didacticism is also the main element of the introduction and the spilogue.

This Layl's a Madjan's was the starting-point of a long series of imitations which were written in almost any language of the man where the cultural influence of Persian literature made itself felt. The poets who ried to emulate the model set by Nigamt borrowed most of its contents and its metre but often also elements of its composition, e.g. the advice given to the of poet and the address to the cupbearer which both occur in Nigami's introduction. Each of them, however, made an effort to produce an original work by making changes in the episodes of the romances, by the addition of the stories or through a shift of emphasis from one motif to another.

No more than a few of these imitations can be regarded as valuable literary works in their own right and have apparently enjoyed the interest of a wide public over a long period. The Madinan w Layls of Amir Khusraw Dihlawi [q.v.] written in 698/1299 and the very first among them, belongs to a complete imitation of the Khamsa. This poem is much shorter than the model (2,660 bayes) and puts less emphasia on didactic aspects. New elements of the parrative are among others the prognosis of Madjaun's late at the time of his birth and the wish expressed by both lovers to have their eyes picked out by the ravens who prey on the dead bodies left after the battle of the clans. Amir Khusraw dedicated his work to his spiritual guide Nizām al-Dīn Awllyā' and to the sultan of Dihll. The much longer poem of Diami [4.v.] (3,860 bayts), completed in 889/1484, almost exhausts the contents of the original ahkbar. The beginning of the love story (the meeting of the two lovers is not situated at school but at the camp of Layif's clan) is also closer to the Arabic tradition. The mystical meaning attached to the romance cannot be mistaken, though the narrative as such is given its full due. In the song addressed m the cupbearer in the introduction, Diami commenceates

the Nakshbandiyya shoykhs and the Timurid rulers of the past. Contemporaries of Djämi's were his nephew Hätifl and Maktabi of Shirdz. The former's poem was a particular favourite with Ottoman poets and was translated into Turkish. The Layli is Madimum of the latter continued to be read till recent times and was printed repeatedly both in Iran and India.

The great majority of the Persian imitators met, however, with little success. Their poems at the most extant in few or even single copies. Some of them seem to have disappeared altogether. They have been listed in the following works: A. S. Levend, Leyld Mechan hidders, Ankara 1939, 86-96; E. Bertel's, Nisami i Fuzudi, Moscow 1962, 273-300; A. Ateg, IA, s.v. "Leylà ile Mecnin"; A. Muntawi, Fibrist-i nushhaha-yi hhatfi-yi farsi, iv, Tehran 1351/1974, 3100-15.

Some poets of the post-classical period wrote, under the title Cas-i wisal, short malinawis which describe a reunion of Malinun and Layll at the bottom of a pit (cf. Munzawl, op. cil., 2753 f.). In a quatrain by Lisani (9th/13th century), on a painter of miniatures, the emaciated body of Malinun as it is commonly represented in Persian art is used as a literary motif (cf. F. Meier, Die schöne Mahasti,

Wiesbaden 1963, 306).

In Kurdish literature, a number of versions of the romance exist which are partly adaptations of Persian or Turkish models and partly original works. To the written tradition belong the works by 'All Bepir Agha (ed. Baghdad 1950), 'Abd al-Diabbar Kanl (ed. Erbil 1969) and Harith Bitlisi, dated 1172/1758-59 (ed. by M. B. Rudenko, Moscow 1965). Polklore tales about "Leylf a Mecram (or Meclúm)" have been recorded in various regions. They show remarkable variants, e.g. the treatment of the romance as an astral myth (cf. Rudenko, op. cil.). Some versions have been written in the Gorani dialect of Persian and in a prosodic form characteristic of popular literature (cf. Ch. Rieu, Catalogue of the Persian manuscripts in the Brilish Museum, ii, London 1881, 733; Kamal Fuad, Kurdische Handschriften, Wiesbaden 1970). In Pashto, Bay Khan of Bunër made a version in stanzas which have the form of ghazals (cf. A. Sprenger, ZDMG, zvi [1862], 789).

Bibliography: Nigam's poem was edited by W. Dastgirdl in the ennotated Khomsa edition, Tehran 1313-18/1934-9, and by A. A. Aleskerzade and F. Babaer, Moscow 1965; Amir Khusraw's poem by T. A. Muharramov, Moscow 1975; Djaml's poem by M. Mudarris-i Gliani in Haft awrang, Tehran 1337/1958, and by A. 3. In Turkish Hterature

The Turkish poets were fascinated also by the Madjim Layla theme, in the first place, and above all, because they were inspired by the classical version of Nichmi [q.w.]; and then later, when taking up meritical position vis-d-vis the versions of other Persian and Turkish poets. Because the theme itself, the combination of the motifs, and, for the greater part, the metre as well, were all fixed, Turkish poets were able either to aim at a more exciting elaboration of the external motivation, melse to try to draw out the "metaphorical" meaning of the story as included in the material. A comparative study of the poetical aims, which, because of the similarity of the theme, should also take into account

Warha u Gillshah, is still lacking.

Gülshehrl and 'Ashik Pasha [g.o.] already taken up the theme in the Mantik al-jayr and Gharlbname. The line of independent Turkish versions starts with the lengthy methodoi [see MATHNAWI] written by Shahidi on behalf of Prince Diem [q.v.], and later plagierised by a cortain Kādimi, Already in Shāhidl's poem, m well as in Madjain w Layli of the eastern Turkish prince of poets Mir 'Ali Shir Nawa'i [q.v.] written shortly afterwards; for the contents, Philologiae turcicas fundamenta, il, 1964, 341-3, Madjann's unrequited love is interpreted a metaphorical road to the divine reality. At the end of the 9th/15th century, the Ottoman Ahmed Sinan Bihishtf [q.v.], who lived for a time in Herat, wrote mystically-inspired version influenced by Djaml [q.v.], to which he added some important alterations in the motifs. At about the **seem** time, Hamd Allah Hamdl (q,v,) and Tütünsüz Ahmed Ridwan composed their arrangements. The toth/16th century was particularly rich in Layla-Madinûn versions. Dielill Hamid-zade Bursall (d. after 977/1509-70) wrote his version in 928/1512-13, more or less simultaneously with his drastically-shortened version of Khusrane w Shirin, apparently concentrated, like the latter, on the external aspects of the action. Two years later Sawda'l's arrangement appeared, in whose copy verses by Fudult [q.u.] have intruded. In 931/ 1524-5 the Adharbaydiani Hakiri wrote a version, inspired by Nizaml and Hatiff [q.v.], which he transplanted to his native country (see PhTF ii, 643) and in which "chance plays an important role" (Levend, op. cit., in Bibl. 295-6). Exemplary for Turkish poetry was the way in which Fudull treated the subject. In his version, finished in 942/ 1535-6, Madinun appears in the symbol of the rollgious ideology of love, whose task consists of freeing himself from the beloved. With this eple poem, which is strewn with ghazels [q.v.] and does justice also to the feelings of Layla, who remains an earthly figure, Fuduli created an impressive Turkish counterpart to the Persian models, which he now came to equal. lo 950/1543-4 Hamdi of Laranda wrote a little-known version again inspired by Nigami, Djami and Nawa". In 962/1554-5 Salib b. Djelal produced wersion which slavishly follows Hatiff. Khalife (d. ca. 986/1578-9) copied passages from Fudull's work after having criticised him and Nawa'l in his preface. An Adharl poet by the name of 'Atayi (rith/17th century?) transformed the story into a fairy-tale in which he inserted quotations from Dede Korkut [q.v.]. The version of Kaizade Falidi (d. 1031/1621-2) remained unlinished. The following

survey shows how popular the theme has remained until present times: "Örfi Mahmüd Agha (d. after 1:86/1772-3) wrote a brief tale; the Turcoman poet 'Andalib Nür Muhammad Gharib (d. 1:79/1765-6) made a popular adaptation of the theme in prose and verse; the prince of Khokand, Muhammad 'All Khan (1822-42; see PhTF, ii, 392) produced an incomplete Caghatay version; the Adharbaydjani Nakam (d. 1323/1905-6), the Kazakh narrator of epic poems Süyümbay (1837-95; = ibid., ii, 749) and Diambul (1846-1945; see ibid., 750) made each their adaptions; and finally, there is the first Adharbaydiani opera, based on Fuduli, by the composer 'Caeyir Beg Hadilbeyll (1885-1948; see ibid., ii, 686), and the opera-libretto of the Turcoman Karadia Burunov, born in 1898 (ibid., ii, 733).

Levend, Arap, fars to turk edobivatlarinda Leyld ve Mecrum kikdyesi, Ankara 1969; Philologias turcicae fundamenta, ii, 1964; A. Bombaci, Laletteratura turca, Milan 1969; Leylä and Mejnün by Fuzuli, Translated from the Turkish by S. Huri, with a history of the poem, notes and bibliography by A. Bombaci, London 1970.

(B. PLERMING)

4. In Urdu literature

The story came into Urdu literature via Persian, not direct from Arabia, and it is most frequently called "Layla Madjinfin". It is found in three main forms: firally, in casual reference in the lovers, especially in poetry; secondly, in narrative poems telling the story, generally in madjinawl; and thirdly in the plot for early Urdu dramas of the late 19th and early 20th centuries, mostly written for various Parsi theatrical companies in Bombay. However, failing the discovery of some hitherto unknown masterpiece, the theme seems to have taspired no work of major literary importance.

Casual references to the lovers are far too numerous to permit detailed discussion. They date from the earliest period of Urdu in the Deccan and Gudjarāt, and continued into the present century, though with decreasing frequency. Nor were they restricted to ghand, or even to secular poetry. For example, Wall Dakani [see mabis. 4. in Urdu], in a hashda in praise of the Prophot (dar na's Hadrat Khayr al-bashar) includes Layla and Madjann among several famous pairs of lovers, as metaphorical representation of fand? If Allah; Wall was, of course, a Süll (see his work cited in Bibl., 361).

The narrative magnauf was a favourite poetical form in Dakani, the type of Urdu current in South India from the 15th to the 18th centuries. Several examples devoted to Layla Madinan are extant; they were modelled on Persian works, particularly those of Hatiff, Nigami and Djami, and perhaps also on that of Amir Khusraw of Dinil, composed around 700/1300. In any case, despite the Persian models, the atmosphere in these Urdu works I distinctly Indian, as can be seen, for example, in the sarapa passages describing the heroine from head to foot. Hashim!, Bakir and Djálibi mention mathnawis by Ahmed Gudjaráti and Muhammad 'Aziz, both poets of the Kutb-Shahl period in Golconda. These were written in 1046/1636 and 1040/1630 respectively. A late Dakani mathaswi is Kissa Layld wa Madinan, composed by 'Ubayd Allah Wa'iz b. Ishak in Gudiarat in 1196/1782. It is in a collection of 12 early Urdu mathmassis by an unknown editor, under the title of Bara hissa. This collection was very popular, and was

published several times both before and after 1857; the later editions, however, tend to modernise the language, bringing it into line with the contemporary Urdu of Northern India.

Dakani Madjnún Layla mathaeuis are characterised not only by their Indian flavour, but also by their concentration on the story, which is told in simple, at times naïve, language. The story deviates considerably from the old Arabic versions. Thus Waiz makes Medinun the son of a Charnawid king by an Arab woman whom he marries while on the badidi. The king has to return home before the boy is born, and an astrologe, foretells the boy's future, and suggests the lakab of Madinun for him. The boy's murshid recommends night prayer and Kur'anic reading, and on the basis of the pun between Layla and lay!, Madinun falls in love with an imaginary Layla and wanders in search of her, his mind affected. He hears of a Layla who is the daughter of a sadi in Egypt. He goes there, and stays in the hadi's house as his pupil. He meets Layla, they fall in love, and then the story continue swiftly to its traditional conclusion with the death of the two lovers. The poem is, however, stretched iii over 500 verses by a good deal of lamentation by the various characters; some philosophisting in which the poet warns of the danger of love; an anecdote in which the Prophot explains God's inscrutability "A'isha; and Madinun's refusal to accompany the Angel of Death until the latter, after consulting God, returns assuming the face of Layla to take him away.

While the chief Urdu poets of Northern India in the 18th and 19th centuries do not appear to have written narrative poems on the story, it obviously remained popular at least into the 1860s, for Blumhardt (op. cif. in Bibl., 117, 254, 350) records three mathmanis, one anonymous published in Dihll in 1864, one by Muhammad Tald Khan Hawas (Lucknow 1862) and a third by Wall Muhammad Nagir (Cawapore 1886).

It was in the 1860s that theatrical companies proliferated in Bombay. Many of the early plays which they staged took their plots from familiar stories, whether Arab, Persian or Indian. The story of Madinin Layld enjoyed a considerable vogue for about thirty years as the subject of mem dramas. It is not known who wrote the first, nor how original those published were, for a playwright employed by company might be commissioned to revise or adapt an existing play, and there was no law of copyright me prevent the reviser from taking full credit for the play. The following wrote Layld Madious plays which are extant (unfortunately biographical information is almost non-existent); Nusrawan Dil Mihraban Dil Aram; Munshi Mahmud Miyan Rawnak (1825-66), whose play was written 1857-8; Husayul Miyan Zarif; and Hafiz 'Abd Allah. Rawnak's play-probably the best of these-was published in Bombay in 1880 in Gudjarati script, with the double title Andjam-i-ulfat, 'urf Layla Madinus. Like the plays by the other three, it has now been republished in the Urdu script at Lahore.

These four plays are distinguished by meertain stagecraft and popular appeal rather than by literary merit. With this in mind, the famous Lucknow polymath and novelist, Mirzā Muḥammad Hādi Ruswā (1859-1931) [see Kiṣṣa. 5. In Urdu] wrote his Muraḥtai-i-Laylā Madjwān ("the Album of Laylā Madjnūn"), published at Lucknow in 1885 and at Allahabad in 1887. He had seen plays performed by various touring Bombay companies in Lucknow, including doubtless Madjnūn Laylā plays. As he

writes in his introduction, he was dissatisfied with their language, which he found to be not that of Dihlt or Lucknow, but of the Bombay fishmarket! (Ruswa, tambid, 5). Encouraged by friends, he wrote this play to demonstrate how dramatic poetry should be. He employed different poetic metres to suit the characters and situations, and envisaged their being me to music, so that the result might be described as an Urdu opera. But no theatrical company would stage it, and critics generally regard it as a failure. Ishrat Rahman (cited in Bibl., 279) remarks that it was entirely in verse at a time when prose was playing an increasing part in Urdu drama. The plot, he suggests, had been "worked to death" and had lost its appeal. As a poet of Lucknow who had seen the heyday of the marthiya [see MAR-THIYA. 4. In Urdul, he was well equipped to write effective passages of melancholy and lamentation: in this respect, the play has much to commend it. But Ruswa was no dramatist; and the story does not tend Itself easily to dramatic treatment.

At least one modern Urdu writer has brought Madinun Layla up-to-date in ■ short story. Sayyid Sadidlad Haydar's collection of short stories Khayaiistan includes one entitled Hikayet Layla wa Madinum (cited in Bibl., 224-61). In it, the two lovers are reborn under modern conditions. Maginum follows Layla about on a bicycle. Layla is ordered electric shock treatment, and at the time of this treatment, Madinan has a fit. He is taken to Mecca to be relieved of his obsession, but prays only that his suffering may never be lessaned. Thus ends this "whimsical and delightfully written story" (Suhrawardy, cited in Bibl., 212), which forms a fitting conclusion to an account of Madjoun Laylà in Urdu literature.

Bibliography: For Dakani mathnawis on the story, see Nasir al-Din Häshimi, Dakan med Urdus, Lucknow 1963, 62-3, 108-13 (including extracts); Djamil Djalibi, Ta'rîkh-i-adab-i-Urdü, E Kadim dawr, Lahore 1975, 249-50; for the text of Walis, see Urdu kë hadim manjum dastanin, ed. Khalil al-Rahman Dawud, i, Lahore 1967, 1-10, 81-148 (a critical assessment is given by Muhammad Bakir, Urdu-i-hadim Dakan awr Pandidb men, Lahore 1972, 77-85); the reference by Wall Dakani to Madinun Layla will be found in Kulliyydt Wall, ed. 'All Absan Mirahrawi, Awrangābād 1927; J. F. Blumbardt, Catalogue of Hindustani books in the Library of the British Museum, London 1889, mentions mathematic published in Northern India in the 19th century. Plays on the story listed by Ishrat Rahmani, Urdu dramd-tárikh-otankid, Lahore 1957, 211-23. The Layla Madjada dramas of Ārām, Ruwnak, Zarlf and Hālig 'Abd Allah are included in the volumes of collected dramatic works of these authors published by the Andjumen-i-tarakki-yi Urdû in Lahore in recent years; the same society has published Mirzā Muhammad Ruswa's Murakkat-i-Layla Madinan, ed. Ishrat Rahmani, Labore 1963. This includes not only Ruswa's own preface, but a aseful introduction by the editor which lists previous dramas on the theme. Sadidiad Haydar's Khayaistan was first published at 'Allgath in 1932, and there is a Dihii edition of 1946; Shayista Akhtar Band Suhrawardy's brief account and assessment of his Hikāyat Layla wa Madinun is in her A critical survey of the Urdu novel and short story, London 1945.

(J. A. HAYWOOD) MADJRIT, mediaeval Arabic name of the city of Madrid (Spain). The Arabic sources seldom mention this place in the Muslim period. According to al-Himyari, the kiss of Madirit was built by the Umayyad amir of Cordova, Muhammad I [238-76] 852-86), M. A. Makki believes that its foundation may be dated between 252/866 and 257/871 in the reign of this amir; the year 252/865 marks the beginning of the reign of Alfonso III of the Asturias, whose military activities had the effect of destabilising the region between Médinacéli and Toledo (al-(haghr al-adnd), which would then have been consolidated by the construction of the fortress of Madjrlt as an important element in the military disposition of the region, with a governor appointed by Cordova, 'Ubayd Allah b. Salim, who imprisoned and executed a rebel from Toledo named 1bn Balûsh.

From its foundation until the period of the films of al-Andalus (399/1009), the few facts supplied by the ancient sources on the subject of Madirit are indicative of its role as a frontier fortress (thachri). In 320/932, it was subjected to an attack by King Ramiro II of Léon, according to the Christian historian Sampiro. In 324/936, a party of citizens of Madirit undertook an expedition into Christian territory and, on their return, they were massacred by the enemy, according to Ibn Hayyan. The hādiib Ibn Abl 'Āmir al-Mansūr (Almanzor), in the course of his campaign against the fortress of La Muela in 366/977, met at Madirit the governor of Médinaceli, Ghalib (Ibn Adharl). Ibn Harm supplies an interesting item of information concerning Madirlt; the slave of a perfume-seller known by the name of al-Fasih led an insurrection in this town, pretending to be 'Ubayd Alläh al-Mahdi, but 🖿 was attacked and killed. J. Oliver Asin believed that this insurrection was inspired by Fatimids; on the other hand, M. A. Makki reckons that the rebel wished to be recognized as the son of the short-lived Umayyad caliph of Cordova al-Mahdi (399/1009 and 400/1010). Thus the rebellion would have taken place in the time of the Umayyad caliph al-Mustakii bi'llah (414-16/1024-5).

In the period of the Taifas (mudik al-famā'if), Madirit must have been attached to the kingdom of the Band Dhi 'I-Nan of Toledo. The king of Castile Alfonso VI took possession of Madirit as well as of other fortresses in the region, shortly before the fall of Toledo, in ca. 476/1083. It seems to have remained under Christian domination except for a very short period, me the time of the so-called Talavers campaign of the Almoravid amir 'All b. Tashfin (Ibn Abl Zar'). But the Christian city retained a Muslim community (mudejares), concentrated in particular quarter (Barrio de la Morería). There were also Moriscos in Madrid at the time of their official expulsion from Castile in 1610.

The only description of Madjrit preserved by Arab sources is that of al-Himyarl. It is very short, stating that the place consists of a small town and an imprognable fortress, with a Friday-mosque, Also mentioned is the discovery of the skeleton of gigantic beast in the most of the town (large fossils not rare in the valley of the Manzanares), and the extraordinary nature of the soil of Madrid, ideal for the manufacture of solid and durable cookingpots.

The topography of Madirit can therefore only be reconstructed in a hypothetical fashion, by means of the archaeological and toponymic remains of more recent period. It seems that the Arab bise was situated on the heights of the Palacio Real, on a raised promontory dominating the Manzanares river. Oliver Asla considered that the entire hill must have been surrounded by walls, with the high

MADIRIT

and other military constructions forming a citadel whose Arabic name was apparently al-Mudayna (Almudena). I name preserved by the church of Santa Maria de la Almudena, to the south-west of the hill, m me extremity of the Calle Mayor. It apparently had two gates, whose existence is known to us from Christian documents: the Puerta de la Vega, to the south-west of the hill, towards the valley of the Manzanares, and the Puerta de la Amudena, to the south-east, finking the citadel with the town or madina. The latter probably had its own surrounding walls, in common with many other towns of al-Andalus. The Arab madine must have extended towards the eastern end of the hill, covering a half of what is currently the Calle Mayor (Platerias), where the gate known as the Puerts de Guadalajara was situated. Its northern extremity was located to the south of the Plaza de Oriente and the theatre of La Opéra. On the other hand, the southern limits of the Arab Madirit are the object of greater controversy, since to the south the hill of the Palacio Real and the madina overhang a ravine of considerable depth, which today is crossed by means of a viaduct and which opens = small valley (Calle de Segovia) before climbing again towards other hills (Las Vistillas and San Andrés), Oliver Asin supported the hypothesis that the pre-Arab Madjelt first grew up in this narrow valley and that the walls of the town must have enclosed the valley, on the descent from the hill of al-Mudayna and the rise towards those of Las Vistillas and San Andrés, as was the with the mediaeval and modern surrounding walls (see the engraving of Códice de Wingaerde, 1563-70). But the archaeologist Basilio Pavon is not in agreement with this hypothesis about the southern limits of MadirIt; he considers that the wall of the second enclosure skirted the northern ridge of the small valley, running parallel to the Calle Mayor, a hypothesis which had already been propounded by E. Tormo. It would be necessary to attribute an origin in the Christian period to the wall which encloses the valley, Las Vistillas and San Andrés, and which would have formed a third southern tier in the fortifications of Madrid. B. Pavon furthermore maintains that the citadel or first tier did not embrace entirely the hill of the Palacio Real; the southern section, currently occupied by the cathedral of the Almudena, would have formed a part of the second tier, = far as the Puerta de la Vega. Almudena or al-Mudayna would thus be a toponym designating not only the citadel, but the mading or town with the sense of "small town", in accordance with the text of al-Himyari.

The site of the Great Mosque is the subject of various hypotheses. It may have been on the former site of the church of the Almudena that of the church of San Salvador, which has likewise disappeared and used to stand opposite the present-day Town Hall; it could also have been on the site where the mudejar-style church of San Nicolás now stands, a few metres to the north of the extremity of the Calle Mayor. The Fuero de Madrid of 1202 also mentions the existence of asoches (markets, bazaars), the most important of which was situated along the Calle Major. There was also an almuzara (al-musdrif), a promenade and place of recreation, as in other towns of the Muslim West; it was most probably located outside the walls.

But the most remarkable characteristic of Madirit, as also of mediaeval Christian Madrid, was its system of extchment and distribution of subterranean waters, this being the basis of the legend, documented

from the 15th century onward, asserting that Madrid had been built on water. The hydraulic system of Madirit-and of Madrid until the 15th century-was based on the catchment of water by means wells linked by large subterranean galleries (kandt [q.v.], pl. kandwät) descending from m elevated place towards the town, where they form new ramifications, on or below the surface, which emerge in public fountains, in gardens or in houses. It is highly probable that this technique we employed in various parts of the Iberian Peninsular in pre-Islamic times; but traces of it have only been preserved in Madrid, a huge complex which has lasted remarkably well over the centuries. This is perhaps a tribute to the quality of the soil of Madrid, noted by al-Himyarl, which is such that were today some public fountains of the town are supplied by this system of water distribution. The hand's of Madirly have been studied by Oliver Asin: the two most important canals are the Alto Abronigal and the Bajo Abronigal, whose respective sources are situated in two hills which are still known as Canillas and Canillejas, toponyms whose Arabic etymology is to be found in kanal, of which the plural form almiys is encountered in the Arabic of al-Andalus. The Alto Abrofigal came to an end by the site of San Nicolas, the church already mentioned, close to the citadel, in the heart of the Arab town. The Bajo Abrohigal terminated at the Puerta Cerrada, on the hypothetical third tier of the town's defences.

It is furthermore quite possible that the name of Madirit should be associated with this hydraulic system, according to a popular etymology which has it evolving from madjrd, canal or water-course. The origin of this name does not seem to have interested the Arab authors of the Middle Ages, but as soon as Madrid became the capital of the Spanish Empire in the end of it toth century, many scholars tried to find Arabic origins for it, helped perhaps by the Moriscos: maddjara, medrasu, mushrik, etc. Subsequently, an etymology of clerical origin prevailed: Majorition (from the Latin major), of which Madirit would be the Arabic transcription. In III 18th century, faced with ill-founded theories, the Maronite priest Michel Casiri (al-Gaziri) was obliged to establish a compromise theory; the original name was the Latin Majoritum, but Madjrk was word of African origin signifying canal or conduit (aguseductum).

In the 20th century, and in the light of modern philological studies, R. Menéndez Pidal has constructed a hypothetical Celtic name Magerito with the sense of "ford" or "long bridge". M. Gomez Moreno claimed to have discovered in Madirlt a terminal -it having its origin in the Latin ending -atum, collective of abundance. Oliver Asin proposed a brilliant hypothesis, that Ma<u>di</u>rit must be a hybrid formed from the Arabic word madira, canal, and from the Roman suffix -it, of abundance; Madirit would thus signify "place where canals are abundant". He considered, however, that the present name of the town comes not from the Arabic name Madirit, but from Majelsi, a Roman toponym having its origin in the Latin Matricem, the primitive name of the small valley where the Calle de Segovia is currently situated, on the site of a pre-Arab settlement, according to this author. Finally, Joan Corominas has made some adjustments to this theory while retaining the connection between Madirit and madira. He rejects the possibility of the use of the collective -etum (-W) other than in the sphere of plants, and he believes that Madirit is a metathesis of the word of Latin origin matridi (from matricem), according to a popular etymology which seeks to link it with madiri. He also considers that the current form of Madrid may derive from the Arabic Madirit, by means of an intermediary form mazirid with an epenthetic st.

The best-known native of Madjirl; in the Muslim period is the astronomer and mathematician Abu I-Kasim Maslama al-Madjirli (q.v.), but other individuals of secondary importance who have been studied by Oliver Asin were also born there. Ibn Hayyan and other historical sources of al-Andalus supply mannes of governors of Madjirl; in the Umayyad period, in particular numerous members of the family of the Bann Sällm, of Berber origin, firmly implanted in the central marches of al-Andalus and especially in the region of Médinacéli [Madinat Sālim].

Bibliography: The Arabic sources on Madjrit are: al-Himyari, al-Rawf al-misjar, ed. E. Lévi-Provençal, Cairo 1938, and ed. I. 'Abbās, Beirut 1980 (s.v.); Ihn Hayyān, al-Makki, Beirut 1973; al-Maktabas, ed. M. A. Makki, Beirut 1973; al-Muktabas, ed. P. Chalmeta, Madrid 1979; Ihn 'Idhāri, al-Bayān al-mughrib, ii; Ihn Hazu, Nați al-sarūs, Cairo 1948; Ihn Abi Zar', Razud al-birjās, Fez 1936. The Fuero de Madrid was edited in Madrid in 1932.

A seminal work which is still useful for Madjelt (etymology, topography, canals and history) that of J. Oliver Asin, Historia del nombre de Madrid, Madrid 1959; M. A. Makki, Madrid alsarabiyya, Cairo n.d. [1968] basically follows the preceding work, with a few historical novelties. On the topography of Madjrit, reference may be made to E. Tormo's slightly out-dated work, Las muralles y las torres, los portales y el alcázar del Madrid de la Reconquista creacion del Califato. Madrid 1945, in anticipation of Madrid drabe by P. Pavon, as yet unpublished. On the almuzaras: Oliver Asin, Las dos almusaras, in Al-And., xxvii (1962), 155-79. On the kandis: Cornel Braun, Teheran, Marrakesh und Madrid. Ihra Wasserversorgung mit Hüfe von Qunaten, Bonn 1924, and H. Goblot, Les ganais. Une technique d'acquisition de l'eau, Paris-The Hague-New York 1979. On the etymology of Madirit: R. Menéndez Pidal, Lu cismologia de Madrid y la antigua Corpetania, in Revista de la Biblioteca, Archivo y Museum de Madrid, xiv (1945); M. Gömez Moreno, Le desinencia -it a proposito de Madrid, în ibid., xv (1946); Oliver Asin, El nombre de Madrid, in Arbor, xxviil (1954), 396-426; J. Corominas, Etimalogia de Madrid, in Revista de Filologia Española. xlifi (1960), 447-50.

(M. J. RUBERRA DE EFALZA) AL-MADJRITI, ABU'L-KASIM HASLAMA B. ARMAD AL-FARADI, in athematician and astronomer, born in Madrid in the mid-4th/10th century, died in Cordova in about 308/1007.

The facts which are known do not enable us trace his biography in detail. He was clearly an important person since Ibn. Hazm mentions him in his Tank al-kamama (ch. xiv). He clearly established himself at a very early age in Cordova, and was a pupil of the geometrician 'Abd al-Ghâfir b. Muhammad. It must be supposed that he maintained contact with the circle of Hellenists which came into being in the period of 'Abd al-Rahman III al-Naşir. In 369/979 he carried out man astronomical observations, and it must have been at this time that he adapted the tables of al-Kh-ärarmi [q.v.] to the Cordova meri-

dian. Some time later, he apparently brought the Rasā'il Ikhwān al-Safā' to public attention in al-Andalus. It is possible that he performed the duties of a court astrologer, since it is to him that one attributes the horoscope which, according to Ion 'Idhāri (Bayān, ed. E. Lévi-Provençal, iii, Paris 1930, 14-15) and Ibn al-Khatib (A'māl, 127-8, apud Hoenerbach, Islam. Gesch. Spanieus, 259), predicted and described the unfolding of the films.

His disciples included: al-Kirmani (d. 458/1056), who introduced the Rasā'il Ikhwān al-Ṣafā' Saragossa and the frontier regions of the North; Abu 'l-Kāsim Aṣbagh b. al-Ṣafāh (d. 426/1035, see 18N AL-Ṣafāh); Abu 'l-Kāsim Aḥmad b. al-Ṣafāfāz (d. 426/1035, see 18N AL-Ṣafāhz); the astrologer Ibn al-Khayyāṭ (d. 447/1055), to whom so many elegies are dedicated in the Memoirs of the Zirid king 'Abd Allāh; al-Zahrawi [q.v.] and Ibn Khaldān of Seville.

The authenticity and the number of works by Masiama al-Madjrifi have given rise to numerous discussions. As a general principle, we can be sure that the books of a magical or alchemical nature which are attributed to him do not belong to him, since the kādi Ibn Şā'id does not mention them in his Tabahdi; they should be attributed to his quasi-temporary and compatriot Abû Masiama Muhammad ... al-Madjriff (on whom see Sezgin, GAS, iv, 294-8) and to the latter's pupil Ibn Bishrûn al-Madjriff (GAS, Iv, 298). Among these apocryphal writings, the principal ones are the Rubbat al-hakim, the Châyat al-hakim (Picatrix) and the Sirr al-kimiyā.

Books which may be regarded as authentic works of Abu 'l-Kasim Maslama al-Madiriti are therefore as follows: (1) A textbook of commercial arithmetic Tamam 'ilm al-'adad = K. Thinds al-'adad = Mu'amalat) which, according to Ibn Khaldun dealt with sales, valuation and taxation and in which, apparently, arithmetical, geometrical and algebraic techniques are employed indiscriminately; (2) a very short Treatise on the astrolabe (not to be confused with that of Ibn al-Şaffår), which deals with the technical construction and use of this instrument (B.N. Arable ms. 4821, 10ls. 76a-8xb, ed. and tr. J. Vernet and A. Catala, in al-And., xxx [1965], 15-47); (3) An adaptation of the Astronomical tables of al-Khwarazmi to the Cordova meridian and to the Leginian Calendar; (4) An adaptation or emendation of some tables of al-Battani [q.v.]; (5) Notes on the theorem of Menelaus (shalf al-kalla"), on which see M. V. Villuendas, La triogonometria europea en el siglo XI . . ., Barcelona 1979, and A. Biornbo and H. Suter, Thabits Work über den Transversalsaiz, Erlangen 1924, 23, 79, 83 and ms. *Esc. 972, 2; (6) Tasfie basit al-kura, which is an Arabic translation of the Pianisphers of Ptolemy; the two originals are lost but Maslama's work in preserved (a) in a Latin version made from the Arabic text by Hermann of Daimatia (1143) and edited in Basle in 1536 and in Venice in 1558, and (b) in # Hebrew version; the Arabic translation can be judged thanks to the Paris manuscript which contains Maslama's commentary, Tallit fald Ballamiyûs fi tastih basil al-kura; and (7) a work of astronomy utilised by Ibn Taybughā b. al-Madidl (d. 850/1447) in al-Durr al-yatim (see Sezgin, GAS, vi. 227, 4).

MADJOS (coll., sing. Magiūsi), originally an ancient Iranian priestly caste (OP magush, Akk. magushu, Syriac mgōshā, Greek μάγος) but used in Arabic primarily for Zoroastriaus.

This caste was closely identified with the ruling élite in Sasanid Iran, where their faith the official religion of the state and where they were organised in a social and religious bierarchy. The priests, called mobad, kirbad, dastür, or rat depending on context and function, had ritual, judicial and educational responsibilities. The priestly hierarchy with the mobadan mobad at its apex interlocked with the secular administration, and priests performed notarial duties in the courts, sealing documents and decisions. At the end of the Sasanid period, hirbads appear to have been in control. The public cult with its royal political significance performed in fire temples involved rituals concerned with the fire itself, well as with animal sacrifices and liturgical recitations. In addition to a hierarchy of village (aduran) and provincial (varkran) fires there were three especially famous temples: that of the Farnbag Fire, probably at Kāriyān in Fars, for priests; the Gushnasp Fire at Shiz in Adharbaydian for soldiers; and the Burzen-Mihr Fire in the mountains above Nishapur for farmers. Other fires are mentioned on seals and in texts, and although fire temples were usually state property, they could be founded and endowed privately. At the personal level, the cult involved at the hearth fire. and emphasised the maintaining of a state of ritual purity by performing ablutions with bull's urine (gomes) and cold water, by avoiding dead matter, by tying and untying the sacred cord (kusti), and by eating is a state of ritual silence (in bidi) with only murmaring (tamtoms). The popular cult included food-offerings at fire temples, the veneration of sacred trees, and public seasonal feasts (gahambars) and dances. The bodies of the dead were exposed in the open. Blaborate private rituals contributed to social differentiation, with the standard of observance greatest among the upper classes and declining one moved down the social scale among the majority of nominal Madius.

Although the Avesta had been written down in its 11 nasks, the texts were usually memorised and known only by those priests who specialised in specific rituals. Since the Avestan texts were imbedded in their commentary, there was no separate sacred book of scripture or closed canon = terms of authority. Nor me there any doctrinal orthodoxy. Monotheist, dualist, and polytheist expressions coexisted with choice of emphasis and interpretation depending circumstances. The Zurvanite tendency to assert the ultimate primacy of the god of Time and Destiny appears to have been favoured in the Sasanid period because of its authoritarian implications, and was associated with the ruling classes. Other monotheist expressions concerning the primacy of Ohrmazd appear in apologetic contexts with Jews and Christians. The most complete dualist expressions me found in the 3rd/9th century Pahlavi literature in a context of polemic with Islam, and these represent Ohrmazd and Ahriman as co-eternal antagonists and creators. Polytheist expressions having do with the Yazatas as being deserving of worship tended to be reinterpreted by semantic arguments concerning the definition of delty and of worship.

An élitist social ethic honouring establishmenterian virtues provided ideological justification for the hierarchic society of the Madiūs. High values were placed on order, stability, legality and harmony among the functionally-determined divisions of society (priests, soldiers, bureaucrats, and workers, or else priests, soldiers, farmers, and artisans) so each would perform its specific duty towards the others. The justice of rewards and punishments was emphasised at the spiritual, political and social levels, while economic, legal, and religious sanctions used to ensure the obedience of women and children. Consanguineous marriage (hhultodas) was approved me a means of preserving the social exclusiveness, solidarity, and purity of descent of the upper classes. Material wealth was equated with the virtue and goodness inherent in the upper classes, whose destiny or fortune (hvernah) it - to enjoy the good creation of Ohrmazd. Naturally antiascetic, their ethic equated poverty with the sin and avil inherent in the lower classes.

Consequently, the Madius were vulnerable to the loss of political support and in the rejection of authority and material success by alienated members of their own society. In the Sasanid period their position was croded by the internal ascetic, gnostic sectarian movements of Mani and Mazdak and by conversions to Christianity in the west and to Buddhism in the east. Bad religion (abramohis) was identified with antinomianism, social disorder, extremist behaviour and dissimulation by the Magias, who executed and disinherited unrepentant apostates.

Thus at the end of the Sāsānid period not alt Persians were Madjūs, not were Madjūs confined to Iran proper. They were to be found as administrators, landbords, and soldiers in non-Persian parts of the Sāsānid empire such as ai-firāk, Bahrayn, 'Umān and Yaman, and there may have been Arah Madjūs in the tribe of Tamlm and in Yaman. Outside the Sāsānid empire, there were Madjūs in western India and China, probably as merchants, and local communities in Central Asia with local differences in cult which were not part of the Sāsānid organisation.

The of the Sasanid state to the conquering Muslims drastically and permanently changed the status of the Madjus from that of rulers to that of subjects. Fire temples were confiscated in Babrayn and al-'Irak, while Madius were required to pay tribute (djisys) wherever they surrendered, at first in Yamen, 'Uman, Bahraya, and al-Irak, At first their treatment was inconsistent, and in 20/641 Diaz' b. Mu'awiya began to break up the families of Madjus and forbade the samsama in the countryside Bagra until 'Abd al-Rahman b. 'Awf convinced the caliph 'Umar I that Muhammad had accepted dirays from the Madius of Hadjar. This provided precedent, since there was no Kur'anic basis for treating the Madjus as ah! al-hilab. Sura XXII, 17 merely lists them along with akl al-kitáb and mughrikun, and it was eventually decided in Muslim theory that the Madias were intermediate between the ahl al-kitab and musk-ikan since they had no real prophet merevealed scripture. Their women and the meat of animals slaughtered by them were forbidden . Muslims, and according to al-Shafff, their blood price was 1/5 that of Muslims. Nevertheless, Madius were employed in the administration at Bases and in Khurāsān under the Umayyads.

MADJUS

In Iran the Madius kept their fire temples, suffered little interference in their cult at first, and were allowed to pay drizya. In some places, such as Rayy, Kimis and Shiz, the peace terms provided for the preservation of their fire temples. However, there was no recognition of the preservation of a religious community by the Muslim state, and since no unitary organisation or hierarchy of priests survived the conquest, leadership devolved local priests and dikkans.

The loss of political power and support had several consequences for the Madjus. First, the loss of members by conversion to Islam was added to continuing conversion to Christianity. The descendants of the Persian soldiers in Yaman (Abna) [q.v.]) were converted to Islam in the lifetime of Muhammad, as were the marshan of Hadjar with some of his followers. A number of dahāķiz and units of the Sāsānid army became converted to Islam in al-Irak, and by the time of 'Umar II (99-101/717-20), the Madjus of al-Hira had become Muslim, Generally, members of the Sasanid establishment became converts in order to avoid paying giftya, to keep their property and position, and to join the Muslim army and administration. The Madjus also lost many members through captivity, since children taken captive were raised as Muslims. Nevertheless, there is no evidence of early mass conversions in Iran. The governor of Sidjistān in 46/666-7, al-Rable, is said to have encouraged conversion by a combination of persuasion and force, and he required converts to learn the Kur'an, Kutayba b. Muslim [q.v.] also encouraged conversion at Bukhāra in 94/712-13, built a Friday mosque on the site of the former fire-temple, and attracted converts among the poor by paying them two dirkams to worship there, although afterwards conversion was discouraged in order to preserve the tax base. Conversion was also discouraged by the Madius themselves, who treated apostates as legally dead, disinherited them, and required property to remain within their community. Converts were also subject to discrimination by local authorities, such as Bahram SIs who, when appointed maraban by the Muslim governor of Khurasan in 105/725 and charged with collecting taxes from the Madjüs, collaborated with the Christian and Jewish agents to make 30,000 converts to Islam pay the diaya and to exempt 80,000 non-Muslims.

Second, the advent of Muslim rule subjected the Madjus to sporadic persecution. About 50-1/670-1 Ziyad b. Ablhi, the governor of al-Trak and the east for Mu'awiya, sent his cousin 'Ubayd Allah b. Ab! Bakra to destroy the fire temples and to confiscate their property in Färs and Sidiistan. Although Ubayd Allah destroyed the fire temple at Kariyan near Dārābdjird and killed the hisbads, the chief hirbad of Sidjistan, Shapur, escaped with his fire temple at Karkuya near Zarang because the local dikkins and Madius appealed to the caliph. There were later extinctions in a village at Kumm by ai-Hadidjädj and at Idhadi on the border between Khuzistan and Isfahan in the time of Haran af-Rashid (170-93/786-809). Al-Mutawakkii [232-47/ 847-61) is seem to have had a famous ancient cyprese tree reputedly planted by Zoroaster cut down in 247/861. In 482/895, the Turk Barun, who was governor of Kumm, destroyed a pre-Islamic fire temple in the village of Fardadjan near Isfahan, and in 288/901 destroyed the last fire temples in the village of Djamkaran at Kumm. Sometimes fire temples were converted into mosques in places where Arabs had settled or as the result of conversion, although

afterwards the Madjüs often continued to venerate sites where tire temples had been.

Third, the Madjus gave = apocalyptic meaning to the events at the end of the Sasanid period, interpreting them as signs of the end of the millenium of Zoroaster and the beginning of the milletium of Oshedar, which calculations based on the Letter of Tansar would place about 41/561 but which was later identified with the beginning of the era of Yazdadird in ro/63r. The end of the millenium was signalled by the advent of Arab rule and destruction by them, and by the overturning of social classes and values, when the nobles would be powerless, separated from their families and forced to share their status with people of low origin, and when people would copy foreign customs. Predictions of the arrival of the liberator, Varhran Vardjavand, of the destruction of Muslim places of worship, and of Roman invasion, may belong to the propaganda of Sasanid restoration attempts. The Mahdist hopes associated with Abu Muslim have also been linked to Zoroastrian eschatology, the restoration of Zoroastrianism and the end of Arab rule in Khurāsān. It was against this background that a series of risings by Zoroastrian peasants provoked by fiscal oppression in eastern Iran in the and/8th century served as the occasion for the emergence of new antinomian, anti-establishment Zoroastrian sects. This began with the peasant revolt near Nishapur led by Bihafarid from 129/766-7 to 131/748-9, who claimed to be a new prophet with a book in Persian, abolished samzama, the use of wine and meat, consanguineous marriage, and fireworship, and limited dowries to 400 dirhams. Although the mobads got Abu Mustim to suppress the rebellion, his sect could still be found near Marw in the 4th/10th century awaiting his return, even though disya was not accepted from them. Madius also joined the rising of Sinbadh in 138/755, and followers of Bihafarid and Madius in Sidiistan and at Harat and Badghis followed Ustadhsis in 150/767; his sect also survived until the 3rd/9th or 4th/10th century, Muslim authors noted four sectarian divisions among the Madjus. Al-Shahrastant lists the Kayûmarthiyya, Zarwâniyya, Zarâdushtiyya, and Saysāniyya called Bihāfarīdiyya, while al-Baghdādī gives them as Zarwāniyya, Mashiyya, Khurramdlaiyya and Bihāfarldiyya, and says that disya was only acceptable from the first two.

Fourth, the inability to execute sinners and apostates themselves produced a change in attitude towards nonconforming members of their own community. Persuasion replaced the threat of force lest sinners be tempted to convert. The nobility of the virtuous poor, whose good works cannot be stolen and who will be rewarded in heaven instead of on earth, appears as a theme in andars literature. This was probably the result of the growing impoverishment of the priests and dihlens as well as an attempt to keep the loyalty of still poorer members of the community, and it reflects a degree of social levelling among Madjūs after the Muslim conquest, although the sincerity of the sentiment was questioned in the apocalyptic Djāmāsp-nāma.

Fifth, unavoidable contact with unbelievers and the loss of texts led to changes in cult and custom. The more elaborate aspects of ritual purity went unabserved. Madiüs were allowed to sell animals to non-Zoroastrians when survival depended on it, and they began to expose their dead inside an enclosure (daēkma) out of the sight III unbelievers. They did not consider it a sin to steal property from non-

MADJOS

Zoroastrians that had been stolen from them. Although they learned to be content with compromises that could not be avoided, they also exerted themselves to maintain their rituals whenever they could.

In spite of their decline in status and in numbers. the 3rd/9th and early 4th/10th conturies appear to have been a time of relative recovery, stability and consolidation for the Madiûs. Part of the fire at Kariyan had been taken to Fasa for safe keeping during the Muslim conquest, and from it the fire temple at Kāriyān, destroyed in the tat/7th century, was restored. Fire was exported from Kariyan and Shiz to new temples and al-Mutasim (218-27/833-42) permitted the restoration of fire temples III Istakhe and in Farghana, What remained of the old religious literature was collected and preserved by Aturiarnbag-i Farrükhzātān, möbad of Färs in the reign of al-Ma'mūn (198-218/813-33). A new didactic, apologetic and polemic literature was produced by Manushcibr, the leading mobad of Fare and Kirman in the second half of the 3rd/9th century, by his brother Zätspram, the mobad of Sirkan, by Manushcihr's nephew, Emet-i Ashavihishtan, mobad over much of southern Iran in the first half of the 4th/roth century and by his successor, Aturpat-i Emetan about the middle of the 4th/10th century. The main Pahlavi texts which were produced in this period sought to forestall conversion through intellectual arguments against monotheism and gnosticism, and through using that part of the legal tradition that concerned social behaviour and personal status in order to preserve their distinction from unbelievers and to draw social boundaries more closely around themselves. But authority and solidarity within the community, which depended on the priest's appointment of the heads of households responsible for carrying out family law, me undermined by the facts that the priests themselves were too few and poorly trained, had taken up waits in order to survive, and had been replaced by those less qualified. In these circumstances, educated laymen were allowed to substitute for them when necessary.

Despite these problems, the testimony of Muslim geographers indicates that Madius were still widespread and fairly numerous in Iran and the cast as late as the 4th 10th century. There were many villages of Madjūs on the Aras River in Adharbāydjān and the five temple at Shiz survived me late as 333/943. Madjūs were numerous in al-Irak and had a large fire temple on the west bank of the Tigris opposite al-Mada'in. There were still a few Madjus in Khuzistan, with several fire temples at the sacred village of Hudidian. They were numerous in al-Dibal, where they could be found at Rayy and in villages near Rumm, while there were still fire temples near Isfahan, Madius were more numerous in Fars than anywhere else, with fire temples in nearly every village, town, and district, and they meet employed as local governors there by the Buyids. However, pressures for conversion, such as the activities of Shaykh Abb Ishāk al-Kāzarānī (d. 426/1034) and his followers, led to conflict and the outbreak of a Muslim-Madjūs rlot at Shīrāz in 369/979. Madjūs could be found in Kühistän, and remained numerous and influential at Kirman until the late 3rd/9th century. There were Madjûs in the Caspian provinces late the 5th/11th century, although in the late 3rd/9th-10th century most of those in Daylam had been converted by Zaydl ShITs and those in Gilán converted by Hanbalis, Madiùs still lived in the city of Zarang in Sidjistan in the early 4th/10th cen-

tury, while the fire temple at Karkuya survived as late as the 5th/11th century. There were several sects of Madjūs in <u>Kh</u>wāsān, where there were fire temples at Mahapar, Harat and near Tus, there was a village of Zoroastrian donkey-drivers near Marw, although the Karramiyya sect [q.v.] were converting Madjüs to Islam at Nishapur. To the east, there was fire temples at Balkh, Bukhārā, and Farghāna in the 3rd/9th century, and Madiūs in villages in Turkish territory and in China in the 4th/10th century. There were also now groups of Madjus settled in northwest India and along the west coast, mainly engaged in trade, from the and/8th century - By the 4th/roth century there was a fire temple and doctions at Broach, while towards the end of the century Zoroastrian merchants at Cambay came into violent conflict with the Hindus and were driven out.

Although outstanding public differences such as the exposure of the dead and the refusal to use heated baths remained between Madius and Muslims, a resonance developed between Islam and Zoroastrianism in the form of common features shared by both traditions. In many cases it is impossible to prove that similarities were the result of the influence of one religion on the other or, if so, which way the influence went. Such are the shared belief in creation, the torment of the grave, the weighing of deeds at the judgment of the soul, rewards and punishments in Heaven and Hell, angels and demons, the end of the world, the coming of a messianic hero and resurrection. Such also are the practice of five daily times of worship, the requirement of an intention to worship in order for it to be acceptable, the recitation of scripture for the dead and a common aversion to idolatry. In both traditions, authoritarian appeals to the interdependence of religion and state were challenged by the antinomian extremism of sectarian rebels. There was a shared philosophical vocabulary and use of rational arguments between the Madjus and the Mutazila, who argued the same issues from opposite sides, the Madjus insisting that if there is only **and** creator he must also **in respo**nsible for evil, and arguing for a dualist solution to preserve God's goodness, mercy, and justice, along with human responsibility, at the expense of God's omnipotence. There is also a similarity between the archetypal religious man (Zaratoshtrom) of the Madius and the Muslim concept of the Insan al-Kamil, while the belief of the Madius in the need follow the religious example of a learned dasier who is the mediator for the age resembles the concept of the Imam of the age and the function of the muditakid among Shl9s.

Other similarities me more likely to be the result of Islamic influence. Zoroaster came be described as a prophet whose revelation was the Dinkari and whose miracle was the Apasta. Sometime after the sth/rith century, khodlödds became marriage between maternal or paternal first cousins. Dowry was approximated to Muslim made. Madius began to establish malfs, but in ways similar to the old endowments for fire-temples. By the 6th/12th century they had adopted the custom of beginning actions such as slaughtering an animal or writing with the phrase "In the name of God" (pa nam i yazdan). Shrines to the yazalas were preserved and protected by rededicating them to daughters of Vazdadird, who disappeared into the mountainside like Shiq Imāma, as early as the 4th/roth century at Rayy, or later by giving them Muslim form as Shiff imamaddas, making pligrimage to them and slaughtering animals there. Madius also began to visit Muslim

shrines on the pretext that they had replaced former fire temples.

Customs of Zoroastrian origin can also be found among Muslims, sometimes in secularised form such m the francian solar calendar, the celebration of the festivals Nawruz and Mihradian, or astrology, The fires lit at 15fähån about 313/935 to celebrate Muhammad's birthday seem to have been inspired by Zoroastrian winter fire festivals. Symbols associated with Zoroastrians such as the cup of Djamshid, wine, the tavera, the old mobad, and the youth came to represent those things forbidden by Islam in Persian poetry with maidmail Suff connotations. It is sometimes suggested that so many similarities as these may have made conversion from Zoroastrianism to Islam easier, although it might also be suggested that many common features were the result of conversion.

The history of the Madius in Iran after the 4th/ 10th century is little-known. They are presumed to have survived as local minorities suffering general disasters with the rest of the population, while their traditions were preserved in priestly and learned lay families. In particular, they preserved and transmitted their religious texts which have survived in India, and manuscript colophons indicate the presonce of kirbads at NTshapur and in Sidiistan in the 7th/13th century. A copy of the Vidended made in Skijistān in 601-2/1205 mm taken back to India by a Zoroastrian named Mahyar from Uch in the Pandiab who was instructed in the religion by the hirbads of Sighistan for six years. The copy of this text made at Cambay in 723/1323 is the source of the oldest known manuscript of this work. We are also told that in the early 8th/14th century the varas ceremony for making the mouth-masks worn by priests attending the fire was abandoned at Yazd because there one left who knew the ritual.

At the same time, Zoroastrians were spreading in Gudiarat and the Pandjab, beginning in the 6th/12th century as farmers, weavers, artisans, toddy dealers, and merchants in the coastral trade. By then they had returned to Cambay, and by 537/2142 there were Madius at Navsari, at Anklesvar by 666-7/1238, and at Thana about 720/1320. By the 8th/14th century, Gudiarat was divided into five religious districts (panthaks). The sole first-rank fire, the Atash Bahram at Sandian, was an object of pligrimage, while daily rituals were carried out at hearth fires in homes. The oldest secondary type of fire temple or Dar-i Mikr was at Navsari from about 536-7/1142 onwards, but did m have a permanent fire; tm priest attending it brought embers from his own hearth lire every day. There was another Dar-i Milar at Broach in the late 6th/12th century. By the 7th/13th century, vernacular Gudjarati versions of Avestan and Middle Persian texts began to made.

Important changes in the Indian community began with new pressures from Muslims and the Portuguese towards the end of the 9th/15th century. The Zoroastrians who joined the Hindus in the unsuccessful defence of Sandjan against Muslim attack in about 895/1490 left, taking the Attack Bahrām with them in a metal vessel, and eventually settled at Navsari in 922/1516, where a layman (behdin) called Canga Shāh, who was the local tax farmer (desai), persuaded the Muslim ruler to exempt local behdins from the djisya. The 10th/16th century saw the rise of the Bhagaria priesthood at Navsari, hased on fees for performing rituals, gifts of endowed property and Mughal patronage. In order to control income from fees, in 987/1579 the chief priest at Navsari, Dastür

Mahrdii Rānā, required his personal permission for other priests to perform rituals. The priests from Sandjan were only allowed to attend the Atas Bahram, and became increasingly impoverished as their numbers grew. The desai-gir - Navsari remained in the family of Canga Shah until 1003-4/ 1595, when Kaykobad the son of Mehrdji Rana combined it with the priesthood. This concentration of priestly authority and control, as well as a greater degree organisation, signals the formation the Parss community. To give it backbone uniform and authoritative content, from the time of Canga Shah onwards questions on doctrine and ritual were sent to the priests at Yazd and Kirman. Their answers survive in the form of letters (Rindyals), the earliest in 883/1478 and the latest 🖩 2187/ 1773, which provide precious evidence for the circumstances of Zorosstrians in Salawid Iran.

By the end of the 9th/15th contury, Yazd and Kirman had become the spiritual if not numerical centres of Iranian Zoroastrianism. The Riveyats reveal the presence in 916/13to of 500 boldins as Yazd, with 400 min the villages of Turkabad and Sharlfabād, 700 at Kirmān, 2,700 in Sidjistān and 1,700 in Khurasan. These figures must represent the minimum adult male population, for me also hear of a group of 3,000 behalins at one place in Khurasan, while 21 behdins from Khurasan had their own congregation at Kirman in 966/1559. There was also a Gushnasp Fire at Kirman, and Zoroastrians could still be found in Fars. Local communities appear to have been under the joint leadership of dasters and behding. In the late 9th/15th century there were only four or five hirbads well-versed in Pahlavi at Yazd, who performed all the rituals. The priests complained of being unable to get beading to give them the tithe of their income, although the meat offerings at Dar-i Mihrs were shared by their owners and the dastur recognised by the offerer. Relations with non-Zoroastrians were rather ambivalent. Behdins were urged to keep their promises and to pay their debts to non-Zoroastrians, and the testimony of a non-Zoroastrian was accepted in a case between two Zoroastrians before a Zoroastrian judge. However, the robbery and murder of unfriendly non-Zoroastrians were condoned and there are references to forced conversions to Islam both in Iran and in India. There was a reliance on the apotropaic function of rituals performed to repel powerful enemies, the tyranny III rulers, the loss of property, conversion and disease, as well as to gain worldly advantages such as wealth, happy marriages or royal favour. Anxious beliding were exhorted to exert themselves and to hope for the best. Although the year 1000 in the era of Yazdadjird fell in 1040/ 1631, expectations of the arrival of the millenium and of the saviour Bahram Vardiavand or of Oshedar were expressed throughout the period, including in 883/1478, 939-40/2533, 957/2550, 982/1574-3, 1036/1627, 1031/1641-2 and 1083/1672.

In the xth/r7th century, the Zorsastrians of Iran are described (armers, labourers, fullers, manufacturers of carpets and, especially at Kirmān, of woollen cloth, and they used their own dialect of Parsian called Dars among themselves. Men wore undyed garments and (approximately manufacturers) wore red and green clothing. In cs. 1017/1608, Shāh 'Abbās 1 (995-1038/1588-1629), who is remembered as a just king, brought 1,500 peasant families from Kirmān to Işfahān as fabour and settled them across the Zanda Rūd near Djulia at Gabrābād, in 1027/1618 their district consisted of about 3,000 plain, single-storied

MADJUS

houses along several long, wide, straight, tree-shaded streets, and the people worked as labouters and craftsmen in lafahan and the countryside nearby. There was a dakkma outside their settlement where they placed their dead fully clothed. Most of them returned | Kirman when 'Abbas I died, and 'Abbas II (1052-77/1642-66) turned the district into a suburban resort with palaces, mosques, markets, and baths and moved the remaining Zoroastrians to the other side of Djulfa. Tavernier estimated the Zoroastrian population of Kirman at over 10,000 in 1064/1654, many of whom were involved in the wool industry. In ros4/1644 a new hidne-ye mike was built at Kirman by a behalis, and there are references to pilgrimage to the shrines of Khatun Band in Fars in 1036/1625 and to the shrine of Pir-i Sabz north-west of Yasd at mid-century. Conditions appear I have worsened towards the end of the Safawid period, when their fire temple at Isfahan was destroyed and many of them were killed there. Zoroastrians migrated to India to escape persecution and forced conversion.

The attraction of India as well = the possibilities for meligious integration of Zoroastrians had already been demonstrated by the syncretistic mystical movement of Azar Kaywan (939-40 to :027/1533-1618) and his followers in Patna, Lahore and Kashmir in the first half of the 12th/17th century. Their allegorical interpretation of Zoroastrianism allowed them to combine it with Hindu asceticism and Suff Neo-Platonism. Half of the group were Zoroastrians, including several mobads and m dibitan. Their nucleus mine from Färs and had been formed in Shirat, where other Zoroastrians from Harat and Islahan had joined them before they went to india; there they attracted a pair of Zoroastrian merchants in northern India and one from Surat. Some of the Persian Muslims who joined the group may have been recent converts from Zoroastrianism.

Meanwhile, increasing numbers of the largely rural Parsi community in 11th/17th century Gudiarat were being drawn to Surat and Bombay, by new opportunities in commerce as artisans, merchants and as brokers for the Portuguese, French, Dutch and English. One of the most important representatives of this new commercial class at Surat Rustom Manak (1044-5 to 1131/1635-1719), broker for the Portuguese and Dutch, who was instrumental in securing a grant of land from Awrangzib (1007-1219/1657-1707) for the English factory at Surat in 1070/1660, achieved the abolition of the distra at Surat in 1083/1672 and served as main broker for the East India Company at Surat from 1111-12/1700 until 1228/1716. The rise of wealthy and influential Parsi merchants, whose reputation for honesty generated credit, encouraged the revival and application of the traditional Zoroastrian work ethic that gave religious significance to worldly success. They also allowed the conversion of household slaves to Zoroastrianism in order to be able to eat what they served. The growth of the urban, commercially-oriented part of the community changed its internal power structure. Beginning in the late rith/17th century, the authority and control of the Bhagaria priests and desais resting on Mughal patronage mus challenged by the behdins, with their connection with European Interests, in a series of religious disputes. In 1084/1673, in order to break the monopoly of the Bhagaria priests on endowments and on the fees for performing rituals, the behalins of Navsari asserted the right to have family rituals performed by priests of their own choice. This issue led to violence in 1092/1686, but the behäus successfully boycotted the Bhagaria priests by establishing secondary fire temptes (Dar-i Mihrs, Agistis) accessible to laymen for the second-runk fire (Aidgh Adardn) encouraged in the Riedyats where they had their rituals performed. In 1102/1691 the Sandjana priests joined the behälins, and Dâr-i Mihrs spread in the port cities of Surat, Balsar, and Bombay. By the 12th/18th century, Dâr-i Mihrs were founded in the settlements of Parsi merchants outside Bombay. This quarrel finally ended when the Atâsh Bahrām was removed from Navsari and permanently established at Udvada in 1135/1742.

The internal conflict, however, was continued In the 12th/18th century in a controversy over the ritual calendar at Surat, which was in economic decline in the 2240s/1730s with trade shifting to Bombay, while Maratha control of rural areas deprived the traditional ditte of its former sources of income. In 1149/1736 an Iranian behdin encouraged the laymen of Surat to adopt the old-style Kadimi calendar used by Zoroastrians in Iran instead of the Parsl calendar which had fallen one month behind it. This issue tended to pit artisans led by merchant brokers for the French and English against the older merchant oligarchy with its ties to the Dutch, and is an early example of the me of religious reform as way to attack conservative authority, In the week year that the calendar dispute broke out, the priests of Surat refused henceforth to marry their daughters to laymen in order to avoid losing their wealth through dowries and inheritance. The Parel community split permantly into two sects: a Shahanshahl majority and a Kadimi minority, with separate fire temples and intermarriage. The process of separation was marked by outbreaks of violence between them in 1158/1745, 1196-7/ 1782-3, 1824 and 1840. In m related issue, the agitation started in 1191/1777 when laymen in Bombay refused to marry their daughters to priests only subsided after 1823.

In the course of the 12th/18th century, the rising ParsI merchant class reduced the grip of the former élite of priests, desais, and éjágirdárs formed in the early Mughal period, secured the right to choose any priest they wished to perform rituals, acquired a share in communal leadership through a series of sporadic, short-lived panisyats that well the power of excommunication, and began to establish secular ties of dependence by redistributing their wealth through charities, private endowments, and by building dakkmas and rest-houses. At the same time, Parsis became increasingly involved with the British other Europeans were forced out by them. By the middle of the rath/18th century, Parsi merchants supplied British garrisons and field armies. By the early 19th century, Bombay had replaced Surat the main Parsi centre and the number of Parsis at Bombay increased from 3,000 in 1194/1780 to 50,000 by 1864. From the late 12th/18th century onwards, Parsi shipping expanded outside India to Burma, Indonesia, China, South Arabia and Bast Africa. Parsi merchants who made fortunes in the China trade from 1810 to 1842 began to reinvest them in industries such as ship-building and railroads.

The emergence of secular leadership in the Parsi community is reflected in the composition of the pantayat appointed at the request of the British by the Parsi Andjoman in 1201/1787 which contained an behelfus and six priests, both Kadimi and Shahanshahi, while the pentayat of 1818-36 had twelve behelfus and six priests. In addition to controlling

MADJUS

community charities, the latter ponerayal issued behavioural codes aimed at increasing conformity and eliminating popular syncretism and participation in non-Zoroastrian customs. The code of 1819 forbade Parsi women to attend fluidu — Muslim places — worship, to wear their charms or to perform their rituals. The code of 1823 forbade child marriage and costly rituals at weddings and funerals, while the Parsi Marriage and Divorce Act of 1865 ended

polygamy. In the 19th century, religious reform was an important means by which the new élite of urbanised, educated, westernising laymen, prominent in British and native administration, business and the professions, aimed to control the rest of the community, although they had growing cultural differences with the poor, rural, conservative majority of Parsis. Reform also a reaction to the threat of conversion by Christian missionaries, which provided the immediate impulse for the foundation of the Rahaumai Mazdayanan Sabha by a group of young, wealthy, aducated laymen in 1851 for the purpose of encouraging a return to the original ideals of Zoroastrianism. The same interests led to the foundation of a school in Bombay in order to train the sons of priests for the priesthood in 1854. Modernist reformers and apologists were attracted to the theories of Martin Haug, that the original monotheistic religion of Zoroaster had been corrupted afterwards into ritualistic dualism by the priests. Haug's theories were used to counter Christian criticism by intellectuals who also attracted to the Theosophical Society. Reformers who favoured rational explanations for the cult objected to the use of texts that no understood in rituals, while conservative priests insisted - the effectiveness of ritual liturgies and on the importance of purification from pollution, preserving a way of life increasingly limited to themselves and ignored by laymen. These issues became involved in the collision between reformers and conservatives over the role and income of priests called the framashi controversy, which mainly involved opposition to expensive, repeated ceremonies for the dead and which is still current and unresolved.

Nevertheless, the Parsi community multiplied in the 19th century. By 1881 they numbered 85,000 in India with 3,000 more abroad, about 10-15,000 of whom were Kādimis. Although intermarriage between the sects was allowed by the 19th century, objections to accepting non-Zoroastrians into the community as converts increased because of fears that lower caste Hindus would be attracted by Parsi charities. Parsis also emerged as the leaders of the world's Zoroastrians the result of changes in both India and Iran.

Although estimates of the Zoroastrian population of Iran in the early 12th/18th century that range from too,000 to one million seem exaggerated, there can be no doubt that their numbers declined disastrously due to the combined effects of massacre, forced conversion and emigration in that century. Having suffered massacre and forced conversion at the hands of the Safawl army that repelled the first Afghan invasion in 1133/1720, the Zoroastrians of Kirman and Yazd joined Mahmud's Aighan army during the second invasion in 1135/1722 and also served = officers in the army of Nadir Shah (1149-60/1735-47). The sack of Kirman by the Afghans after the death of Nadir Shah, one repeated by the Kadjars in 1209/ 1794, left the Zoroastrian district in ruins. By the and of the century, almost none of the 12,000 Zoroastrians at Kirmân survived, and the Zorozstrian population of fran is estimated to have fallen to about 30,000 in the reign of Muhammad Shâh (1834-48); of these, some 8,000 were at Yazd.

1115

The late 12th/18th and early 19th centuries seem have been a time of unprecedented insecurity, poverty, and discrimination for the Zoroastrians of Iran. The intensity of the oppression they suffered then appears to have been more a reflection of contemporary social problems in Iran, where they served scapegoats for the frustrations of their Muslim neighbours, than to have been characteristic of centuries-long conditions. However, Zoroastrians were vulnerable to robbery and kidnapping while their murder went unpunished. Although they were required to wear honey-coloured clothing and were officially forbidden to build new or to repair old houses, to wear new clothing, to ride horses, to travel outside of fran - to engage in skilled crafts or professions that might bring them into contact with Muslims, sumptuary rules were enforced in the usual selective way and exceptions can be found to many of them. Forms of economic discrimination that prevented them from accumulating wealth were probably more affective than social pressures. Zoroastrian merchants were subject to extra taxes, newly-acquired property me taxed up to one-fifth of its value and houses were liable to be looted. The actual total gissys on the community usually amounted to about 2,000 thmens, which by mid-century was paid by 1,000 adult males, for whom the individual and of two famins amounted to ten day's wages for a labourer. The Shiff legal provision that favours a Zoroastrian convert to Islam over other Zoroastrian beirs encouraged conversion and resulted in the loss of property. During the 19th century, forced conversions created a population of half-Zoroastrian, half-Muslim diadid al-Islam at Yazd with distinctive clothing and a separate cometery.

For self-preservation, the Zoroastrian community turned inwards. The style of fire temples and homes provided a maximum of protection and concealment from unfriendly intruders. The exterior of fire temples resembled private houses, while inside was w confusing maze of rooms, passages, and low doors with the fire chamber behind a blank wall and inaccessible even to behdies. A succession of defensible doorways guarded the entrance to homes, while access over the rooftops was restricted by covering the courtyards to protect the women, children, and valuables. Only property endowed = welf for the benefit of the benefactor's soul respected by Muslims. In spite of general illiteracy, religious learning was preserved among priestly families that provided local readership, especially in the villages. From the late 12th/18th century onwards, refugees who escaped to India became objects of Parsl aid and concern and helped to develop trade connections

between Yazd and Bombay.

In 1834 the Persian Zoroastrian Amelioration Society in Bombay sent Manakdii Limdii Hataria (1813-90) to Iran, where he found the Zoroastrian community had abrunk to 7,725 people. Yazd was main surviving centre, with 6,658 Zoroastrians the city and 24 surrounding villages. Most of them were farmers, but there were also about dozen merchants W Yazd, while the poorest artisans, weavers, bricklayers and carpenters. Each apring group of several hundred Yazdis went to Tehran to work as gardeners, even in the royal

tri6 MADJUS

palace, and returned in the fall, travelling together for protection. In addition to these seasonal workers there were about 50 Zorozstrian merchants in Tehran in 1854. The community at Kirman amounted to 932 people, while a few Zoroastrians could be found Bushir, Shiraz and Kashan. With Parsi aid. fire temples and dakhmas were built or restored and traditional councils iii ciders were transformed into elected audiumous III behdins at Kirman, Yazd and their villages, whilst rest houses were built at shrines and in Tehran. Schools providing a secular education were started by Manakdil at Yazd and Kirman in 1857, and some students were were to Bombay. In :882 joint Parsl and British pressures finally secured the abolition of the diays. Parsi efforts improved security, freedom of worship, respect and opportunities for the Zoroastrians of Iran, although they were still subject to random violence. Parsi aid also introduced modernising social and religious reforms from Bombay. Manakdii revived abandoned rituals, forbade animal sacrifice, the eating of beef and carnel meat, and he discouraged polygamy, the use of cosmetics and Muslim clothing styles as too immoral. The of priestly families took advantage of the opportunity for a secular education in the village schools and left for the cities in order to become physicians, teachers, engineers, bankers and mer-

While villagers at Yazd remained engaged in the transport of goods from the Gulf across central Iran as camel-drivers and owners until the early 20th century, by the end of the 19th century many Yazdis were going to work in Bombay and the they left behind often put themselves under Muslim law to claim a share of their inheritance. Zoroastrians from the provinces were also employed by the Indo-European Telegraph and by Tehran banks in the last two decades of the 19th century. Yazdi merchants grew wealthy through their contacts with India by the end of the century, while their children invested in land and the import-export trade, reinvesting their profits later in industry. Their numbers rose again m about 8,500 in 1879, over 9,000 in 1892 and about 11,000 III 1902, with the largely rural majority still at Yazd and Kirman. However, modernising changes, new opportunities and wealth had begun to transform the Zoroastrian community by the late 19th century, breaking down village and communal ties and undermining the position of the priests, whose authority began to be challenged by the creation of a new secularlyeducated élite of laymen.

The position and even existence of the villagebased priesthood has been drastically affected by the increasing urbanisation of Zoroastrians in the 20th century. As a falling water table, rural impoverishment and the lure of employment in cities drew Zomastrian peasants from the villages south of Kirmān early in this century, Muslims began to move into them. In these newly-mixed villages the remaining Zoroastrians were at a disadvantage in conflicts over water, and moved to Kirman to escape increasing oppression. By 1962 Zoroastrians had entirely deserted the villages south of Kirman and lived entirely inside the city, where they numbered 2,385 in 1963 in spite of emigration to Tehran. The villages around Yazd have also become increasingly Muslim as the result of immigration and conversion. The urbanisation of Zoroastrians is still transitional, with the labour force living and working, often seasonally, outside the villages in cities and provincial towns but keeping up some joint family ties and sending part of their income back to support the women, children and old people who remain manage the land. People who have moved to Tehran still keep their houses in Yazd and return for the annual ceremonies for the dead.

Religious usages have been affected by strong Parsi influences, modernisation and changes in social context. Although a bull was sacrificed annually in Yazd until the late 19th century and sheep fat was offered to the fire until the early 20th century, most Zoroastrians in Iran have abandoned animal sacrifices since 1900 and object to calling those animals slaughtered and eaten at seasonal festivals sacrifices. Nor has gomes been used since the middle of the 19th century, although offerings to water are still made. Now Indian-style fire temples open to laymen were built in Tehran in 1908, in Kirman in 1923 and in Yazd, and the fire now burns in silver vessels, Indian-fashion, instead of on stone altars. Old festivals such . Sada, 100 days before Nawrus, have been revived and new ones such as the hirthday and death of Zoroaster on 6 Fatvardin and 5 Dey respectively have been created. While rituals that survive have their meaning subject to reinterpretation, the elaborate details of purification have been observed only by priests since the early 20th century, Unable to live on the fees for rituals, the priesthood has declined mumber. There are now only 15 Iranian priests left, all of whom me middle aged or older and no young Iranian priests we being trained, Since they are too few to serve all the fire temples, these sometimes kept up by laymen, and since the 1940s communal leadership has developed the andjumen in Tehran.

Several currently divide younger, educated, modernised Zomastrians from the older, more conservative generation. The younger generation objects to inbreeding through marriage between cousins, because of the high incidence of hereditary diseases within the community and favours intermarriage with non-Zoroastrians, the acceptance of converts, and the re-admission of recent converts to Islam and the Baha'l Faith. Their opponents wish to preserve racial purity, and fear that mencourage apostasy from Islam would provoke Muslim violence against them. Although the influence of the Bahálk is credited with improving their own security, most Zoroastrian families have lost members as converts to the Bahā'l Faith because of its appeal to young people impatient with priestly authority. The practise of interring the dead on a metal stretcher in a grave with coment walls and cover, instead of exposure in a dahlma was started at Tehran and Kirman in the 1930s and was begun at Yazd in 1965. By 1975 a dadama was used only me the village of Sharlfabad. The sects formed during the calendar dispute still exist. Iranian Zoroastrians adopted, in 1939, a seasonal calendar beginning = the vernal equinox, which is close to the Iranian secular caleadar, although the community at Yazd reverted

the Kadimi calendar in 1940.

After receding slightly to about 10,000 in the 1920s, the Zoroastrian population of Iran rose to 16,800 by 1938 IIII by the 1970s to between 20,000 and 25,000, with 19,000 in Tehran and other cities. The younger generation has taken advantage of the opportunities in management and in the professions provided by the economic growth in Iran in recent decades. In the 1960s and 1970s the five major Zoroastrian firms in Iran were all leaders in their fields and Iranian Zoroastrians were encouraged to

return from India. However, the Iranian revolution of 1979 has created anxiety in the Zuroastrian community and uncertainty about the future.

The relative circumstances of the two communities have been reversed in the 20th century, which has been a period of retrenchement for the Parsis. The Ilm-i khshnum movement began at Surat in 1902 as a combination of Theosophical ideas with ritual purity which was justified as being the esoterio meaning of the Avesta. In a victory for the conservatives, membership was restricted to descent from Parsi families in 1909, the only exception being the child of a Zoroastrian man by a non-Zoroastrian woman. The communal welfare system. supported by the benevolence of the members of the few very wealthy families, leaders in Indian commerce and industry, and providing schools, hospitals, and the cost of marriages and funerals, well as fire temples and dokhmas, became increasingly inadequate to care for the growing numbers of the poor created by rural flight to Bombay. Social and economic changes since independence have eroded the economic base of the community still further. Increasing industrialisation has brought more management opportunities for other Indians than for Parsis: support for communal charities has been reduced by taxation to pay for the state's socialist and welfare programs; and Parsis have been burt by the effect of prohibition on the toddy industry, which began in Gudjarat in 1937, and of land tenure acts on Parsi landlords with Dobra labour. The Parsi population has fallen from its peak of nearly 215,000 in 1941 to approximately 87,500 in India, Pakistan, and Sri Lanka by 1976 because of the combined effects of emigration, a rising marriage age and declining birth rate. The community was shocked to discover in 1967, that 40 % of its members were impoverished and that 2,000 Parsis in rural Cudjarat were on the point of starvation. Zoroastrian rituals are still observed in India, although the number of priests in Bombay and declining by the late 1970s. In addition, the quality of priests has been questioned because appointments to fire temples have been controlled by the patronage of the businessmen who endowed them. To deal with this problem, a programme has been started to train priests at the Cama Aethornana school in Bombay, to pay them salaries and to appoint them on merit.

Bibliography: A complete listing of all the literature on Zoroastrianism is impossible because of its volume, and inappropriate because much of it concerns pre-Islamic issues. General introductions with references to the sources and acholurship provided by A. Bausani, Persia religiota, Milan 1959; J. Duchesne-Guillemin, La religion de l'Iran ancien, Paris 1962; M. Boyce, A history of Zoroastrianism, Lelden-Cologne 1975; and Ident Zoroastrians, their religious beliefs and practices, London, 1979. For the Săsăuld period, L.C. Casartelli, The philosophy of the Musdayasnian religion under the Sassanids, tr. F. J. Jamasp Asa, Bombay 1889, is still a useful introduction to doctrinal issues, while H. W. Bailey, Zoroastrian problems in the ninth-century books, Oxford 1943, is a seminal work that also identifies much of the older scholarship. A key = the Arabic ====== is provided by H. S. Nyberg, Sassanid Masdaism according to Muslim sources, in Inal. of the K. R. Cama Oriental Institute, xxxix (Bombay 1958), 1-63. The most important work on Zurvanism has been done by R. C. Zaehner, Zurvan, a Zoroastrian dilemma, Oxford 1955; idem, The down and twilight of Zoroastrianism. London 1961. An introduction to Sasanid religious organisation is given by J.-P. de Menasce, L'Église mardéenne dans l'Empère sassanide, in Cahiers d'Histoire Mondiale, il (1955), 554-65; idem, Feux et fondations pieuses dans le droit sussanide, Paris 1966, and by M.-L. Chaumont, Recherches sur le clergé zoroastrien: le hêrbad, in RHR, clviii (1960), 55-80, 161-79. For religious art, see J. Duchesne-Guillemin, Art et religion sous les Sussanides, in La Persia nel Mediocuo, Rome 1971, 377-88.

For the treatment and disys status of Zocoastrians during and after the Muslim conquest, see Abū Yūsuf, K. al-Kharādi, Cairo 1382/1962, 67, 122-4, 129-31, 134, 189-90, 206-7; Ibn Sa'd, vilf1, 94; Ibn Sallām, K. al-Amoāl, Cairo 1969, 30, 44-6; Balādhurl, Fatāh, 69, 77-8, 85, 200, 318, 325-6, 388; Bukhāri, al-Diāmi' al-sahih, v, Cairo 1390/1971, 238; and Sarakhsi, Sharh Kidh al-siyar al-hahir li 'l-Shaybāmi, Cairo 1971-2, 116-9.

For examples of the destruction of fire temples, see Diahiz, Hayaman, iv, 479-81; Baladhuri, Ansāb al-ashrdi, i, Cairo 1959, 494; Ibn al-Fakin, Mukhiasar Kitāb al-buldān, 256-7; and anon., Ta'rīkh-1 Sistān, Tehran 1314/1935, 92-4. For early conversions to Islam, Abû Yûsuf, 131-1; Baladhuri, Fulia, 69; Tabari, ii, 1462; Narshald, Ta'rīkh Bukhārā, tr. Frye, Cambridge, Mass. 1954), 47-9; and Ta'rīkh-i Sistān, 91.

Much of the material on the condition and conversion of Zoroastrians is presented in B. Spuler, Der Verlauf der Islamisierung Persiens, in Isl., XXIX (1949-50), 63-76; idem, Isan und der Islam, in Die Welt als Geschiebte (1952), 227-32; and idem, Iran in früh-islamischer Zeit, 183-204. Internal evidence from Zoroastrian literature is provided by de Menasce, Problèmes des Maxdiene dans l'Iran musulman, in Festschrift für Wilhelm Eilers, Wiesbaden 1967, 220-30. The most up-to-date treatment is now that of R. N. Frye, The golden age of Persia, London-New York 1975, which also has information on the Sasanid period. The most important Pahlavi sources are identified in de Monasco's ch. Zoroastrian Literature after the Muslim conquest, in Cambridge History of Iran, iv, 543-65. Apocalyptic questions may be approached through K. Czeglédy, Bahram Cöbin and the Persian apocalyptic literature, in AO Hung., viii (1958), 21-43. Muslim information on Zoroastrian sects may be found in Baghdadl, al-Fark bays al-fired, ed. Kawtharl, 117, 153, 171-2, tr. Walker, 115-6, 131, 183; Murtada b. al-D39 al-Rāzī, Tabşirat al-'audimm, ed. Tehran 9-14; and Shahristani, K. el-Milel we 'I-nihal, ii, Cairo 1387/1968, 35, 38-49. The standard treatment of sectarian movements is that of G. H. Sadighi, Les mouvements religieux franiens au 11º et au 111º sitcle de l'atgire, Paris 1938. The information from Arabic geographers is collected in B. M. Tirmidhi, Zoroastrians and their fire temples in Iran and adjoining countries from the 9th to the 14th centuries, in IC, xxiv (1950), 271-84.

Comparisons between Islam and Zoronstrianism go back to I. Goldziher, Islamisme et Parsisme, in Revue de l'Aistoire des religions, xilli (1901), 1-29, and idem, The influence of Parsism on Islam, in The religion of the Iranian people, ed. C. P. Tiele, tr. G. K. Nariman, Bombay 1912, 163-86, followed by S. P. Osztern, Zum Problem Islam and Parsismus, in ArO, vi (1934), 150-60, 342-52. The most extreme case has been made by H. Corbin, Les molife soroastriens dans la philosophia

de Sohrawardi, Tehran 1946, and idem, Spiritual body and celestial earth. From Mardean Iran to Shifts Iran, tr. N. Pearson, Princeton 1977.

The most important sources for the Şafawid period are the Rivayats edited by M. R. Unvālā, Dārāb Hormaryār's Rivāyats, Bombay 1922, and tr. B. N. Dhabhar, The Persian Rivayats of Hormaryār Framars, Bombay 1932. See also J. J. Modi, A Parsee High Priest (Dastur Azar Kaiwan, 1329-1624 A.D.) with his Zoroastrian disciples in Patna, in the 16th and 17th C.A.C., in Journal of the K. R. Cama Oriental Institute, xx (1932), 1-85. D. Menant, art. Gabars, in ERE, vi, 147-56 identifies references by European traveilers.

The earliest standard treatment of the Parsis is D. F. Karaka, History of the Parsis, London 1884. Among the more useful subsequent treatments are D. Menant, Les Parsis, Parks 1908; S. H. Hodivala, Studies in Parsi history, Bombay 1920; and J. J. Medi, The religious ceremonies and customs of the Parsees, Bombay 1937. P. Balsara, Highlights of Parsi history, Bombay 1963 is a useful summary of the traditional type. Among the more useful monographs are J. J. Modi, The Parases at the court of Akbar and Dastur Meherjee Rana, Bombay 1903; J. F. Buisara, Parsi charity, relief and communal amelioration, Bombay 1935; S. P. Davar, The history of the Parsi Punchayat of Bombay, Bombay 1949; and F. M. Kotwal, Some Observations on the history of the Parsi Dar-i Mihrs, in BSOAS, xxxvii (1974), 664-9. For 20th century problems, S. F. Desai, Parsis and eugenics, Bombay 1940; idem, A community at the cross-road, Bombay 1948; and M. P. Mistry, Report of the survey of Gujurat Parsis (rusal), Bombay 1967.

In spite of her tendency to minimise premodern change, the most important work on modern Iranian Zoroastrians and the history of the Zoroastrian cult is that of M. Boyce, The fire temples of Kerman, in AO, xxx (2966), 52-72; cadem, Bibi Shahbann and the lady of Pars, in BSOAS, = (1967), 30-44; eadem, The Zoroastrian villager of the Jupar Range, in Festschrift für Wilhelm Eilers, 148-56; eadem, On the sacred fires of the Zoroastrians, in BSOAS, xxxi (x968), 32-68; tadem, The pious foundations of the Zoroastrians, in BSOAS, xxxi (1968), 271-89; eadem, Manechji Limji Hataria in Iran, in K. R. Cama Oriental Institute Golden Jubilee Volume, Bombay 1969, 19-31; eadem, Rapithwin, No Rus, and the Feast of Sade, in Pratidanam. Indian, Iranian and Indo-European studies presented to F. B. J. Kuiper, The Hague-Parls 1968, 201-15; cadem, Some aspects of local farming in a Zoroastrian village of Yard, in Persica, iv (1969), 121-40; eadem, On the Calendar of Zoroastrian Feasts, in BSOAS, xxxiii (1970), 513-39; eadem, The Zeroastrian houses of Yand, in Iran and Islam, Studies in memory of V. Minorsky, Edinburgh 1970; and eadem, Zoroastrian Baj and Dron, in BSOAS, xxxiv (1971), 56-73, 498-323. The most original and innovative recent treatment of contemporary Zoroastrians from the viewpoint of social anthropology is by M. Fisher, Zoroastrian Iran between myth and praxis, Ph.D. diss., Univ. of Chicago 1973, (M. MORONY) unqublished.

AL-MADJUS, the term used by Arabic historians and geographers writing about the Maghrib and Muslim Spain with the sense of Northmen, Vikings, denoting the participants in the great Viking raids on Spain. These raids were manned from Scandinavia, so, from Norway, Denmark and to a certain extent

also from Sweden, the raiders leaving Denmark, Norway and Ireland, where Norwegian Vikings from the and of the 830s had gained a firm footing and had founded some minor tributary states towards the beginning of the second millennium A.D. In western Latin and Spanish sources they are called, inter alsa, Normanni, Nortmanni, Latdomani, Larmanes, Almajuses, Almosudes and Almonides.

r. The first attack by the Vikings on Muslim Spain took place in 230/844. As early as 1 Dhu 'l-Hididla 229/20 August 844, 54 Viking long ships (the Norwegian Gokstad ship from the latter half of the 9th century, the biggest ever found, was 23.8 m. long, 5.1 m. broad amidships, had 16 oars and 32 shields on each side, and could take 70 men, The Viking, London [1966], 254) appeared, and the same number of smaller ships, in the estuary of the Tagus, anchored there and fought three fierce battles against the defenders. After thirteen days they re-embarked and sailed southwards. The governor Wahb Allah b. Hazm had informed the amir 'Abd al-Rahman II, who advised his commanders to be on their guard. Part of the crew disembarked on the coast of the province of Shadhune (Sidone) and occupied the harbour of Cadiz, but the main part of the fleet sailed up the Guadalquivir and encamped on a large island in the river about 20 km. south of Seville. A few days later, = 1 October 844, the inhabitants of the city caught sight of the fleet with their brown sails on the river. They tried to organise resistance, but the city had no defences, could do nothing. The few ships they sent against al-Madius were attacked with showers of arrows and were set on fire. The pirates went ashore in the city, where the main part of the citizens had fled precipitately. Those left behind were killed, even old and disabled people; women and children were taken prisoner; and they tried to set the mosque on fire, without success. The sack continued for seven days, 'Abd al-Rahman sent troops against the invaders, inflicting on them heavy casualties. In the decisive battle to the south of the city on 11 November 844, more than a thousand of the pirates were killed and four hundred others were taken prisoner; these were killed before the eyes of the others, who in great haste fled to the ships and set sail southward. Thirty abandoned Viking ships were set on fire. The defeat of al-Madiûs was proclaimed all over the country, and 'Abd al-Rahman even informed the Berber amirs in Morocco and the Kharidii imam in Tahart. The Viking fleet steered north towards Aquitania after some attempts at landing at Niebla, me the coast of Algarve and in Lisbon; in the meantime, a few Scandinavlan ships had made a brief landing on the coast of Aslla (Arcila [see ASILA]) in northwestern Morucco, about 50 km. below Tangier. On the dating of the descent Aşîlâ and the foundation of the town, - A. Melvinger, Les premières incursions des Vikings en Occident d'après les cources arabes, Uppeala 1955,

"Abd ai-Rahman II ordered defences and an arsenal to be built in Seville, watch-posts to be set up along the Atlantic coast, and warships to be built in greater numbers, according to Ibn al-Kūṭiyya. Hence when in z44/858 another Viking offensive, comprising 62 ships, and launched, the Muslim squadrons patrolled along the west and of the peninsula up to the French coast. Two of the Viking ships salling in advance captured off the coast of Algarve, with their cargoes of sliver and gold, prisoners and supplies. The rest of the ships sailed on towards the Guadalquivir estuary, but on discovering that a Mus-

lim army was advancing along the river valley, they sailed on to Algerias (al-Diazira al-khadra' (q.v.)), where they disembarked, took the town and burat down the great mosque. They were soon driven away, but advanced along the coast of Tudmir (near Murcia) and pushed forward up to the fortress of Urtyain (Orihuela, 23 km, north-east of Murcia). From Algericas, some of the ships sailed to the northern coast of Morocco, where they took the town of Nakur, some 20 km, south of Alhucemas Bay, for eight days sacking and taking prisoners all those who did not flee, among those some members of the princely house, later ransomed by the ruler in Cordova. As to the timing of the attack on Nakur. there is varying information among the Arab authors, mentioning the occurrence (see the long discussion in Melvinger, op. cit., 151-77], but the exact date cannot Be established, since it has not been possible to investigate what Ibn al-Khatib in his still-unpublished part of A'mail al-a'lam relates about Nakûr, After the attack on Uriyûla, the Viking fleet sailed towards the French frontier, invaded the country, took rich spoils and numerous captives and passed the winter in the Camargue. Then they returned to the Spanish coast, but were met and attacked by Muhammad I's ships, which set fire to two of the unbelievers' ships and took two more as spoils. More than 40 of their ships had now been lost. The rest joined another Viking fleet which had harried the Balearic Islands, and ■ few smaller ships found their way up the Ebro valley wis the River Bidassoa and its valley from Irun on the Bay of Biscay, so that a contingent arrived at Banbaluna (Pampeluna) [see BANHALONA] and in 245/859 captured the andr of the Basques, Gharsiyya b. Wannako (Garcia Iniguez), who had to ransom himself for 70,000 gold coins (E. Garcia Gómez-E. Lévi-Provençal, Textos inéditos del "Muqtabis" de Ibn Hayyan sobre los origenes del reino de Pamplona, in Al-And., xix [1954], 309). After this Viking raid, which probably lasted till 247/861, it was more than a century before Muslim annals tell us about further attacks from al-Madjus.

On a Radjab 355/23 June 966, the caliph al-Hakam II received from Kaşr Abî Dânis (Alcacer do Sal, 94 km. south of Lisbon) a message that a Viking fleet of 28 ships had been seen in the neighbourhood. The Muslims marched - them when, after ravaging the coast, they reached the plain round Lisbon; many were killed in the battle on both sides. The Seville fleet left and found the enemy ships in the mouth of the River Silves, put several of them out of action. rescued the captured Muslims, whom they found on board, killed a great number of the unbelievers and put the see to flight. News continued to reach Cordova from the west coast about the movements of al-Madius, until they disappeared. During the same year, al-Hakam II ordered Ibn Futays to keep the fleet ready in the Cordova River (sc. the Guadalquivir) and to build ships of the meet type as those of the Vikings, in the hope that they would come near the ships.

2. At the beginning of Ramadan 360/end of June 971, alarming rumours spread abroad about movements at sea by al-Madjūs al-Urdumāniyyūu (on this term, see below). Al-Hakam II immediately sent the admiral of the fleet to Almeria to make it ready to leave for Seville and to sail with all the naval forces to the western coastal district, but we hear nothing this time about any landing operation. Ibn Hayyān mentions (In A.A. el-Hajji, Andalusian diplomatic relations with western Europe during the Umayyad

period (A. H. 138-366/A.D. 755-976), Beirut 1970, 163, also in Hespéris-Tamuda, viii [1967], 74 f.) that at the end of 360/971 the Vikings made attack to the west coast but that the Buslim fleet was able to repel them. The last thing to bear in Arabic sources about Viking raids on Muslim territory is a notice by Ibn Hayyan (Lévi-Provençal, Hist. Esp. 1885., ii, 171 n. 2) about summer campaign by land to Algarve in Ramadan 361/June 972; the Muslim army advanced up to the town of Santarém to the north-east of Lisbon and returned to Cordova in the middle of September 972.

In all the previous texts except one, the word al-Madjus is used about the Vikings, but in the text of 971 the phrase al-Madius al-Urdumaniyyun is used. The last two texts in Ibn Hayyan's al-Multabis have only been available to the present writer in Anales paletinos del califa de Córdoba al-Hakam II, por Isa ibn Ahmad al-Rāzi (360-364 H. = 971-975 J.C.). Trad. por E. Garcia Gómez, Madrid 1967, 76, 88, to1, 116-7. The translation has on p. 76 los Mayes, on pp. 88 and 101 los Mayus Normandos, and in the events of 17 September 972 on pp. 116-17 first los Mavils Normandos and then only los Normandos. So there is a certain doubt(ulness here. It is no longer m question about al-Madjus in its earlier some. This fits well in with the fact that, in this case, the attackers came from Normandy. The Vikings had, after the treaty of St. Clair in 911, been given the territory in northern France which got its name Normandy from them, and had settled there. They no doubt me accepted the Christian faith, at least officially, but they sometimes received heathen reinforcements from their original fatherland. In the early 960s, we of these bands of reinforcements arrived from Denmark at the request of Duke Richard I of Normandy, who was in conflict with Count Thibaud de Chartres. When peace was made between them, the Vikings' presence was no longer desired in France. They gradually returned to the northern lands, but encouraged by Duke Richard, they made an expedition against Muslim Spain, in the course of which they also attacked Christian Galicia and in 970 occupied Santiago de Compostela, which they held for some time. It was these troops from Normandy, partly heathen and partly Christian, who me here quite logically described by the double name.

3. Only the term al-Urdamaniyyan (= Normans) is used by Ibn 'Idhari in his account of the capture of the town of Barbastro [see BARBASHTURU] in 456/1064, when the inhabitants were treated in a very barbarous way by the Christian army, in which Normans were included. The later geographer Ibn 'Abd al-Mun'im al-Himyari uses in = summary account of this same capture of Barbastro the word al-Rudhamanin for "Normans" instead (Melvinger, op. cit., 68 f.).

4. The Spanish-Arabian author Ibn Dibya (d. 632/1235) relates in his anthology al-Mufrib min ash and al-Magirib that 'Abd al-Raḥmān II (206-38/822-52), after the disembarkation of the Vikings in 844, was said have had relations with them and sent an ambassador to their country to come to an agreement with them. Ibn Dibya's report is founded on what this envoy told the vizier Tammām b. 'Alkama (d. 283/896) on his return twenty months later. The ambassador Yahya' b. Hakam al-Bakrl al-Ghazal (d. 250/864) [see al-Ghazal], who had led mission to Byzantium in 840, does not give us any ham from his journey to the country of al-Madiûs which confirm the authenticity of his report. But even in the journey never in reality took place, it is nevertheless probable

that we have here the contemporary Hispano-Arabic view of al-Madjus. The Viking king's residence, it is related, was situated me a large island in the ocean. There are Madjus there in great numbers, and in the neighbourhood of this island there are many other islands, big and small, where III the inhabitants are Madiūs . . . They used to Mi Madiūs, but now they profess Christianity, after having forsaken the worship of fire and the religion they had before and adopted Christianity, except the inhabitants of some isolated islands in the sea. These last have stuck to their old religion, with its worship of fire, and they continue to marry their mothers or sisters (a trait attributed likewise to the Persian Magians] and practise other infamous deeds. They fight them and make them slaves (Melvinger, op. cit., 58-6s, with refs.; here it must be stressed that -pace p. I n. r., the information about marriage with a meet relative seems suspicious, and must be due to a misunderstanding on the Arabic side).

The reason why the Vikings and the peoples or groups of peoples living on the northern fringes of civilisation were described by the Arabs as Madjus was evidently the fact, as appears from the account by Ibn Dibya, that their religion reminded the Arabs of that of the Persian Magians, According to Islamic sources, Madiûs denotes "die Einwohner des alten Persiens, vor allem in threr Eigenschaft als Feuerverehrer" (S. Wikander, Fenerpriester in Kleimasien and Iran, Lund 1946, in Skrifter alg. av K. kuman. vet, samf, i Lund, xl, 28). The religion of the Scandinavians and other Germanic peoples was essentially the same, Al-Mascudi montions in his Muradi aldhahab, written between 944 and 947 (Melvinger, op. cit., 47-8) that in 330/941-2 in Fustat in Egypt he had come across a book written by Bishop Ghudmar (Godmar) of Gerona, dedicated to [Prince] al-Hakam (II, 350-66/961-76). He states "In that book it is said that the first king of the Franks Kulūdwih (Chlodovech) was first a Madjusl and that his consort Ghurtild (Chrodechild) made him a Christian," According to western sources he was baptised in 496. It is not asserted in the text that he embraced the unspecified heathendom al-djability a. The same author relates in another place (ibid., 49): "Before the year 300/912-3, ships with thousands of men arrived at al-Andalus and sacked its coasts, and the inhabitants there thought that it was a people of al-Madjus, appearing every two hundred years . . . But I think . . . that it was al-Rus [see x0s], whom we have dealt with before in this work." In his K. al-Buldan (written 276/889), 354, the historian and geographer al-Ya'kübl names those who in 229/ 843 invaded and sacked Seville as "al-Madj as who are called al-Rus" (al-Madias alladhina yuhalu lahum al-Rus). Thus even very early Arabic authors linked the Madius with the Rus, and both the abovementioned authors were widely-travelled and knew from personal experience the conditions not only in the Middle East but also the western parts of the Mediterraneau countries (A. A. Vasiliev, The Russian attack - Constantinopie in 860, in The Mediaeval Acad. of America, Publs., zlvi, Cambridge, Mass., 1946, 3-4 with refs.). The author al-Watwat (d. 718/ 1318) assigns in his scientific and geographic encyclopzedia (Melvinger, op. cit., 53) "to Yafit's (Japhet's) descendants, al-Rüs ... They believe in the Madjus religion and burn their dead in fire." The Persian Magians, on the other hand, did not burn their dead. The Spanish-Arabic historian and geographer Ibn Sa id al-Maghribi (d. 672/1274)

writes in Bast al-ard ft falika we 'l-'ard (Molvinger, op. cit., 62-3) about the great Saklab Island, "whose length is about 700 mils (one mil - 4000 dhirat) and its extent across the middle about 330 ml/s. There are mountains, rivers, towns, built-up areas and mumerous population. It is said that they still adhere III the Madius religion and worship fire, as they consider nothing more important than this (sc. fire), because the cold is so severe there." (As is well-known, the Muslims in Spain used the term al-Şakāliba as a general word for slaves, produced to Spain from different parts of Europe; since many of them were of Germanic origin or from Scandinavia, in that way the Germanic tribes became known an al-Şakāliba; cf. A. A. El-Hajji, op. cit., 207, n. r. with reis, and \$A&ALIBA). The geographer al-Idris! (d. 361/: 166) says in his Nuthat al-mushtat (Molvinger, op. cit., 57): "The fourth section of the seventh zone comprises the majority of the provinces in al-Rūsiyya (Russia), the provinces in Finmark (Finnmarken or Finland), the country of Tabast (Tavastland), the country of Astalanda (Estonia) and the country of al-Madjus." R. Ekblom (Idrisi und die Orisnamos der Ostseeländer, in Name och bygd. xix [1931], 65-6) writes: "Magas ... ist in früheren arabischen Quellen die gewöhnliche Bezeichnung der nordischen Wikinger, die ... mit einem gewissen Recht als Feueranbeter bezeichnet werden konnten. Sie verehrten Thor, den Gott des Donners, sie verbrannten viellach ihre Toten, und das Feuer spielte eine grosse Rolle bei ihnen ... Um die Mitte des 12. Jahrhunderts waren die Skandinavier christlich

. . Das einzige Gebiet in Europa, das zu dieser Zeit nicht unter nennenswerten Einfluss des Christentums gekommen war, waren, wenn man vom innern Russland absieht, die Länder östlich der Ostsee. Bei den hier wohnenden finnischen Völkern spielte jedoch das Feuer keine hervorragende Rolle im Kultus. Ganz anders verhielt es sich mit den baltischen Stämmen. Bei diesen war das Feuer heilig, sie verehrten den Donnergott Perkûnas, und Leichenverbrennung war bei ihnen noch im 12. Jahrhundert nicht ungewöhnlich. Was ist natürlicher, als dass die arabischen Geographen die Bezeichnung Magus auf sie übertrügen. Das Land der Magas ist bei Idris? meiner Ansicht nach das baltische Gebiet, ungefähr das jetzige Lettland und Litauen" In al-Marwazi's text it says (22, l. 13, tr. 35) concerning al-Şakāliba: "The Slavs ... burn their dead, for they worship Fire" (V. Minorsky, Sharaf al-Zamdn Tähir Marvasi on China, the Turks and India, Asabic text (cs. A.D. 1120) with an English translation and commentary, London 1942). In his commentary, Minorsky writes (116 f.): "... Eastern Slave are usually confused with the Rus, I. Kh., 154 ... The naive indication that the Slavs burn their dead 'because they me fire-worshippers' may explain why the Arab historians call the Rus ai-Madius. Yackabi, Buldan, 354, calls ill raiders who plundered Seville in 229/843: al-Majūs allādhina yuqalu lahum sl-Rús. In a famous passage 1. Fadlán 🖿 an eyewitness describes the cremation of a Rûs, and the argument may have been reversed: 'the Rûs were fire-worshipping Magians, for they burnt their dead', cf. Minorsky, Ras, in E.f. ... " (cf. Melvinger, op. cit., 8x-5 and Corr. to p. 81.) In a review of Dunlop's History of the Jewish Khasars, in Oriens, xi (1958), 136, Minorsky says: "P. 189 . . . Nor can the term majus applied to the Northmen of Spain refer to their 'Zoroastrianism', but to the popular explanation of their custom of cremating their dead, see Minorsky, Rus in E.I., Tähir Marvazi. . . . "

5. R. Brunschvig put forward the hypothesis, that, as the law school of al-Awalf [q.v.] declared as Madjūs all heathen with whom they wanted to become to an agreement, this was the reason why the Vikings harrying in Spain have been called Madiūs in Arabic; "dès leur première apparition en les côtes d'Espagne en 844, il y a eu entre eux et l'émir - Cordone des tractations de paix" (Ibn 'Abdalh'akam et la conquete de l'Afrique du Nord par les Arabes. Étude critique, in AIEO Alger, vi [1942-7], 112; reprinted in Al-Andalus, x1 [1975], 133 f.). But this hypothesis is groundless. There is no certain proof of relations between the Vikings and the Muslim rulers, and in any case, al-Awzā'T's modhhab had been pressed back in Spain by that of Mālik towards the end of the and/8th century (Melvinger, op. cst., 74-7).

6. Ihn Idharl relates (ibid., 116 f. with ref.) that the ruler Higham I in 177/793 sent 'Abd al-Malik b. 'Abd al-Wahid b. Mughith on a summer campaign to the Rum country. This expedition is famous in history and one of the most important. He came to Ifrandia (Gerona), besieged the town and made a breach in its walls by using catapults. And he got nearer to the land of al-Madjus, marched through the enemy's land and stayed there several months, burning villages and destroying strongholds. He attacked the town of Arbūna (Narbonne). It was a great victory, where the value of one-fifth of the prisoners amounted to 45,000 in minted coins. In 179/795 Hisham I b. Abd al-Rahman, according to the same author (ibid., 14 f.) sent out a commander on a summer campaign against Galicia. The latter was informed that Idhfunsh (Alfonso II el Casto) had asked al-Bashkunish (the Basques) for help and the people in this neighbourhood, viz. al-Madjus and others. Ibn al-Athle (ibid., 10 ff.) speaks about his neighbours the Basques and those of al-Madius who lived near them and the people round there. In Ibn Hayyan's al-Muhtabis (Garcia-Gomez-Lévi-Provençal, op. cit., 296 f.) it is related about a summer campaign in the year 200/816 against the Prince of Pampeluna that in a battle lasting thirteen days many were killed, among others Saltan, the leader (el mejor caballero) of al-Madjüs, lbn Hayyan (Lévi-Provençal, Hist. Esp. mus., P. 204) is the only one to mention a campaign against Alava, commanded by the sakib al-saud'if "Ubayd Aliah, who invaded the district in August 825/Rabic II 210, caused devastation and finally met with the Asturian forces. "Une violente bataille m déroula au pied d'une montagne que le chroniqueur appelle Djabal al-Madius, 'la montagne des adorateurs du feu', ou peut-être 'des Normands'. Elle se termina par la détaite des Chrétiens, et l'on appeia par la suite an Espagne musulmane cette campagne Texpédition de la victoire' (gharrest al-fath)." It is probably here a question of the same peoples who were mentioned in 793, 795 and 816; the territories where they are said to have lived, are not too distant from each other. Of course there - never have been genuine Zoroastrians in those regions, but at present - do not know anything about these so-called al-Madiûs in the neighbourhood of the Basques (cf. Melvinger, op. cit., 116-18, 9-22, 86-115). Lévi-Provençal states (Du nouveau sur le royaume de Pampeluns au IXsiècle, in Bulletin hispanique, ly (1953), 8) that some of the Basques were evidently still pagan at the beginning of the 9th century, and Cl. Sánchez-Albornoz (Invasiones normandas a la España cristiana durante el siglo IX, in Settimans di studio del centro italiano di studi sull'alto medievo. XVI. I Normanni e la loro espansione in Europa nell'alto medioevo 18-24 aprile 1968, Spoleto 1969, 370) considers it certain that these al-Madjüs were Basque idolaters, maintaining that the name Zaidān (thus correctly instead of Şaitān) is a purely Basque word.

7. As make seen, the term al-Madjüs was used for tribes living in the north, even when we know for certain that it does not apply to the Vikings (all the textual loci probantes are not recorded here). In such cases, the Arabic authors were thinking about the religion in which fire in some from played a

prominent part.

Al-Madjüs was used in the West as a name for Vikings, evidently because they did not know of, nor did they use, the correct term al-Rüs, which was used by the Arabic Persian authors. Besides, the latter knew the difference, - far religion was concerned, between the Rus on one hand and the other the Madiûs (- Zoroastrians), who never burnt their dead. The Arabs in the West did not know the crucial difference between Vikings and Zoroastrians in the use of fire for funeral ceremonies, but mostly paid attention to the dominant element of the fire itself. And since the Vikings were neither Christians nor Jews, they were consequently assimilated to the Madjus because of the role of fire in their religious culture.

Bibliography: in addition to the works mentioned in the text: R. Dozy's monograph Les normands en Espagne, in his Recherchert, ii, 250-371 and Appendix XXXIV, deals with the various attacks by the Madiûs in Spain. At the beginning of this survey, references are given to earlier literature by Werlauff, Mooyer, Kruse and Kunik, Dozy, Melvinger and El-Hajji have abundant references, Dozy and Melvinger also some Arabic texts; see also A. K. Fabricius, La première invasion des Normande dans l'Espagne musulmons en 844, In Actes du Xª Congrès international des Orientalistes, Lisbon 1892. A. Seippel has mentioned all the texts known to him, also dealing with other peoples than the Madids, in Rerum normansicarum fontes arabici. E libris quum typis expressis tum manu scriptis coll. et ed., Oslo 1896-1928, Norwegian tr. in Det Norske Videnskaps-Akad, i Oslo, Skrifter, II. Hist.-filos, Al. 1954, no. 2 by H. (A. MELVINGER)

AL-MADIUSI. [See 'ALI B. AL-'ABBAS AL-MADIUSI.]

MADMUN (A.), passive participle of damma "to be liable"), a legal term meaning the thing for which one is liable or responsible. It occurs in the following connections: madmin bibi "thing pawned"; madmin 'anhu "debtor"; madmin labu or 'alsyhi "creditor". Liability (damin [q.v.]) plays im important role in the law of obligations; the rules which

are applied to the parties involved and to the legal institutions are enumerated in the chapters on

Lishility and obligation to restore may arise from the non-performance of a contract, if the object has perished, or from totaddf "transgression" i.e. from illicit acts, when the object is lost or damaged by the unlawful act. The obligation to restore depends on the division of things (mdl), which me divided either into fungibles (might) i.e. things that can be measured (makii) or weighed (mamzin) or counted (ma'dnd), or secondly, are divided into things (mutammamát) with a special value (time) and individuality i.e. they are 'ayn species.

MADRAS, a major port and city on the Coromandel coast of southeastern peninsular India, in lat. 13°4' N. and 80°15' E., formerly a governorship of the presidency of the same name (the latter comprising the eastern coast of India from Cape Comorin to Lake Chilka in present-day Orissa, as well as a large part of the interior of the Deccan, and the northern Malabar coast); since independence the capital of the Indian Union State of Tamil Nadu.

r. Nomenclature. The origin of the name "Madras" has been much debated. Perhaps the two most plausible explanations - offered by Hobson Jobson and the Madras glossary. The former (532) points out that the "earliest maps" of the region show Madrasapatanam . Muslim settlement, and "having got so far we need not healtate to identify it with Madrasa, a college . . . That there was such a Madrasa in existence is established by the quotation from Hamilton, who was there about the end of the 17th century. Fryer's map (1698, but illustrating 1672-73) represents the governor's house as # building of Mahomedan architecture, with a dome. This may have been the Madrasa itself. Lockyer (1711) also speaks of a college of which the building was very ancient, formerly a bospital, and then used apparently a residence for young writers". The Manual of the administration of the Madeas Presidency (il, gr) dismisses this idea, however ["Madrissa, a Mahommedan school, has been suggested, which considering the date at which the name is first found seems (anciful"), and vol. iii of this work, the Madras glossary (144), offers the alternative explanation that "Madras", in Sanskrit Mandasājāpaṭṭana, is derived from the Telugu Mandarddru, the name of a local ruler.

Until the early rith/17th century Madras was a small fishing village. It is not mentioned by Ibu Battūta, who landed in Ma'bar [q.v.] at the "large and fine city of Fatten" (thought to have been Kaveripattanam, Gibb, op. cil. in Bibl., 263-4) in ca. 739/1338. Marco Polo, however, writes at some length of the shrine of St. Thomas, built at Malaipür, "the name of which is still applied to a suburb of Madras about 31/2 miles south of Fort St. George" (Yule, The Book of Ser Marco Polo, il, 354-9).

2. History. In March, 1639, Francis Day of the East India Company "obtained a piece of ground five miles long, and me broad" (Manual of the administration of the Madras Presidency, ii, 270) at the small village of Madras, on which to build a town and fort. The land thus purchased, formerly a part of the waning Vijayanagar Kingdom, - to become the nucleus of the modern city of Madras,

Called originally by its founders Fort St. George, Madras remained subordinate to the Chief of the Settlement of Bantam in Java until 2653, when it raised to the rank of an independent presidency. In 1702 Dawad Khan, m general in the service of the Mughal Emperor Awrangelb [q.v.], blockaded the settlement for a few weeks, but without success. In 1741 the town me again attacked, this time by the Marathas [q.v.], once again unsuccessfully. Fort St. George was expanded and strengthened in 1743, but this failed m prevent Labourdonnais from bombarding and capturing it in 1746. The city, by this time the targest in southern India, was restored to the British in 1748 by the treaty of Aix-la-Chapelie, although the Government of the Presidency did not return to Madras until 1752. The French made a second, unsuccessful attempt to the Madras in 1758; the city was occupied, but the French, under Lally, failed to take Fort St. George. After two months the French were forced to withdraw by the arrival of a British fleet in the Madras roads. From this time the city, although threatened in 1769 and again in 1788 by the approach of Haydar 'All [q.v.] of Mysore's cavalry, was to remain in British hands until independence in 1947.

At the time of the 1971 Census of India, Madras, the third most important port and fourth largest city of India, had a population of 2,469,449 (Consus of India, series 19, part X-B); of this number 210,083 (comprising 116,444 males and 93,639 (emales) were Muslims (Census of India, series 19, part II-C-i). The Census of India figures are not divided to show sectarian affiliations, but the great majority of Madrasi Muslims are Tamil-speaking, either Rawther or Labbai [c.v.], Sunni Muslims of the Hanaff madkhab who do not claim Arab ancestry and who predominate in the interior of Tamil Nadu; or else Marakayar and Kayalar, Sunni Muslims of the Shafi'l madhhab who claim some Arab ancestry and who predominate

along the Coromandel coast.

(A. D. W. FORBUS)

MADRASA, in modern usage, the name of an institution of learning where the Islamic sciences are taught, i.e. a college for higher studies. as opposed to an elementary school of traditional type (kuttáb); in mediaeval usage, essentially a college of law in which the other Islamic sciences. including literary and philosophical ones, were ancillary subjects only.

I. THE INSTITUTION IN THE ARABIC, PERSIAN AND TUREISH LANDS

1. Children's schools.

The subject of Islamic education in general is treated under TARBIYA. Here it should merely be noted that the carliest, informal institutions of learning in the Islamic world were probably children's schools, such arrangements doubtless going back to the pre-Islamic period. In Medina, the teachers were often Jews (see al-Baladhurl, 473 below; cf. the name rabbani for the teacher: Kur'an, III, 79; V. 44. 63; Bukhāri, "I'm, IIII 20; Ya"kūbi, ii, 243); but ability to write was not so common here as in Mecca. After the battle of Badr, several captured Meccans were released to teach writing in Medina (al-Mubarrad, Kāmil, ed. Wright, 171). A contemporary of 'Umar's, Diubayr b. Hayya, who was later an official and governor, was a teacher [mu'allim buttab) in a school in Tabif (Ibn Hadjar, Isaba, Cairo 1325, i, 235). Mu'awiya, who had acted = the Prophet's amanuensis, took a great interest in the education of the young. They learned reading, writing, counting, swimming and a little of the Kur'an and the necessary observances of religion. Famous men like al-Hadidiādi and the poets al-Kumayt and al-Tirimmab are said to have been schoolmosters. (Lammens, Mo'dwia, 329 ff., 360 ff.). The main subject taught was adab, so that the schools of the children were called madilis al-adab (Aghāni*, xviii, tot), and the teacher was called muladdib, also mu'allim or mukattib (al-Makki, Küt al-kulüb, i, 158, l. 8), in modern times fight (see Lane, Manners and customs, 6x). The teacher was as a rule held in little esteem, perhaps a relic of the times when he was a slave, but we also find distinguished scholars teaching in schools; thus Dahhak b. Muzāhim, the exegist, traditionist and grammarian, who died in 105/723 or 106/724 had m school in Kūta, said to have been stiended by 3,000 children, where he used to ride up and down among his pupils on an ass (Yákût, Udaba?, iv, 272-3). As language was of the utmost importance, we find a Bedouin being appointed and paid as a teacher of the youth in Başra (ibid., ii, 239). School spread during the Umayyad period, and instruction was also given at home in the houses (see Haneberg, Schul- und Lahrwesen, 4 f.).

For the subsequent development of children's schools, see KUTTAB.

2. Islamic studies in the mosque: the early period.

The madrasa is the product of three stages in the development of the college in Islam. The mosque or masaiid, particularly in its designation as the non-congregational mosque, was the first stage, and It functioned in this as an instructional centre. The second stage was the masdid-kkdn complex, in which the Man or hostelry served as a lodging for out-of-town students. The third stage was the madeasa proper, in which the functions of both masdiid and khan were combined in me institution. based on a single want [a.v.] deed.

The masdid (q.v.) appears early in Islam = a centre for instruction, above all for the inculcation of the sacred texts and scriptures. Within the masdid, the focus of learning was the madific (q,v_*) , from dialasa "to sit up" in contradistinction to the near-synonymous verb &s'uda, which means "to sit down". Learning took place in the masdiid, a place of worship, specifically a place of prostration (from sadiada, "to prostrate oneself") in prayer before God. From the prostrate position of the prayer, the teacher and his students would then "sit up", and the class, or madilis, would begin. (From the near-synonymous verb hafada, the ism makin, se. mak'ad, is a bench, upon which one sits from a standing position).

in the new studies associated with the mosque, the learning by heart and the understanding in the Kur'an formed the starting-point and next came the study of hadith, by which the proper conduct for Muslim had to be ascertained. The Prophet was often questioned on matters of belief and conduct, or outside the mosque (al-Bukhāri, Tim, bab 6, 52; 23, 24, 26, 46). After the death of the Prophet, his Companions were consulted in the same way and scientific study began with the collection and arrangements of hadiths. This process is reflected in the hadiles themselves. According to them, even the Prophet in his lifetime was asked about hadiths (ibid., bab 4, 14, 33, 50, 52, 53); the Prophet sits in = mosque surrounded by a balks and instructs this hearers; the latter repeat the kadilles three times until they have learned them (ibid., bab 8, 30, 35, 42). The Prophet sent teachers of the Kur'an to the tribes, and so did Umar in the year 17 (ibid., bab 25). The necessity of silm is strongly emphasised, Jewish influence is perhaps to be recognised when learning is compared with the drinking of water (Bukhari, "Ilm, bab 20; cf. Proverbs, aviii, 4; Pirke Aboth, i, 4, 11) and the teachers are called robbiniyyan (al-Bukhārī, "lim, bāb zo). A special class of students, akl al-film, was formed who spread the knowledge of traditions throughout Muslim lands (sbid., bab 7, x2). They collected people around them to instruct them in the most necessary principles of the demands of Islam. In this simple form of instruction, which was indistinguishable from edifying admonitions, lay the germ of Islamic studies. The knowledge imparted was 'ilm or hikme (ibid., bāb 15).

It was from the study of the Kur'an and of kadith that a science of jurisprudence began to develop, since the principles which were to be followed by the faithful did not always ready-made from the meet reading of scripture. Although the early religious scholars, the 'ulama' [q.v.] (sing. 'dlim', were usually the experts on the Kur'an and were called al-hurra' (sing, kāri') [see KUR'AN. 3 and KURRA"], on the haduh [q.r.], and were called al-muhaddithun (sing, muhaddith), and on Kur'anle exegesis and were called al-mufassiran (sing. mufassir) [see TAFSIR], yet the 1st century of Islam saw the development of the jurisconsult-doctor of the law, the mufti-fatish. The turn of the century was later commemorated as "the Year of the Jurisconsults", sonal al-fuhaha", because of a number, generally considered to be seven, who died in and around that time (J. Schacht, Origins, 243, and see AL-PUKAHA" AL-SAB'A in Suppl.),

We hear of a madilis for studies in the Medina

mosque in the ret century A.H. (Aghānī, i, 48; îv, 162-3). Yazid b. Abi Habib, sent by 'Umar b. 'Abd al-'Azīz muffi to Egypt, is said to have been the first to teach in Egypt (Suyutl, Husn al-muhadara, i, 131); he mentioned along with another as teacher of al-Layth (al-Kindl, Wuldt, 89) and the latter, upon whose pronouncements faireds were isaued, had his halks in the mosque (blass, i, 134). "Umar II had before this sent al-Nafit, the maple of Ibn 'Umar, to Egypt to bring them the sunan (ibid., 130). He also sent an able reciter of the Kur'an to the Maghrib as kddl to teach the people bird's (ibid., 131). Education was arranged for by the goverament by allowing suitable people | give instruction in addition in their regular office. The first teachers I the mosques were the kussds, as a rule kādis, whose discourses dealt with the interpretation of Kur'an and the proper conduct of divine service. Their mamisa was the direct continuation ill the moral instruction given by the old Companions (cf. al-Bukhārī, 'Ilm, bdb 22). The instruction started in the mosque of 'Amr was continued for centuries. In the and/8th century, al-Shaff9 taught verious subjects here every morning till his death (204/820) (al-Suyûtl, Husm al-muhādara, i, 134; Yakut, Udaba', vi. 383). It was after this time that the study of fish came markedly to the front and the great teachers used at the same time to give faturás (cf. Husn, i, 182-3).

Arabic philological studies were acduatty prosecuted in the mosques. The interest of the early Arabs in rhetoric survived under Islam; the fakth Sand b. al-Musayyab (d. 95/713-4; cf. al-Tabarl, il, 1266) discussed Arabic poetry in his madjiis in the mosque in Médina; but it was still thought remarkable that poems should be dealt with in a mosque (Aghani, i, 48; iv, 162-3). In the year 256/ 870, al-Tabari by request dictated the poems of al-Thrimmah beside the Bayt al-Mdl in the Mosque of 'Amr (Yakut, Udaba', vi, 432). In the chief mosque of Başra, the ashab al-'arabiyya sat together (ibid., iv, 135). In Baghdad, al-Kisa'l gave his lectures in the mosque which bears his name. At quite an early date we read of special appartments (which were certainly also lecture-rooms) for authorities on the Kur'an, for, according to al-Wakidl, 'Abd Allah b. Umm Maktum lived in Medina in the dir al-hurrd' (Husn al-muhādara, ii, 142).

As is evident from the examples quoted, studies not only prosecuted in the chief mosques but also in other mosques. In Egypt, not only the Mosque of 'Amr but also the chief mosques of later date were important and of study. As soon as the Mosque of Ibn Tolon was founded, a pupil of al-Shāti fi began to lecture in it on badith (Busa almuhādara, ii, 139). During the Fāţimid period this continued. In the year 362/972, the Azhar [q.v.] Mosque was finished. Soon afterwards, the new Shiff hadi, 'Ali b. al-Nu'man, lectured in it on fich according to his school; in 378/988 al-'Asla and his vizier Ya'kub h. Killis founded 35 lectureships, and in addition to their salaries the lecturers were given quarters in a large house built beside the mosque (al-Makrizi, iv, 49; Sulayman Raşad al-Hanafi, Kans al-diawhar fi ta'righ al-Ashar, 32 ft.).

Thus the masdiid continued to be used for the teaching of one or more of the Islamic sciences, or their ancillaries among the literary arts, well into the 3rd/9th century of Islam. The turning-point in its man came after the miless [q.v.] or Great Inquisition. Regun in the last year of al-Ma'mūn's caliphate, 218/833, the miless extended across the

caliphates of al-Multapim and al-Wāṭḥiḥ to the second year of al-Multawakkil's caliphate, 234/848, a period of fifteen years. The upthot of the militar was the political bankruptey of its authors, the rationalist forces represented by the philosophical theologians, and the correlative triumph of the traditionalist forces, its victims, the doctors of the law, a triumph due in great measure to the heroic endurance of Ahmad b. Hanbal [g.v.].

After the mikes, more and more masdids came . be founded for legal studies, i.e. as colleges of law. Since the masdid could not serve as a lodging place for teaching staff and students-the exceptions being the wayfarer (ibn al-sabil) and ascetic. plous men who had given up all wordly goods (ruhhad, sing, zākid) - khāns were founded next to the masdids to serve as lodging for students from out-of-town. The outstanding example of this type of arrangement was the extensive network of masgid-khan complexes founded in the lands of the eastern callphate during the 4th/toth century by Badr b. Hasanawayh (d. 405/x0r4), governor of several provinces under the Buwayhids [see HASANWAYR]. Such men of power and influence needed the good offices of the 'ulama', their sole sure link with the masses of the faithful. To establish this connection, such men founded for the "ulama" institutions wherein they could teach the Islamic sciences. Besides currying favour with the 'ulama', the powerful founders were performing highly meritorious acts of charity endearing them to the masses and the 'slama' alike.

The terminology for legal studies developed before the flourishing of the madrasa in the 5th/11th century. It derived from the radicals ders. The second form of the verb, darrass, used without complement, meant "to teach law"; todris, its verbal noun (masdar), meant "the teaching of law", the function as well as the post of professor of law; the plural, taddris, or "professorahips of law". of later development, when the holding of several professorships by one doctor ill the law became a practice. The term days, meant "a lesson or lecture on law"; mudarris, the active participle, meant "the professor of law". It must be kept in mind that these terms had these significations in reference to law, especially when used in the absolute, without a complement. The verb fabbaks is of rare occurrence, and was not commonly used to designate the teaching of law. The term fahlh was used in the good of "doctor of the law", or "student of law", particularly "a graduate student", in contradistinction to mutafabbih, used to designate "the undergraduate". The accomplished jakin was eligible to become a mudarris and a mufit; for a fakth who had successfully defended his theses in disputations (munășara), he obtained his licence to teach and to issue legal opinions (idiata lí "I-tadris wa "I-ift4").

The college of law therefore began as a massifid and was soon joined by the khān or bostel for outof-town students. The lodging place next to the massifid see especially necessary for the student of law as distinguished, for instance, from the student of the hadith. Jurisprudence was by now science whose rudiments had to be learned in a period of years, usually four, and these usually under the direction of one master. After this basic undergraduate training, if he was successful and chosen by the master see sight or fellow, he went set to graduate studies that lasted an indefinite period of time, some follows working see repetitors (master) under their masters for as many as twenty years before

acquiring their own professorial chair. In contrast, the student of hadith travelled from one place to another, acquiring rare hadiths, and collections of hadiths, from hadith-masters who often were the last link in the chain of transmitters, holding alone the authorisation to pass on their collections authoritatively to others. The hadith student travelled therefore from place to place and collected as many authorisations, idjáms, as possible from as many masters as he could reach. The law student was interested in an authorisation covering a field of knowledge, that of law, in one idjara; the licence to teach law and issue legal opinions, idjuxat al-tadris ma 'I-fatwa, which he obtained from one masterjurisconsult. The hidn, founded near the masdfid, therefore necessary as ■ lodging-place for law students away from home.

3. The library as an adjunct to the mosque and other institutions of higher learning.

In the descriptions of the larger mosques the libraries are often mentioned. These collections were gradually brought together from gifts and bequests, and it was a common thing for a scholar to give his books for the use of the muslimum or all al-tilm (e.g. al-Khatib al-Baghdådi: Yäküt, Udaba), i, 252; cf. iv, 282). Many other libraries were semi-public. These often supplemented the libraries of the mosques, because they contained books in which the mosques were not much interested, notably on logic. falsafa, geometry, astronomy, music, medicine and alchemy; the latter were called al-fulum al-kadima or 'ulum al-ama'il (cf. Goldziher, in Abh. Pr. Ak. W. [1915], phil. hist. Kl. no. 8, Berlin 1916), The academy, bayt al-hikma [q.v.], founded by al-Ma'mun (ro8-218/813-33) in Baghdad, deserves first mention, It recalls the older academy founded in Gundeshapur to which al-Mansur had invited Georgios b. Gabri'el me head of the hospital; he also translated works from the Greek (Ibn Abl Uşaybi'a, i, 123-4). In the new academy there was a large library, and it was extended by the translations which were made by men qualified in the above-mentioned fields; there also an astronomical observatory attached to the institution, in which there were also apartments for the scholars attached to it (Fibrist, ed. Flügel, 243; cf. Ibn al-Kifti, Tabrikh al-Hukama? 98). When the caliph al-Mutadid (279-89/892-902) built himself a new palace, he had apartments and lecture-rooms in an adjoining building for men learned in every science, who received salaries to teach others (al-Makrizi, iv, 192 if.; Husn al-muhadara, (i, 142).

Private individuals of wealth continued benefactions on these lines. 'All b. Yahya, who died in 275/888 and was known as al-Munadidikn, had palace with ■ library, which was visited by those in search of knowledge from all lands; they were able to study all branches of learning in this institution, called khisanat al-hikma, without fee; astronomy was especially cultivated (Yākūt, Udabā', v. 467). In Mawsil, Diaffar b. Muhammad al-Mawsili (d. 323/935) founded a dar al-film with a library in which students worked daily at all branches of knowledge and were even supplied with free paper. The founder lectured m poetry in it (ibid., ii, 420). In the 4th/10th century, al-Makdisl visited in Shiraz a large library founded by 'Adud al-Dawla (367-72/977-83) to which people of standing had access. The books were arranged in cases and listed in catalogues and the library (thirdnot al-kutub) was administered by a director (wakii), an assistant (khāsin) and an inspector

(mushrif (al-Mukaddasi, 449). Similar institutions are known in Başra, Rām-Hurmuz, Rayy and Karkh (ibid., 413; Yākūt, Udabā', li, 3-5; Ibn

Taghribirdi, ed. Popper, ii, 51-2).

In Cairo, they were well-known under the Fatimids. In their palace, they had a library which was said to be the largest in Islam. It had about 40 rooms full of books and all branches of knowledge were represented; they had for example 1,200 copies of al-Tabarl's History and 18,000 books on the "old learning" (al-Makrizi, ii, 253-5). The visier Yackub b. Killis founded an academy with stipends for scholars and spent 1,000 dinars a month on it (Yahya b. Sa'ld, ed. Tallquist, fol. 108a; Ibn Khallikân, Wafayât, Cairo 1310/1892-3, ii, 334; cf. al-Makrizi, iv, 192). It was overshadowed by the "House of Knowledge" (ddr al-film or ddr al-hikma) founded by al-Hakim in 395/1005. It contained a library and reading-room - well as rooms for meetings and for classes. Librarians and assistants, with their servants, administered it, and scholars were given allowances to study there; all branches of learning were represented-astronomy, medicine, etc., in addition to the specifically Islamic subjects. Al-Hākim built similar institutions in al-Fusţāţ (al-Makrizi, ii, 334 ff.). The whole institution was closely associated with Shi'a propaganda, which be obvious from the fact that it and administered by the das "I-dusat, who held conferences with the learned men there every Monday and Thursday (al-Makrizi, iv, 226; al-Kalka<u>sh</u>andi, Şubh al-a'skā', iii, 487; see also manulis. 2. In Ismā'ili usage). A similar missionary institute (dar al-da va) - built in Aleppo in 507/1113-14 by the amir Fakhr al-Mulk (ibn Taghribirdi, ed. Popper, ii, 360). We may assume that these buildings were also arranged for the performance of the salat.

With the dar al-hikma, Islam was undoubtedly continuing Hellenistic traditions. Al-Makrizi mentions a dar al-hibma of the pre-Islamic period, where the learned men of Egypt used to work (iv, 377); Ibn. Abl Uşaybi'a also mentions pre-Islamic seminaries in Egypt where Hellenistic learning was cultivated (das al-sim, i, 104), and the similarity with the Alexandrine Mussion, which was imitated in Pergamon and Antioch, for example, is apparent (J. W. H. Walden, The universities of ancient Greece, New York 1919, 48-50). Al-Hakim's institution was finally closed with the end of the Fatimid dynasty (567/ 1271). Salab al-Din had all the treasures of the palace, including the books, sold over a period of ten years. Many were burned, thrown into the Nile, or thrown into a great heap, which was covered with sand so that a regular "hill of books" was formed. The number of books said to have disposed of varies from 120,000 to 2,000,000, but many were saved for new libraries (al-Makrīzt, ii, 253-5; Abū Shāma, Kiteb al-Rawdalayn, Cairo 1287/1870, i, 200, 268).

Bibliography: A. Mez, Die Renaissance des Islâms, 1922; M. Meyerhof, in SB Pr. Ak. W., phil-hist. Kl., xxiii (1930), 388-429; idem, in HE, xv (1933), 109-23; idem, in The legacy of Islam, Oxford 1931, 311-55; J. Schacht and Neyerhof, The medicophilosophical controversy between Ibn Butlan of Baghdad and Ibn Ridman of Cairo, Cairo 1937; Olga Pinto, Le biblioleche degli Arabi neil' stà degl' Abbasidi, Florence 1928.

4. The origin and spread of the madrasa proper.

Although the madrasa proper now began to evolve, there was for a long time much overlapping between the mosque and the madraca, for even after the appearance of madrasas, the regular mosques remained school as before.

Ibn Battuta, who travelled in the 8th/z4th century, in the period when madratas flourished most, attended lectures in hallis in the Diami' of Shrāz and in the Diami' of sl-Manşūt in Baghdād (ii, 83, 170). In Damascus in 580/zz84, Ibn Diubayr refers to rooms in the Umayyad Mosque, which were used for Shāiil and Māliki students, who received considerable stipends (idjina, ma'lam) (Rikla, 272, above). In Egypt in the time of al-Makrīzi (9th/15th century), there were I rooms for fiha studies in the Mosque of 'Amr (al-Makrīzi, iv, 20, 21). In al-Azhar in the 7th/z4th century, and later, after the carthquake of 702, many lecture-rooms with paid teachers were built (ibid., 52). Ilkewise in the Mosque of al-Hākim (ibid., 57).

When a particular room was set apart for teaching purposes in a mosque, this was often called madrasa; for example six the Damascus madrasas were in the Umayyad Mosque (JA, ser. 9, iii, 410, 437, 437; iv, 262, 270, 481; others: vii, 230). The madrasas were often also built close beside the large mosques so that they practically belonged them. This was the case in Mesca (Chrow. Metha, ii, 104 ff.; cl. 1bn.

Battûţa, i, 324).

Though the madrasa was an independent institution, the distinction between the madrasa and ordinary mosque was very slight, all the less as sermons also preached in the madrasa. In the Nisāmiyya in Naysābūr, services were held mem as it was tinished (by 'Abd al-Rahlm: Wistenfeld, Schafi's, iii, 285) and the Nisāmiyya in Baghdād had mainbar (Ibn Diubayr, 219). In Egypt from 569/1174 m 565/1267 there was only me Priday khufba, but after this time there musually mainbar in the larger madrasas.

It monly natural that the madrasas should also be called masgid (cf. Ibn Diubayr, 48). Ibn al-Hādidi in the 8th/rath century still wants to distinguish between masgid and madrasa and to give more importance to the former (Madkal, ii, 3, 48). The distinction ramained, however, quite an artificial one, and this is also true of the distinction between madrasa and dismit. The name madrasa was decided by the main object of the institution and the special style of the building. The name dismit was only given if the Friday service was held in it.

The connection between mausoleum and mosque was also found with the madrasa. The tomb of the founder was placed in Nur al-Dan's madrasa in Damascus (Ibn Diubayr, 284-5), and during the Mamilik period it was the regular custom for the founders of madrasa to be buried under a

kubba [q.v.] in it.

On education and the madrasa in general, cf. also F. Wilstenfeld, Die Akademien der Araber und ihre Lehrer, Göttingen 1837; von Kremer, Culturgesokichte, Vinnna 1877, ii, 479 ft.; Haneberg, Abhandlung über das Schul- und Lehrussen der Mukammadaner im Mittdaller, 1850; van Berchem, Corpus inser, arab., i, 252-69; G. Gabrieli, Manuale di bibliografia musulmana, i, 1916, 109 ff.; Johs. Pedersen, in IC, iii (1919), 525-37; A. Talas, La Madrasa Nizamiyya et bistoire, Paris 1939.

While the institutions called the dar al-'ilm developed in Fatinid countries into centres of Shiff propaganda, the madrasa grew up in the east out of similar Sunni institutions. It is interesting to note that in 305/1005 al-Haldim built a Sunni dar-al-'ilm in Cairo (Ibn Taghribirdi, ed. Popper, ii, 64, 105.

106). But after these years, this institution was abolished and its two learned teachers executed. With the growing strength of the Sunna, especially in the Shāfi² and Hanafi forms, many educational institutions arose in the east which had a pronounced Sunni character (al-Mukaddasi, 232, 365, 425). Many teachers built houses of their own, where they dictated hadiths and held lectures on fibh, e.g. a teacher who died in Marw in 420/1029 (Wüstenfeld, Schāfi², 232). Abū Hāṭim al-Bust, born in 27/690, founded in his native town a school with a library with apartments and allowances for the maintenance of foreign students (bid., 163; cf. 204, 245).

In Naysabur especially, where studies were vigorously prosecuted in the mosque (e.g. Wüstenfeld, op. cit., 236), many such institutions arose. Thus a special school was built for the Shafin figh-scholar al-Şā'igh al-Naysābūrī (d. 349/960; ibid., 156; cf. 160). Abū 'All al-Ḥusayni (d. 393/1063) himself founded a school in which to teach hadith, and it was attended by 1,000 scholars (ibid., 203). Ibn Fürak (d. 406/1015-6; ibid., 216) did the same, likewise Abu 'l-Kāsim al-Kushayri in 437/1045-6 (ibid., 284); and for Rukn al-Din al-Islara int (d. 418/1027) a school - built which surpassed all others (ibid., 229). As early as the 4th/10th century, m find al-Mukaddasi praising the very fine madaris of Iranshahr (BGA, iii, 315). In the first half of the 5th/11th century, there were four especially farnous madrates in Naysabûr: al-Madrasa al-Bayhakiyya, founded by al-Bayhaki (d. 458/2066), when he became a teacher in Naysabur in 441/1049-50 (Wüstenfeld, op. cit., lii, 270); al-Sa'Idiyya founded by the amir Nasr b. Sebüktigin (governor of Naysabür in 389/ 999); built by Abū Sa'd Ismā'll al-Astarābādī; and another built for the teacher Abn Ishak ai-Isfarabini. A Nizāmiyya was also built here by Nigâm al-Mulk for the Imâm al-Haramayn al-Diuwaynt (al-Makrizi, iv, 192; Husn al-muhādara, ti, 145-2). It was an event of great importance when Nizām al-Mulk (456-85/1064-92 virter of the Saldiülk sultans Alp Arslan and Malik Shah) founded the colebrated Madrasa Nisāmiyya in Baghdad; the building was begun in 457/2065 and on to Dhu 'l-Ka'da 459/22 September 1067 it was consecrated. It was founded for the Shafi'l teacher Abû Ishâk al-Shirāzī.

The Muslim historians in in doubt about the history of the madrasa. Nizām al-Mulk is given the credit of having founded it, but al-Makrizi and al-Suyutl point out that madrasas were aiready in existence before him and mention the four abovenamed ones; but, me we have seen, even they were not innovations. Ai-Subki thinks (says al-Suyûți) that the new feature - that Nizim al-Mulk endowed scholarship for the students. This again, however, was nothing new. But the enthusiasm and energy of Nizām al-Mulk marked the beginning of a new period of brilliance for the madrass (cf. G. Makdisi, Muslim institutions of learning in eleventh century Bughdad, in BSOAS, axiv [1961], 1-56; A. L. Tibawi, Origin and character of al-Madrasah, in BSOAS, xxv [1962], 225-38; H. Halm, Die Anfänge der Madrasa, in ZDMG, Suppl. III, 1, XIX, Deutsche Orientalistentag [1977], 438-48). The sultan and of high rank were now interested in it, and the type evolved by Nixam al-Mulk, a school in which the students were boarded, became the prevailing one after his time. We may presume that the older schools also had a place for prayer in them, i.e. they were a kind of mosques. The type of school

known to m is built as a complete mosque. Since even the older mosques contained living-rooms which were frequently used by students, there is no difference in principle between the school and the ordinary mosque; only the schools were especially arranged for study and the maintenance of students. This character is expressed by the name madrasa, plurai madāris; it is a genuine Arabic formation from the word darasa, "to read", "in study", taken from Hebrew or Aramaic.

In the time of Nizam al-Mulk and immediately afterwards, the madrasa spread in 'Irak, Khurasan, al-Diazira, etc. He was not content with the two he founded in Naysabur and Baghdad. There was also a Madrasa Nipamiyya in Balkh (Wüstenfeld, Schiffiff, 240); in Mawsti (ibid., 319); in Harat, to which al-Shash! (d. 485/1092) was called from Ghazna (ibid., 3:0); and in Marw (Vakut, iv, 509). The great vizier's rival Tadi al-Mulk (d. 486/2093) founded a Madrase Tādiiyys in Baghdād (ibid., 511). In Naysābur, other madrasas were founded in the same time, for example one by al-Maniti (d. 463/1070-r; ibid.,

277) and a Shatbiyya (ibid., 327).

The prosperity of the madrasas stimulated by Nizam al-Mulk in the 5th/11th century survived for a long time in the east. In the 6th/rath century Ibn Djubayr (580/1184) mentions some thirty madrasas in Baghdad, all in the eastern part of the town, the most notable being the Nizāmiyya, renovated in 504/ 1110-11 (Risia, 229). In 631/1234, the caliph al-Mustanşir founded the magnificent Mustanşiriyya as school for the four rites, each with steacher and seventy-five students and a teacher for Kur'an and one for hadith, as well as a physician. Attached to it were a library, baths, hospital and kitchens; there was a clock at the entrance; beside it was a garden where the caliph had a pavilion (mongare) from which he could survey the whole building (cf. Le Strange, Baghdad, 266-7; Wüstenseld, Akademien der Araber, p. iv and 29).

The Nizāmiyya and the Mustanskriyya survived the destruction of Baghdad by Hülagü; both are mentioned at the beginning of the 8th/14th century by Ibn Battūta (ii, 108-9), and the building of the latter still exists. Ten others are known of the 8th-9th/14th-15th century, all of which were founded for Shati'ls, Hanafts and for the study of Kur'an and hadith (L. Massignon, Les Medreseks de Bagdad, in BIFAO, vii [1909], 77-86; the inscriptions, idem, MIFAO, xxxi [zgr2]). Although the Tatars in 699/ 1300 destroyed many madrasas (Quatremère, Hist. des sult. maml., ii/2, 163-4). Ibn Battata shows that in the 8th/Lith century there were still flourishing schools in the east. The Mongols also built madrasas; Hülägü's mother built two madrasas in Bukhārā where 1,000 students studied daily in each (JA, ser. 4, 22, 389; Quatremère, Hist. sult. mami., i/1, 56). The period of greatest prosperity of the madrasas in Central Asia was under the Timurids, notably in Samerkand, where Timus built a didenic "in the Indian style", and his wife a madrasa (Ibn 'Arabshith, Vita Timuri, ed. Manger, 1767, 444 ff.; see also Diez, Kunst der islam. Völker, 99-100).

In the towns of Mesopotamia and Syria, the movement spread from the 5th/rith century onwards.

In Damascus the two rulers Nur al-Din b. Zang! (541-69/1146-63) and Salah al-Din (570-89/ 1174-93) displayed a munificent activity in this direction, as did their amirs and relatives. This activity was continued into the 7th/13th to 9th/15h conturies, in that al-Nu'aymi (d. 927/1521; JA, ser. o. ili-vil) can give the following totals: seven ddr al-Kur'an, sixteen ddr al-hadith, three for both Kur'an and hadith, 60 Shalif, 52 Hanaff, four Mālikī and ten Hanbali madrasas, also three madaris al-fibb, all of which belong to the 7th/13th century. The tounders were mainly rulers and amirs, but also included merchants and quite a number of men of learning, and a few women also.

Salah al-Din introduced the madrasa into Jerusalem. According - Mudilt al-Din (d. 927/1521), there were 3t madrasas and monasteries (which were in part used in the ways as madrasas) in direct connection with the Haram area, 29 min it, and 16 🖿 🚃 distance. Of these, some 40 are especially called madrasa, one a dar al-Kur'an and one a dar al-hadith (Sauvaire, Hitt. Jerus. et Hibr., Paris 1876, 139 ff.; van Berchem, Corpus, ii, 1; cf. for Salah al-Din: Ibn Khallikan, Wajayat, li,

Cairo 1310/1892-3, 402-3).

Next M Nizām al-Mulk, Şalāh al-Din has tho greatest reputation as a builder of madresas. He owes this mainly to the fact that his great activity as a builder lay in countries which became of great importance in the Muslim world, Syria with Palestine, and Egypt. Even before the fall of the Fatimids, in the year 566/1171: he had founded E Cairo the Nāşiriyya for Shāfi'is and the Kambiyya for Mālikis; for Shaff's also the Shariffyya and notably the great Şalāhiyya or Nāsiriyya (for the identity of the two, of, al-Makrizi, iv, 25t, with Hush al-muhadara, ii, 142-3), beside al-Shāliff's mausoleum (Husa almuhādara, ii, 241-2; al-Maķriel, iv, 192 ff.; lbu Khallikan, ii, 402-3). Those around him emulated this activity.

During the period of the Ayyubids and Mamfuks, the number of medians increased to an extraordinary degree. In the street called Bayn al-Kasrayn there were two long rows of madrasas the site of the old Fatimid palace in Cairo (cf. P. Ravaisse, in MMAF, i, 1889, 409 ff., pl. 3). Al-Makrizi (d. 845/1442) mentions 73 madeatos, 14 for Shaff's, four for Malikis, ten for Hanafis, three for Shaff's and Mālikis, six for Shāfias and Hanalis, one for Mālikis and Hanafis, four for 🔳 four rites, two exclusively used as dar al-hadith, while the rite of 25 is not mentioned and four remained unfinished. Of these madrasas, according to him, about 13 were founded before 600, 20 in the 7th century, 29 in the 8th century and two after 800.

In Salah al-Din's time, the madrasa was also introduced into the Hidjaz. In the year 579/1:83-4 the governor of Aden built in Mecca madrasa for the Hanaffs, and in the following year a Shaff's madrasa was also founded there (Chron. Mehka, ii, 104). Up to the beginning of the 9th/15th century, 11 madrasas 🚃 mentioned (ibid., 104-7), but others added (ibid., iii, 177-8, 211-12, 225-6, 351 ff., 417). In the 12th/18th century, they ceased entirely to be used for their original purpose (see Snouck Hurgronje, Mekka, ii, 229 ff.). Madrasas were also built in Medina (Wüstenfeld, Medina, 58, 98, 112).

In Asia Minor, madrasas spread under the Saldiuks; the oldest known date from the 7th/13th century (Cl. Huart, Konia, 1897, 156, 160, 178; Fr. Sarre, Raise in Kleinasien, 1895, 48-9, 5x-2; R. Hartmann, Im neues Anatolies, 1928, 106 ff.).

In Tunis, many madeases were erected under the Haisids (625-941/1228-1534), the oldest being the Madrasat al-Mafrad in about 650/1252. In the Chronicle of Tunis (al-Zarkashl, Chronique des Almohades et des Hafsides, tr. E. Fagnan, in Ret. Not. at Mem. Soc. Arch. Const., xxi [1895], see index)

12 are mentioned. The first madrata in the Maghrib was, according to Ibn Marzūk's Musnad, the Madrasat al-Şaffārin built by the Mariald Abū Yūsuf Ya'hūb b. 'Abd al-Hakk (656-85/1258-86) in Fās in 684/1283 (also called al-Halfā'iyyla; see the edition by Lévi-Provençal, in Haspāriz, v [1925], 34 [Arabic] — 44 [French]). Other Marinids and their continued the building of madratas in Fās, Tilimsān and other cities (cl. Bel, Inscriptions do Fès, in JA, ser. 11, x [1917], nii [1918]; G. Marçais, Manuel d'art musulman, ii, 1927, 465 ff.).

In Spain, according to Ibn Sa'd (7th/13th century), there were no madrasas; instruction was given in the mosques (al-Makhari, Analostas, i, 136); in the following century, however, m large madrasa was founded in Granada by the Nagrid Yusuf Abu 'l-Hādjdjādj in 750/1349 (Almagro Cardenas, in Boletin de la Real Acad de la Hist., xxvil,

490; Marçais, op. eik., 516-17).

Ibn Khaldun (808/1406) testifies to the spread of madrasas in Tunis and the Maghrib but laments the decline in education. In al-Andalus, Muslim culture was dying out and after the decline of Kurtuba and al-Kayrawan, education in the Maghrib was on a low level, while the old schools in Trak were - longer of importance. Cairo was a centre of learning to which all made their way, and studies also flourished in Persia (Mukaddima, fast 6, no. 2). This decline in interest in learning soon became general. The learning of the time lacked vitality, and international scholarship was affected by political conditions. In 1517 A.D., Leo Africanus [q.v.] says that the lecture-rooms in Cairo were large and pleasant but the numbers who attended them were small. Some still studied figh, but very few the arts (Desc. de l'Afr., ii), 372, in Rec. de Voy, et de Doc., ed. Schefer, Paris 1896-8).

5. The constitution of the madrasa.

We have that, already in the 4th/10th century, there were a number of madrass outside Baghdad, the cultural centre of the Islamic world, but we have also noted the impetus to madrasa-building which took place in the next century and is associated especially with Nirâm al-Mulk. Even so, as further noted, earlier types of educational institution continued to flourish

The madrata, combining the functions of the sundid and its nearby his in one architectural unit, brought nothing new to legal studies as such. Nor was the student body men numerous in the madrasa than it was in its predecessor; the number in either type of college of law was usually twenty. Nor did the new medsass put an end to the masdid a college; these test continued to be established charitable foundations. Indeed, many 'ulama' deplored the innovation of the madrasa which provided for all the needs of the student, including room and board, and encouraged, according to the "wismd"s complaints, worthy and unworthy alike to pursue knowledge for the wrong kind of motivation, a parasitic life of ease, instead of learning for the greater glory of God. Thus the masdid-khan type of college continued to be founded, and many professors of law continued to teach there, - for instance, within the Hanball madhhab, whose first madrasa was founded only in the first part of the 6th/12th century. This lingering preference for the masajid is not surprising, given the place of the mosque in the Muslim community and the encouragement of the faithful to build mosques: "The Apostle of God ordered ... that masdids be built" (amara rasul Alláh ... bi-bind? al-masädjid, Abū Dāwūd, Sunan, salát, 23; al-Tirmidhi. Djámi', djumu'a, 65; sec also Muslim, Sahih, masädjid 288; al-Tirmidhi, op. oit., da'audt, 82; al-Dārimi, Sunan, salāt, 60).

One should not attach undue importance to the fact that the madras developed especially in the eastern lands of the caliphate, in 'Irak, Persia and Transoxania; this does not imply a cultural swing away from Arab Baghdād towards Persian Khurāsān, especially towards Naysābūr, which would be mistreading of cultural history due to anachronistic nationalist sentiment. Since there was no change in the curriculum, or in the teaching staff or students, and since the final product of the two types of colleges was exactly the same, that is, the muffifabih, the reason for the change in institutional typology must be sought elsewhere and may be found in the legal status of the two institutions concerned, the massifid and the madrasa.

Relevant here is the fact that the legal status of the madrass allowed the founder to retain complete control over the administrative and instructional staff of the institution, and therefore the retention of the power of patronage. For government officials, such as a maste, it permitted him to attract the support of the rank and file through their religious leaders employed by the founder. For these men, as well as for some of lesser power, the law of master permitted them to place their wealth where it could be secured against confiscation.

Moreover, the masdid and the madrasa were charitable foundations based wast. The founder, the makif, was free m found the me or the other type of institution. He could, in his deed of foundation, make any stipulations he wished regarding any aspect of his foundation, whether it be a masgift or madrasa, with only one limitation to his freedom of choice: none of his stipulations were to contravene the tenets of Islam. Legally speaking, he could not appoint the imam of the masdid. If the masdid had a professor in addition to the imdm, the founder could appoint the professor. The imdm, or the professor-imam, was appointed by the caliph alone, or by the caliph with III consent of the people of the quarter where the masagid was located. A madrasa, as such, had no imam, unless the foundation was a complex including a madrasa and masdid. The fundamental difference between the two institutions was that the masdiid, once the make deed was signed, became a mast takris; that is to say, a foundation whose legal status is assimilated to the manumission of a slave. As the master, once he freed his slave, had no further rights - him, the founder, once the deed of his masdid see signed, had no further rights over it, other than those legallyvalid stipulations in his deed pertaining to the Instructional aspects of his foundation.

Thus between the two great patrons of learning mentioned previously, Badr and Niţām al-Mulk, the difference is that, while the former founded margirds over which he had limited control, the latter founded madrasas over which his control was complete, Niţām al-Mulk retained for himself and his progeny complete control over his network of madrasas. In Baghdad, where professorial tenure was usually for life in the margird-college of law, Niţām al-Mulk hired and fired professors, some after a tenure of a month or even of a day. The introduction of madrasas in Baghdad may therefore be viewed as an encroachment upon the patronage of the caliph, whose control over margird- and didmi*-mosques did not extent to the madrasa.

After the masgid and madeasa, other institutions came into existence, especially the dar al-hadiff [q.v.], the first of which was, as already noted above, founded by Nür al-Din b. Zangi Damascus. In this institution, the muhaddith was raised to the level of the mudarris in the madrasa. The madrasa founded for one madhhab tended to be divisive, since only those students who chose to belong to that madkkab were admitted for study of law and the ancillary sciences. The dar al-kadith served to being together students of all madhkabs, and may thus be seen as a further manifestation of the triumph of traditionalism over the forces of rationalism represented by the dar al-film [q.v.] institutions, which soon disappeared from the scene. The dar al hadith must not be confused with either day al-tadris or day al-sunna, occasional terms that referred not to the study of hadith but of fikh, and were used as terms of traditionalism opposing the rationalism of dar al-film.

Education in Islam was religious in nature and an obligation incumbent upon the 'ulama', the men of religious science. The caliph = the successor to the Prophet made it possible for teachers to teach in the Friday mosques where halkas [q.v.], study-circles, provided instruction in the various religious sciences and their ancillaries. Private individuals endowed institutions of learning, masgrids and madrasas, which they specified for one or the other of the madhashs m they chose. Muslim institutions of learning, based on the law of maki, were endowments made by individual Muslims, of their own free will, without interference from the governing power. Even when the founder caliph, a sulkin, a mirir, or other official, he endowed his foundation as a Muslim individual, instituting his own private property as most for a public purpose. These institutions were not public in the sense that anyone was entitled to attend them. They were set aside for restricted - in accordance with the walf stipulations of the founder, restricting admission to one or the other madhhab.

Founded at first for only one madhab, madrasas were later founded for more than _____ In the latter case, the students of each madhab _____ taught separately. The system was ____ individualistic as the law itself: one madrasa, ____ madhab. There were double, triple and quadruple madrasas, meaning that two, three or four madhabs were involved; but the students of each madrasa within the compound were kept separate, each student body following the madhab of its choice,

Madrasas usually Hanall, Shali'l or Hanhall, with very few for the Malikis. Spain, predominantly Maliki, had no madrasus as late as the 7th/r3th century; as noted above, the earliest madeasa, said to be that of Granada, was not founded till the following century. Their sparsoness throughout the Islamic world can be explained by the Mäliki law of walf, which prohibits Maliki founders to retain control of the trusteeship of their institution. This discouraged founders from endowing madrasas as means of sheltering their wealth against confiscation, by retaining control of their institution for themselves and their progeny to the end of their line. Mälikl madrasas were founded in North Africa by the sovereigns, whose motives differed from those of private individuals; they were motivated by the prestige brought by their foundations to themselves and to their realms.

Besides the diamic and its study-circles, the masdid, the madrasa, the dar al-hadilk, there were

also the där al-Kur'an, the ribāt [q.u.] and other conventional establishments (khánkáh, zámiva (a.ve.)). in which learning took place in the Islamic sciences. 'Abd al-Latii (d. 629/1231) lectured in a riddf in Baghdad 🖿 usul, hadigh, etc. (Ibn Abi Uşaybi'a, ii, 203) and a Ribil al-Khallani is mentioned here, which had a library (Ibn at-Kifti, ed. Lippert, 269). There are other references to libraries in monasteries (see for Marw: Yakūt, iv. 500). In the Khānakāk Shayhha founded in 756/1355, an extensive course of lectures, figh according to all four madhahib, hadith and itera? (al-Makrizi, iv. 281) was given. In the Ridde al-Athar in the Sthitath century, instruction was given in Shafi'l fight (ibid., 296); the Hanafi madrosa al-Diamaliyya (730/1430) was also a khanahah (sbid., 238 above); they had a common director. There were also institutions of learning consisting of a combination of some or three of the institutions mentioned; as, for instance, a madrasa-ribit-dar al-hadith. In the 8th/24th and 9th/15th centuries, this combination of the two institutions became quite frequent, for example in the Nizāmiyya in Cairo of the year 757/1356 (Van Berchem, Corpus, i, 242 ff.) and in the mausoleums of Barsbāy, 835 (ibid., 365-6; cf. Ibu lyās, ii, 21, 22, 4r), of al-Malik al-Ashraf Inal, 855-60/1451-6 (ibid., no. 271 ff.) and of Ka'it Bay, 879 (ibid., 43r ff.). In the east, Ibn Batthta found the relationship, for example in Shiraz and in Karbala? (ii, 78-9, 88, 99), and this in what he means when he says Persians call the admiya the madrata (ii, 30, 32). In the west, he lauds his own sovereign, who had built a splendid adwise in Fas (i, 84); here also learning and Sulism were associated (see the quotation in Dozy, Supplement, s.v. sawiya) and the zāwiya still plays an important part in North Africa.

Learning further took place in the hospitals (mdristān, from the Persian bimāristān [q.v.]) which also used as schools of medicine, well as in the private homes of scholars and elsewhere.

. Courses of instruction and personnel.

As already explained, in the earliest period the principal subjects studied in the mosque were Kur'an and hadily, to which was added the study of the Arabic language. In al-Bukhārī (Kitāb al-cīlm), 'ilm still means hadith but, with the development of the systems of law and theology, these were also taught in the mosques. In the mosque of al-Mansur in Başra, al-A<u>sh</u>'ari heard al-<u>Di</u>ubbā'i expound the Muftazill kalám (Wüstenfeld, Schäffif, 131); closely connected with this was methodology (al-mediakara wa 'l-naşar: cf. Yakût, Udaba', vi, 383). But many different subjects could also be taught. Al-Khatlb al-Baghdadl, who taught in al-Mansur's Diami' in Baghdad, lectured on his history of Baghdad (Yāķūt, Udabā', i, 246-7). Philosophy proper, however, disappeared from the mosques. In Spain, we are told, folsofa and tandilm mem only cultivated in secret, as those who studied them were branded as sindiks, and even stoned or burned (al-Makkarl, Analestes, i. 236). The madrasas were mainly established to teach the systems of file, and originally each school was intended to represent only one madhlab. Where the four madhlable are represented in one school, one can speak ill four madrasas, e.g. al-Maddris al-sdithiyya (al-Makrizi, iv, 209, 282).

The ordinary madrasas, however, included other subjects beside the study of fifth alone. Special mention is made of nater (al-Sāḥibiyya; al-Makrīzī, iv, 205). In the Nīṣāmiyya in Baghdād and in other

madrasas in the east, philological atudies were prosecuted (cf. Yākūt, Udabā*, v, 423-4; vi, 409). The custom, often occurring before Niṭām al-Mulk*a time, of founding II dār al-ḥadīṭh was continued after him, e.g. III Cairo and Damascus. In 604/1207 al-Malik al-Mu*azṭam built beside the Ṣakhta mosque a Madrasa sahwiyya, exclusively for Arabic linguistic rtudies (Sauvaire, Hist. Jēr. al Hābr., 86, 140), and schools for special subjects were not rare (cf. al-Subkl, Mu*ād al-mi*am, ed. Myhrmann, 153). Al-Subkl mentions, in addition to the special hadīṭh schools, also madāris al-nābū.

In his Mukaddima (fast 6, nos. 4 ff.), Ibn Kheldun gives a survey of the divisions of Islamic studies, They are divided into 'ulum labl'iyya and nakliyya, The former are based on observation by the senses and deduction and are therefore also called falsafiyya or sakliyya; the latter are dependent on revelation by the lawgiver (al-wadi' al-shar'd). and are therefore based on special transmission. The 'uliam nagliyya therefore comprise all branches of knowledge which owe their existence to Islam, namely Kur'an, i.e. tafsir and the seven kird'dt (no. 5), hadiff with the sciences auxiliary to it, including al-nāsiķā wa 'l-mansūķā, mustalah alhadtth (no. 6), al-fish with special emphasis on al-fard'id, the law of inheritance (nos. 7-8), usul al-fikh with the principles of law including methods of deduction and the differences between the madhhahib (no. 9), al-kalām, theology, which is nahliyya in as much as it is really a further development of iman which much under the head of religious duties, but is 'aktivea in its since it is entirely based on abstract proofs (no. 10), al-lessamouf, something like practical theology (no. 11) and table al-ru'ya, interpretations of visions (no. 12).

Linguistic sciences — related to the study of Kur³ and hadith (cl. nos. 4, 37 beginning), which are divided into 4 parts; al-natur, al-lugha, al-buyán and al-adab (no. 37), and in the last named category comes the whole study of Arabic literature.

The 'ulum 'abliyya - variously classified, usually into 7 main sections (no. 13), and = al-mantis, logic which is the foundation of all others (no. 17), al-arithmāliki, arithmetic, including kisāb etc. (no. 14), al-handasa, geometry (no. 15), al-hay'a, astronomy (no. 16), al-mūsiķi, the theory of tones and their definition by number etc. (see 13); then there is al-tability ydt, the theory of bodies at rest and in motion-heavenly, human, animal, plant and mineral; among its subdivisions, special mention is made of al-fibb, medicine, and al-faidha, agriculture (nos. 18-20; cf. no. 29). The seventh main head is 'ilm al-ilakiyyal, metaphysics (no. 21). Magic, talismans, mysterious properties of numbers, etc., also form branches of Muslim learning (nos. 22 ff.).

Medicine was not only taught in special schools but also in the mosques and the madrasas; about 600/x203-4, "Abd al-Latif lectured in the Azhar Mosque, but it is not quite clear whether his instruction in fibb was also given there (Ibn Abi Usaybi'a, ii, 207) and in any case the "philosophical sciences" were cultivated outside the mosques.

The merhod of teaching was by lecturing and learning by heart (talbin). The first task was to learn the Kur'an by heart and then to acquire as many traditions me possible. The hadih was repeated three times so that the student could remember it (Bukhari, 'Ilm, hab 30). Lecturing soon became dictation (imia'), when the student wrote down what was said, except in the case of the Kur'in (approved):

al-Bukhari, 'Hm, bdbs 34, 36). The method was the same for linguistic or literary subjects in for hadith, tafele, etc. The philologists not only used to dictate their grammatical works, as for example Ibn Durayd (Wüstenfeld, Schaffi , 127) or Muhammad b. Abd al-Wabid (d. 345/957), who dictated from memory 30,000 folios on lugha (Yākūt, Udabd', vii, 26), but also the text of the poets, like al-Tabari, who lectured on al-Tirimmah in the Mosque of 'Amr in 256/870 (ibid., vi, 432). Dictation especially important in the case of hadith, as the exact establishment of the text was the first necessity. It is therefore always said "he dictated kadith" (Husn almuhādara, ii, 139; Yākūt, Udabā', i, 246). The class of a teacher is therefore madilis al-imla (ibid., ii, 243; vil, 74), and his famulus among the students is al-muslamil (cf. ibid., vi. 281; vii. 74). Problems of figh were also dictated (so Abū Yūsuf, Ibn Kutlūbughå, ed. Flügel, no. 249).

All this meant that reliance on the memory, for the learning above all of the Kur'an and Andith, was highly prized, and repetition much cultivated. Jurisconsults were quoted as saying that in their student days they used to repeat each law lecture fifty times or more in order to imbed it in the memory. A school exercise was developed, whereby students quizzed one another as an aid to learning their lesson and as a contest to see who knew more than the other. The term used for the exercise was mudhahava ("a calling something to mind with another, conferring with another"). However, the importance of understanding was also recognised, above all as legal studies developed, and this in the lexical meaning of the term fikk [q.v.], which comes to have the technical meaning of "positive law". This shift of emphasis to both memorisation and comprehension is illustrated by the saying that "learning is a city, one of whose gates is memory and the other is understanding" (al-ilm madīna, ahad bābayhā al-riwāya, wa 'l-āḥḥar al-dirāya).

But the most important method developed for legal studies was the method of disputation (sundtern, tarifet al-napar), the legal school exercise par excellence. It consisted of (z) a thorough knowledge of khiláf, that is, the divergent legal opinions of jurisconsults; (2) a thorough knowledge of diedal, dialectic; and (3) mundawa, disputation. disputant had to know by heart as extensive a list as possible of the disputed questions of law (al-massibil al-hhildfiyya) and have ready answers for them. It was his skill in disputation which earned; for him | licence to teach law and to issue legac opinions (igjanat al-tadris wa 'l-fatud). The licency he obtained after a long period of study, usuall, four years of basic studies of law, followed by indeterminate period of fellowship (subbaj during which he was apprenticed as musid m repet tor of his master or otherwise made himself useful to the younger students, sometimes called muff4 ("one who imparts useful knowledge") and holding the post of i/ada,

During the subba stage of his learning, the graduate student wrote a tailita, which was a compilation of notes from the lectures of his master, often including notes taken from the latter's writings. When such a compilation was original in nature, as to its arrangement and the treatment of the subject-matter, it came to be known by the name of its compiler. The term tailita is also applied to a compilation of the master, a syllabus on law, from which the master taught his disciples. Some of these tailitas consisted of many volumes, as many

as fifty in one case. Masters who had no talkas used those of others.

The class (dars) began with the recitation of the Kur'an by a Adri', with blessings on the Prophet, and other religious formulae (Madhal, i, 56; cf. Mez, Renaissance des Islams, 172-3). At the present day, the teacher as a rule simply pronounces the bermala himself. Dictation alone was not everywhere the custom. In time, there were to be so many copies of the chief texts that the students were able to get copies for themselves. The text men in this case read aloud and the teacher gave his comments and emendations on the text (Yākūt, Udabā), i, 255). It was only natural that the dictation of texts was first abandoned in philology; it is said to have been dropped mearly as the 4th/10th century (Mez., Ronaissance, 171). This does not mean that dictation was completely abandoned, for the teacher still made his pupils write down his comments; for example, Muhammad b. 'Abd al-Rahman (d. 584/1188) dictated his lessons (Yākūt, Udabā', vii, 20) and the method of having a text read aloud, while the lecturer explained only any remarkable phrases, was used mearly as by the teacher of hadith. Ibu Kaysan (d. 299/912; ibid., vi, 282).

Ibn Khaldun taments that so few teachers in his time understand the correct methods of teaching (turnet al-ta'lim). They put difficult questions at once to the pupil instead of arranging the talkin so that it is always combined with explanations, and it is a fundamental principle that 📖 pupil should not mix the different subjects. They laid too much stress on learning by heart (hifz) (Mukaddima, fast 6, no. 2, 29, 30; cf. al-Subki, Mu'id al-ni'am, 151-2). Mechanical learning by heart is recognised for the Kur'an. When the above-mentioned Ibn Kaysan expounded hadilys, he also asked his hearers about their, meaning. Conversely the class was at liberty to ask questions of the teacher. Al-Shaff'l used to sit in his great halks in Mecca and say: "Ask me what you want, and I will then give you information on the Kur'an and sunna" (ibid., vi, 391; cf. al-Mukaddasi, in BGA, iii, 379). The teacher was sometimes overwhelmed with questions (Yakut, Udaba', v. 272). Ibn Diubzyr saw written questions being handed to a teacher in the Nigamiyya in Baghdad (219-20). Both practices are still in vogue, and even in large classes the student may interrupt with questions.

7. The scholastic community: the teachers.

The general designation for master was chapkly. When used with a complement, the term designated the master of various fields; as, for instance, they kk al-hadith, thay the al-hira'a, for the professor of hadith and the professor of Kur'anic studies respectively. The was a kind of honorary title (see Yākūt, Udabā', i, 113, 209, ii, 271, v, 353; 354. 358, 448); it has continued in use till the present day, and in contemporary Arabic usage is the equivalent of the Western term "professor", "holder of a professorial chair". But in distinction from these more general terms, the professor of law had a designation all his own, a term used without a complement, sc. mudarris. He was not referred to as shaykh al-fish. The term mudarris with a complement was sometimes used to designate other professors. Shaykh al-ribdt was used to designate the director, or abbot, of a monastery. The mudarris, like the hadi, was entitled to have a deputy, a naih mudarris, who taught during his absence, The mudarits could, in fact, have several nd'ibs. This happened when the professor of law hold several poets (tadis, pl. tadisis); he would teach in me or the other of these posts and hire deputies to teach in the others. Thus, me the chair for the professorship of law could be divisible, the professorships could be multiple.

The term rabis me applied to any scholar who had reached the summit of his field in his locality. It was used especially in the field of law; biographical notices often express it by saying that "leadership in the school of law ended up with him" (intaket ilayhi riyasat al-madkhad). The terminology used in these notices is indicative of the competition that existed among the jurisconsults: bara's fi "I-figh ("he excelled in the field of law"; la yughahbu ghubaruh ("his dust cannot be penetrated"-comparing the legal scholar to a thoroughbred so swlft that other horses in the race fall to keep him in sight, the dust of his hoofs having settled by the time they get to where he was); kāna kāḥi al-nuṣarā' ("he was the annihilator of his peers"); etc. The titulature is also indicative of this competition to gain the heights, not only in learning but also in the military and in government: amir al-umara? ("prince of princes"), malik al-mulik ("king of kings"), sulfan al-salafta ("sultan of sultans"), had! "l-hudat ("Judge of judges"), "alim al-"ulamd" ("scholar of scholars"), and seem of the term ralls itself, ra'ls al-ru'asa' ("leader of leaders").

In places where the term rais designated a post, as for instance in Naysabûr, where there was also all rais to rais, a sub-leader, or deputy-leader, the post appears as one requiring, besides the qualification of leadership, that of non-partisanship, and capable of acting as peace-maker, a moderator between opposing factions among the scholars. This, however, was not the head of a guild of masters. Such an organisation was unlikely in a system highly individualistic in character. The concept of a guild or corporation based on juristic personality was unknown to mediaeval Islam, where juristic personality belonged to the natural physical person alone.

It has often been said that teachers were organised into a guild, and the usual argument advanced for this assertion is an anecdote cited in Yākût, Udabā?, i, 246 lf., according to which al-Khatib al-Baghdadl (d. 463/2071 [q.v.]) had to have the permission of nakib al-nukaba' in order to teach hadiths in Baghdad's Mosque of al-Mansur. The function of the nakib al-nakaba? was also confused with the term ra'ss, further adding to the concept of head of a guild of masters. No one has claimed to know how the guild worked, which is no surprise, since there was none. The natio was the marshal of the acbility, the ashraf. His function was to investigate all claims to descent from the Prophet's family and to keep rolls of the legitimate descendants of the Prophet, for they were entitled to a lifetime pension. There were two mables: me for the Sunnis, nable al-hashimiyyen; and one for the Shiffs, nable al-fallibiyyin.

The above-mentioned anecdote has to do with the nahlb al-hdshimiyyin. The Mosque of al-Mansûr was located in the quarter of Bab al-Başra, on the west side of the city, the stronghold of the constituency of the nakib. This constituency was made mu of traditionalist asked and an overwhelming majority of Hanballs. Al-Baghdadl had been m Hanball, had changed over to the Shāfi'l school of law, but was suspected of Ash'arism, to which the Hanballs were highly hostile. Al-Baghdadl asked the caliph's permission to lecture in the Mosque, for

it was his declared, lifelong ambition to do so, the Mosque being known as the institution with the highest reputation for the science of kedith. The caliph, aware of the hostility of the people of the Bab al-Başra to the lecturer, called on the mekil, as the Marshal of the Sharlis III the IIIII al-Başra quarter, to see to it that the event would not produce a rlot. The makib agreed to do so, but reluctantly, since he felt that he did not have enough men to control IIII assembly if it should get out of hand. An incident did occur, bricks were thrown at the speaker, and turbane were anatched, but the makib succeeded in limiting the damage.

Thus permission to lecture in the Great Mosque was sought from the caliph, who slone made appointments to the teaching poets, the halkes, of the great mosques (there were, at the time, six of these).

Baghdad The makib was not the head of a guild of masters, such in the suiversitas magistrorum of the Latin West; there was no such guild in mediaeval

Siam.

In spite of all flexibility, a certain stability developed in the teaching staff of the mosques. This was connected with the question of pay. It was for long in dispute whether it was permitted to accept payment for giving instruction. In the collections of hadith the practice is both supported and condemned, and it is that the teacher may accept money, but not demand it, and avaricious teachers are strongly condemned. There - continual references to people who gave lecturers without payment (al-Bukhāri, Idiása, báb ró; Abu Dāwūd, Buyūs, bdb 36; Ibn Magia, Tidiarat, bat 8). The custom of the older Jewish scholars of exercising a handicraft was not common among the Muslims, but were found occasionally. Among men of learning we find shoemakers, locksmiths and sandal-makers (Wüstenfeld, Schafi's, 227, 231, 267; ct. also Mez, Renaiszance des Islam, 279). It was the rule, however, for the teacher to be paid for his work. This might be a wholly personal donation from prince or other rich man; for example al-Tabarl was given a sum of money when he taught in the Mosque of 'Amr (Yākūt, Udaba', vi, 428; cf. the remarks above on wandering scholars). It was as a rule, however, a regular salary which was paid out of endowment, in that the posttion regular professorial chair; this was especially the me in the madrasas. The salaries of the teachers (ma'lūm, also diawamik, diamakiyya; see Dozy, Supplement, s.v.) varied considerably, according to the endowment. According to al-Malurizi, learned might have so dindes a month in III in addition to allowances in kind (iii, 364). On ceremonial occasions, they often were given special marks of distinction, such as gifts in money and robes of bonour.

There were a very large number of teachers in the great mosques. In the madrasa at first only one was appointed. A madrasa frequently took its name from a distinguished teacher (e.g. the Ghaznawiyya in Cairo; al-Makrisl, iv, 235; Sharfifyya, originally the Nāṣiriyya; ibid., 193; cf. the Masdjid al-Kiṣā'i in Baghdād). In the larger madrasas, however, several teachers were appointed; Ṣalāḥ al-Din appointed 4 lecturers to the Kamhiyya in Cairo (ibid., 193); in this case a definite number (20) of students was allotted to each teacher (cf. Chron. Mahha, ii, 105-6).

It is easily understood that the conditions in the older mosques, where every one could come and go, were freer than in the madrasas, which were built for particular teachers and students. There

was probably me a rule me official recognition of the teachers in the earliest period. After textbooks had come into use, the certificate of qualification was the idiase, and so it has remained to modern times. Anyone who had studied with a teacher could get permission from him to teach from the book, which be had copied out and studied from his dictation; the teacher wrote this permission (idian) in the book (e.g. Yākūt, Udabā², i, 253; ii, 272). A teacher could also give idjata famous, which permitted the individual concerned to teach from all his works (Ibn Battuta, i, 252). It was the usual thing for a travelling scholar to collect numerous idjands; thus 'Abd al-Latif had certificates of this is from teachers in Baghdad, Khurksan, Egypt and Syria (Ibn Abi Uşaybi'a, ii, 202). There were special formulae for the idides for tadris and futys (al-Kalkashandi, Suble at a share, xiv, 322 ff.). Some scholars only gave occasional lectures, and others only dealt with a very limited subject; thus was appointed to the Nipamiyya to lecture in al-Bukharl's Sahia because he had attended lectures on this from a celebrated teacher. There were however many learned men who devoted themselves mainly to teaching and taught several subjects; often they taught many hours every day (e.g. Yaküt, Udabd), vi, 282, 383; vii, 176), and pious teachers even spent the night in the mosque in prayer (Witstenfeld, Schiffi'i, 258). Sometimes a young teacher began by dictating hadith and later received a post with a wider scope in a mosque (ibid., 239).

The distinction between teacher and taught was not absolute; any one could have an idiata in one subject while he was still a student in others, and men of ripe scholarship attended the lectures of notable teachers. This led students to travel from one seat of learning to another, just m they used ■ travel in early days ■ collect hadī<u>h</u>s (al-Bu<u>kh</u>ārī, "Ilm, bab 7, 19, 26). All the biographies of learned mon give examples of this; the old Hellenistic custom was thus continued (cf. Walden, The suriversities of ancient Greece), and royal courts still played the same part; at them learned guests received donations, which enabled them to appear as teachers in the mosques (e.g. Ton Battata, ii, 75 ff.; Ibn Khaldun, Kudo al-Tber, Bulak 1284, vii, 452; Ibn Abl Uşaybi'a, ii, 205; cf. Mommsen, Rêmisote Gesoliiokie, vi, 589). Distinguished scholars were of course much visited by lovers of learning; of of the latter, it is said rubila ilayhi or ilayhi hdnat al-rible "they used to travel to him" (Yakut, Udaba", vit, 174; Husn al-muhādara, i, 207; cf. 141).

The blurring of the distinction between the teachers | the taught only really applied to fields were the authoritative transmission of a text was involved. This occurred especially in hadith. In this field 🚃 remained, in a sense, 🛮 student 🔣 one's life, collecting authorisations (idjara) from the transmission of one many hadiths. There were many instances where an accomplished scholar of hadith would seek the authoritative transmission of a collection of hadiths, me even of a single hadith, from one many years younger than he but who had the idians to transmit the hadith(s), and was, most likely, the last to receive that authority from its last holder. This situation was due m the oral character of authoritative transmission. The perennial preoccupation of the conscientious hadity scholar was to travel in search of those rare hadiffs, whose farity was due to the ever-decreasing number of transmitters duly authorised to transmit them. Biographical notices sometimes tell of the authorised transmitter who had made a collection of such hadiths and had waited until he had survived all other authorised transmitters before making them available, at which time he could exact his own price for them. This practice was, of course, condemned. There well-known hadiths not only encouraging the gathering and spreading of knowledge but also condemning those who would gather and conceal it.

On the other hand, the distinction between teacher and taught in the field of law was quite clear. To obtain the licence to teach law, one had to study many years under a professor of law, become proficient in the scholastic method of disputation and build up as vast a répertoire of disputed questions of law m possible, together with solutions to these questions; then one had successfully to defend one's thesis or theses against the adversary, often one's own master. This long process could take place under one master alone; but it sometimes took place under two, one for the basic four years, another for the graduate, apprentice, period. More rarely, a law student could study under as many as five professors, but the process was always the same: the defence of a thesis or theses which learned him the licence to teach and to issue legal opinions, a licence attesting to his competence in the law as a field of knowledge.

Islamic law is individualistic; this may be --in the function of the kadi, the muffi and the mudarris, or professor of law, m well as in the madrasa, the college of law. The kadi was alone responsible for his legal decision; the multi was alone responsible for his legal opinion, based in iditible, and individual, personal activity of research in the sources of the law. Likewise, every madrasa represented one madhhab; a double madrasa represented two madhhabs where students were kept separate; in also with the triple, and quadruple madraso; and every madkhab was represented by professor of law, who might have under his direction one or several musids and mu/ids. Some instances in history illustrate this unicity of the professorial chair in the college of law. In 483/2000, a few months after the appointment of Abū 'Abd Allah al-Tabari in the Nizāmiyya's chair of law in Baghdad, Abb Muhammad al-Fami arrived with orders to occupy the chair. Both professors were made to share the chair, and taught law according to an alternating schedule, one teaching one day, the other, the next. A variation on this solution later became standard procedure in some colleges of Damascus, where the professorial chair was assigned to two, three and four professors of law, each retaining = half (nist), = third (thulth) or a fourth (rub') of the post and being paid accordingly.

The teacher had his particular place in the mosque, often beside a pillar: this medilis, which was inherited by his successors (Husa almuhādara, i, 135; cf. 281 below, 182; al-Makrizi, iv, 5; Yākūt, Udabā', iv, 135; Wüstenfeld, Schaff's, 239). The outward appearance of the class did not alter through the centuries. His hearers sat in circle (halks: the listeners taballaks; al-Makrizi, IV. 49. U. 17-50; cf. on the word, Quatremère, Hist. sull. maml., 1/2, 197 ft.) on the ground before the lecturer. The teacher sat on a carpet (sadididda; cf. Yāķūt, Udaba², i, 254) or skin (farma). This was described = a symbol of his dignity in his wasiyya (al-'Umari, Ta'riy, 134). We often find in large audiences that the teacher had a raised seat (for the older period, see Ibn Battūța, i, 212).

It was not the custom for teachers to live in

the mosque. Of course, a teacher, like any other pious individual, could stay in the mosque and even have a room there; al-Ghazall for example lived in the mosque in the Umayyads, where the Djubayr saw in room. But these exceptions; al-Galabult a dwelling-house for the teachers in the Azhar near the mosque (al-Makrizi, iv. 49). The earlier madrasas founded by Nixam al-Mulk often had lodgings for the teacher, especially as the teacher sometimes made his lodging his classroom, and this is also found later. Thus in the Salabiyya, the head of the college had his home within the buildings (lbn Djubayr, 48).

Of the teachers, many were also hiddle (as in their day were the hussels, who were in a way the predecestors of the teachers). The hiddle frequently were able to accumulate a considerable number of offices. The chief hiddle in Bint al-A'azz (ca. 700/1300-1) had 17 offices (Quatremère, Hist. Sull. Manil., il/1, 137-8). The teacher could also be a mufit (e.g. Valut, Udabá', iv, 136).

The professor of law was assisted by the "repetitor", mutid, as drill-master. The professor of law was also assisted by the mufid, a sort of "scholar in residence" who imparted "useful information", farida, pl. faudrid, to the students of the institution. The post of mufid was also used in the field of hadith, for the same general purpose. There were usually two mulide for each teacher. The mulid's duty was to read over with the students the lecture after the class and explain it to the less gifted students. The celebrated fakih al-Bulkini began as a repeater with his father-in-law in the Kharrubiyya (al-Makrizi, iv, 202); it was also possible to be an independent teacher in one school and a repeater in another (al-Nasir, d. 669/1270-1; Hum al-muladara, i, 189). The Şalāhiyya, which ought to have had 4 teachers with 2 repeaters, was run for 30 years by repeaters and no teachers (al-Makrizi, iv, 251; cf. also 210; al-Subkl, Maye el-ni'am, 154-5; al-Kalkashandl, Subk al-Sha, v, 464, and Haneberg. Schul- und Lehrwesen der Muhammedaner, 25; Witstenfeld, Die Akademien der Araber und ihre Lebrer, 1837). As noted above, the counterpart of the ma'id in law was the mustamit in hadith, whose function it was to repeat the hadith dictated by the professor of hadith = class that could often run into the hundreds and thousands. In the case of such large classes, several musicimits relayed the hadiff to those who were not within earshot of the professor.

Other posts in the various institutions included the grammarian or naturi, who taught grammar and the other literary arts generally, and the various preachers. These comprised al-hiest's [q.v.], who preached the Friday sermon in the diamit; al-milip [q.v.], who preached the scademic and taught the art of the sermon; and the popular preachers called al-\$655 [q.v.] and \$dri' al-hurst. Other holders of posts included al-imam, who led the five daily prayers in the mosques; the elementary school teacher of the making and kuttab, called variously al-mu'allim, al-mu'addib and al-fabih (colloquially, in Egypt, esp., al-fiel); im monitors, al-fartf, kattb al-ghayba; the copyists of manuscripts, alndsigh and al-warrak (the latter term also used for the bookseller; it would seem that the marrie copied books for sale and hired the ndsigh, pl. sussake, to copy for him); the corrector of copied manuscripts, al-musakhik; the collator of copied manuscripts, al-musabil or al-musarid; and the servitor, al-haddim, m manservant who worked for m professor = a rich student while pursuing his own

studies. Most of these functions were performed by students working their way through college.

8. The scholastic community: the students,

Every one was absolutely free to join a halka in the mosque in order to a teacher. Al-Mukaddasi for example tells in that the learned men of al-Fars used m sit from early morning till midday and from fast to magnets for the common people (ii 'I-cardman') (BGA, iii, 439). But as soon as the teachers developed into a regular class of society, the students (falaba, fullab, sing. falib) who were systematically training in the Muslim sciences also became a recognised section of the community. Together with the teachers, they formed the guild of the educated, ashab al-Imama (now ahl al-Imms in Egypt). They were able to select their teachers as they pleased; the most celebrated teachers had therefore large numbers of students. Many never finished studying, for they could always find new teachers to study under up to their old age, even if they themselves also taught. The ambitious would only study under (darase 'ald) great teachers and therefore travelled about the Muslim world a great deal (cf. ai-Mukaddasi, 237). This travelling, partly as teacher and partly as student, for the sake of falab al-film was long kept up in Islam.

When the student had completed his teacher's course, the teacher declared his knowledge mature in the particular subject and the student was able to regard himself as perfect in it (takhasradja 'alayhi). The relation of student to teacher is patriarchal and the student kisses his hands. This does not prevent quarrels breaking out, and in such cases the teachers might be treated very disrespectfully (cf. Sulayman Rasad, Kana al-djawher, 141 ff., 192 ff.).

The madrasas introduced an innovation into the relationship of teacher to student, when m definite number of students (as a rule, twenty) was alloited to a particular teacher. Instruction was thus organised on more systematic lines. But even then irregular students were also admitted, it is only in quite modern times that the instruction has been really properly organised.

We hear exceptionally of women students;

was member of al-ShāfiTs madilis (Huen
al-muhādara, i, 181, below). In the early centuries
it cannot ham been unusual, for it is several times
mentioned in hadilis, which reserve special days for
women (al-Bukhāri, 'Ilm, bāb 32, 36, 50).

In the madratas and mosques, students were offered lodging and certain allowances in addi-

tion, food, bread (djardya) and money.

A student living in a mosque is called mudidasis (al-Makrizi, iv, 54), a word which is also applied to Meccan pilgrims (1bn Djubayr, r22) and to anyone living in a mosque. The students' apartments are divided into arising, usually according to nations, a word which is derived from the fact that they originally lived in the colonnades. Each riskly is under a shapkh. Many students live in phinakaks, other in private houses.

g. Conclusion.

The Muslim system of education in the Middle Ages was based on the was, which, as already mentioned, gave the founder a free hand in determining the course of his foundation, molong as his stipulations were in keeping with the tenets of Islam. The historian must be circumspect about generalising for one institution on the basis of the particulars of another. The history of Muslim education must

therefore be written on the basis of the deeds of walf, of which few are extant, and in any case mostly late in date, as well as in the basis of biographical literature and the chapters in walf in the faturd-works. These are the main sources to be consulted for the history of institutionalised education; that is, that education which took place in the diamit, the masalial in madrata, the där al-kalik, the ribal, the kiankal, the sawiya and the various combinations of these,

For the selation between Muslim institutions of learning and those of the mediaeval Latin West,

II. IN MUSLIM INDIA

The medrases in Muslim India were institutions of higher learning similar to those in other parts of the Islamic world. Their principal function was in train personnal for government service, more particularly, for the administration of justice. They were either founded and subsidised by the state or established by private individuals. The education provided in them dealt mainly with religious subjects, and was offered by well-qualified teachers.

The real foundations of Muslim education in India may be traced back to the establishment of the Dibit Sultanate in 1206 and the emergence of Dibit an important seat of Islamic learning. Evidence points to the existence of two major madrasas in Dibit in the early years of Muslim rule. One of them the Mu'izziyya, institution probably founded by litutmish (607-33/1211-36), and named after Muhammad Ghūri's title Mu'izz al-Din. The other

madrasa, known as Nāsiriyya, was built by Balban while he was working as chief minister to Nasir al-Din Mahmud (644-64/1246-66), from whom the madrate took its name. At the Mongols overran the beartlands of Islam, many refugee scholars from Central Asia and Persia took shelter in Dihli, and their presence gave further momentum to educational activities in the capital. Early Muslim education found a strong champion in Firuz-Shah Tughluk (752-90/1351-88) who, according # Firishta, built me less than me colleges in various parts of his kingdom. The sultan is also noted for having restored mlarge number of madrasas which had follow into disrepair. Among the institutions founded by him the most outstanding we the Madrasa-yi Firûz-Shâhi, constructed in Dibli in 753/1352-3. It was the biggest madrass in the capital, with residential facilities for both teachers and students. It stood on the southern bank of the Hawd-i Khass, on enormous tank built by 'Ala' al-Din Khaldil in 695/1296. It was a doublestoreyed building with arched galleries on all sides and projecting windows overlooking the tank, and its facade presented impressive mixture of Hindu and Muslim architectural elements.

Other important educational centres, besides Dihll, included Badā'ān [q.v.], a city approximately 250 miles east of the capital. Under the Sayyid dynasty (827-55/1414-51), it rose into prominence meset of learning with meny schools and colleges. In Agra [q.v.], which acquired importance during Sikandar Lodi's reign (894-923/1489-2517), the latter founded a madrasa famous throughout northern India. In addition, he established non-religious schools where Hindis also could ented themselves to learn Persian, which now replaced Hindi as the language of lower administration. This, in turn, led to the growth of a parallel school system distinct

from the regular madeasas. Education received encouragement in the regional kingdoms which sprang up in different parts of the country during the 8th/14th and 9th/15th conturies. Under the rule of Sultan Ibrahim Sharki (804-44/ 1402-40), Diawnpur [q.v.] acquired distinction as an intellectual centre of considerable importance having many educational institutions. Likewise, the BahmanI kingdom of Deccan was known for its patronage of learning and learned men. Some of its kings, such as Tadj al-Din Firûz (800-25/1397-1422) and Muhammad Shah III Lashkari (867-87/1463-81), were great benefactors of education. Mahmud Gawan (d. 886/1481 [q.v.]), minister of Muhammad Shah, founded in 877/1472 madresa in Bider (q.v.) which acquired fame m a great institution. It was a magnificent building equipped with living quarters for students and teachers, and had me attached library containing alarge number of books. Though severely damaged during Awrangelb's campaign against Bidjapûr towards the later part of the 17th/17th century, its surviving remains bear sufficient witness to its superb architecture.

Under the Mughals, educational activities continued to find an important place in the policies of the government. Băbur (932-7/1526-30 [q.v.]), during his brief reign, founded a medicase in Dibli where, in addition to traditional subjects, special provision was made for the teaching of mathematics, astronomy and geography. He also charged the Department of Public Affairs (Shukrat-i 'Amm) with the task III establishing schools and colleges in the kingdom. The vicissitudes of Humayûn's (937-47, 962-3/1530-40, 1555-6) fortunes were, no doubt, responsible for the pancity of educational activities

seen during his reign. But under his successor, Akhar (963-1014/1556-1605), numerous medrases were founded by the state as well as by private individuals. Akhar built a big college in his new capital Fathpūr Sikrī [q.v.], and, in Dihlī, his wetnurse, Māham Anga, founded a madrase in 969/1561-2, which was noted for its architecture. Akhar also iaid down that the curriculum of the madrases should include subjects such methics, mathematics, agriculture, geometry, astronomy, physics, logic, natural philosophy, theology and history. In response to Akhar's policy of religious accommodation, non-sectarian institutions increased in number, providing common education to Hindús and Mustims alike.

During Diahangir's reign (1014-37/1605-1627), many madrates which had ceased to function or had fallen into decay were restored and revived. The ruler issued ordinance which required that if a wealthy person or a traveller died without m heir, his property should revert to the state and be utilised for the building and maintenance of the madeasas, Shāhdjahān's (1037-68/1628-57) is associated with the imperial madrata attached to the congregational mosque built by him at Dihil in 1060/1650. Under Awrangzib (1068-1118/1658-1707), special emphasis was placed of the diffusion of Islamic learning. The foundations of the famous seminary in Lucknow, known as Farangi Mahall [q.v. in Suppl.], were laid during this time. The name actually referred to the building granted by Awrangelb, towards the end of the 11th/17th century, to a a family of scholars who made Farangi Mahail a leading centre of Islamic learning. Mulla Nigam al-Din, author of Dars-i Nisami, the syllabus named after him, used to teach at this place. Another wellknown institution, opened in will during Awrangzīb's reign, was the Madrasa-yi Rahīmiyya, Founded by the noted divine and father of Shah Wall Allah (1115-75/1703-62), Shah 'Abd al-Rahim, this madrasa specialised in the teaching of exegesis and traditions, and was the forerunner of the modern seminary of Deoband [q.v.].

Little is known about the organisation and working of the madrasas. The emphasis on religious subjects in their curriculum seems to have remained consistent throughout their history. An attempt was made during Akbar's time to give importance to the instruction of mediaeval rational sciences such as logic, mathematics, medicine and astronomy, but it is doubtful whether this me followed by every madrasa. The Dars-i Nijami, after its introduction in the mid-12th/18th century, was adopted by the madesses all over the country, thus standardising the syllabus for traditional education. It included Arabic grammar and syntax, logic, philosophy, mathematics, rhetoric, jurisprudence, principles of jurisprudence, scholastics and dialectics, exegesis and traditions.

The of traditional Muslim education received setback in the years following the decline of the Mughal rule. It suffered further reversal with the expansion of English education and spread of Western knowledge and idras. Nevertheless, many madratas continued to flourish in later times. The oldest among these was the madrasa at Farangi Mahall; another important madrasa was that of Deoband, a small town north of Dilil. It was founded in 1867 by Mawilana Muhammad Käsim Nanotawi [d. 1879) in conjunction with other "ulama". The last of the traditional institutions to mentioned is the Nadwat al-'Ulama' of Lucknow established

in 1894. Among its founders was the reputed scholar Shibli Nu*mani (1857-1914), who remained actively associated with it from 1904 to 1913. All the above madrasas have survived up in init present time, despite their limited financial resources and meagre enrolments.

III. ARCHITECTURE

The madrasa are a response to the specific needs of the Muslim community; it - custom-built structure tailored to serve institution which was itself a deliberate innovation. Moreover, the madeasa was the creation 闭 a self-confident, well-established civilisation near the peak of its achievement: the earliest madrusas recorded are those of eastern Iran in the early 4th/roth century, and evidence unearthed by modern historians working on the pre-Saldiuk period in eastern Ivan suggests that the "prehistory" of the madrass can be traced for at least one and half centuries before the official Saldith adoption of the institution. It is, however, highly unlikely that these earlier madeasas were substantial public buildings. Their very number argues against it. By 416/2025-6 there were twenty madrasas in the modest provincial region of Khuttal [q.v.], and each was fully endowed with awkaf. The missionary Karrāmiyya movement [q.p.] which me so strong in eastern Iran in the 4th/roth and 5th/rith centuries had a strong educational and polemical bias, and both Manakaks [q.v.] and madrasas were built in quantity by the adherents of this sect. The Ghaznavids also madrasas endowed with augal in order to establish Islam in the stubbornly pagan territory of Chur, possibly through the intermediary of missionaries from the Karramiyya.

Above all, such foundations should be within the context of a well-established tradition of building madrasas in the large cities of the eastern Iranian world. The best documented case is Nishāpūr, where no less than 38 madrasas predating the great Nisāmiyya of that city (founded ca. 450/ro58) recorded, though of them survive; for further details, see above, section i, 4.

The apparently eastern Iranian origin of the madrana makes that the obvious area in which to

seek the architectural origins of the institution. Two major possibilities present themselves, and these are not mutually exclusive. The first, espoused by Bartold over sixty years ago, would link the medrasa with the Buddhist vihera as attested in Central Asia and Afghānistān. This area had been saturated in Buddhism in the centuries immediately preceding the Muslim conquest and it seems not surprising that a Buddhist institution combining the functions of worship, education, communal life and burial should have flourished in the almost very area associated with the earliest madrasan, Bartold's prescience was confirmed by the discovery of such site at Adzhina-Tepe just across the Oxus to the north-east of Balkh. This consisted of a monastery and stupe complex, the whole comprising two equal halves joined by s gangway and each measuring some 50 m square. Both elements use four-tween plan focused on a central courtyard. The monastery element consisted of temple structures, cells for the monks, and a large assembly hall, plus various ancillary rooms. All this was linked by corridors. In its essentials, and even more in its four-lease plan, this 7th-8th century monument comes remarkably close in spirit to madrasa, though the Muslim emphasis on education is somewhat more marked. Numerous other Buddhist sites have been excavated in Soviet Central Asia over the last two decades, among them Ak-Beshim, Airtam, Kalai-Kalirnigan and Ruba, while perhaps the most important Buddhist site in the Iranian world was just south of the Oxus-the Nawbahar of Balkh.

The other architectural source which has been proposed for the Iranian madress is the typical Khurāsāni house. Godard, the champion of this theory, was forced at the outset to assume unbroken continuity of tradition between the mediaeval and the modern houses of the area. Ha then compared this domestic form with of later madress and concluded that it was the private structure that had generated the public one. While the literary evidence gives ample warrant for the functions of a madress being carried out in private houses, no such houses which be shown to have served this function have survived. Next as Godard's theory is, it cannot be more than speculative.

The formal, as distinct from the informal, history of the madrasa is commonly taken to begin in 460/1067 when the great Nitamiyya madrasa inaugurated in Baghdad. In short succession a whole series of state-sponsored and largely statefinanced madreses sprang up throughout the Saldiuk empire (see above, section i, 4). Two related factors deserve special emphasis here. One is the wholehearted state support for these buildings, which is reflected in the name Nizâmiyya which they bore. They represent, in short, a state investment of the first magnitude. The other is their carefully calculated location in the major cities of Saldink realm. From this one may deduce that each was designed to serve as a provincial centre with a wide catchment area embracing the smaller towns and villages of the region. Such a function presupposes buildings of considerable scale and capacity.

The reasons behind this sudden spate of building activity, which significantly enough was confined to the Saldjük empire, are probably to be connected with the resurgence of Sunni orthodoxy, spearheaded by the Saldjüks after their entry into Bagidåd in 44/1055, — a counter to the propaganda efforts of militant Isma'lli Shi'ism organised by the Faţimids from al-Azhar (founded in 339/970) [4.v.] and other

centres (see above, section i, 3). In fact, the Sunni orthodox medvasa-building activity soon stimulated a Twelver Shf9 counterpart movement, for according to the Kitab ai-Nahd the later 6th/12th century saw Shf9 madvasas appear in Ray, Kum, Kashan, Åba, Waramin, Sabzawár and elsewhere. One of the madvasas at Sawa had indeed been found as early as the mid-sth/11th century. The form of these madvasas is as obscure as that of their Sunni counterparts, but in judge by the later consonance between Sunni and Shf9 madvasas in the Iranian world, there was probably no formal distinction between them.

The number of madrasas erected within a short space of time throughout the Saldjök empire at the order of Nizām al-Mulk and by others is itself clear indication that some kind of blueprint had been developed for this purpose. Unfortunately, none of these early Iranian madrasas has survived; in fact, the earliest extant Iranian building of this type is the Madrasa-yi Imami of 725/1325 in Islahan. It is a compact structure (some 92 m × 72 m at its widest extent) employing the standard Iranian a-Iwan plan, but the modifications to the traditional layout are significant. The imans no longer rear above their flanking arcades; the roof-line is now unbroken. This simple change entirely reverses the traditional pattern, in which the toda was the dominant feature and dwarfed the flanking arcades. Two stories of continuously niched façades, behind which the cells for student accommodation were located, form the principal accent of the elevation and engulf the central suds on each side. The question is, of course, whether such massy, cliff-like façades also characterised the elevations of the first Nizāmiyyas. The example of the Madrasa Imami, the known Saldjuk predilection for the 4-fwdn plan, and the need to accommodate substantial numbers of students living in the building as distinct from visiting it, all combine to suggest that the first official Iranian madrasas were indeed fairly similar to their Ilkhanid descendant.

So far the discussion has assumed that the more important of these early madrasas were purposebuilt structures intended solely for the students accommodated in them. Other possibilities have, however, been aired. Perhaps the most extreme is that the buildings generally accepted as the major urban mosques of the Saldjuk period-those of Ardistān, Qazwin, Guipāyagān and so on-were actually madrasas. This theory tuns counter to common sense, for it does not account for the resultant absence of Friday mosques in these centres. More intrinsically likely is the proposition that the larger mosques contained in inbuilt madrasa element in the provision of a second storey around the courtyard. On occasion, the niched façades of these upper storeys could indeed lead to separate chambers, but the extremely diverse functions discharged by a Friday mosque in a large city means that a wide range of other purposes can be suggested for such rooms. Elsewhere in the Islamic world such joint foundations were labelled as such; cases of mosquemadrasas (see above, section I, 2) or mosque-mausolea and various other combinations abound in Mamlak Cairo. A further argument against the madeuse function of the upper storeys of large urban mosques in the Iranian world is provided by the well-documented practice of adding self-contained madrasas to established mosques (e.g. Isfahān and Mashhad). There would have been little need for such new foundations if the mosques in question were already serving inter alia as madrasas. If one bears in mind

the noted imprecision of the Arabic terminology of building types, and also the virtual interchange-ability of these types, it will be clear that no firm conclusion as to the form of the pre-Mongol madrata in Iran is warranted. Rather does the evidence suggest that the forms of the madrasa were scarcely less varied than those of the mosque itself. But the ead lack of standing buildings hangs like a cloud over any discussion of these early madrasas. Their organisation, personnel, curricula and financial arrangements can be followed up in minute detail in the literary sources; but the all-important question for the student of architecture, namely the precise material form which they took, remains obscure.

With such a plethora of literary evidence available, it is ironic that Iran should retain not one pre-Mongol madrate that is universally accepted as such, Two Saldiak buildings have been identified by some as madrasas, but others deny this. The more controversial of them is a mud-brick ruin at Kharpird [4.v.] whose damaged inscription specifically identifies it as a foundation of Nizām al-Mulk. Its principal surviving feature is a broad and deep kibia Indu with at least one room of comparable depth flanking it on either side. Little sense can be made of any other part of the structure, but the dimensions of the courtvard in front of the foods might well be about 22 x 28 m. In favour of the identification as a madrasa may be cited the very fact that Nizām al-Mulk is cited in the inscription the official founder, although a mere shapek actually carried out the work of supervising construction. Why should this august personage, the pivot of the Saldiuk state, take an interest in Khargird? The family of Nizām al-Mulk hailed from Sabzawar, and he himself was born in Tus, - there can be no question of explaining his connection with this monument by his desire to erect a public building in his native town. Khargird was a small town of secondary importance. Moreover, this structure is, as Herzfeld noted, very small for a courtyard mosque of its period, and the row of windows high up in the kible inder would make much better will in the context of the cells on the first floor of a madrasa than as an element of mosque architecture, These various factors suggest that the most natural interpretation of the rains is to see them as the sole Surviving trace of Nizam al-Mulk's extensive programme of building madrasas, though against this it must be admitted that the presence of supplementary mihrabs does suggest a mosque rather than a madrasa. The flanking halis have also been cited evidence that this is a mosque, but this feature occurs consistently in Anatolian Saldiuk madratas. To summarise, the evidence seems to incline towards interpreting the Khargird structure as a madrasa. but without fresh evidence there is no clinching the matter.

The other putative madrasa is a shoddily-published structure found in excavations at Ray in the late 1930s. Godard himself, the source of all the information available, at first expressed himself with reserve as to its function but eventually shed such caution and treated the identification as a certainty. Nevertheless, he produced a arguments to offset his earlier qualms about the eccentric orientation of the structure and its equally atypical emphasis—by means of the differential size of the indus—on the east-west rather than the north-south axis. In must also be admitted that the 16 habitable spaces which together parcel out the ground plan do not correspond in their layout to any known madrasa. All this being

admitted, it would be still more accurate to say that no mediaeval house of this kind is known either; that to of the ground floor spaces could well have functioned m cells accommodating one m several students, to say nothing of the capacity of an upper floor; and that cases of the faulty orientation of religious buildings we logion in mediaeval Islam and that the difficulties of that kind presented by this building disappear if one assumes that the west fuds is intended to function as if it faced south-west, the direction of the kibia. Finally, and most significantly of all, the presence of mistab is not easily explained away. Unfortunately, Godard's plan does not mark it, so that to identify it as a milerab is itself somewhat hazardous. Nevertheless, despite the fact that in its present form, on display in the Tehran Museum, it is largely m figment of the restorar's imagination, the published photograph of it in situ shows clearly enough the Kuranic Kuffe inscription which it hore. The presence of a midrab with a Kur'anic inscription in a private house takes somewhat more explaining than does the eccentric orientation of a madrasa. Even so, it may be felt that the building at Ray presents rather more problems of identification than does its counterpart at Khargird. Whatever conclusion is reached, it is regrettable that the undoubtedly seminal role of Iran in the early development of the madrasa is unjustly obscured by the lack of early surviving specimens whose claims to be madrasas are not disputed.

It is with some relief, therefore, that one turns to an examination of the surviving madrasas whose identification as such is incontrovertible. The earliest of these, the madrasa of Gumüshtigin in Boşrâ, bears a disappointingly late date—530/1135—and is located in Syria, an area which has not yet entered the discussion. It is followed in brisk succession by some fourteen surviving madrasas in Syria all dated or datable before 700/1300, and the literary evidence confirms that these are only a fraction of what was built in this period and has since vanished—82 madrasas are mentioned in the detailed chronicle of mediaeval Damascus, for example, and 46 in the

These numbers, impressive though they are, need not, however, be interpreted a confirmation of the primacy of Syria in the architectural development of the madrass. Nor, pace Creswell, can this honour be claimed by Egypt without further ado, lied lists some 29 madrass in Cairo dated before 700/1300, and of these a scant four have remained. From the undoubted fact that the latter group includes the first cruciform four-rite madrasa to survive he has built a elaborate edifice of argument designed to establish the innovatory role of the Egyptian madrata.

above, section i, 4).

As will shortly be apparent, however, the with the largest number of surviving madrasas datable before 2300 is Seldjük Anatolia, which boasts that has 50 examples, 9 of them datable to the 6th/22th century. Egypt and Syria together cannot match the latter tally, and indeed have only a third as many madrasas datable before 700/1300. Yet these buildings figure not at all in Creswell's history of this architectural type. Common sense dictates that the Anatolian madrasas, built in an area culturally dependent on Iran and geographically close to the the first that the first who themselves sprang from Great Saldjük stock would be likely to reflect the Saldjük madrasas of Iran, whose decisive role in the

formation of the genre has never seriously been questioned. Iranian influence may in any case readily be detected in the plan types, brickwork and tile decoration of much of Rûm Saldjûk architecture. The historical background outlined above encourages the assumption that it is precisely in these unfortunately vanished Iranian Saldjûk madrasas that the essential original lineaments of the official madrasa are to be sought. Hence the paramount historical importance of the Anatolian Saldjûk madrasas as the closest surviving relatives of the Iranian type. Many of their features are duplicated in contemporary Syrian madrasas, which may be seen in a parallel and cooval group.

Returning to the Board madrata, one notes that, like most Syrian madrasas, it is diminutive; for all that its patron was a senior amir serving the Atabegs of Damascus, mexternal dimensions do not exceed 20 m 17 m. On this tiny scale, there is scarcely room for a proper courtyard, and the space which would normally be designated as such is domed, a feature which was 📰 recur a century late: in some of the Saldiuk madrasas in Konya and elsewhere. Two lateral lesins open off this space, while a prayer hall and a kind of parthex to the south, the latter reached by narrow entrance vestibules m east and west, fill up most of the remaining area. In this single-storey building, the only space left over is the area flanking the prayer hall, which yields two rooms per side. Since these each average less than 4 m square, the total number of students accommodated in this medrate can scarcely have exceeded a dozen. Such a building will simply not fit to popular image officially sponsored madrasas located strategically throughout the Saldiuk empire and serving, at least in part, significant political eads.

Later Syrian madresas rejected many of the solutions found in the example at Bosra, Perhaps the most distinctive local characteristic was to be the laterally developed prayer hall entered by a triple archway and vaulted in a variety of ways (Ddr al-Hadith [q.v.], Damascus, between 349/1134 and 369/1174; Madrasa Khān al-Tutun, Aleppo, 364/ 1168-9; Madrasa of Nur al-Din, Damascus, 367/1172; and Madrasa of Shadbakht, Aleppo, 589/1193 among others). Sometimes the central bay of the musalle is domed, with groin vaults covering the flanking bays (Shāfifi Madrasa, Mafarrat al-Nufmān, 595/1199) though tunnel vaults for these bays are commoner; but in other examples all three bays are groin-vaulted ('Adiliyya Madrasa, Damascus, completed 619/1222-3) or domed (Zähirlyya Madrasa, Aleppo, 616/1219-20; Diàmis and Madrasa of al-Firdaws, Aleppo 633/1235-6). Recurrent features of these buildings include a mikráh which projects on the exterior of the kibla wall, mausoleum or moccasion even two, occupying m angle of the building, a tank in the centre of the courtyard, and utilitarian accessories like wells and air-shafts. Most of these madrasas have one inde but only one—the example at Boşrā has a pair of immes facing each other across an empty space. Altogether exceptional is a joint foundation: the djami'-com-madresa of al-Firdaws, Aleppo, which not only has two large imans-back-to-back but also two small but self-contained courtyard units, each with a pair of swans facing each other across the court, an intimately domestic arrangement encountered earlier in palaces and caravanserais.

The emphasis on one rather than several image may reflect the fact that the great majority of these buildings—all but seven of the 228 madrasas

in Damascus and Aleppo which pre-date 700/1300 and are recorded in the literary sources-were erected to single madhhab and therefore required only one location for teaching. But this is purely supposition, for the two-isses madrasa at Bosra was built to serve the Hanafl madhhab tione, while the two-rite Sultănivva madrasa at Alcono (620/1223-4) has no imins at all. It therefore seems equally possible that any causal connection between the number of insies in a Syrian mades and the number of madhhabs which it served is more apparent than real. This conclusion seems all the more appropriate when it is remembered that neither Anatolian nor franian madrasas attest any consistent connection between the number of nedes in a madress and the number of madhhabs which it serves. Against this wider perspective the Egyptian cruciform four-rite madrasa is nothing short of freakish, reflecting perhaps a conciliatory religious policy on the part of the founder. Not surprisingly it remained very rare; the overwhelming majority of mediaeval madrasms throughout the Islamic world were built to serve a single madhhab.

A cursory examination of the Syrian madratas is enough to establish that the provision of student accommodation was not a major priority. The information available on this score is unfortunately not very precise, for most of these buildings are long since disaffected and modern houses have encroached on them. But the Bosra medrasa, as noted above, suggests in the gross disproportion between public and private space that the structure was purpose-built to accommodate no more than a handful of students, and that its catchment area was probably no wider than Boşra itself. Nür al-Din's Dar al-Hadith in Damascus also seems to have had no than four rooms, and although the other surviving Syrian madrasas are more generously provided with student cells, not one of them approaches the larger Maghribi madrasas, let alone those of Iran, for capacity. The Khan al-Tutun modrasa in Aleppo probably had ten cells, while the Nur al-Din madrasa in Damascus, and the Zāhiriyya madrasa in Aleppo, had 16 disposed in two stories. If so, they had the most generous housing capacity to be found in surviving contemporary Syrian madrasas. The most unusual solution of all, however, as noted above, was the introduction of two minute courtyard houses, each one complete with several irregularly shaped cells, on either side of the great double itseds of the didmit-cummadrasa of al-Firdaws, Aleppo. But even this very carefully designed building leaves inexplicably fittle space in the layout for student cells. One in driven the conclusion, therefore, that the patronage directed towards the building of madratas in Syria was deliberately kept on a small scale, possibly because nearly all of them were built to serve (exclusively?) single madhhab, or else, they might have been meant more m oratories for the daily of the local population than as madrasas tout court, m practice recorded in Maghribl madrasas.

Some III of these factors may well have been operative in Ayyübid Syria. But they are scarcely enough to account for the phenomenon of such large numbers of small madrasas. The answer seems rather to lie in local circumstances. To begin with, the topography of these madrasas is itself revealing. They are crammed into the nocks and crannies of ancient, densely populated cities, where building space was at a premium. There could be no question here of a state-inspired blueprint imposed regardless

of local conditions. Sociologically, too, the picture differs from that presented by Iran, 'Irak or Anatolia. The patrons and not the suitans themselves but lesser ansies, their wives or mothers, or local notables, Such people were well-to-do but not necessarily rich or with free access to public funds. Thus the buildings had, so to speak, a wider social base than their equivalents elsewhere in the Islamic world. Sometimes the endowment even specified the conditions of use; for example, that the teacher appointed was forbidden to teach anywhere else. This individual approach is reflected in the very varied layout of these madrasas which show the architect grappling with a unique site. For Ayyubid patrons, it seems, small was beautiful. Small was also functional. Since madrasas were built by the score in the larger citles it would have been wasteful to give them a large capacity, just as it would have been wasteful to decorate them lavishly. What decoration there is, bowever, maintains a high level of quality and is set off by the consistently fine stereotomy of Syrian tradition. The stone vaulting of the time deserves particular commendation. Thus these madeacas were figurely rooted in a topographical, sociological and artistic context which depended little on external influence.

Perhaps the main distinguishing feature of these Syrian madrasas is the inclusion of a mausoleum (kubba [a.v.] we turba). Indeed, it is doubtful whether the connection between the madrass and the mausoleum was ever closer than it was in Ayvobid Syria. Once again, epigraphy provides a clue for this, for inscriptions in the Sultāniyya and Atābakiya madrasas, located in Aleppo and Damascus in spectively, refer to the recitation of the Kur'an there. Provision was made for this recitation III be unceasing-an Islamic parallel for the Christian custom of paying for masses to be said for the souls of the dead. Burial in madresa, then, was like burial in the neighbourhood of a saintintended in least in part to confer baraka upon the dead. It was in Syria rather than in Egypt that the exaltation of the mausoleum at the expense of the madrasa proper can first be traced; time and again it is the mausoleum which has the favoured site of the street (acade, with the madrasa modestly tucked away virtually out of sight. In sheer surface area, the mausoleum is apt to rival, if not exceed, the madrasa. Small wonder, then, that it has even been suggested that the terms lurba ("mausoleum") and madrasa were interchangeable in this period. On the other hand, the notion of ensemble which underlies a modern term like "funerary madrasa" is belied by the epigraphic evidence, which suggests that the furba element and the madrasa element both had their me foundation inscriptions. This practice has often obscured the original intention of the founder, for it has resulted in many now freestanding turbus being identified as simple mausolea rather than as part of a funerary madresa (e.g. Farrukh-Shahiyya and Amdiadiyya torbas, Damascus). Conversely, it sometimes happens that the inscription of a turba may mention the madrasa of which the mausoleum part, and may be the only surviving evidence that such a madrata ever existed ("Izziyya madrasa, Damescus).

The intimate symbiosis of turba and madrasa is epitomised by a curious joint foundation in Damascus The Farrukh-Shāhiyya madrasa, with the mausoleum of 'Izz al-Din Farrukh-Shāh attached, dates from 578 or 579/1182-3. A generation later, in 628/1230, another madrasa was built beside it and this

too me provided with a mausoleum, which boused the son of fizz al-Dio, al-Malik al-Amdiad, Father son, then, buried in adjacent furbos: the turbs of the former is, perhaps appropriately, the larger of the two. Similar pairs of tombs survive in Damasous and later Mamilik madratus. If the madranes of Ayvobid Syris were analysed from the purely formal point of view, with no backward glance at their eastern origins, the obvious conclusion would be that a major, if not indeed the primary. purpose of the institution was meontain a montymental mausoleum. Is it fair to assume, then, that the term madeata in not have a consistent meaning throughout the mediacyal Islamic world? Certainly, Avvabid Syria provides evidence suggesting that the term did we connote one single type of building. Thus the Dar al-Hadith or al-Ashrafiyya in Damascus (614/1237) is called a madrasa in its foundation inscription, and in its sequence of entrance vestibule. prayer hall and turbs conforms to the standard type of contemporary madrate as illustrated by the Murshidiyya madrusa in Damascus. Conversely, the Kilidilyya, also in Damascus, is defined in its foundation inscription as an institution for teaching hadith, but is identical in form to the Murshidivya. As in Iran and Egypt, it was common for a private house to be converted into a madrasa, but more ambitious conversions are also recorded and it is these that testify yet again to the loose boundaries between mediaeval Islamic building types. Thus the Halawiyya madrasa in Aleppo was successively a church and a mosque before it became a madrasa, while the Maridaniyya served in turn = a madrasa. burial ground and mosque. Thus the mere fact that a structure was founded with a given purpose in mind was no guarantee that it would continue to function as such, especially if the value of its endowment fell; it might easily shed meet functions or acquire additional ones. The absence of any sign of student cells in many of these admittedly halfruined Ayyibid madrasas invites speculation that at least some of these foundations were never intended to be residential.

If the Syrian madrass tradition, as it developed during the scant century of its heyday, is analyzed as a whole, the sheer variety of types encountered cannot fall to make an impression. It is hard to avoid the conclusion that these differences are not casual or contingent on the local topography, but rather reflect a basic uncertainty about the ideal form such buildings should take. For a long time, Syrian architects were sidetracked by the influence exerted by the mosque. The prestige of that longestablished model helps to explain why ideas derived from mosque design permeate these madeasas. They were after m religious buildings. The Shadbakhtiyya madrase in Aleppo (589/1193) is essentially a mosque writ small, especially in its laterally developed domed magaild, and to judge by the plan alone, the teaching function of the building is plainly secondary.

 The building of madrasas in Cairo gathered new momentum with the coming of the Mamlüks. The largely vanished Zāhiriyya madrasa (660-2/1262-3) of Sultan Baybars was a gigantic 4-tuxin structure with a stalactite portal probably of Syrian inspiration, a theme repeated in the deep niches with muharms hoods which articulated its façade. This building inaugurates, if indeed it was not preceded by some comparably magnificent earlier madrasa, the distinguished tradition of Cairene madrasas with splendid façades and interiors to match. Anatolia was about m generation earlier in this development, so far as surviving evidence indicates,

while Syria lagged behind.

This notable degree of splendour can be explained on both political and economic grounds. Mamilik madrasas in Cairo are overwhelmingly the product of royal or high official patronage, a fact consistently reflected in the names they bear and in their lavish decoration. Outward splendour would be the natural corollary of such patronage. But it would be inaccurate simply to treat these buildings as instances of conspicuous consumption, even though the lengths to which an amir or sultan would go to secure a fashionable site with ample street frontage do suggest such a conclusion. Many of them were endowed far more generously than their size and therefore the scope of their activities dictated, and while these endowments (awkif) were inalignable under Islamic law, that same law permitted any surplus from an endowment to be applied to the benefit of the descendants of the original endower. The more lavish the endowment, therefore, the more such a foundation would approximate to an investment. Not surprisingly it was among the first concerns of an amir, upon reaching power, to found some charitable institution, - there any bar to his adding piecemeal | its endowment over the years.

Perhaps the most ambitious of these multipurpose Mamilik foundations, and the one which to have set the fashion for such institutions, in the miristan tomb and madrasa of Sultan Kalawun, the whole built in a most thirteen months (683-4/ 1284-5). As in the case of the Salihiyya (639/1242), its internal arrangements are at odds with its façade, which at nearly 70 m is exceptionally long and to which in a sense the whole building is subordinated, Mausoleum and medrase are sundered by a long corridor which led to the now largely-vanished hospital. It is me doubt significant that the Mausoleum, now enlarged by a functionally dispensable courtyard, occupies a far larger proportion of the combined tomb and madrasa portion of the ensemble than it did in the Salihiyya. The madrasa itself has generous courtyard with two factors on the longitudinal axis and cells disposed laterally. Its most notable feature is without doubt the hibia india which is divided into three naves and therefore explicitly associated with the traditional architecture of the mosque. Interestingly enough, Kalawun's son, al-Nasir Muhammad, himself built a mausoleumcum-madrasa cheek by jowl with his father's great foundation, and in this later ensemble (695-703/ 1295-1303), the mausoleum is relegated to a subsidiary role beside a substantial 4-fudn madrasa.

This latter building has the peculiar distinction of being the first known cruciform madrasa intended is serve all four madhhabs.

By consent, the masterpiece among these Mamilik ensembles, (150 × 68 m.), and certainly the largest of them was the mosque, madeasa and mausoleum of Sultan Hasan (757-64) 1356-63). Its lofty portal, originally designed to have flanking minarets, and with a sparious vestibule behind it, bears the unmistakable imprint of Anatolian Saldiuk architecture, but most of the detailing within is typically Cairene. At first sight, the layout familiar enough, focussed as it is an ample 4-Inde plan. But-and here again foreign influence, this time from Iran, must be taken into accountthis cruciform plan is employed, exceptionally in the case of Egypt, for a mosque, while each madhhab bas its own madrase in one of the corners between the arms of the cross. The sultan's own mausoleum, a gigantic dome chamber, extends the full width of the bible and is placed (emphatically not in Iranian fashion) directly behind the kibia wall. It therefore usurps the position of the domed sanctuary I the classical Iranian mosque. The building thus epitomises the vitality and versatility of the traditional 4-lean formula.

Several prestigious Mamlük buildings in Cairo, such as the various funeracy madracas of Sultan Sha'han and his family, followed the lead of the Sultan Hasan ensemble. But its principal impact on later buildings was through its 4-finds schema, which henceforth was to be repeatedly used for mosque architecture until the Ottoman conquest, In other words, the architecture of the madrasa had now come to influence that of the mosque; indeed, the unprecedented expansion of the bible scen into I full-scale musolla in later Mamluk buildings (e.g. the Ka'it Bay complex) can only be explained by such a process. Presumably the decisive factor was that the mosque thereby gained a large unbroken space for the musalla, which—unlike mosques with arcaded columned musalias-allowed all the congregation to see the imam. This inherent advantage of the fashs schema had not been seized at the time that the Kalawan ensemble was built, and thus the kibia fada there is treated like a traditional musallá and parcelled up by areades, a device continued in the mosque-madrasa of Barkûk (786-8) 1384-6). Moreover, even as late as the funerary madrasa of Barkük (801-15/1309-1412), 2 set of domed bays forming miniature compartments take up the areas normally reserved for fundas. The liturgical distinction between the hible fude and the subsidiary ones was expressed in architectural terms too. The former was vaulted, and thereby given the illusion of still greater spaciousness, while the scale of the latter was reduced and their ceilings were now flat.

For the madrasa to influence mesque design was indeed a momentous change; it signalled a new relationship between the two buildings. Earlier, the dependent status of the madrasa had been vividly expressed by the way it had been tacked on, very much in the manner of an atterthought, to the parent structure. Examples abound; they include the madrasa of 507/1113-14 beside the Great Mosque of Urfa and a trio of madrasas—those of the amira Taybars (709/1309-10). Akbugja (740/1340) and Djawbar (before 844/1440)—attached to the Axhar mosque in Cairo. Henceforth, however, these two institutions could combine their functions within a single building (which was highly desirable given

the chronic shortage of space in Cairo) and with minimum trespass of one upon the other. For it is noticeable that in the Sulfan Hasan complex a novel solution for the madrasa has been devised: not only does each madabab occupy a corner of the building, but certain aspects of the traditional full-scale madrasa are retained even on this miniature scale. The cells for students - chistered on two sides of a diminutive courtyard, except in the case of the Maliki madrass situated in the western corner, where the exigencies of the site bisected the space available. Since the Maliki rite enjoyed relatively less popularity than the other three (though the Maliki professor was allotted the prestigious kible iwan in the funeracy modeasa of al-Malik al-Nășir], this solution was not munipost to that madhach m might at first appear. Furthermore, the small size of the student cells meant that their numbers and dimensions could be readily adjusted to fill the space available, thereby obviating the need to encroach on the mosque proper. Presumably, however, the four imins were used for teaching purposes outside the hours of prayer; the association between fadas and teaching had been rooted for a good two centuries in Syria and thence Egypt: thus the Mamlük historian al-Makrizi, in his description of the mausoleum and madrasa of al-Nāşir Muhammad, liştş the four lecturers—one from each madhhab—who were first appointed to teach there, and specifies the iwan allotted to each one. The lack of subsidiary militabs in the lateral findus is sufficient indication that their role as places for prayer was not paramount.

At the mosque-madrasa of Barkük, built a generation later (786-8/1384-6) the emphasis is reversed in favour of the medrasa without any fundamental change in plan. Thereafter, while true 4-toon mosques or madrasas remained the exception rather than the rule in Egypt (e.g. the foundations of Diamal al-Din of Seritaos and Sultan Intl of 860/ra65), the principle that the same building could serve both functions was unassailable. It is not surprising, therefore, to discover in 7th/13th and 8th/14th century Mamiük architecture a marked propensity to use furfus, though the combinations varies widely one, two or three furing may be used in conjunction with courtyards, balls, mausolea or sets of smaller chambers; acute shortage of space was no doubt a contributory factor in these developments.

The diminutive scale of many Circussian Mamilik foundations necessarily excluded ample accommodation for students, but to make up for the difficulties inherent in lateral expansion many of these foundations extended upwards instead, comprising two or even -in the case of the 4-hodn funerary mediase of Amir Surghatmish (757/1356)-three stories which, in the latter example, all contain cells for students. The see of the tiny but elegant mediasa of the Amir Mithkal, datable to the period between 762/1361 and 776/1374, and measuring a mere 20 m per side, shows that the practice of allocating separate stories to the functions of worship and to those of teaching and/or accommodation had already established itself in pre-Circassian times. Relieved of the requirement to fit student cells into the ground floor of a cramped, awkward site, the architect could create - ordered and even ample layout by expanding the 4-luan plan to take up virtually all the available space, with special emphasis a laterally placed musallé which stretches the full width of the building. Without a comparably bold solution such a building would be undesirably cloistered, indeed claustrophobic. An airshaft

(maiker) is another means of countering the unduly inward-looking quality of such buildings. In the Mithkallyya, store-rooms take up what little remains on the ground floor, while the two upper floors are reserved for living and lecture rooms and a library. The mezzanine floor is not continuous but is confined to the lateral firdus which have wooden ceilings at their springing and above this are closed by mathrabiyya grilles giving into the rooms behind. Thus was created the so-called "hanging mediasa", a natural development from earlier "hanging" or "suspended" mosques in the same city. The functory madrasa of Zayn al-Din (697/1298) may have been a forerunner of this type. Like many other Mamlük madrasas, the Mithkiliyya was sited close to the private quarters of its patron-indeed, as at Nishapur centuries earlier, a private bouse (\$d^a) was frequently turned into a madrasa after its owner's death and named after him (e.g. the still-surviving Madrasa al-Ghannamiyya in Cairo, dated 774/1372-3, and this can be supplemented by a dozen literary references). In both types of building, the two-lads plan is normal though not mandatory. The interdependence of private house and madrasa is highlighted by the absence of staircases between ground and first floor in the original composition. It seems, therefore, that the madrasa proper can only have been reached via such private quarters as adjoined it, presumably those of the amir himself. The madrasa in turn would have provided access for buildings behind it.

Among the surviving madeasas in Cairo one type is clearly predominant—the funerary madrasa. So traditional was this kind of building in Cairo that (to judge by surviving structures) it was the madrasa lost court that remained exceptional. In the earlier funerary medvases, the mausoleum occupied such a significant portion of the ensemble that it is appropriate to describe such structures as joint foundations. Pive such monuments survive dated between 697/ 1298 and 715/1315 alone, and they were only gradually superseded by foundations of still wider scope. It is hard = avoid the conclusion that the madrasa was a convenient means of justifying the mausoleum -for the latter building type of course flouted Islamic orthodoxy. An early example of this process is the vanished madvasa built in conjunction with a magnificent mausoleum near the grave of the Imam al-Shafiff (d. 204/820) in 572-5/1276-80. This ensemble conferred an implied legal recognition on the cult of mausolea; after all, if a funerary madrata could be erected in honour of the founder of one of the four major madahabs, the practice could henceforth safely be regarded = unimpeachable. Nevertheless, the mausoleum continued to provide the true raison d'être of such monuments, and visually it almost invariably usurps pride of place. This is particularly evident when the ensemble includes two mausolea instead of one (funerary madrass of Salar and Sandjar al-Djawull, 703/1303-4), although later in the century such double mausolea appropriately enough take second place to the madrasa itself (madrasa of Khwand al-Baraka, also known as that of Shaban, 770/1368-9). The inclusion of minarets, which by this time were too common in the city for fresh ones to be anything but redundant, may also have been designed to ward off pious disapproval. Even so, it me the minaret and the mausoleum, not the madrasa itself, which gave these buildings their distinctive stamp externally. Perhaps the competition of these already well-established building types was one of the factors which prevented the madeasa from developing its own instantly recognisable form. A modest edifice in the name of al-Malik al-Djakandar (719/1379), described as a masdjid in its inscription, even though the now demolished rooms the roof, the striking resemblance to the slightly later Mithkaliyya and the historical evidence all point to its being a madeasa epitomises the simplicity and austerity of the madeasa shorn of such parasitic structures. It is the first Cairene madeasa to have the sales roofed in the Anatolian manner. This feature continues in later madeasas and results in the courtyard shrinking to the level of a large madeasa of Kā²it Bay, 880/1475).

These remarks should not be construed to suggest that Cairene madrasas served exclusively educational, religious or funerary proposes. A casual reminiscence set down by al-Makrizi indicated that the madrasamausoleum of the Amir Karasunkur was used as a bostel by couriers of the barid service preparing for their return journey to Syria and elsewhere. The same source mentions a ribil for women attached to the madrasa and mausoleum of the Amir Sunkur Safell (715/1315). But above all, the madrasa provided a focus both for the relentless emulation of the Mamilik amirs in architectural projects and for their desire to make financial provision for their descendants.

Just as the madrasas of Syria in the 6th/r2th and early 7th/r3th centuries yield valuable data not available from Egypt as monuments, so reciprocally do Mamlük Egyptian madrasas fill the information gap in Syria. The sudden decline in madrasa bullding in Syria after 648/r250 can safely be associated with the fall of the Ayyūbid dynasty, whose power was centred there.

This decline is not reflected solely in madrasas; it is a widespread characteristic of later mediaeval architecture in Syria, and is only to be expected given the henceforth provincial status of the area. After the death of Baybars, whose own early career adequately explains his interest in Syria, it was very rare for a Mamlük sultan to undertake an important building project in the province. Jerusalem, on the other hend, by virtue of its exalted status in the Islamic world, continued benefit from the architectural patronage of the Mamlük sultans right up to the

Syrian madratas of the Marnink period, then, significantly below the level of contemporary work in Cairo. Moreover, they were built in significantly smaller numbers than under M Ayyubids, for under the Mamiliks the emphasis of patronage shifted mausolea and lunerary mosques. Even so, it is well-nigh impossible to draw a clear line of demarcation between either of these categories and the madeata; there is me significant difference in layout between the tomb of Shaykh Nakhlawi (730/1330), the funerary mosque of Shutayb (ca. 800/ca. 1400) and the funerary madrasa of Shaykh Basan Rasi al-Himma, all in the same city (863/1459). Single-tomb structures combined with much larger laterally developed musula, sometimes with a vestibute, continued to be built, and these could equally well bear the mosque (Turuziyya, Damascus, 825/1413) or madrasa (Djakmakiyya, Damascus, rebuilt and enlarged 822/1419). Thus in Mamilik as in Ayyabid times, the term madeasa did not connote exclusively me kind of building or one particular function. Other continuities may readily be noted. The Zahiriyya madrasa in Damascus, for example, dated 767/1277-8 and containing the mausoleum of Baybars, is essentially still in the Ayyübid architectural tradition, Its steep narrow portal, focussed on a mularnas vault ending in a scallop-shaped niche, does however find its natural parallels in other Bahri Mamitik buildings in Cairo. Some madrasas, such as the Turuntaliyya in Aleppo (794/1392) had two such portals, neither in any way integrated with the principal features of the building. This madrasa, incidentally, combines in a new way many of the standard features of earlier Syrlan madeatas: around its spacious central courtyard are disposed a mesalla extending the entire width of the kibia side, arched colonnades with rooms above on the two long sides and a huge iwan, presumably for teaching, occupying all the north side. The role of mosque played by many Mamlûk madensas in Syria is advertised by the addition of a minaret (Madrasa Saffāhiyya built by the kādī Ibn al-Saffāh in 869/1464 and Madrasa Ansâriyya, both in Aleppo).

Attention = far has been locussed on the Mamilik madrasas of Damascus and Aleppo, and the evidence cited makes It clear enough that these buildings fall substantially below the standards set by contemporary Calrene madrasas. Another local school flourished in Tripoli (madresas of al-'Adjamiyya (766/1365) and al-Khātūniyya (774/1373-4), but this too could not rival Cairo. As noted above, it is in Jerusalem that most of the best provincial Mamlük architecture is to be found, and this is as true of madrasas as of any other building type. Particularly worthy of note is the sparse but exquisite applied and architectonic decoration of these buildings, including stellar vaulting (Madrasa al-Dawådärtyya, ca. 697/1297), niches with radial or makarnas vaulting (Khātūniyya, 784/1383 and Salamiyya, ca. 700/ca. 1300 respectively) and entrance with trefoil heads (Tashtimurlyya, ca. 784/ca. 1384; Muthiriyya, 885/1480-1). These and other Jerusalem madrasas (e.g. the Diawhariyya, 844/1440 and meet the early Ottoman Risasiyya, 947/1540) concentrate attention upon the entrance. This feature is easily explained. Streets were very narrow and the buildings bordering them constituted a succession of cliff-like façades. No one building, however, had a street frontage of any substantial length. Thus the custom developed of leaving most of the façade plain and confining applied and architectonic ornament to the entrance and perhaps the windows. The doorway itself tended to be much smaller than the slender, lofty entrance recess into which it was set, and was normally crowned by a mukernes composition enclosing the inevitable epigraphic panel trumpeting the name and titles of the founder.

The self-same shortage of space which had conditioned the characteristic local exterior façade ensured that in residential madrasas the cells were disposed on two meven three stories. There is even a case of a madrasa being extended over the roof of an adjoining ribât (Diawhartyya madrasa, 844/1440). In such cramped conditions it is not surprising to find that the 4-iwin plan used on more spacious sites in contemporary Cairo is apt to be reduced, for example by the suppression of lateral iwins as in the Muzhiriyya madrasa. Here the portal gives on to a vestibule which leads into an imin facing a courtyard, probably once covered, with a fible indu opposite.

There can be little question that the most important of these Mamiük madrasas built outside Cairo is the Aghrafiyya erected in Jerusalem by Kā'it Bāy in 887/1482. This was the third extension and rebuilding of the monument, which was already a major institution staffed by an indefinite number of shaykhs, fuhahā' and 60 Şūffs, all salaried. Several reasons combine to lend it special distinction. To begin with, it attests the patronage of the sultan himself, a rare occurrance—as already noted—in provincial Mamilik madratas. Secondly, its location in a favoured site along the inner façade of the Haram. al-Sharif would confer baraks on it to an unusual degree. Earlier in the Mamilik period, several -drasas had been precied along the Haram, but the visual impact of the Ashraflyya is much greater, Kålt Bay's patronage must however be assessed against m wider context than the purely local amblence of the Haram, m indeed of Jerusalem itself, A short time previously, he had erected madeatas within the precinct of the Haram in Mecca (882-4/ 1477-9) and the Mosque of the Prophet in Medina. Like his foundation in Jerusalem, these buildings are se designed that their windows look out upon the sucred enclosures in each case. Thus the Ashrafiyya falls into place mone component in a religio-political master plan expressing imperial Mamlük involvement in the boly places of Islam. The foundations of al-Walld I nearly eight centuries before provide an obvious parallel. Finally, the Ashrafiyya possesses intrinsic distinction on account of its architecture alone. Seen as a whole, the inner laçade of the Haram emphasises the motif of arcading above all others. The architect of the Ashrafiyya was therefore constrained to reject the model presented by earlier Mamlûk madrasas in the city, with their emphasis on high blank façades and block-like design. An open-arcaded laçade had no functional justification in a madrasa. But this device did permit the Ashraflyya to blend fairly naturally with its surroundings: not content with the prime site which the medrase already occupied, as close as practicable to the Dome of the Rock, Kallt Bay took the major step of sanctioning the extension of the madrasa façade, which until then had remained flush with the open arcade fronting the inner side of the Haram enclosure, so that it projected well beyond the arcade. It a brutally simple way of drawing attention to his new foundation. Earlier madrasas bordering the Haram enclosure and indeed forming with the Ashrafiyya a continuous band of monuments, such as the Tankiziyya (729/1328), the Baladiyya (782/ 1380) and the 'Uthmaniyya (840/1437), had by contrast all respected the extant portico. The Ashrafiyya was regarded in its time as one of the three jewels of the Haram al-Sharif, with the Dome of the Rock and the Aksa mosque, a distinction expressed in symbolic fashion in 882/1477 when, like these other two buildings, it was specially illuminated to celebrate the visit of m Mamilik amir to Jerusalem. Not is this all. A detailed analysis of the building shows that its silhouette was very carefully designed to make an impact from a few selected viewpoints; it would be interesting to look for comparable evidence of sensitivity to the urban skyline on the part of Islamic architects elsewhere. The immediate source for this unwonted emphasis me the skyline, as for the presence of a minaret which is exceptional in the Syrian context, is likely to be Cairo, Cairo, too, as will be shown below, provides the fullest context for the recast, not to say deformed, cruciform fown schema encountered at the Ashrafiyya,

The ensemble takes an unusual form which is due only in part to the exigencies of the site. At ground floor level it comprises three elements. The most important of these is a large assembly hall (maijma*)

whose capacity and spatial extent are much reduced by the architect's decision to retain in his remodelling (the original piers of) the arcade enclosing the Haram, Here congregated the judges, fukaka2 and other notables connected with the madrasa. Behind the hall is a series of three adjoining square or rectangular rooms whose western walls abut the Baladiyya madresa; they neatly subdivide an awkward lateral corridor of space. The third component of the ground floor layout is the entrance complex, which comprises a vaulted porch open all four sides and leading in the entrance itself flanked by stone benches (mastabas), which opens into a tripartite vestibule within. The first floor is ingeniously and tightly planned to serve as a self-contained madrasa. As such it immediately recalls, for example, the Diawhariyya madrasa in Jerusalem itself, which like the Ashrafiyya is intimately dovetailed with pre-existing structure, or the Mithkaliyya madrata in Cairo. The first-floor unit divides naturally into two areas, one north of the minaret above the staircase and the other west of it. The latter area consists of an L-shaped open-air terrace (saka) with twenty rooms, disposed roughly as uneven pairs, to the south and five Identical rooms plus a washroom (mulawadda') to the west. Even if the larger rooms are excluded and only symmetrically repetitive chambers are identified = student cells, the number of resident students which were catered for here was scarcely have been less than twenty. Its sister foundation in Mecca had (according to one account) forty students attended by four lecturers (mudarrisan) plus a jurisconsult (fakth), Kur'an reciters (burrd') and, somewhat surprisingly, muerzios. The area north of the minaret comprises another open-air terrace in the west, lavatories with a reservoir, and a remarkably compact cruciform madrasa adjoining the terrace to the east and thus placed directly above the madima', comprising a rectangular half some 22.7 = 12.1 m. in area, The east imds of this takes pride of place among the others it is the one which looks out on to the Haram. It has in effect been transformed into an open loggia offering spectacular views over the Haram. This architectural form, known = mak'ad or tārime, has a wide distribution in domestic architecture throughout the Near East, and may parenthetically is compared with similar forms in contemporary Renaissance architecture; it underlines yet again the deep roots of the madrasa in domestic prototypes. But this development, for all its domestic flavour, also had religious implications, for the view from this loggia was over one of the holiest sites in the Islamic world. A note of luxury is struck by a huge stained glass window and is echoed throughout the complex—in the two-tone (ablak) masonry, the polychrome marble flooring of the and inner courtyard (a practice frequently encountered in late Mamilik Cairene madrasas). the veneered wooden ceilings of the favors, the lead sheeting of the roof and in its carpets and lamps, whose beauty, in the words of a contemporary historian, was "unequalled elsewhere". In short, there is ample evidence that the Ashrafiyya was a metropolitan import into the local architecture of Jerusalem.

In the earlier part of this section the discussion focussed on literary references to the earliest madrasas. This emphasis was dictated by the lack of surviving structures. It is unlikely that future cavations will substantially illuminate this crucial early period. After all, the written sources indicate

clearly enough that the early, pre-Saldjuk, madeasas. in keeping with their private and non-official charactor, were of a domestic nature. Frequently a house became a madrasa without, it seems, any structural alteration, or served impartially as house and madrasa by turns. It follows that excavated ground plans will not be enough in themselves to prove that a given pre-Saldink structure functioned as a madrasa. Even in the Saldick period itself, the two frances buildings identified by some as madrasas (the ruined structures at Khārgird and Ray) have aroused a controversy still not laid to rest. In this situation it seems sensible to accept that the architectural history of the madrasa before 530/2136 (the date of the example Boşrā) is irretrievably lost, no matter how rich the documentation of its character me an institution may be.

Such a conclusion inevitably confers particular evidential value me the earliest considerable group of madrases to survive, namely the examples in Saldjük Anatolia, where 50 surviving examples permit a more searching and reliable analysis of trends than do 15 Syrian ones. These Anatolian buildings have been quite imjustifiably neglected in the history of the genre; Creswell's obsession with absolute chronology and his bias towards material from Syria, Palestine and Egypt led him to over-estimate the role of this area in the development of the madrasa, and his views have dominated subsequent discussion. However, the Anatolian madrasas are the best available guide to the nature of the building in Saldiak Iran; thanks m the work of Kuran and Sozen, they are much better known as a group than any others in the Islamic would. Some So of them datable before 905/1300 survive, and this figure be supplemented by a further 58 vanished buildings of the same period recorded in the literary sources. In both categories, incidentally, the numerous Ottoman buildings, which form separate study, are excluded; the grand total of Anatolian madrasas surviving or recorded in this period is probably about 200. The preponderance of surviving over vanished buildings is highly unusual in the mediaeval Islamic world and is unlikely to reflect the true state of affairs. But the two sets of ligures do complement each other significantly. They confirm what may be deduced from other sources—that building activity was most concentrated in the 7th/13th century, that is, under the Saldlüks of Rum. Forty-one surviving and 27 vanished medrasas, that is almost half of the entire recorded output of Anatolia in the period 2200-2500, date from this century. The comparable figures for the 8th/14th century, are 22 and 15, comprising about a quarter of the output of the period as a whole. The Karamanida [q.v.] the principal patrons responsible for new madrates in this period. In the 9th/15th century the rate of construction declined still more sharply by a further 70%. Even the 6th/12th century saw construction than this, with nine surviving buildings and a further six so far recorded in the literary sources; but of course the decline of Beylik madrasas in the 9th/15th century directly mirrors the growth of Ottoman power. Indeed, the earliest Ottoman madrasa to survive, that of Sulayman Pasha at Iznik, predates 759/1358 and was itself preceded by a now vanished madress at Bursa. With the 9th/15th century, Ottoman madrasas began to be erected over much of Anatolia.

The turbulent political history of 6th/12th century Anatolia is perhaps sufficient explanation for the

slow spread of the madrass in this area and period. But with the consolidation of Saldiuk power, the movement gathered such momentum that it long outlasted the disintegration of the Saldiuk state. Clearly, it had deep roots in the society which it served.

Not surprisingly, therefore, and | contrast to the situation in Egypt, Palestine and Syria, and for that matter in the Maghrib, these mediaeval Anato-Jian madrasas men not confined to a few large cities. The surviving examples alone are distributed among 39 cities, towns and villages throughout the length and breadth of the land, while the literary sources add a further dozen localities. In the fullest sense, therefore, this was a popular movement. Naturally this did not exclude a concentration of madrasas in a few key centres. Konya, as the Saldlok capital, obviously took pride of place, though only seven of its 24 madrasas have survived. Next comes Mardin, the Artukid capital, where surprisingly enough 11 of the recorded 13 madrasas remain; similarly, Kayseri retains 9 of its 11 recorded madrasas. These are without doubt the three major centres of the time. However, quite a number of towns had between four and six madrasas erected in this period-Sives, Sivrihisar, Akşebir, Tire, Aksaray, Krzurum, Diyarbakir and Karaman. Thus there is ample evidence to indicate that the intensive building activity of a few centres was complemented by provision in depth at a good many more. Finally, seven sites we recorded with two or three modrasas apiece. Such remarkably even spread of facilities throughout the land may best be explained by the Interaction of two complementary trends: a centralised building programme and—though probably to a lesser degree—a popular fashion for the madrasa an institution, or any rate as a suitable object of modest architectural patronage.

It is in fact these Anatolian buildings which provide the best evidence of the multi-functional nature of the mediaeval madeura. In so doing, they are a reminder that the form of these buildings is not an infallible guide to their function. Many building now conventionally termed modrasa/ medeese (and subsumed in the present discussion) was actually intended to serve as a medical school, mental hospital, Smaret or an observatory, and it frequently allotted substantial space to mausoleum. The two former functions may be combined in the sense that each is discharged in separate but adjoining premises, as in the Citte Minare madrasa at Kayseri or the Kaykawūstyya at Sivas, though the mental hospital (blendrhhous) of Melike Yildla Khatun at Amasya is a single self-contained foundation. Nothing in its layout would exclude its identification as a madrata. In the case of longdisaffected, anepigraphic buildings, therefore, a madresa-type layout should not automatically be taken to signify that the building really was a madrasa.

The rich quantity of Anatolian material available prompts a variety of conclusions. The most important of these is perhaps that no single type of arrangement was dominant. This in turn invites speculation that the evolution of the genre was by no means complete. In some madrasas (Tokat, Karahisar), whole cluster of cooms of varying shapes and sizes mirror the uncertainties of the architect. In many of these buildings, too, me notional purpose of a madrasa—to house students seeking the fulumit—obviously comes a poor last to such other functions as providing

a place of prayer, an elaborate façade, a mausoleum (or even two, as at the Boyaliköy madrasa), a minaret, a bath, a fountain or halls for public gatherings. Not surprisingly, the cells are usually tiny, a scant three paces per side. But it is their paucity that is most striking. Even the most splendld of all domed Anatolian Saldiūk madrasas, that built in Konya in 671/1215 by the virler Digital al-Din Karatay and bearing his name, has no more than a dozen cells. The most capacious madress of the period, = the other hand-the Cifte Minare in Erzurum, which at 35 m 48 m is the largest Anatolian madrasa of the period-still has a more so cells on each of its two stories and therefore lags far behind the larger modrasas of the Maghrib or Trak. In the Sth/14th century, the capacity of the average Anatolian medrasa declined still further. Saldjük Anatolia shows just as clearly as do Syria, Egypt or Iran the growth of the multi-purpose foundation, and several Anatolian madrasas were built in conjunction with structures serving another purpose altogether. Thus the madrasa at Cay bears the me date (677/1278) as the caravantaral which adjoins it. Presumably as in the some of similar though later joint foundations (those of Amlr Mirdian in Baghdad, 756-9/1356-9 and Shah Sultan Husayn in Islahan, 1105-35/1694-1722), the revenues of the commercial establishment were intended to linance the running costs of the madrasa. It was common enough, too, for madrasa to adjoin a mosque (Zindjiriyya madrasa, Diyarbakir, 595/1198; Hādidit Killė madrasa, Kayseri, 647/1249-50). This fact is not necessarily mirrored in the plan of the madrasa, however, for the Khwand Khatun madrasa, Kayseri (635/1237-8) provides the usual facilities for prayer even though there is a mosque right next door. Perhaps the most diverse group of buildings erected by a single Anatolian patron in one building campaign is the complex of Ibrahim Beg at Karaman (836/1433) comprising mosque, 'imaret, dar al-hurra', madrasa, tabhhane and massoleum, though the complex of Isma'll Beg at Kastamonu (cs. 88o/2475) runs it close comprising as it does a madrasa, mosque, tomb, 'imara', caravansarai and bath. Such buildings make most sense in an Ottoman context.

Any attempt to characterise the mediaeval Anatolian madrasa must therefore reckon with this very varied background, but encompassing and overriding all these no doubt individually significant variants - two broad categories into which the entire body of mediaeval Anatolian madrasas may be fitted. These are the open type, with a courtyard; and the closed type with a domed area replacing that courtyard. Of the 53 surviving madrasas in good repair, 38 are of the open type and 15 are domed. The 28 ruined madrasas are deliberately excluded from these calculations because most of them are too fragmentary to be placed with confidence in either category. Even so, here too the predominance of the open plan in unmistakable, for of the ruined madrasas whose original layout can indeed be established, eight are open and only two are closed. That the open plan should dominate is only to be expected, given the popularity of this form in non-Anatolian madrasas and the fashion for courtyard houses in the mediaeval Iranian world which produced the earliest madrasas. The closed, domed madrasa-which may have anything from to four feedus, very occasionally has two stories (Karaman, madress of Ibrahim Bey), and may or may not have a portico around the central spaceis not so easily explained. Its reison d'être, incidentally

1146

more rewarding subject than its architecture, therefore deserves separate consideration.

The most convenient explanations—that the form is dictated by function or by climate—will obviously not do. After all it is the domed, not the open, madrasa that is exceptional in Anatolia. Nor can regional preferences be invoked, for the type occurs with tolerable consistency throughout the country. An important factor in its genesis may well have been that interchangeability of building types - typical of mediaeval Islamic architecture. The association of the madrasa with burial and worship would make it natural for the forms of mausoleum and mosque to be integrated into the structure of the madrasa -as indeed happens—and eventually to exert influence upon its form. Moreover, it can scarcely be coincidence that it is precisely the madrasas of smaller surface area which attest the domed type. If very few students were to be accommodated in the building, the need for a substantial courtyard would diminish. In such a situation, the building would gain extra dignity and monumentality by the placing of a dome over the central space, while the memory of the courtyard would be retained by of a skylight and/or a fountain. This ablutions fountain or stadisman readily brings to mind the impluvium of the assism in a Roman house, and thus underlines yet again the domestic origins of the madrasa. The integrating power of a central dome may also have been a relevant factor in the growing popularity of the domed madrasa. Two further considerations, which me perhaps only at first sight mutually exclusive, may be borne in mind. First, the compact madrasa with large central dome and smaller domed m vaulted areas surrounding it cannot fail to recall the standard type of mid-Byzantine church which was widespread in Anatolia at the time of the Turkish conquest. Nor is this resemblance simply a matter of external silhouette; the rear incin flanked by dome chambers in the domical madrasas of Konya brings to mind a Byzantime church apse flanked by disconicon and prothesis. Secondly, when these domed madrasas are seen not simply in their contemporary context but against the later background of Ottoman architecture, especially mosques, their emphasis on an integrated multi-domed and -vaulted space may be recognised as prophetic. Indeed, some of these domed madrasas, such me the Ince Minarell madrasa in Konya or the Tash madrasa in Aksehir, actually incorporate earlier mosques in their structure. This close link with mosque architecture is incidentally not to be seen in the courtyard madrasa, which in Anatolia at least developed quite separately; but whatever the origins of the idea, its development was formidably consistent right up to the Ottoman culmination.

Anatolian conrivard madrasas, like those of domed type, do not readily fail into formal sub-categories, although attempts have been made to analyse the buildings to be basis.

Certain generalisations about these buildings may be made. It is clear, for example, that the typical rectangular madrasa kept the facade short in relation to the sides. This had the advantage of concentrating student cells in the long sides and separating them physically from the rooms serving other functions. Most cells had a fireplace and in cupboard, but sanitary facilities were communal and there was usually no provision for meals to be cooked on the premises. Equally characteristic is a tripartite division of the building parallel with the major, that is the longitudinal, axis, as in contemporary caravansarais.

At the far end of that axis, marking the bible and continuing the major chord first sounded by the portal, is a wide finds in dome chamber serving in the mosque and frequently flanked by a subsidiary vaulted or domed ____ either side. Evidently honorific intent lies behind this placing, though it must be conceded that the mosque was sometimes located alsowhere in the madrasa (for example, next to the entrance vestibule at the Cifte Minare madrasa, Erzurum). When the madrasa form was used for an observatory (Wādjidiyya madrasa, Kütahya, 714/1314), a small opening in each of the lateral dome chambers served for star-gazing. In a true madrasa, these two chambers most likely functioned m classrooms and for the library; smaller rooms flanking the entrance perhaps accommodated the professors. In 4-feeds plans the hible inde is typically the broadest and the most richly descrated of all, and it has a similar pre-eminence in two-iwin madrasas, in which the šudns, as in Iranian Saldjūk building of that type, are confined to the longitudinal axis. However, the form of the lipfin within these buildings---as distinct from their exteriors-does not follow Iranian precedent, in that its façade comprises the arch alone without a framing pithiak.

The discussion so far has by implication highlighted the originality of these Anatolian madrasas, but the dearth of contemporary comparative material from elsewhere forbids any very positive statement on this score. Even so, one may set against the occasional echo of Syrian madrasas or of Iranian buildings, a growing sense of confidence in forging a local style. Imported ideas are rapidly given Anatolian garb, as the late of Persian elements shows. Minarets become stumpier and stockier than in Iran, with tiers of well-articulated balconies; in 4-iman plans, the imans are diminished and subordinated to the emphasis on continuous areades surrounding the courtyard, and pronounced longitudinal axis at odds with the centralising function of the 4-iman plan-makes itself felt. It should also be pointed out that the first four-rite madrata to survive is in all probability not, as is often thought, the Mustansiriyya in Baghdād but the Mastūdiyya 🖮 Diyarbakir, founded in 590/rr93-4. Such m detail symbolises the central importance of mediaeval Anatolia to an understanding of madrasa architecture.

Ottoman madrasas inevitably look somewhat tame when measured against the output of the preceding centuries, but what they lost in unpredictability they amply made up for in symmetry and scale, characteristics hitherto undervalued. Long, uncluttered façades - preferred, and this change is symptomatic of the severity which was to replace the luxuriant idiom of Saldiuk and Beylik architectural ornament. But it is more than a matter of stylistic preference. The typical Anatolian Saigliūk and even Beylik madrasa was a self-contained foundation, even if its raison d'are was as often funerary - educational. Exceptions are not hard to find, but they are distinctly recognisable as such. With the advent of the Ottomans to supreme power, the joint foundation-typically a mosquecum-madrasa, but frequently a still larger complexbecomes commonplace, and sometimes several madrasas cluster around a mosque; such an ensemble is conceived as m architectural unity and often executed in a single building campaign.

These changes left their mark on the madrasa. Its function as a place of prayer was now positively subordinated to its role man advectional institution, and this change is swiftly mirrored in its architecture.

The twin is demoted and by degrees removed, and in its place appears the dominant dome chamber; the Celebi Mehmed madrasa, Merziion (817/1414), illustrates an intermediate stage of this process, with its compact, square layout focussed on a central courtyard, ideally adapted to a cruciform indn plan; but the indns no longer dominate the arrangement, for behind each of them rises a powerful, foursquare domed unit.

The closer relationship between mosque and madrate in this period was to have still more farreaching results. There was less need to provide ample facilities for prayer, so the masafid or musalla occupies a smaller proportion of the surface area. Innovations in mosque design are swiftly reflected the planning of madrasas-for example, in the provision of a mediating cloister, each bay domed, between courtyard and cells. Above all, the madrasa was me readily conceived as a mosque writ small with proportious reserved. Thus the domed musalla shrinks to a few metres square, although it is symbolically singled out by virtue of its isolation at the far end of the courtyard or even by its projection from the rest of the madrase, m at the madrase of Bäyazid II at Edirne and, still earlier, the Muradiyya and Yeshil madrasas in Bursa. Instead, the courtyard enclosed by cells on three sides takes pride of place. The resultant U (or reversed U) shape soon became standard in the Ottoman madrasa

Perhaps the most important change of emphasis in Ottoman madrasas vis-à-vis their predecessors lies in the hugely increased numbers of student cells. The designer had a free band and did not have to tailor his plan to an awkward and immutable site, so that me result, perhaps, space is used quite prodigally; the cells are med demed, and often have two windows apiece. The courtyard has not only a central pool or fountain but is also planted with trees, possibly in attempt to minimise the sense of regimentation which the plan exudes (madrasa of Bayazid II, Istanbul). In their size, their internal logic, their simple square or rectangular silhonettes, these Ottoman madrases bear the unmistakeable imprint of imperial patronage; hence their architects had no need to grapple with the intractable sites that had put earlier architects on their mettle.

The recognition that the form of the Ottoman madrases gradually stagnated should not blind to their visual impact. It is a truism that an instinctive feeling for space permeates the buildings of the period, and madrosas are no exception. This explains why they are so often sited so that they can be viewed from all sides, and why the domed masdiid is set apart from the rest of the building by some device or other. It also explains why in so many madratas at least half the surface area is wasted -from the narrowly utilitarian point of view-by a vastempty courtyard, why the calls are placed only on the ground floor, and why domed cloisters lead from cells to courtyard. Clearly it was less important to cram the madrasa full of students than to ensure that those who lived there had room to breathe. Consequently, when an Ottoman sultan, such as Mehemmed Fatih, wished to accommodate students on the grand scale, he built no less than 16 madratas, even though the total number of rooms was only 230. This can fairly claim to be the first Turkish university. Architecturally speaking, the culmination of this trend may be seen in the Sulaymaniyya complex, whose 18 buildings are conceived = a single cutity and, perched on one of the city's highest hills, command a matchless view.

The sheer size of these Ottoman madrates departs decisively from the Arab tradition. It finds its natural counterpart, however, in the later madrases of the eastern Islamic world. Their origins pose insoluble problems. In the early part of section, the remarkable dearth of Iranian madresus datable before 251/1350 was emphasised. Their absence from the tally of surviving monuments is all the more puzzling since representatives of nearly all the other major building types have survived in abundance, and since madrasas are plentiful among the standing monuments of Syria and Anatolia from the 6th/12th century onwards. This situation suggests that Iranian madrasas may indeed have survived-but not under that name. It is well known that throughout the mediaeval period and throughout the Islamic world the function of teaching was frequently discharged within the mosque (see above, section I, 2). This is not to say, of course, that many of the Iranian mosques of this period were madrasas; and even those which might have been centres of religious instruction could clearly never have functioned as residential madrasas because their design did not include cells for that purpose. Perhaps, then, it is a mistake to that a madrate must connote a residential as well as an educational function. Indeed, since madrasas were apparently built all over the country in large numbers, the majority of them might be expected to cater for local students who would not require accoramodation within the building. Only the largest and prestigious institutions, whose reputation would attract students from far afield-like the Baghdad Nizamiyya = the Mustansiriyya-would need to make ample provision for students in residence.

The difficulty, of course, lies in identifying such "hidden" madrasas. Inscriptions might provide the requisite clues; in fact, Sauvaget interpreted the Ardistan diamit as a madrace on the strength of a Kur'anie inscription in the hible twen mentioning the ways (madhahib) of reaching God. But this is to go too fast. Rather would it be justifiable to infer from that inscription that | least the hible ludn of this mosque may have been used for teaching purposes in the Saldjük period. Such Iranian mosques as have rooms of various kinds on the first floor might be regarded as prima facie candidates for residential madrasa status, in addition to their primary role - communal places of worship; but unfortunately, published plans are virtually without exception confined to the ground floor and give bint as to the disposition of the upper level. The lack of formality which characterised mediaeval Islamic teaching methods enabled virtually any mosque to perform the teaching and religious functions of madrasa; special lecture rooms were not required. This close functional correspondence between mosque and madrasa clearly favoured composite foundations, or at any rate the use of me building for several distinct purposes, and such a concept was of course widespread in other categories of Islamic architecture.

Enough has been said to highlight the difficulties of matching the physical and literary evidence about the early history of the madrasa in the Iranian world. In this area the earliest madrasa identified as such by inscription in the example dated 571/1175-6 at Shāh-i Mashhad in north-western Afghānistān. Ruined as it is, it nevertheless yields much useful information. To begin with, its splendid ornament proclaims it to be a monument of the very first importance, and in size alone, the building is re-

markable for its time, measuring as it does some 44 m. per side. This far exceeds the dimensions of 6th/12th century madesas further west, but it was to find many subsequent parallels in the Iranian world. Nothing on such an ambitious scale survives from the following two centuries, and the obvious question is why this exceptionally large and expensive building was erected in an which was always remote. The minaret of Diam [see GHORIDS] may provide the necessary clue. The role of that tower as a beacon of Islam in a context which until recently had been pagan goes far to explain its site, size and epigraphy; and the madrasa of Shah-l Machhad, with its lifteen inscriptions, may have been intended in similar vein to stamp an Islamic presence on a stubbornly pagan countryside.

likhänid modrases are on an altogether smaller scale, but before they are considered, one building from area hitherto neglected—'Irak-deserves notice. Already in the late 6th/12th century, Ibn Diubayr [q.v.] had recorded some thirty madrasas in Baghdad alone, all of them in the eastern sector of the city. All of them, however, were eclipsed by the Mustanskiyya madrasa there, widely regarded in its own time and subsequently as the exemplar of the genre and its fullest, finest expression. Its endowments (swkdf), too, exceeded those of other madrases. To a later age, it is the obvious symbol of the rejuvenated late 'Abbasid caliphate, and several factors suggest that this symbolism was deliberately intended at the time. The madvasa was built in Baghdad, which for six centuries had been the spiritual and intermittently the political centre of the Islamic world. It proclaimed the essential unity of orthodox Islam. Its patron was the caliph himself, who lent his name to the building. It was the first madrasa specifically designed to serve each of the four major medihabs, well containing facilities for the two fundamental ancillary disciplines taught in a dår al-hadith and a dår al-Kur'an, Each medhiob had its own place of worship. Thus the building explicitly claimed universal status. The long band of foundation text, inscribed in letters a foot high, that unfolds, in defiance of Islamic custom, across its exterior façade, advertises this claim for all to see. In size alone the building was unprecedented; an oblong of ca, 105 × 44 × 49 m. The solemn festivities of its inauguration in 630/1233 after six years of construction set the seal on its pre-eminent status among the madrasas of the Islamic world, whilst architecturally speaking, the monument is a triumph of technique. It is built according to a complex system of proportional relationships and modular units. Both the ground plan-a modified four-feels layout-and the elevation were based on a grid of zo and 30 Byzantine feet respectively. Thus the unit of measurement (one Byzantine foot - 31.23 cm.) used for Hagis Sophia was still employed seven centuries later in the heart of the Islamic world, an astonishing tribute to the tenacity of Hellenistic influence in Muslim science. In addition to providing accommodation on two floors for a large staff and for some 300 students, the madrato included a celebrated library (as did several Saldiūk madrasas in Marw), a kitchen, w kammam and a hospital.

The original layout of the Mustansiriyya was increasingly observed in later centuries by numerous modifications, but the study of a closely related building has clarified most of these problems. The building in question, the so-called "Abbāsid palaco", is in all probability the Bighriyya madrasa of 653/1255

and seems—to judge by the manifold improvements of detail which it incorporates—to be the work of the same architect as was responsible for the Mustansiriyya. The fragmentary state of this later building is all the more regrettable in view of the ambitious scale of what survives.

The variety of forms attested by the few surviving likhanid madrasas suggests that no one type predominated in this period. To judge by Timurid and Şafawid buildings, it was the Madrasa-yi İmâmi (already discussed) and the custom-built madrasa added to the Friday Mosque of Islahan from 768/ 1366-7 that best expressed the officially approved layout of such buildings, the latter being a two-smass courtyard structure. The madrasa of Diya' al-Din in Yazd, otherwise known as the Zindan-i Iskandar and datable to the 8th/14th century, is of substantially lower quality than the two Islahan madrasas; indeed, it is constructed of mud brick. Despite subsequent modifications, enough survives of the original layout to suggest that the fudes on two adjoining sides of the courtyard were complemented by another pair opposite. Apart from this, there is little observable regularity in the plan; its rooms are indiscriminately oblong or square, broad or narrow, multi-recessed or with unbroken walls, and are bundled together with outright carelessness. The Shamsiyya madrasa III ca. 766/1365, also in Yazd indeed, the literary sources record the names of about a more of 8th/14th century madrates built in that city—is an incomparably more soigné variation on the same theme. Here the design is tauter and fully integrated, each half a mirror reflection of the other: the portal logis announces the major axis, which continues without interruption until it terminates in its square mausoleum which adjoins the madrasa proper but projects well beyond it; and long lateral halls flank the portal iwas in m foretaste of Timurid buildings at Khargird and Garur Geh in Harat.

The Timurid period was unquestionably the golden age of the Iranian madrasa. Khurasan and Transoxiana were the forcing-ground for new developments, though competently-designed madrasas were also built in southern Iran, and features from that area are sometimes incorporated into the monuments of the north-east, like the badgir [q.v. in Suppl.] at Khargird. The four-foots type predominated and was executed on a scale consistently more spacious than had earlier been the norm anywhere in Islam. This ambitious scale often generated comparably ambitious decoration; the finer madrasas of the period yield nothing in the quality of their ornament to contemporary mosques, and occasionally even strike out in new directions, as in the murals with trees, streams and birds in the madrasa of Tůmán Ághā at Kihsan (844/1440-1). Such was the prestige acquired by this kind of madrasa that it became the model for nearly all the notable sacdrasas erected in the Iranian world in subsequent centuries; numerous madrasos in Şafawid Işfahān, Shaybanid Bukhārā and even Mughal India, illustrate this dietum.

It was in the Tinurid period, then, that the consonance between mosque and madrass became so marked that there is little to distinguish them so far external and internal façades are concerned. What goes on behind the façades, however, is very different in the two cases. Within the general format of the four-leads plan, there was ample room for experiment in the placing of mosques, mausoles, lecture halls and residential accommodation. A side-

effect of the greatly expanded size of these foundations was that room could now be found for a wide range of ancillary units, such as libraries and khānakaks for example, and for differentiated summer and winter chambers. Sometimes-as at Ghudiduwan, Khargird and in the Ulugh Beg madeasa at Bukharathe complex contained a mosque, and often a lecturehall as well. Sometimes both units were mosques (as at Turbat-i Djam) or lecture halls. In other madrasas, such as that of Ulugh Beg at Samarkand, dated \$20-3/1417-20, the mosque extended the full length of the bible side opposite the portal man. By contrast, a trio of madrasas in the Mashhad shrine (Du Dar, Parland and Bala Sar) have the mosque situated in an of the courtyard fuens-indeed, the Dû Dar madrasa even has a second mosque in a ____ of the building. There man no general rule governing the siting of the mausoleum in these royal Timurid madrasus, but the examples of the Gawhar Shad and Sultan Husayn Baykara madrosas in Harat, and that of Firuzshah at Turbat-i Djam, show that they could be the single dominant feature of the entire complex. Indeed, the fashion of the time firmly favoured the incorporation of mausolea into madrasas, and free-standing mausolea of high quality exceptional. As curiosity, the siting of a diminutive madrasa in the entrance complex of the Ziyaratgah Djami' is noteworthy, in smaller madratas, such in those of Mashhad, the incorporation of mosques and mausolea seriously overbalanced the ensemble and cut down the space available for student cells. But these cases are somewhat unusual, since the architects had to make do with a site which was stready heavily built up and therefore had to sacrifice symmetry to expediency.

The new emphasis on scale implied almost by definition a corresponding emphasis on external façades, Minarets are used to mark the corners—e.g. the Ulugh Beg madrasa at Samarkand and numerous later examples such as the Mir-i 'Arab madrasa at Bukhārā, 942/1533-6; and the portal is now apt to mercessed and thus streamlined with the curtain walls of the façade rather than projecting from it. Sensitivity to the setting of the manument made it natural to group such buildings together, notably in the Rigistān at Samarkand (Ulugh Beg, Shir Dar and Tilla Kari madrasas) or the Lub-i Hawd complex at Bukhārā.

As in Ottoman times, again, there was a tendency for these very large madrasas, all endowed by royal patrons or high officials of state, to cluster together in the major cities. Thus the original plan conceived by Nigam al-Mulk, whereby madrasas would be built in large numbers but distributed evenly over wide geographical area, was reversed. In Iran proper, Sum, Mashhad and Islahan account for nearly all the significant post-Ilkhanid medrasas, while similar concentrations may be observed in Samarkand, Bukhārā, Harāt and Khiwa. The latter city, with its quartet of highly traditional madrasas erected between 1810 and 1910 (Pahlawan Mahmud. Allah Kull Khan, Amin Khan and Islam Khadie) shows how fossilised the Timurid manner had become.

A more appropriate envol to the makrass, however, is provided by the buildings of Safawid Islahan. Several madrasss of medium size were erected there in the course of the 11th/17th century, such as the Madrasa-yi Nadda Kūčik, built in 1058/1648 by the grandmother of Shah Abbās II and with accommodation for 67 students, the Madrasa-yi Sadr, and those of Mulla Abd Allah (1088/1677)

and Kasangaran (1104/1693). But these 🚃 only of secondary interest when set beside the two madeasas, which flank | great doine chamber of the Masdid-i Shah, let alone the great Madrasa-vi Mådar-i Shåh (1118-26/1706-14). The two madrasas in the Masdjid-i Shah are longitudinally conceived. and with their miniature garden courtyards make a delightfully bijou impression; and they exploit the available space to the full for student cells. The Madrasa-yi Mådar-i Shåb, sited in an originally idyllic environment fronting the Cahar Bagh, injects a new dynamism into the traditional four-looks layout by means of a large extra dome chamber in each of the diagonals, and the cells, too, are unusual in their tripartite division; a vestibule and a terminal recess bracket the cell itself. The main prayer chamber here is not easily distinguishable from that of the Masgid-i Shah, and the continued intermingling of the two forms in Iran is attested by several joint foundations in Kädjär times.

Although dependence on Andalusia is a constant of Maghribl architecture, little trace of Spanish influence can be detected in the ground plans of the local madrasas, Indeed, since the madrasa movement was primarily an eastern Iranian one which by degrees moved westwards, it would be only logical to assume that in this particular genre of building it was atypically the Maghrib that influenced Andalusia. The only surviving physical evidence of the Andalusian madrasa confirms this supposition. This is the structure built by the Nasrid monarch Yüsul I in 750/1349, sc. in the golden age of the Marinit madrasa. Though largely demolished in the 18th century, the prayer hall was excavated and restored from 1893 onwards; it has nothing to differentiate it from its Marinid contemporaries in Morocco. Of the madrasas built by the Almohad ruler Ya'kūb al-Mansūr (580-95) 1184-99] in Spain = elsewhere in his dominions. nothing survives, nor is there any record of further Nașrid madrasas, = the question of reciprocal influences between Andalusia and the Maghrib in this genre cannot be regarded in finally settled. Valuable as this literary evidence is, in very pancity instructive, for it suggests the virtual absence of one of the major Islamic building types in Muslim Spain. Yet that area was unquestionably the foremost centre of Islamic art west of Egypt. In fact. however, this dearth can easily be explained. By the time that the madrasa had established itself in the eastern Islamic world, the great days of the Cordovan caliphate were long over, and the fate of Muslim Spain sealed. The cities of the north, Toledo, and even Cordova itself, had been lost. With the splendid exception of the Albambra, significantly a secular rather than a religious monument, little architecture of note was erected in the Iberian peninsula in the last three centuries of the Muslim presence there.

context of such limited building, madrasas would obviously have claimed less priority than mosques. Moreover, the Aimoravids as their name itself indicates were noted primarily for building ribats [a.v.]. Not only is there no mention of their building madrasas; it seems, rather, that it was precisely in these ribils that some of the teaching functions later performed by the madrasz were carried out. The consonance of plan between the two institutions leaps to the eye. Moreover, the early and marked association of the madrasa with the Shafi'l madhhab, and to an only slighter lesser extent with the Hanafl and Hanball ones, would perhaps not immediately have struck a chord in the predominantly Maliki Maghrib. Ironically enough, the first recorded madrasa (in late 3rd/9th century Nishapur) was in fact Mātiki, but in subsequent conturies that madhhab noticeably lagged behind the others in the number of madrasas allotted to it. It is perhaps relevant that the religious message preached by Ibn Tumart, the ideological founder of the Almohad dynasty, was disseminated in mosques rather than in special educational institutions. Hostile as he were to the prevailing orthodoxy of his time, it is not surprising that he did not use the madrasa as an instrument for his preaching, since that institution was itself the very emblem of orthodoxy by his time. Finally, one may perhaps adduce the generally conservatism of Maghribl society as a meet for the late spread of the madrase movement to this area.

Thus the fashion for building madrasas probably reached the Maghrib late—too late, for example, to make an impact - Andalusia. The references to the late 6th/rath century madrasas built by the Almohad ruler al-Manşûr are somewhat unspecificindeed, the statement of Ibn Sa'd that there was no madeasa in 7th/13th century Spain partially contradicts them-and the first securely dated modrasa in the Maghrib, the Shamma'iyya, was built in Tunis by the Halsid Abû Zakariyya' in 647/1249, and within a decade was followed by the Marridiyya madrasa built by his widow. Neither has survived, and thus the Salfarin madress in Fas, founded by the Marinid sultan Aba Yasul in 670/1271, is the earliest Maghribl example to survive. Its location may be seen as prophetic, since for reason the institution of the madrasa took deepest min in Morocco, and specifically in Fas, where we of the round dozen Maghribi madrasus predating 1700 are situated. Moreover, the majority of these madrasas are the work of the Marinid sultans and were erected between 670/1271 and 757/1356. Several Algerian madrasas belong to the same group. This sudden efflorescence of a building type which had hitherto been virtually unknown in the area demands some explanation. Perhaps the answer lies in the fact that the Marinids, unlike their more illustrious predecessors the Almoravids and Almohads, were swept to power by a wave of religious fervour. Their uncomfortable consciousness of this deficiency may have led them to make restitution of a kind by providing the patronage for religious buildings. Madrasas fitted the bill admirably. They were much less expensive than mosques, a very relevant factor since the Marinid empire was much smaller than that of their predecessors. Marinid mosques would have suffered by comparison with those of the Almohads; Marinid madeatas, being effectively a new genre, were safer from such unwelcome comparisons. Moreover, they underlined the orthodoxy of their patrons and thus provided a counterweight not only to Shiffem and to the Almohad movement but also to the increasingly popular Süfism. Indeed, m crucial epigraphic document indicates that the Marinid sultans were actuated by motives which had much in common with those of Nizān al-Mulk over two centuries earlier. The very first surviving madrats in Morocco, the Saffaria madrans in Fās (670/1271) mentions in its foundation inscription the need to resurrect the forgotten religious sciences, m clear attack on Almohad heterodoxy:

"Praise be to God, Master of the Two Worlds! Who exalts the status of men of learning, Who recompenses with a generous hand those who devote themselves to acts of picty; Who by man of madrasas revives the vanished traces of fish and of religion, using as His instrument those of His good servants whom He has specially singled out for His guidance and ennobled by His solicitude and by His care . . ." Finally, the desire to make Fås intellectual centre the sultans Abu I-Hasan and Abū 'Inan both prided themselves on being men of learning-may help to explain not only the concentration of madrases in that city during the Marinid period but also the endowment of several madreses with fine libraries in the 7th/13th and 8th/ 14th centuries (Satiarin, Fas; Bu'Inaniyya, Fas).

These madratos all obey a well-defined schema. Their dimensions are smaller than those of any other groups of madeases elsewhere in the Islamic world, ranging from 35 × 36 m. (115 × 218 ft.) to 14 × 14.5 m. (46 × 47.5 ft.). Perhaps their exclusive use by a single madhhab made larger buildings unnecessary. Around a central courtyard - grouped on the ground floor mosque, galleries facing each other along the lateral axis and an entrance vestibule which is frequently open will the courtyard along its entire length. Unlike the universal practice elsewhere I the Islamic world, the courtyard facades of these various halls are not marked by colonnades or imans but are fenced off by an unbroken surface of wooden panels. On the first floor, a narrow gallery overlooking the courtyard gives on to the cells in which the students lived; sometimes in the earlier madrasas these cells are also ranged behind the galleries on the ground floor.

No madrasas with facilities for all four madhasis incorporated into their ground plans me known in the Maghrib. One legal school—the Mäliki—maintained a virtually unchallenged dominion over the Maghrib throughout the mediaeval period. Perhaps this exclusiveness, which made it unnecessary for architects to provide separate teaching areas reserved for other madhasis, was the factor which kept the

madrasas of this area small.

This diminutive size gives such buildings an essentially human scale which well expresses the informality of teaching in the mediaeval Islamic world. They are made even more inward-looking and cloistered by the downward pitch of their roofs as seen from the courtyard. Yet the organisation of space within the building is by turns ingenious and dramatic. On the first floor the needs of circulation and accommodation are admirably devetailed; the corridor which encircles the courtyard and gives access both to individual cells and to the corner staircases is kept so narrow that two people can barely squeeze past each other III it. This frees extra space for accommodation. At the meetime, It is no walkway but has aesthetic distinction. The openings = regular intervals along its shaded length allow the viewer to catch partial glimpes of a courtyard bathed in sunlight. Most Moreocen makeases have a central pool with a fountain. Given the somewhat cramped dimensions of these courtyards, the presence of rippling water sets space into motion to m degree that would not be possible in larger expanses. This introduction of nature into the ordered, man-made world of architecture is typically Islamic. These fountains serve m further, more directly scenic, function too. For anyone within the halls bordering on the courtyard, the view into that courtyard is firmly directed by the act that the only entrance to these halls is m single arch. On the major axes of the madrasa this atch frames the fountain, which thus becomes the centrepiece of a carefully calculated composition.

Most Moroccan madrasas were produced either under the Mariaids in the 8th/14th century or under the Saidian or Filall sultans in the 17th/17th century. Since these two periods also saw much greater production of mosques and mausolea than other periods, it is unlikely that the building campaigns of the two periods in question themselves constitute evidence that a specific penchant for madrasas can be attributed to the patrons of the time. But the political background outlined above provides the missing explanation. Given the role of the madrasa in training the politically influential Maliki "wiama" it is not surprising that the patrons of these buildings when their names are recorded—should include the sultans themselves [c.g. the Ba Inaniyya madrases in Pas, Sale, Meknes and Algiers) and their high officials, and that they should have been lavishly endowed, as their luxurious decoration indicates.

More often, however, their names reflect their relative size (al-Kubrā, "the greater", or al-Sughrā, "the lessor); their location in a quarter dedicated to m certain trade (al-'Affarin, "the perfumers, or as in Fas and Meknes, al-Saffarin, "the metalworkers"). and occasionally even those who taught there (al-Misbähiyya is named after its first professor, Misbāh b. 'Abd Allah al-Yalsútí) or the subjects in which the madrasa specialised (thus the Shariyyin madrasa derives its name from the study of the methods of reading the Kur'an). Like so much religious architecture in Islam, these madrasus are often sited in the midst of bazaars-though there seems to III no connection between the presence of a madrasa in a particular quarter of the basaar and its endowment. Thus, while certain trades or crafts might singly or in concert put up the money for a mosque, the foundation of madrasas seems to have been the result of official patronage.

That the teaching function of these madrasas paramount is suggested by the almost total absence of the patron's tomb in them. One may note mexceptions the case of the 18th century Sulaymaniya madrasa in Tunis, founded by sulayman and containing the tomb of his Sulayman and earlier the case of the vizier Ibn Tafragin who was buried in the madrasa had founded 1 765/1364. Buth this official had significantly enough spent this practice was widespread.

Such oriental influences, though rare, mm of crucial importance. A later Tunisian madrata, the Muntaskriyya (837-40/1434-7) again demonstrates Egyptian influence in the unusual feature of a rectangular bastion or salient placed in the middle of each of the countyard façades. These projections do duty as portals to significant parts of the building and are thus explicable m interpretations—though in a different idiom—of the levins in cruciform disposition found in madratas further east. The

lateral lecture halfs of the Bu 'Inantyya madrasa in Fas also seem to be a local interpretation of the inda scheme. Yet another derivation from eastern models may be the use of the madrasa as me element in a larger complex. A typical example of this tashion is the madrasa built in Tlemcen in ca. 754/ 1354 by Suitan Abū Inān in association with the mosque, tomb and zāreiya of Sidi al-Halwi, or the mosque, tomb and madrasa of Sidi Ibrāhim built in Tlemen by the Zayanid Aba Hammu II, The Sahrīdi madrasa 🖿 📟 (721-3/1321-3) is situated right next to the mosque of the Andalusians; but as if this juxtaposition were not enough, it was by 250/1350 given dependencies significantly larger than itself. These included a now-vanished guesthouse, the Dâr Abl Habasa with 21 rooms, a large ablutions half and-most important of all-another madrasa, that of al-Sbariyyin, which still survives. This latter phenomenon of paired madeasas linked by a passage cannot but recall the Salihiyya complex in Cairo. Also relevant in this connection we the Kadima madrasa built by Abu Hammu I in Tiemcen in 64. 710/1310 for two pious brothers, for it comprised two balls, each with a house attached. Thus it seems that the principle of separate premises for separate courses was accepted even when there question of different madihabs being accommodated within a single building. For all their strong local character, then, these Maghribi madrasas attest the strength of eastern Islamic influences in this genre of building,

In many cases, the connection between a mosque and a madrasa is so close that the obvious conclusion to draw is that the mosque served inter alia as the oratory for the madrasa (e.g. the Walad al-Imam mosque, Tlemeen, erected in = 710/1310 next to the Kadima madrasa). Conversely, the oratory of many a Maghripl madrasa served as the mosque for the quarter where it was built. Accordingly, many of these madesus have minarets, and one even has a minber, thereby qualifying it to be a djāmi', It has even been suggested that the madrasa, by dint of becoming the most typical and widespread structure of the later mediaeval Maghrib, began for its turn to influence the layout of the mosque itself, specifically in its preference for square rather than rectangular courtyards, shallow rather than deep prayer halls and monumental portals on the major axis of the building. Something of the same process has been noted in Egypt, where the cruciform plan developed in the madrass was subsequently adopted quite widely for mosques.

Although the casual visitor to these Moroccan madrasas is upt to believe, after walking around half a dozen of them, that they follow a standard pattern, such an impression is quickly modified on closer examination. Their layouts suggest that while the architects in question had a firm grasp of the essential constituent elements of a madrass, they were unable to impose a preconceived solution on the sites abotted to them. These madrasas are located within an extremely cluttered urban setting, and so they commonly betray the various shifts of their designers to make the most of a difficult site. In these circumstances, it would be idle to expect to find a model which was more or less faithfully copied, or even a consistent, rational development of plan in these madrasas. Even so, all the Moroccan buildings of the genre share an emphasis interior rather than exterior façades in that they focus on a central courtyard; and their decoration is extraordinarily consistent in medium and ornamental repertoire alike. In these respects, then, it is justifiable to point to their marked generic similarity, which easily asserts itself over such contingent factors as site and size. Moreover, most of the Moreocean madrasas were erected—as noted above—in less than a century, from 670/1271 to 257/1356, a period which also encompasses the surviving work in Algeria and Spain.

Externally, their most striking characteristic is a negative one: they lack monumental façade. This is no novelty in Islamic architecture, but it is a feature which recurs so consistently in these buildings. that it seems justified to regard it as a deliberate principle. The only exception is itself so consistent that it proves the rule: virtually every madeasa has an elaborate portal, usually a densely carved overhang m hood on brackets, a kind of awning executed in wood. By its marked projection-sometimes as much as two metres-and its commanding height above the bustle of the street, it signals the entrance of the madrasa from a distance. The tortuous alleyways of these Moroccan towns would discourage any more marked emphasis on the facade: there is simply point of vantage from which a general view of the building could be enjoyed. In addition, one me two madrasas have a porch in front of the main entrance (e.g. the Bū Inaniyya, Fās, where the vault is crowned by a pyramidal roof). This is more in the nature of the lahar-sa of eastern Islamic basers than a monumental enclosed construction like the porch of mediaeval parish church. for it is simply a vault or dome spanning the street and supported by the walls which define that street. Most of these madrases abutted on to the principal streets of the town, streets that were nonetheless so that even a slightly projecting porch would have created mobstacle to traffic.

In common with contemporary local domestic architecture, these madrasas nearly always contain a bent entrance, partly to ensure that the interior of the building is sundered from the outside world—
matter of noise as well as proximity. Corridors leading off the entrance passage from left to right respectively give access to the fatrine area and a staircase leading in the upper storey (fAttarin and Misbāhiyya madrasas, fās), though other locations for the latrines do occur. The standard practice is to provide a series of cubicles around a subsidiary courtyard with a central fountain. This latter feature means that the area can serve for abhutions as well, and it is doubly proper therefore that it should be physically separated from the rest of the madrasa.

Several medrasas have minarets (Şaffārīn, Fās; madrasa of Fas al-Diadid; Bu Inaniyya, Fas) and this may serve as a reminder that the institution eften served as an independent place of prayer. Often enough it was located very close to a mosque m that there was no need for m separate minaret. Indeed, the interplay between mosque and madrasa was close and continuous. Just as the madrasa functioned as an oratory, m too did the mosque function as a place of teaching. This is especially relevant when it is remembered that most Moroccan madrasas in Fas, which boasted in the Kazawlyyin mosque (q.v.) the foremost centre of learning in me western Maghrib. Lectures in the Karawiyyin would therefore supplement the teaching of the madrasas. Indeed, in some sense the madrasas acted as overflow facility for the earlier and more prestiguous institution. This was clearly part of the function of the Mishahiyya madrasa, which was situated very close to the Karawiyyin and whose

students, mostly drawn from southern Morocco until recently, were enrolled in studies in the mosque, The Sabridi and Shafiyyin madratas illustrate the same phenomenon. Similarly, most Tunisian madrosas are found in Tunis itself, where the students could benefit from the teaching offered in the other great Maghribl university-mosque, the Zaytana, To concentrate the leaching function in a single urban centre in this way obviously made good sense from the economic point of view, and it meant also -since in both cases the centre in question was also the capital city-that the educational activity of mosque and madrata alike would be directly under the eye in the sovereign. Once again, then, the inherently political nature of the madrata asserts itself.

In view of the diminutive size of these Maghribl madrasas vis-a-vis equivalent institutions further east in the Islamic world, the emphasis laid on the prayer hall-which functioned concurrently lecture hall, as indeed did many mosques outside the regular hours of prayer-is noticeable, and is especially relevant in the context of the preceding remarks. It seems, in short, that these madrasas functioned quite widely as neighbourhood mosques. The case of the Bu 'Inaniyya madrata in Fis, though admittedly exceptional, offers supporting evidence for this theory. It is placed midway between the old city, clustered around the Karawiyyin mosque, and the new foundation of Fas al-Diadid, which at that time (751/1350) had not yet been given = Friday mosque. Thus the minaret of the Bo Inapivva could pass on the aghan given in the Karawiyyin mosque which was too far away to be audible in Fas al-Djadid, and the Friday prayer could accordingly begin there at the ordained hour. The foundation inscription of the Bu Inaniyya madrasa (originally named al-Mutawakkiliyya after one of the titles of its founder) specifically states that the building has the advantage of serving as a diamit. This madrase has many of the appurtenances normally reserved for Friday mosques—a minbar, a maessira, a 🖿 tuary and a Kur'an school, plus a unique external clock with a set of songs presumably intended to mark the divisions of the daily prayers. It even has a subsidiary entrance to the rear of the building, well as an unusual division of the main entrance into two sections, one of which is intended for those with bare feet and is accordingly provided with = treshold of running water. The same idea is applied within the building, for a water-channel runs laterally across the façade of the prayer hall and is crossed by a slab of marble at each side. The building is raised above the level of the bazaar and is reached by staircase provided with benches; but its in everyday life are aptly emphasised by the shops which line its main façade. It is precisely in its flexibility and in its multiple functions that the Bû 'Infinity's madrasa approximates most closely not to other madrasas but to the classical type of mediaeval Friday mosque, as much a community centre as a place of worship.

Although the Bû Inaniyya madrass is unique in the blaghrib in its comprehensive range of functions, it is typical in that it is a royal foundation. In this particular the ruler bore not only the expense of building but also financed the provision of water and endowed the salaries of the staff, the board and other expenses of the students and the upkeep of the building by making over to the institution of formidable list of properties.

Various methods are employed to emphasise

the role of the prayer hall in the Maghribi mediases. It must the constant must of the architects to give this hall pride of place in the overall layout, and majority of them achieved that aim by means of axiality. Sometimes, in the Şahridi and Bü Inaniyya madeasas, Fas, the entrance, courtyard and mosque were all disposed on the major chord of the building, and in the former we even the elongated rectangular pool played a spatial role. More often, the exigencies of the site and the predilection for a bent entrance meant that this axial emphasis could assert itself only at the entrance to the courtyard (al-'Ubbad madrasa, Tlemcen; Misbahiyya madrasa, Fas). So firmly did this axial arrangement establish itself that it was even maintained when it ran counter to the correct orientation of the prayer chamber, in the 'Attarla madrass, Fas, where in order to mark the kible accurately, the milwab has to be placed to the right of the entrance instead of opposite it as the internal logic of the layout demands.

The placing of the chambers for students varies quite markedly. In the earlier madrasas, all the living accommodation was confined to the ground floor (Şaftārin madrasa; madrasa of Fas al-Djadid). In the following decades, it continued to be standard practice for the more commodious madeasas to provide, in addition to the main accommodation at first-floor level, at least some student accommodation = the ground floor. It is here that the ornate wooden lattice-work screens known as maskrabiyyes into their own. Placed between the arcades or other openings of the court, they close off from the public gaze the sections of the madrasa which serve for student accommodation. The bleakness of the latter are is therefore masked by a lavish exterior. Symbolically enough it is only the outer, namely courtyard, face of these maskrably yas that is richly carved; the inner face is plain perhaps belits the sparse facilities offered to the students. Between these and the cells runs a corridor, for all the world like the cloister of some mediaeval western monastery. These screens continue on the upper storeys where their principal function is obviously to decorate the interior façade rather than to seal off the student cells. Sometimes the corridors or galleries are located only along the lateral walls of the courtyard ['Attarin madrasa, Fas; Tara madrasa), but they often extend to three sides, especially in the later examples of the genre. and there is even an isolated with student cells arranged unevenly but me all four sides of the ground floor (Saban madress, Fås). The extra height required for a suitably imposing prayer hall meant that there was frequently no room for student cells above it, and there is even a case of a prayer and assembly hall located on the first floor (Misbahiyya, Fās).

Nothing testifies more forcibly to the inadequate publication of these buildings than the widely divergent figures given for the number of student cells which they contain. Often enough these statistics are confused with the number of students which the madrass could accommodate. This figure is in itself wide open to discussion. According to some estimates, a typical cell can hold as many as seven or eight students. However, this is clearly inaccurate guide for rooms at the smaller end of the scale; indeed, cells measuring no more than 1.50 × 2 m. 2re quite frequently encountered and it would clearly be difficult to accommodate more than one or at the second two persons in such room.

That many cells were intended to house only # single occupant is clearly indicated by the custom that the student "paid" for his room by buying the key for it from his predecessor. Besides, in many cells the floor space was reserved for living as distinct from sleeping accommodation—a feature which will be discussed in more detail shortly. Within a given madrata, moreover the size and layout of individual cells will often fluctuate quite markedly. This is especially apt to occur when the madrasa has wails built at acute angles because of the spatial con-straints of the site. While windowless cells are known, it was standard practice to provide tiny windows, often with metalwork grilles, opening on to the corridor, the main courtyard, a subsidiary courtyard (especially in post-Marinid madrasas), or even-though rarely-on to the street.

The spartan fittings of these cells do suggest that the provision of maximum sleeping space **- a** priority of the designer. There was no bedding to clutter up valuable space. Students slept under a blanket on mat. Often projecting shelves below the ceiling function as bunk beds; they are reached by wooden bars mortared diagonally across the corners of the rooms so as to form a simple ladder. Sometimes a small table is provided—the students were, after all, issued with paper, pen and ink. A narrow slot beside the door permitted the daily ration of flat bread 🔳 🔝 distributed with maximum speed. Since that ration was fixed a one piece per student, the amount of bread set aside per day for the madrasa provides the necessary clue in calculating the maximum occupancy for which the building was designed. This quantity of bread was made available daily, according to the requirements of the walf which financed the institution, irrespective of whether the building was fully occupied or not; in practice, therefore, it often happened that at least some students would have extra rations.

The largest of the mediaeval madratas in Morocco is the Misbabiyya, for which a rally of 117 has been proposed, with 23 on the ground floor alone and the balance in the two upper storeys. A two-storey design is commoner, however, and therefore the 'Attarin madrass, in which Bel counted 34 cells, the Bu Inaniyya madrosa, whose capacity has been estimated at me students, are more representative. These are large numbers for buildings designed on such an intimate scale, especially when it is remembered that the prayer hall of such a madrasa could serve as the masdfid not only for the students and staff but also for the people of the area. It is bard to avoid the conclusion that the students lived a hard life-frequently cold, cramped and underfed.

With the fall of the Marinids, the golden age of the Maghribi madrasa was over. Not only are there comparatively few surviving madrasas of later date, but the majority of them are either attached to mosques or shrines, and dominated by them. They are intrinsically of very little interest (Rabat, Ceuta, Tangiers and Ksar el Kebir/Alcazarquivir). Only two deserve closer inspection—the Ben Yüsuf or Yüsufiyya madrasa in Marrakesh, dating to 972/1564-5, and the Shara'tin madrasa in Faq, dating to 1081/1670, both royal foundations. Their interest lies in their plans rather than in their decoration or structural techniques, for in these latter respects they are disappointingly derivative.

Although the Ben Yüsuf medrase is traditionally believed to have a plan based on that of the Marinid madrase whose site II occupies, it has a degree of

integration and symmetry foreign to its predecessors. Externally, it forms = almost perfect square but for the projecting polygonal mikrab. The internal disposition is admirable in its clarity and economy. Broadly speaking, the arrangement is tripartite, with a large porticoed courtyard-containing a substantial pool instead of the usual fountain—acting as the focus of the design and the student cells relegated to the flanking tracts. The oratory, placed as usual along the main axis, is also divided into three parts, a device already encountered in Marinid medianas. The arrangement of the cells, however, is novel; for instead of lining a long corridor they are clustered symmetrically in sixes or sevens around a series of seven small courtyards or dewayras. These are accessible via a cloister-like corridor which encloses the courtyard on three sides and also leads into the patio for ablutions. A similar arrangement is followed on the first floor, so that the madrasa contains about a hundred

A comparable lucidity of planning informs the Sharratin madresa. Here too the polygonal milesto projects forcibly, breaking the men tenor of imperimeter wall. This wall is stepped in three places but is otherwise straight. Exceptionally, three separate entrances give access to the corridors which debouch into the courtyard. Each of the three lesser courtyard façades is broken by three hays, and the whole elevation rises to an unprecedented three stories. Student cells, mostly arranged around somewhat noisome dumayers more like pits than courtyards, occupy three of the four sides On the ground floor; traditionally, students from various parts of country—the Tafilalt, the and eastern Morocco-congregate around appropriate dumayra to that each courtyard becomes in some sense a local microcosm. The oratory on the fourth side is similar to that of the Ben Yusuf madrasa. Despite the proximity of the building to the Karawiyyin, the milerab is seriously out of true, facing as it does the north-east. The high walls, cramped courtyard and blank spaces of the building give it a somewhat oppressive atmosphere. Its history does not belie this impression, for the madrasa was erected on the site of a MarInid foundation, the Madrasa al-Labbadin, which Mawlay al-Rashid had ordered to be demolished because its students had brought women there and given themselves over to debauch. Despite the radial symmetry of its plan, the building falls for below Marinid standards so far as its decoration is concerned. The large capacity of these two later madrasas and their eminently logical layout put them in a category of their own among Moroccan madreses and make them a worthy coda to a distinguished tradition.

(R. HILLENBRAND)

MADRID. [See MADINIT].

MADURA, an island north of East Java, separated from Java by a narrow strait in the north of Surabaya; it is 2,113 sq. miles in area, and has 2,385,300 inhabitants, among them 2,378,047 Muslims (1971). It is divided into four habitaties (regencies): Pamekasan, Sampang, Sumenep (Sungenep) and Bangkalan, all of them being districts in the Indonesian province of East Java.

In the course of history, many of the Madurese settled in adjacent areas of East Java, or participated in the government-sponsored transmigration programme to other islands. The Madurese language is spoken "mative" idiom by approximately e million people. It knows different styles according to the status of the speaking and the addressed person, but the differences are not so great as in Javanese, Balinese, or Sundanese. The traditional literature is written in a mixture of Madurese and Javanese, due to the strong influence Javanese culture and language have exercised on Madura. The customs of the Madurese, too, see similar to the Javanese, although they were to be less refined.

Geologically, Madura is related to North Java, consisting of the same limestone rocks as the hill range around Surabays and Rembang. Pauna and flora, too, we similar to East Java, but the soil is much less fertile. Of great economic importance is the breeding of domestic animals, especially cattle, which we the same time gives provision to the most popular sport, i.e. bull racing, which originally may have been connected with the annual division of the

samahs, or rice-fields. Another source of income is fishing and trading. As skilled sailors and shipmakers, the Madurese have developed their own type of

vestels (perahu Madura).

Islam is the religion to which the Machirese gemerally adhere, but as in other Indonesian societies, adat law still exercises its influence. In pre-Islamic times, Madura was divided into two main parts: Western Madura with traditionally close relations to Surabaya, and Eastern Madura with Sumenep as its most important centre. The ruler of Sumenep is said to have played an active role in the transition period between the kingdoms of Singasari and Majapabit which was characterised by the turbulences caused by Kubilay Khan's military plans. In both East and West Madura the ruling families are said to have had matrimonial relations with the court of Majapabit. Thus the first (legendary) ruler of Sampang, Lembu Peteng, M described as a son of the Majapahit king Bra Vijaya and the famous "princess of Campa" who confessed Islam. One of his grandsons, according to tradition, was the later Sunan Giri, one of the "nine walls" (wall songe) who spread Islam in Java. In Summer, a cettain adipati Kangduruhan, presumably a son of the first Muslim ruler of Demak, Raden Patah (d. 1518), played a role during the second and third quarters of the 16th century. These were probably the first Muslim rulers in Madura. After the final fall of Majapahit in 1527, Summer participated in fighting the still "heathen" kingdoms in the eastern corner of Java which were supported by the Balinese king of Gelgel (Klungkung). The court of Aros Bava (Bangkalan) embraced Islam in 1528, and the crown prince and later ruler, panembahan Lemah Duwur, tried to keep peaceful relations with Demak, Later he married a daughter of Adi Vijaya, the sulfan of Pajang (1548-82), and matrimonial relations with the Javanese sulfans continued mexist after Pajang was succeeded by Mataram (1589). Descendants of (West-) Madurese nobility influential in Mataram, especially in the 17th and 18th centuries. The relationship between Sumenep and Mataram, however, was less fortunate: after the whole of Madura was conquered by the army in Sultan Agung in 1624, the ruling family of Sumenep was extinguished. A Javanese prince, Angga Dipa (from Jepara?) became governor, residing in Sumenep.

After 1570, the situation in Madura became turbulent again. After the defeat of Makassar [q.v.] by the Dutch admiral C. Speelman in 1667 and 1669, part of the Makassarese nobility and their soldiers fled to Madura and other areas in North Java to earn their livelihood 🖿 pirates. In 1670, raden Truna jaya, a descendant of the last ruler in West Madura, was allowed by the susuhunan of Mataram, Amengku Rat I (1646-77), to reside in Madura, which he soon got under his control. For different reasons, not all of them being quite clear, Truna Jaya, who was spiritually supported by the Sunan Giri, joined the Makassarese pirates against the Dutch East India Company (Vercenigde Oost-indische Compagnie, V.O.C.) and their ally, the susuhuman. After having destroyed most of the North Javanese ports [except Jepara) and appeared the Makassarese in 1676, Truns Jaya turned to the interior of Java with his forces, which included part of the Makassarese nobility. In 1677 he lost Surabaya after it was attacked by Speelman and Mataram troups, and he established new headquarters in the old royal town of Kediri in East Java. In the same year 📰 sacked the heston (palace) of the susukunan. After the old susukunan's death, his Amengku Rat II (1677-1703) took stern against his former protégé Truna Jaya and attacked Kediri. Truna Jaya escaped, but finally, at the end of 1679, he was taken prisoner and a few days later killed by the susukunan.

After x683, the V.O.C. virtually ruled over East Madura; this was legalised by Mataram in 1703, and in 1743 the V.O.C. extended its suscerainty over the whole Island. Having old grudges against Sultan Agung and the house of Mataram, the Madurese were in favour of Mataram's being divided in 1755. In the "Javanese War" of 1825-30, they sided with pangerang Dipa Negara. This led to m limitation of the local rulers' power by the Dutch, until in 1885 the island was put under direct Dutch rule. During the revolutionary years after World War II, Madura was part of the republican territory as acknowledged

by the Linggajati Agreement in 1947.

[W. H. RASSERS - [O. SCHUMANN]]

MADYAN SHU'AYB, a town of northwestern Arabla, lying inland from the eastern
shore of the Gulf of 'Akaba; it is mentioned in the
mediaeval Islamic geographers as lying on the pilgrimage route between the Hidjaz and Syria, which
there went inland to avoid the mountainous coeat of
the Gulf.

The name is connected with that of the tribe of Midianites known from the Old Testament (LXX Μπδιαγ, Μπδιαγ; in Josephus Μπδιηνίται, ἡ Μπδιαγή χώρα) but it can hardly be used without further consideration to identify the original home of this tribe, in the town might be in later Midianite settlement, and besides, it is difficult to fix the real home of such wandering tribes. In the Old Testament, a town of Midian is not mentioned (not even in Kings, xi, 18 where "Ma'um" may conceivably be read). On the other hand, Josephus (Amiquisies, it, 2, 1) knows Madiane as it town on the Erythraean

Sea, as does Eusebius (Onomast., ed. Lagarde, 176); in Ptolemy (vi, 7, 2) it is mentioned as a town on coast and Modiana or Modouna while in another passage he gives it as an inland town under the name Madiama, a difference which is explained by the actual position of the town. In Muhammad's time there is only one reference (in Ibn Ishāk) to the town of Madyan, when the Prophet sent an expedition under Zayd b. Häritha thither. There are occasional references in the poet Kuthayyir (in Yakat), who speaks of the monks there and in the record of Muhammad b. al-Hanafiyya's journey to Ayia. According to Yakat also, Madyan was occasionally the residence of the Umayyad prince 'Abd al-Wahid b. Sulayman, and visits to him there by the poet Ibn Harma [q.v.] are mentioned. In the geographers we find Madyan only as a town near the coast, six days journey from Tabuk; it was the second station on the pilgrim's road from Ayla to Medina and was a dependency of Medina. In the ard/9th century al-Ya'kübi speaks of its position in a district rich in springs and watercourses, gardens and date groves and of its mixed population. Al-Istakhrī says it is larger than Tabūk and describes from his own observations the spring there, from which Moses watered the flocks of Shu'ayb (see below); it was now covered by a house which had been built over it. The town then began to decline gradually. In the 6th/12th century al-Idrisi says it is an unimportant little trading centre with scanty resources: al-Makrizi in his Khitat describes Madyan as affording its inhabitants only a modest livelihood, with declining trade, and making various remarkable ancient buildings and ruins still standing there (ed. Bulak 1270/1854, i, 186-8).

It was only in the roth century that the district of Madyan began to be visited by western travellers like Ruppell and Burton, and was only described in detail in this present century by Musil and Philby, with a preliminary investigation of its antiquities being undertaken recently by a team led by P. J. Part. The mediaeval town probably lay in the middle reaches of the Wadi 'l-Abyad for Wadi 'l-'Alal, as its lower reaches | called), which carried the ancient pilgrimage southwards. On the western side of the wadi, in lat. 28° 30' 30" and 16 miles/25 km. north-east of Makna (Ptolemy's Makna) on the 'Akaba Guli coast, is the archaeological site known locally Magha'ir Shu'ayb "the caves of Shu'ayb", referring to a large necropolis with tombs carved into a very soft and triable limestone, hence much worse-preserved than those at Petra. As Musil and Philby correctly surmised, the tombs are Nabataean; the surface pottery is largely Nabataean and Roman, and a fragment of a monumental inscription in Latin has been found. Parr's expedition also noted extensive of ruins nearby on the eastern side of the wadl, and the participants in the expedition prefer to locate the Islamic Madyan at these latter sites of al-Malkata and al-Maliba.

In the Kur'an, following the Old Testament, there are repeated references to Madyan me people: for example, in the stories of Moses' stay with them (XX, 4z; XXVIII, 21 if., 45), where his father-in-law (Jethro in the O.T.) is still anonymous, or in one of the stereotyped legends of prophets in which the Madyan are punished because they would not believe their prophet Shu'ayb (VII, 83-91; XI, 85-98; XXIX, 35-6). This Shu'ayb me later identified with the father-in-law of Moses, for which there is no authority in the Old Testament; but in the early shras (XV, 78; XXVI, 176-9x; XXXVIII, 12/x3) it is not the people

of Madyan but the askab al-ayka "men of the thicket" who reject the divine message brought by Shutayb. A. F. L. Beeston has recently suggested that these last were the devotees of the Nabataean deity Dusares or Dhu 'l-Shara [q.v.] (and Musil noted that the lower part of the Wedl 'l-Abyad was full of dense undergrowth) and that they must nevertheless have been closely connected with Madyan, despite the Muslim exegetes' distinguishing of two separate missions for Shu'ayb; the of Shu'ayb's mission in the Meccan suras might be considered as that intended for an audience familiar through its trading links with the cult of Dhu 'l-Shara in northwestern Arabia, and that of the Medinan suras for one familiar only with the general existence of Madyan. See The "Men of the Tanglewood" in the Que'an, in JSS, xiii (1968), 253-5, and also C. E. Bosworth, The Quranic prophet Shutaib and Ibn Taimiyya's spisite concerning him, in Muséon, Ixxxvii (1974), 425 ff., and saufava.

(F. BURL - (C. E. BOSWORTH)) KITAB MAFAKHIR AL-BARBAR, the title of an anonymous work written to the greater glory of the Berbers of Morocco and al-Andalus, existing in a ms. of the Bibliothèque Générale of Rahat (cote 1020 D). E. Lévi-Provençal published from this, as Fragments historiques sur les Berberes meyen age-Nubadh ta'rikhiyya fi akhbar al-Barbar fi 'l-kurun al-wusta (Collection de textes arabes publiée par l'Institut des Hautes Études Marocaines, i, Rabat 1934), the following extracts: a chapter from Ibn Hayyan's Muktabis on the relations of al-Mansur Ibn Abl 'Amir [q.u.] with the Berbers of the Maghrib (pp. 1-37), a passage from Abū Marwan 'Abd al-Malik al-Warrak's Mibbas ft akkbör al-Maghrib wo 'l-Andalus wa-Fās 🚥 Ziri b. 'Atiyya and his son al-Mu'izz (37-42); = extended section on the revolts, the Berber chiefs and kings in Spain and the Maghrib, stemming in large part from Ibn Hammadüh ai-SabtFs Muhtabes (43-60), with the intercalation of passages borrowed from Muhammad b. Abi 'l-Madid al-Maghill's Küdb Azidb al-Barbar (48-52, 57-8), from al-Warrak on the Almoravids (53), from Ibn Bassam's Dhakhira on the Barghawata and the Almoravids (54-7) and from Abu 'All Ibn Rashik on the Almohads (59-60); concise biographies of scholars, writers, poets, saints and even false prophets of iiii Berbers (60-78); a passage from Ibn Hazm's <u>Diamhara</u> on the Berber tribes established in Spain (78-80); and finally, a list of **111** Almoravid governors of al-Andalus according to al-Warrak's chronicle (1-2).

The only indication about the anonymous author from the biography of the shaykk Abu 'All Salin b. Abd al-Hallm, where it is said that the latter was alive in 712/1312, the very year in which the compilation was put together. But we have here quite clearly the case of a Berber who, although a good Muslim, is especially proud to belong to a people whose entitlement to glory he undertakes to proclaim, since many people consider this people = "the most erring people, the most ignorant, the most lacking in good qualities and the farthest from virtuous deeds". In order to achieve this aim, he eschews retailing all the history of the Berbers since the time, so he says, when they settled in the Maghrib after having fled from Syria in the wake of David's killing of Goliath, and limits himself to recalling their part in al-Manşûr Ibn Abi 'Amir's expedition against Algeciras in 368/978-9, but he nevertheless intends to speak of "their kings during the Islamic period, their chiefs, their rebels, their genealogies and some of their famous men". This programme seems then to have been carried out.

Lévi-Provençal thinks that Ibn Khaldun probably used this Kidab Majakhir al-Barbar, and his opinion is substantially shared by Maya Shatzmiller, who has recently drawn attention to the existence, in the Bibliothèque Générale of Rabat, of a ms. (cote K 1275), whose contents she has studied in ■ note Une source méconnue de l'histoire des Berbères: le Kitāb al-Ansāb li-Abi Hayyān, in Arabica, xxx/1 (1983), 73-9. It is quite certain that the fragments published by Levi-Provençal belong to this ms., so that the problems posed by a compilation of this kind can now be examined with greater sureness. Moreover, Lévi-Provençal had published Un nonneau ricil de la conqueté de l'Afrique du Nord par les Arabes, In Arabica, i/t (1954), 17-43, based m a text which appears equally in the ms. in question, and he considered that the Mafakhir al-Barbar could well be attributed "with likelihood to Ibn 'Idharl', but Nme. Shatemiller comes very near to attributing to Aba Hayyan (654-745/1286-1344) the authorship of the compilation which she describes,

(ED.)

AL-MAPARROKHI, MUPADDAL D. SA'D, Buther of the local history of Işfahân in Arabic entitled Riedlal Mahdsin Isfahân. The work appears to have been written during the reign of Nalik Shāb (465-83/1072-92). Nothing is known about al-Māfarrūkhl's life, but it is apparent from the wealth of poetry contained in the work and from the frequent of rhymed prose that he was an adib. He cites his father, Abu 'l-Fadi Sa'd, as his glayli and quotes several of his poems.

He claims descent (92) from one Māfarrūkh b. Bakhtiyār who in turn was descended from Adhurshāburān b. Āghurmānān, whom he describes as completing the building of the walls of Djayy, the fortified nucleus of pre-Islamic Işfahān, — hundred and seventy years before Islam. Sam'ānl chims (af-Ansab, fol. 502b) that the misba al-Hāfarrūkhi relates only to mamāl of the original Māfarrūkhi, but the genealogies of earlier bearers of the nicha seem in several instances to go back to Mārarrūkh himself (cf. Abu Nu'aym, Ahhbar Işfahān, i, 124-1; ii, 142, 272, 325). On his grandmother's side, al-Māfarrūkhi claims descent (25-6) from a poet in the retinue of 'Adud al-Dawia named Abū Muslim Tāhir b.

Muhammad, himself allegedly descended from Abb Muslim the 'Abbasid revolutionary. A final ancestor cited on his maternal grandmother's side was related to a one-time governor (99).

Al-Mafarrükhl's book reflects his education in adab and familiarity with court culture. Unlike other local histories of the period, it pays little attention to religion and contains no biographies of 'alama'. Instead, it contains poetry in praise of Isfahān, descriptions of the area's points of interest, tales from the pre-Islamic period, and encomiums of Büyid and Saldjükid rulers.

An 6th/14th century Persian translation of the work contains many interpolations that postdate at-Mālarrūkhl's composition. These have been identified by Browne.

Bibliography: Kiläh Mahdsin Isfahān, ed. Djalāl al-Din Tihtānī, Tehran 1312/1933. The Persian translation, Tardjuma-yi Mahdsin-i Isfahān, im 'Abhās Ikbāl, Tehran 1328/1949, is studied at length by E. G. Browne, Account of in rare manuscript history of Isfahān, in JRAS, liii (1902), 411-46, 661-704. For reference to manuscripts, see C. A. Storey-Y. E. Bregel', Persidshaya literatura II, 1021-2.

MAFIA, the name of a group of islands off the Tanzanian coast in approximately 8'S and 40° E. They consist of a main island commonly known as Mefie Island, but by its Inhabitants as Chole Shamba (Swa. "Plantation Chole"); wery small island known = Chole or Chole Mjini (Swa. "Town Chole"); Juani; Bwejuu; and Jibondo. The only references in Arabic literature are in Ahmad b. Madjid al-Nadidl's log books, where it is called Manafiyya, and in the anonymous History of Kilwa, where it occurs once as Manfasiya, four times as Manfiyya, and three times as Manfasa. In Portuguese there are further references in a now lost Chronica dos Reyes de Quiloa ("Chronicle of the Kings of Kilwa"), where it is generally spelt Montia, and in other historians and archives. In Swahili, Freeman-Grenville has published a traditional history of the town of Kua, Juani Island, Malia; a variant version of this by Amur Omar Saidi, a former hdd!, has been published by D. W. I. Piggott, and another version by T. M. Revington. At Kisimani Malia (Swa. "at the well of Malia"), H. N. Chittick has excavated the remains of mosque and other buildings; he has likewise cleared the palace and a number of mosques at Kua, Juani Island.

No consecutive history can be established for the main island. The founder of Kilwa, 'All b. al-Husayn b. 'All, retired to Mafia in his old age, and set up his son Muhammad as ruler in co. 386/996. He was succeeded by his brother, Bashat, who raied for four-anda-balf years. The third ruler of Kilwa, Dawad b. 'All, also made Mafia his residence, after abdicating at Kilwa in favour of his son. In the reign of Dawad b. Sulayman of Kilwa (? ca. 526-66/1131-70), Malia is mentioned as a mere appairage of Kilwa. It is not mentioned again until the reign of Sulayman b, al-Hasan II (ca. 1294-1308), when it revolted. It was recovered post 1310 by his son, al-Hasan b. Sulayman II (ca. 1310-33). When the Portuguese took Kilwa in 1505, Maiia passed quietly into their hands. They bartered goods for local produce, cattle, ghee and guns copal. They had a small blockhouse, but its site has so far not been identified. In 1653 the islands were pillaged by the King of Pemba, who was forthwith punished by Francisco de Seixas Cabreira, When the Portuguese lost Mombasa to the Umani Arabs in 1698, Malia again quietly changed hands; and when, after a brief comeback (1728-9), the Umanis again expelled the Portuguese from Mombasa, several Portuguese residents in Masia decemed it wiser to become Mustim. Under the Umanis, Araba gradually acquired the southern part of the main island, turning it over to coconut plantations, for which its sandy soil is especially favourable.

The excavations carried out by Chittick show that Kisimani Mafia was imperiant from the 6th/nzth to 8th/nzth centuries, but that it thereafter declined. According to the diary of Lt. (later Admiral) J. B. Bustace, the last inhabitants departed after the disastrous cyclone of 1872. In Kua it has been shown that most of the buildings belong to the 12th/18th century. The site covered some thirty to forty acres, including the palace, and there were at least seven mosques and two cemeteries. It is now totally deserted. There are also late mediaeval Islamio Chole and Jibondo Islands.

In Uman times, the islands were ruled from Chole. When the Germans took the islands over when German East Africa was proclaimed in 1885, they built a headquarters there and a street of shops, which survive. The administrative headquarters were in 1912 transferred, however, to Kilindoni, on the main island, and this is the present seat of government. The greatest number of the inhabitants, in all about 16,000, live in the northern part of the main island. They are almost all Muslims. Some aspects of their society have been described by A. P. Caplan. Regrettably, there is messaged description of the state of Islamic learning, albeit clearly there is a class of literali; at other levels witchcraft practices abound.

MAPROSHAT (A.), that which is spread out (on the ground or on a bed), bedding.

In mediaeval times, there was no adequate, single term for designating furniture and furnishings; this idea was expressed rather by the term forght (meaning not only "that which is spread out" but also, by extension, the more solid domestic objects which filled the role of "furniture" according to western concepts—whence the adjective mafray [vernished, provided with furnishings" [see AffAla in Suppl.]) or else by collocations of words such as forgh and dis (lift carpets, mattresses and utensits), forgh and affait (carpets, mattresses and domestic

articles), etc. Carpets, mats and cushions played an important part in domestic interiors, at this time. Complete furnishing ensembles were often put together through the use of various cushions, set around low oriental tables which were quite unsuitable for the use of chairs and stools (seats of this kind existed, but had restricted functions: they were carely used at meal times [see ATHATR]). and by use of cushions there were formed circles (balks, with its sade or place of honour, often a or a throne, sarir, lakkt, in palaces) for gatherings of friends, family celebrations, literary discussions, etc. The use of rigid seats and of sofas and couches more limited, and that of cushions, for sitting upon, widespread (but this depended in the circumstances and the social setting). People leading a simpler life made do with sitting on very simple cushions or me a carpet or mat, but rarely on the actual earth. However, in the gatherings of high society, the persons farthest from the sade received the lowest seats and had to make do with a single cushion (other persons each got two cushions, one on top of the other, or a cushion folded into twoquite m social hierarchy!) or m carpet. Actually to sit on the earth was considered, in such social groups, to be a sign of mourning.

In many households, the carpets and mats were protected by means of a lining, and it was difficult to distinguish the carpets from the mattresses, but better-off households had clearly-distinguishable mattresses which were placed m bods with frames (a rare and expensive piece of furniture). On the carpets [see BISAT in Suppl.] were placed other domestic articles which served as mattresses, seats and bedding at one and the same time, according to the so-called "oriental" way of life. Mattresses (bardha'a, didiā', farsh, firāsh, hashiyya, iwats, mudarrabo, markad, mariaba, majrah, mijrāsh, jarrāka and finfisa) were usually placed on the ground. Cushions (bardha'a, da'ira, hashiyya, husbana, hif'a, mikhadda, misfaka, misdagha, misnad or misnada, mudawwara, numruh, finfita, luk'a, lukiyya or wisāda) varied greatly; they were distinguished by their functions (cushions for the back, for sitting on, for leaning on with the elbow and pillows) and by their shapes (big, small, elongated, round, rectangular, etc.). Often, however, their original function had become changed. Thus mikhedds, properly "pillow", might be used for sitting upon, and wisade, properly a much larger cushion often used for supporting the back, might be used for "pillow"; in the spoken language of mediaeval Egypt, mikhodda was used for all kinds of cushlons and the word wisada had almost disappeared from usage so that, in order to designate a pillow, resort had to be made to a pleonasm, mithadda ii 'l-thadd "pillow for the head", lit. "for the cheek", "Offering" a cushion (to someone who had been invited) was literally "throwing down" (jaraha) a cushion, but this verb was also used, by extension, in the meaning of offering & chair, stool, etc., and thus symbolises | transition between a purely "oriental" mode of life and the use, in certain circles, of solid furniture.

Sedentary civilisation was always proud of its luxury cushions (see J. Karabacek, Susandschird, Leipzig 1881, e.g. 71, 81: cushions covered in embroidered tapestry), and sometimes it accused the ancient Araba of mem having had any of them (Ibn Khaldûn, Muhaddima, tr. Rosenthal, i. 347-8 and n. 85). But this accusation was far from the truth; the Bedouins had their own kinds of cushion (see al-Tha*alibi, Fifth al-lughs, Beirut 1881, 130-1, and

other sources). The arts of weaving, making tapestries and embroidering cushions were widespread amongst Bedoulus, country-dwellers and citydwellers all through the ages. Iconographic evidence of the richness of shapes and functions of mattresses and cushions, as well as the forms and colours of curtains, is given in well-known miniature paintings (e.g. in the series illustrating the works of Dioscorides and al-Hariri). Curtains and hangings had been known amongst the Arabs since pre-Islamic times; their role in Islam sedentary civilisation was even meet important, as much for the daily life of the greater part of the various social classes as for the palaces and their modes of behaviour (see Ibn Sida, al-Muhhassas, Cairo 1316/1898-9, iv, 75; Ps.-Diabis, K. al-Tadi, tr. Pellat, Paris 1954, 56 ff.; al-Washsha, al-Muwantsha, Cairo 1953, 230-1; al-Shabushti, K. al-Diyerdt, Baghdad 1965, 42, 43, 45, 220, 270, 188, 424; al-Kadl Ibn al-Zubayr, al-Dhakha ir wa 'l-luhaf, Kuwait 1939, pasaim; W. H. Worrell, in Art Islamica, i [1934], 219-22; M. Canard, in Byzantion, xxi [1951], 363; D. Sourdel, in REI, axix [1960], 132; E. Ashtor, Histoire des prix et des salaires dans l'Orient médiéval, Paris 1969, 87, 178, 255). The term mafrasjät (modern Tkish, mefrasat) still appears today in the labelling and signs of shops which sell curtaining, decorative fabrics, cushions,

(J. SADAN)

MAFSUL (A.), a term used to denote certain juridical categories of landed estates in Syria in the time of the Mamfüks. The word has no connection with the Arabic root f.-s.-l., but is derived, according mal-Nuwayri, Nikdya, viii, 256, "from the Frankish" vassal.

MACHARIBA (A., pl. noum), denotes the Arabic-speakers of the Muslim West (Maghrib, pl. Magharib), - opposed to those of the East (Mashrik, pl. Masharik), known as Masharika, This division of Arabic-speakers into Masharika and Maghdribo-which is a continuing process, discernible in the contemporary dialects, variously categorised - Oriental and Maghribl-may be traced from its origins. The frontier between the two major groupings-Muslim Spain included, in spite of its special circumstances and its separate destiny-is still located to the east of Tripoli, at Lebda, which accounts for the peculiar situation of Libya, constantly divided between its Maghribl and Oriental associations,

The Arabs who settled on a permanent basis in the West rapidly became sufficiently Maghribised or Hispanised to appear different from their racial compatriots who had remained in the East, as is indicated by a considerable quantity of concordant evidence. From the middle of the and/8th century onward, the Arab colony which established itself in the province of al-hayrawan (the AM Ifridiya) became aware of its specific local identity (see M. Talibi, al-Mazkrib min al-fath ild awakhir al-rub al-aempal min al-karn al-thant wa-budhar al-thu ar bi-kawmiyydi mahalliyya, in no. 4 of Silsilat al-diresat aliditima iyya, CERES Tunis 1979, 207-30) in violently opposing, at the time of me great Khāridil upsurge of 122/740, fellow-Muslims who had meet from the East to support it, while regarding it, it is true, with all the contempt hitherto reserved for Berbers alone. A similar evolution, with opposition between indigeneous Arabs (baladiyysis) and "foreigners" arriving at a later stage, is also to be observed in Muslim Spain, although the distinction became blurred in the course of time (see E. Lévi-Provençal, Hist. Esp. mus., Paris 1950, I, 44-53, 83, 110, 345). In the East, the Maghribi (pl. Maghariba) in turn created the impression of a poor relation, and this old mediaeval reflex is tenacious that it continues to the present day, with varying ansances and in varying degrees, to colour Mashrik-Maghrib relations at all levels, including that of music. In spite of all the developments that have taken place, the Maghrib still admires the Mashrik and imports from it, much more than it exports to it, cultural consumer goods such as books, films and records.

We are concerned here with a very ancient phenomenon which deserves analysis and explanation, and to which no overall study has yet been devoted. The following are examples dating back to the first two centuries of Islam: Abb Muhammad Ibn Imran al-Tudilbi (d. 125/743 or 745), resident in Tunis, cherished a genuine feeling of exile in this "barren corner", that is the Maghrib (M. Talbi, L'Emirat aghiabide, Paris 1960, 43); the Tunisian Ibn Farrükh. who studied in 'Irak under Abū Hanifa (80-150/700-68 [q.v.]), was humiliated on account of his Maghribi demeanour (it 'i-maghribiyya, ibid., 20); Asad h. al-Furât (d. 212/827 [q.v.]), who became one of the most eminent teachers of al-Kayrawan, man allowed to attend lectures given by Malik (d. 179/796 [q.v.]) m group of Egyptians, because he was too intelligent to remain in the class of the Maghariba (ibid., 20); etc. The Magarib was thus visibly subject to an interiority complex vis-d-vis the Mashrik, a fact which led Ibn Bassâm (d. 542/1147) to write indignantly: "The people of our lands are easer to ape the Orientals . . . to such an extent that if a raven were to croak in those distant horizons, or a fly to buzz in the furthermost extremities of Syria Trak, they would fall on their knees if before an idol, and recite all this like words of Scripture" (Dhakhira, ed. Cairo 1358/1931, i/1, 2).

This explains why the dominant direction for the movement of elites has above all been established as from the West to East. For purposes of demonstration, it may be noted that al-Makkarl (d. 1041/ 1641 (q.v.)) compiled a list of 307 Andalusians who visited the Orient (Nafk, ed. Ihsan 'Abbas, Beirut 1968, ii, 5-704) 🖿 against 248 Orientals who 🚃 the reverse journey (ibid., ili, 5-149). An more significant fact is that no great poet of Damascus, of Baghdad or of Cairo, in fact, no poet at all, ever set out on the road to the Machrib. The rible, a journey usually with the combined objectives of pilgrimage, of study and occasionally also of trade, took place, for evident religious cult and cultural reasons, in an eastward direction. The traveller usually returned to his own land endowed with

knowledge and prestige,

But it very often happened that a traveller settled permanently in the Orient. Thus Magheibl colonies were formed in the major eastern metropolises which marked the pilgrimage routes, particularly at Alexandria, at Cairo, at Küs, at Damascus, at Medina and at Mecca. In the absence of a systematic general study, their history is still fragmentarily and imperisetly understood. It may, however, be assumed that if the Maghribi presence was felt, and at times concentrated, in the East, it never played in history and in society a role equivalent to that of the Persians of the Turks. In perticular, there was no Maghribi in the Burya, and no influence on institutions or on the style of life.

Berber women were highly regarded in the Umayyad and 'Abbänid courts. Hishām b. 'Abd al-Malik (105-25/724-43) requested some of them from his governor of Hrikiya (M. Talbi, op. lend., 33); Abū Dia'far al-Mansūr (136-58/754-75), himself the som of Berber mother, Salāma, married m woman from al-Kayrawān, Umm Mūsā, mother of the future caliph Muhammad al-Mahdī (158-69/775-85); Rāḥ, eriginating from the Nafza tribe, was the mother of 'Abd al-Raḥmān al-Dākḥil (138-72/756-88), the founder of the Umayyad dynasty of Spain; Katīl was the mother of al-Muttadid (279-89/893-902); and Karāṭis was the mother mal-Kāhir (320-3/

932-4; M. Talbi, op. land., 42-3).

In the armies of the Umayyad and 'Abbasid caliphs, the role of the Maghribls, without ever having the importance of the Khurasanis or of the Turks, was far from being negligible. Under the leadership of Țărik b. Ziyad, Berbers played a decisive part in the conquest of Spain. In 98/717 the army of Ifrikiya (ajaysh Ifrikiya), led by al-Mughira b. Abi Burda al-Kurashi, participated in a major assault, which ultimately met with failure, on Constantinople (Abu 'l-'Arab, Tabakāt, ed. Ben Cheneb, Paris 1913, 22; Iba 'Idhari, Bayan, ed. G. S. Colin and E. Lévi-Provençal, Leiden 1948, i, 49). In Baghdad, it from the time of the reign of al-Mutawakkil (232-47) 847-61) that the Maghariba began to play, in the army and under officers drawn from their own ranks, a considerable role. They received pay equal to that of the Turks (al-Tabari, Tabrigh, ed. Abu 'l-Fadi librahlm, Cairo 1968, fx, 155), and, with the latter, they nominated al-Mustafin (248-52/862-66) as to al-Muntasir (247-8/861-2; al-Tabari, ix, 256). They abandoned him subsequently, taking an oath of loyalty, again in parinership with the Turks who played the role of a driving force, to al-Mu'tasz (al-Taharl, ix, 287) and participated actively in the civil war which broke out between a51/865 and 252/866 (al-Taberī, ix, 290, 295, 304-39), in 255/869 they took part in the dethronement and assassination of al-Mu'tazz, who was unable to pay their salaries and those of the Turks, and, from this moment onward, they ceased to occupy the forefront of the stage.

It is not until the time of the Fatimids that the Maghribls are seen making a massive influx into the Orient. The Fatimids owed their victory to the Kutama Berbers (q.v.), and the latter followed them to Calco and to Damascus, forming the spearhead of their army and of their Isma'lli propaganda. Diawhar ai-Şikilli, the conqueror of Egypt, gave them positions of authority at all levels of powers. "In all functions, without exception, Diawhar appointed a Maghrib! as partner to the official who already held the post", writes al-Makrizi (Ini'ar, 78). Between 361/972 and 363/974, the Kutama were the instigators of numerous riots in Cairo. In 386/996 they imposed their chieftain, Ibn 'Ammar, on the caliph al-Hakim (386-471/996-1020). In Damascus, the presence of the Maghariba also led to trouble. The most serious riot, in which they ciashed with the indigenous population, broke out in a61/1060. The town and the Great Mosque suffered severe damage.

Numerous representatives of the Maghrill clite

were not content with visiting the East; they settled there. Obviously, an exhaustive list cannot be presented here. For purposes of illustration, the following among the most eminent: al-Turtushi, born in Tortosa in 452/2059 and died ca. 525/2231 in Egypt, where he exercised wide influence = 485h and ascetic; Ibn Djubayr, the celebrated author of a rible, born in Valencia in 540/1145 and died in 514/2217 in Alexandria, where he gathered around him a circle for the study of tradition and of Süffsm: Muhyl 'l-Din Ibu al-'Arabl (560-638/1165-1240 (e.v.)), the most famous and most controversial of the Suffs, born in Murcia and buried in Damascus in the turbs of the distinguished family of the Iba al-Zakl, who had welcomed him; the historian 'Abd al-Wähid al-Marrakushi who, born in Marrakesh in 581/1185, took the road to the East in 613/1216 and died there some time after 621/1224, having lived successively in Egypt, Baghdad, the Hidjar and Damascus; Ibn Marzūk (ca. 710-81/1310-79 (q.v.)), who, born in Tlemeen, left in 771/1370 for Cairo where he enjoyed high repute and became \$adi, preacher and teacher; Ibn Khaldun who, born in Tunis in 732/1332, settled permanently in Cairo (784-808/1382-1406), without ever relinquishing his Maghribl clothing; al-Makkarl who, born in Tlemcon in 986/1578, left in 1027/1618 for the Orient, where he composed at the request of his students in Damascus his much-praised Nafh al-fib, dying in Calro in 1042/1641.

Among the contemporaries, the following may be noted: Bayram al-Tūnusī (1840-89), author of the Safwas al-tībār, who settled in Cairo; the amis 'Abd al-Kādir (1807-83) who, freed and given a pension by the French authorities, in 1855 chose to live in Damascus where he played an appreciable moderating role; 'Abd al-Kādir al-Wardighī al-Maghrībī (d. 1895), who was one of the most eminent teachers of al-Aahar; and 'Abd al-Kādir al-Diazā'rī (1887-1945), m distinguished member of the Arab Academy of Damascus.

Finally, it may be recalled that the founder of a religion—that of the Barghawata {q.v.}—Yūnus b. Ilyās b. Tarif (227-71/842-84), sought bis inspiration in the Orient (M. Talbi, Hérèsis, acculturation et nationalisme des Berbères Barghawata, in Actes du premier congrès d'études des cultures méditerrandennes d'influence arabo-berbère, Algiers 1973, 217-33), and that the founder of m school and of a state, Ibn Tūmart {q.v.} (cs. 471-524/2078-1130), there brought together the elements of the doctrine which gave bitth to the Almohad movement.

The presence of Maghāriba in the East was not confined exclusively to distinguished individuals. It also comprised populous colonies of merchants, students and various types of émigrés. Information on these colonies is very scanty. Only that of the lirikiyan Jews who settled in Cairo between the 11th and 13th centuries is fairly well-known today, through the medium of the Geniza documents, edited by S. D. Golteln (A Mediterranean society, i, Berkeley-Los Angeles 1967, ii, Berkeley-Los Angeles -London 1971, iii, Berkeley-Los Angeles 1978; and Letters of medieval Jewish traders, Princeton 1974). These documents reveal a well-organised and perfectly-structured world, endowed with efficient means of communication and of currency transfer, all of this in the service of important commercial operations covering not only the whole of the Mediterranean basin but extending m far as the Indian Ocean, The recent study by J.-C. García has in addition underlined the decisive role played by

the Maghariba in the restoration and reinforcement of Sunnism in Egypt after the fall of the Fatimids. At Kuna [q.v.] on the pilgrimage route and a day's march to the north of Kûs [q.v.], they settled in large numbers. "The town to a large extent owed its new prosperity to the prestige which it acquired when saintly persons, most of them Maghribl, settled there, died there and were buried in its cemetery which became a place of pligrimage in its own right. These ascetics and mystics were distinguished by their Sunnism, and it was through them rather than through the direct influence of circles in Alexandria or Cairo that the Sunni 'counter-reformation' spread among the people" (Un centre musulman . . . Quis, Cairo 1976, 161). This example is unique. Louis Pouzet, in a well-documented article (Maghedias & Damas au VIII/XIII siècle, in BEO, xxviii [1977], 167-99) stresses how the Maghariba, installed in large numbers in Syria, "where able to profit from circumstances relatively unfavourable towards them (exile and partially enforced emigration, personal difficulties of a doctrinal kind will otherwise, political agitation we upbeavals in the very land of their exile, etc.) to establish a presence of the very highest level for each of them, and quite prestigious for the 'Maghribi colony' of Damascus as a whole" (192). In the 18th century, the presence of Maghariba in Cairo is seen to be more numerous and varied than ever: students at 2l-Azhar having at their disposal a rivide of their own and constituting a pressure-group which could show itself formidable on certain occasions; traders exercising a monopoly over the marketing of certain products such = oil or tarbusks; etc. (A. Raymond, Artisans et commerçants au Caire au XVIIIe siècle, Damascus 1974, i, 171, 191, 201, ii, 52, 419, 452, 470-6, 507, 518). Their number is estimated at 15,000 or 20,000 persons, firmly installed in certain quarters such as that of the Iba Tulun Mosque. On his arrival in Egypt, Bonaparte clashed with them; unable to dislodge them from Cairo, he contemplated utilising them and decided to raise a "Maghribl battalion" constituted of "energetic scoundrels, as pitiless as their chief" (A. Raymond, Tunisiens et Maghrébins au Caire au dixhuilièms siècle, in CT [1959], nos. 26-7, 364-5). This enterprise failed, since the Maghribis were among those who responded most enthusiastically to the call for resistance. The establishment of the French in North Africa gave rise to a vast raigratory movement, essentially in three phases: 1881-8, 1890-1908 and 1909-14. In general, Algerians settled in Syria, and Tunislans in Constantinople, in Egypt and in Tripolitania (P. Bardiu, Algeriens at Tunisiens dans l'Empire Ottoman de 1848 à 1914, Paris 1978).

Recent history provides further examples of the continuity of the Maghribl presence in the East. The Tunislan nationalist leader, al-haykh al-Tha'alibl, visited Egypt in 1898, met the reformist scholar Muhummad 'Abduh, was influenced by him and introduced his ideas in Tunisla (N. A. Ziadeh, Origins of nationalism in Tunisla, Beirut 1962, 97 ft.). Later, when the Arab League was created, President Habib Bourguiba, then leader of the Néo-Destour Party, travelled secretly to Cairo in March 1945. With the Moroccan Istiklal and the PPA (Parti Populaire Algirian) he established there, in 1947, the "Bureau du Maghreb" before returning to Tunis on 8 September 1949.

Bibliography: Besides the references clied in the body of the article, information may be gleaned from all sources of a historical or geo-

graphical nature, in particular from the Ribles and the Tabubit. (M. Tates)

AL-MAGHĀZĪ (also maghdsī 'f-nabi, maghdsī rasāl allāh), a term which, from the time of the work in the subject ascribed to al-Wāķidī (d. 207/823), if not earlier, has signified in particular the expeditions and raids organised by the Prophet Muhammad in the Medinan period.

The first such sortic is reported by al-Wakidi to have involved a party of thirty men led by Hamza b. 'Abd al-Muttalib, which in 1/623 briefly intercepted a Kurashi caravan heading for Mecca from Syria on the coastal route (other accounts differ). The last was an expedition in the direction of Syria by an army of 3,000 men under the command of Usama b. Zayd in 22/632, immediately following the Prophet's death. For al-Wakidi (largely followed by Ibn Sard), the compass of the term al-maghari appears to have included important ghaswas (such as those of Uhud, al-Khandak, al-Hudaybiyya, Khaybar, Mecca, Hunayn and Tabûk; Badr is elsewhere styled # ghasws, but not by ai-Wākidi), small-scale sariyyas (such as that of Hamza), acts of assassination of individuals (notably Kab b. al-Ashraf), and such other significant events of the period as the pilgrimage of 9/631, the hididial almada' of ro/532, and the death of the Prophet in 11/632. In this narrower sense of events in the Medinan period, principally expeditions, raids and assassinations numbering in excess of eighty, but also in a broader sense of the Prophet's biography and background, the term al-maghasi came to be rooted in the Islamic reflective tradition at an early stage and was perpetuated in later works both for the more serious purposes of film, e.g. Iba 'Abd al-Barr (d. 463/1071), al-Kalaq (d. 634/1237) and ibn Sayyid al-Nās (d. 734/1334), and on a popular level, particularly with poetic embellishments reminiscent of chansons de geste (see Paret).

It is this broader sense of the term maghasi which appears to have been prevalent in respect of the earliest Muslim transmissions relating to the period of the Prophet (see, for example, the comments by Sezgin, 251, 275). Moreover, while Sachau's suggestion that the term maghan was a calque on the "struggles" of Christian spiritual athletes (Das Berliner Fragment, 448) may be unconvincing, it is nonetheless apparent that it was the term magdet that characterised the early transmissions and that the term sire emerged only later as signifying a literary genre relating specifically to the Prophet. In 1809, Hartmann (Die angebliche sira, 32) opined that Ibn Ishāk "hat keine sīra geschrieben" and it has since been proposed (Hinds, Maghāzi and Sīra) (t) that not just Ibn Ishak but all transmitters and compilers before Ibn Higham (d. 218/834 or 213) who dealt with material about the period of the Prophet in general regarded that material as being about maghāti; (2) that Ibn Hishām, in using the term sira, was simply introducing the bulk of the Maghari of Ibn Ishāk with a term which was in the idiom of his own time; and (3) that it was probably al-Wāķidī (d. 207/823) who was the first to view maghāsī and siza as fields of study which were related but could somehow be differentiated-a view in which he was evidently followed by Ibn Sard (d. 230/845). Those scholars who concerned themselves with maghati and pre-deceased Ibn Ishak (whose probable date of death was 150/767) included notably 'Urwa b. al-Zubayr (d. 94/714), al-Zuhrl (d. 124/742) and Müsä b. 'Ukba (d. 141/758) (for further names and details. see Horovitz; al-Duri, Bakth, 20-7, 61-113; and

Sezgin, 276-87); in addition, I Kitāb al-Maghāri is ascribed to each of seven compilers who died after Ihn Ishāk, but before al-Wākidi (viz. Maʿmar II. Rāshid (d. 154/770), Abū Maʿshar Nadith b. ʿAbū al-Raḥmān (d. 170/786), ʿAbū al-Malik b. Muḥamnad b. Abī Bākr (d. 170/792), ʿAlī b. Muḍjāhid (d. 182/798), Yabyā b. Saʿld al-Umawi (d. 194/809), al-Walid b. Mislim al-Umawi (d. 193/810), and ʿAbd Allāh b. Wahb (d. 197/811), while the few works dating from the same period which contain the term siza in their titles bear III relation to the Prophet (see Hinds for references).

Just how broad the scope of these early maghani works was is difficult to determine, since (apart from a few papyri) they survive only in later recensions (in the case of the work of Ibn Ishāk) or as fragmented citations in later compilations (in 🔤 case of the other works). While the existing recensions of Jbn Isbāk's work are restricted in scope to the period and background of the Prophet, it has been proposed by Horovitz (The carliest biographies, 186-7) in respect of the Kitab al-Maghari of Musa b. 'Ukba that that work may have included material relating not only m the period of the first four callphs but also to the Umayyad period. Although Schacht (On Masa b. 'Ugba's kilab almaghári, 296) did not accept this proposal, other evidence has since become available to support the view that, in early Islamic times, the subject matter of maghazi was drawn at least from the period of the first four caliphs in addition to that of the Prophet. This evidence is to be found in the Kitab al-Maghari contained within the Musannaf of the Yemeni mudaddith 'Abd al-Razzāk b. Hammam al-San'ani (126-211/744-827), where the majority of the reports bear the undd Marmar b. Rashid from al-Zuhri and presumably reflect the view of those two authorities about what constituted the proper subject matter of maghdal. The account starts with the digging of the well of Zamzam (as does Yunus b. Bukayr's recension of Ibn Ishāk's Maghāsi), moves on to the background of the Prophet and the main events of his lifetime, and then touches on various events after the Prophet's death; these events include the bay's of Abu Bakr I the Saklfat Banī Sā'ida, Abū Bakr's appointment of 'Umar as his successor, the conflict between "All and Mu'awiya, the shard, the ghazus (sic) of al-Kadisiyya, and the marriage of Fatima.

The published papyri shed little light on the general character of early maghāti works. The earliest relevant document so far known is meightline papyrus text dated by Grohmann to the early and/8th century, which contains some details about the battle of Badr (Arabic papyri from Hirbst sl-Mird, Louvain 1963, 82-4, 105). Kister (Notes on the papyrus text) has pointed out that the last section of the Chicago papyrus (Or. Inst. 17635) dealing with Badr, Bi'r Ma'una and the B. al-Nadir, which is dated by Abbott to the late and/8th century and attributed by her to Masmar b. Rashid (i, document 5), is textually almost identical with a passage in Abū Nu'aym's Dalā'il al-nubuwwa (Hyderabad 1320, 176), where the itende ends with Ibn Lahra-Abu 'I-Aswad (d. 131/748)-Urwa b. al-Zubayr; Kister himself is inclined to ascribe authorship (sic) of the papyrus to Ibn Lahl'a (d. 174/ 790). The early 3rd/9th century Heldelberg papyrus on the meeting at al-'Akaba, the conference of Kuraysh in the dar al-nadwa, the hidira, and the expedition against Khath'am, which has an isnad going back to Wahb b, al-Munabbih, is accorded the Arable title maghārī Rasūl Allāh by Khoury, although this phrase nowhers appears in the text itself.

It is therefore clear that only the eight-line Khirbat al-Mird papyrus can conceivably be regarded as being from the earliest (i.e. pre-fAbbasid) period, and this is obviously too truncated to provide any definitive picture of the shape of the maghani works which are reported to have existed at that time. Otherwise, we have only citations at one remove or more in later works, and later references to the existence of early maghari works. One such report. which has been noted in modern studies, is given by al-Balâdhuri (d. 279/892), with an ismad going back to al-Zuhri, according to which the caliph 'Abd al-Malik, on seeing one of his sons with hadith almaghazi, gave orders for it to be burned and enjoined him (instead) to recite the Kitāb Allāh and know and act according to the sunna (Anonyma arabischa Chronih, Band XI, 172; Goldziber, Muh. St., i. 206 (Eng. tr. 191-2); Abbott, i, 17). Goldziher, while remarking that there seems to be "nothing against admitting the existence of such literature in early times", also commonts that "the text of this account unmistakeably bears the stamp of those circles who condemned unauthenticated maghasi in favour of authentically recommended traditions", and in this connection he goes on to cite the saying attributed to Ibn Hunbal that "three things have no asi: tafsir, the maldhim and the maghasi" (see

also Goldziner, Richtungen, 57).

The purpose of, and the climate of opinion about, the study of al-maghari from the second half of the and/8th century onwards are, however, matters requiring further research and only a few brief additional comments can be made here. I'm Ishak is reported to have committed his motorial on almaghari to writing for the 'Abbasid caliph al-Mansur, who instructed his son al-Mahdl to study the subject with that compiler (Abbott, i, 89; Watt, The materials used by Ibn Ishaq, 31); and Harun al-Rashid's chief hadi. Abû Yûsul, who had been Ibn Ishak's pupil (Abbott, i, 92), is said to have been interested in maghāsī, tafsīr and ayyām al-'arab (Goldziher, Muh. St., ii, 207). It is apparent that one practical application of the study of maghini me in that area of figh called siyer, which was concerned with the rules of war and of dealings with non-Muslims, apostates and rebels. The term siyer appears in the corpus iuris ascribed to Zayd b. Ali (kitāb al-siyar, bab al-ghasw = 'l-siyar), is supposed to have been used by Abû Hanîfa (d. 150/767), was the name by which the work of al-Awzā¶ (d. 157/774) = knowa to Abu Yusuf and al-Shafi'l, and figures in the titles of two works by al-Shaybanl (d. 189/805); it was, moreover, a term which, as the 8th/14th-century lexicographer al-Fayyumi explains, "took over from the term) al-maghan on the tongues of the fukaha". While this seems in general to be true, the same type of material also appeared elsewhere under other rubries: the appropriate section in the Munuita' of Malik is entitled neither maghest nor siyar but dishad; in the Musannaf of Abd al-Razzak b. Hammam al-San'ant the kitab al-dithad includes the sort of material that the fubaha' were styling siyar, but the work also includes a kitāb al-magkāzī (as noted above); the later al-Bukhari has separate books on djikad (bab 1; fadl al-djikad wa 'l-siyar) and maghasi, but he seems to be the exception in this respect among the 3rd/9th century compilers of hadile material—the other compilations contain books on dishad (and, in some cases, siyar) but not on maghāri (for references, see Hinds, Maghāri and Sīra). This declining interest in maghāri as such was accompanied by the emergent view that Ibn Ishāk bad drawn material from Jews and Christians (Yākūt, Udabā', vi, 401; Ibn Hadjar, Tahhhīb, ix, 45) and that he and [at least some] other aṣhāb al-maghāri had Shl'i inclinations (Udabā', vi, 400); in addition, Ibn Hanbal is reported as having said that Ibn Ishāk's handling of sīnāds rendered him masuitable = authority for āndīth (Tahhhīb, ix, 43), and the same consideration may have been behind his reported denunctation of al-Wākidī =

hadhdhib (Tahdhib, ix, 364). There remains the question of how useful the engelded material is for the purpose of historical reconstruction of the early Islamic period. Here it may be remarked first that there - considerable chronological and other discrepancies between the accounts available; these have been discussed most recently by Jones (On the chronology . . .) and Kister (The expedition of Bir Ma'dea). In more general terms, however, Watt sees "little ground for doubting the truth of the main events of the maghasi" and is of the opinion that "the maghāzi-material (in the special sense of the main outline of events, and omitting all anecdotes) . . . is an essential foundation for the biography of Muhammad and his times" (The materials used by Ibn Ishaq, 28). On the other hand, Sellheim has attempted to discern the main tendencies of Ibn Ishāk according to "layering" of sources (Quellenschicklung), involving an original layer which reflects historical reality, a further layer made up of legendary material about the Prophet, and a top layer reflecting political tendencies of Ibn Ishak's own time (Prophet, Chalif und Geschichts). Such an approach is not wholly incompatible with 5chacht's conclusions that an issaid cannot alone guarantee the authenticity of a work ascribed to an author of the early 2nd/8th century and that in general "the more perfect the isadd, the later the tradition" (JRAS [1949], 147). From this standpoint, Schacht has examined the short Musa b. Ukba text (an edition of the 4th/9th century) published by Sachau and has challenged Sachau's view that the text contains no elements from the 'Abbasid period. Schacht has seen the growth in the 2nd and 3rd centuries of traditions ascribed to Müsil m typical of the way in which spurious information was put into circulation, and has concluded that "the whole of the standard biography of Müsä in the later works is without documentary value, particularly the touching picture, taken seriously by Sachau and Horovitz, of his regular fectures to a circle of pupils in the mosque of Medina. This presupposes the concept. of Medina as the home of Islamic learning, a concept which as yet unknown to Shafif (d. 204)" (On Masa b. "Uqba's hitab al-maghasi, 299).

More recently, Wansbrough, who also doubts the feasibility of historical reconstruction of the Islamic period up to ca. 200 A.H., has viewed the signal-maghasi literature (as he terms it) — an Islamic adaption of Biblical salvation history. In his opinion "the earliest expression of Islamic soteriology consisted in membership of the umma" and it is in the siva-maghasi literature "that the earliest formulation of Muslim identity is contained" (The sectorian milieu, 89), the conceptual motive in this (as in scripture and summs) being polemic (ro3). Wansbrough — a transition from the sira-maghasi literature, where ecclesie is the dominant cognitive category and precedent is historically articulated, to the summa-hadible literature, where nomes is the

dominant cognitive category and precedent is "idealized and bence shorn of its historical dimension" (87); for him, the fbn Ishāk-Wākidl-Bukhārī development from size to marked a passage from loosely structured narratio to concise exemplum (27-8). In modification of this view, however, it should be remarked that the signification of sire was also close to that of exemplum and that the passage was rather from maghest to will via sira, the sira material being essentially maghari material viewed in a new light. It can also be noted that, while the narrowing-down of the scope of the maghant to the period and background of the Prophet seems to have been conventional from the 3rd/9th century onwards, it is nonetheless difficult to discern point at which al-Wakidi's even narrower definition gained any exclusive currency. It seems rather that the two senses of maghasi co-existed: in the broader of the senses, the term echoed an earlier scope which had been yet broader (note particularly the title of al-Kalaq's work) and seems to have been used more or less synanymously with the term stra as a genre label; the narrower sense appears to have been a more technical one, i.e. the magkest "proper", as distinct from the mabtalk, for example. The term stra, while occurring as a genre label more or less synonymous with maghdai, also came to signify preeminently the account of the Prophet's life and background as transmitted by Ibn Hisham = the basis of the work of Ibn Isbak-the maghati which became sirs = exemplum, only to ill largely superseded by the sunna-hadith literature.

Bibliography: For a general survey, see F. Sezgin, GAS, i. Leiden 1967, 237-56, 275-302; Sezgin is incorrect when he suggests (306) that ion Hadjar, Tabldib, i. 167 ascribes a work on almaghast to Wahb b. Munabbih (the reference is to maghast material from ['Abd Allāh] b. Wahb)—for further critical comments on Sezgin's remarks about Wahb b. Munabbih and al-maghasi, see R. G. Khoury, Wahb b. Munabbih: der Heidelburger Papyrus PSR Heid Arab 23, Wiesbaden 1972, Teil 1, 12; Sezgin is also incorrect in saying (38) that the Fibrist (see 228, 9) attributes a work on

al-maghāri to Hushaym b. Bashir.

The main surviving texts (other than major chronicles) dealing with al-maghari are: Ibn Ishāk, Kitāb al-Maghāsi: extant portions (mainly in the recension of Yunus b. Bukeyr) ed. by M. Hamid Allah under the title Siral Ibn Ishah (Rabat 1976) and by S. Zakkar under the title Kildb al-Siyar wa I-maghasi (Beirut 1978); al-Wāķidi, Kildb al-Marhāzi, ed. J. M. B. Jones, London 1966 (for wersion in German, see J. Wellhausen, Muhammed in Medina. Das ist Vakidi's Kitab al-Maghazi in verkürzter deulscher Wiedergabe, Berlin (882); 'Abd al-Rattak b. Hammam al-San'anl, Kitab al-Maghari, in vol. v of al-Musannaf, Beirut 1970-2; Ibn Hisham, al-Sira al-nabawiyya, ed. Sakkā et alii, Cairo 1955 (for a version in English, see A. Guillaume, The life of Muhammad: a translation of [Ibn Hisham's recension of Ibn] Ishaq's Strat rasal ailda (sic), London 1955); Ibn Sa'd, il/t: Ibn 'Abd al-Barr, al-Dutur fi 'hhtişar al-maghari me 'l-siyar, ed. Sh. Dayt, Cairo 1986; al-Kaian, al-Iktifa' fi maghásí rasúl alláh ma 'l-thalátha al-khulafa', i, ed. 'Abd al-Wähld, Beirut 1968; Ibn Sayyid al-Nas, Uyûn al-athar fi funûn al-maghasi wa-'l-shamd'il wa'l-siyar, Cairo 1356; al-Halabi, lnsan al-tuyun fl strat al-amin al-ma'mun almatrafe bill-stre Thalsbiyya, Bülük 1875 (with

al-Sira al-nabewiyya wa'i-dihar al-muhammadiyya by Ahmad Zayni Dahian in the margin).

MAGRILA, a Berber tribe belonging to the great branch of the Butr and related, if min is to believe the ancient Berber traditions cited by Iba Khaldûn, to the tribes of Darisa, Saţiūra, Lamāya, Matmāta, Şadīna, Nalzūza and Madyūna who lived, in the early Middle Ages, in eastern Barbary.

It is also apparently in the same region that the ancient habitat of Maghlla is to be sought in the period in question, According to the Berber traditions cited by various early Arab historians, the Maghille, after coming from Palestine into North Africa, reached Lübiya (Libya), from where they made their way to the Maghrib, establishing themselves, before the Arab conquest, in the mountainous regions of this land, probably in the Diabal Dahar and Djabal Tebaga in south-eastern Tunisia. Vivien de Saint-Martin has suggested seeing in the Maghila the Libyan tribe of the Mecales or Imacles of Corippus (6th century A.D.), This hypothesis appears very probable, despite the opposition of Stephane Gaell. Similarly, another hypothesis of Vivien III Saint-Martin and J. Desanges appears highly likely, according to which the Mecales of Corippus and the Maghila of the Arabic sources were none other than the Makhlues of Herodotus, a Libyan tribe who lived, in the 5th century B.C., in south-eastern Tunisia. It is there, to the south-east of the Sbott el-Djerid, that J. Desanges places the Makhlues and the Mecales. As for the Maghila, we lack proof of Arabic sources on their babitat in eastern Barbary in the 1st-3rd/7th-9th century; however, Ibn Khurradaghbih enumerates them, in his geographical work composed ca. 232/846-7, among the Berber tribes of the east, counting them alongside well-known eastern tribes such as the Hawwara, Parisa, Warfagigiūma, Mazžta and Nafūsa.

Algeria. The Arab historians and geographers note the existence of two groups of the Maghilla in this country. One of them occupied, in the 8th/r4th century, according to Ibn Khaldun, the countryside from the mouth of the Chelif on the west as far as the town of Masouna on the east. It seems that formerly the possessions of this group of Maghila were larger and that they extended towards the sam as far as the environs of the town of Ashir, where al-Bakri locates, in the 5th/11th century, "at the entrance of the great desert", the town of Tamaghilt, whose name seems be strictly linked to that of Maghila, Further to the west, al-Bakri places, ill two days' journey from Tähert, a castle which also bore the name of Tamaghilt. It is again in the environs of Tahart that there is to be found, according to al-Bakrl, at a distance of five farsakles from the sea, very near Oued el-Khamis, m the north of the town of Mazouna, a locality called Kalfa Maghila Dalul, also doubtless named after a section of the Maghita who lived there. On the west side also, the limits of the territory of the Maghila exceeded, in the 5th/11th century, those of the Bth/14th century. Indeed, it is in the territory of the tribe of Maghila that the town of Aslen was situated, which was to be found immediately to the east of the mouth of the Talua, and to the east of the island of Arashkul, Rachgoun on our maps. It is from one of the ports of the Algerian Maghila that there set sail, in 138/755, the founder of the Umayyad dynasty of Spain, 'Abd al-Rahman I b. Mu'awiya, in order to disembark at al-Munakkab (Almuñecar) in al-Andaius. In our opinion, this port is none other than Marsa Maghlia, m anchorage situated a little to the west of Ténès, which is noted in the geographical work of al-Bakri.

Another Algerian section of the Maghila lived, in the and-4th/8th-roth centuries, in a region situated in the province of Tlemcen. Ibn Khaidun says that the Zanāta tribe of Banu Ifran domiciled in this region, supported by Berbers of the tribe of Maghila, revolted in 148/765 against the 'Abbasids, "having chosen as their chief Abū Kurra the Itranid, or rather the Maghlid". In another passage of his work, ibn Khaldûn however puts in doubt Abû Kurra's belonging to the Maghila. He says only that the Band Ifran and the Maghlla lived alongside each other, the Banu Ifran being stronger and more numerous. According to another passage of Iba Khuldun's work, the Maghila professed the Sufri faith. They lived always in the lands which depended on the town of Tlemcen towards the middle of the 4th/10th century, and al-Bakri cites - Arabic poem which speaks of the losses of this tribe in a ***** which took place in 338/949-50.

Morocco. la Morocco also, there were, according to al-Bakri, al-Idrisi, lbn Khaldün and other Arab mediaeval authors, two branches of the tribe of Maghila, of which the remnants lived in the

8th/t4th century dispersed in the triangle formed by towns of Fas, Meknès and Sefrou. One of these branches occupied the region situated to the southeast of Fas, where the mediaeval Arab geographers place, halfway between Fas and Meknes, the fortress called Maghila. Al-Bakri also locates there a district called Maghila, which, in his period, was under the command of a certain Mūsa E. Djalid. Al-Bakri places to the south of Fas, = the road leading from this capital to Sidjilmasa, two localities doubtless inhabited by the Maghilla, of which one was called Maghilat Ibn Tidiaman (its population professed the Suirl faith), while the other was Maghillat al-Kat. It seems that these two fortresses belonged to the same branch of the Maghilla as that which was governed Musa b. Dialid. They were also perhaps the same Maghila as those who, united with the Awraba and Sadine, supported the cause of the Idrisids from the arrival of Idris I b. Abd Allah in the north of present-day Morocco. Another branch of the Maghila occupied, in the 5th/17th century, the district of Maghila which al-Bakri locates to the south of Oued Opergha, to the north-west of Fas and which has to be distinguished from the district of Maghila situated I the south-west of the same town.

It may further be added that it is to the tribe of Maghila that Ibn Abi 'l-Madid al-Maghili belonged, author of a genealogical work devoted to the Berbers and quite frequently cited in the Maghribi chronicles.

LEWICKI)

AL-MACHILI, MAHAMMAD M. 'ABB AL-KARIM, reformist fabib of Tlemeen, chiefly famed for his persecution of the Jewish community of Tuwat (Touat) in the Algerian Sahara and for the advice he gave to Sudanic rulers. The general outline of his seems is fairly well established, but many details remain obscure. He may born in Tlemeen. ca. 1440 of Berber stock and studied under 'Abd al-Rahmān al-Tha'Salibi (d. 875/1470) and Yahyā b. Yadir al-Tadallisi (d. 875/1472). At an uncertain date he took up residence in Tamantit, then the principal fortified town (8287) of the Tuwat oasis, which was closely linked Tlemeen and to the towns of the Sudanic belt by the ties of commerce.

The prosperity of the Jewish community there and in the neighbouring casis of Gurara, and the connivance of the Arab chiefs in ignoring the letter of the law in regard to these "protected persona", aroused his ire. He wrote a treatise (R. stakkamahlal-dhimma)

asserting that the Jews of Tuwat had broken their pact ('ahd) with the Muslims, and thus forielted their protection, by not paying gifuya regularly in a state of "abasement and humiliation" (al-dgill we 'l-saghd') and by "rebelling against Islamic laws" (al-tamarrud 'ald 'l-ahlam) through too close association with their Muslim overlords. He also claimed that the existence of the Tuwat synagogue was contrary to Islamic law and demanded its destruction.

Both he and the kdds of Tamanili, 'Abd Aliah al-'Asnûni, who opposed his views, sought the support of North African scholars. The majority favoured al-'Asnûni's interpretation, but the support al-Maghill received from two Tiemcen scholars, the historian al-Tamasi and the theologian st-Sanúsi (al-Wansharisi, al-Mis'ydr al-mughrib, Fâs 1315/1892-8, ii, 120-202; tr. in Archives Marocasus, xii [1908], 244-55, who adds im own view which supports theirs], was sufficient to encourage him to rouse a mob to destroy the synagogue. He also offered seven mithelis of gold for every Jew killed.

Not long after these events, which probably took place shortly before 1490, al-Maghill left Tuwat, possible expelled on account of his unwelcome zeal. but this is not clear. It may be at this period that he visited Fas, where he made an unsuccessful attempt to establish his influence with the Wattasid sultan Muhammad al-Shaykh (Ibn 'Askar, Dawha, 96, is the one source to report this bizarre episode). He then left North Africa for Bilad al-Sadan, stopping first at the important commercial centre of Takidda (Tegidda, identified with Azelik to the west-southwest of the Air massif) to teach and preach, and passing on to Katsina and Kano, then burgeoning city-states. He had contact with the ruler of Kano, Seriki (sultān) Muhammad Runfa, as early as 870/ 1491-2, when he addressed him a letter on "deterring people from forbidden acts" (text in Bûnar's edn. of Abkam ahl al-dhimma, misleadingly titled Misbah al-armak (a different work by al-Maghill), 73-7). He evidently resided several years in Kano, for a family there still claims descent from him (and "Sharifian" status), and it is no doubt while he was there that he wrote his longer treatise of advice for Muhammad Runfa (published under the invented title (Tādi al-die fi mā yadjib falā 'I-mulāh, Boirut 1932].

The date and duration of his visit to Katsina not known, but before the close of the century he was in Gao advising the Songhay ruler Askia Muhammad b. Abi Bakr after the latter's return from pilgrimage. His replies to that ruler's questions legitimised the Askin's scieure of the goods and chattels of his predecessor, Sunni 'All, and strengthened his claims to sovereignty over a wide area of Muslim territory in the Sudanic belt. On hearing of his son's death in Tuwat at the hand of a group of Jews, al-Maghill called on the Askin to arrest all Tuwaris in his realm and only the opposition of the bade of Timbuktu, Mahmud b. 'Umar, prevented persecution. He subsequently returned to Tuwat and died there under unknown circumstances in 909/1503-4 or gro/1505-6.

His known writings total twenty-six items, mainly on topics of fish and tawkid. He also had an interest in formal logic (maskis). He exchanged verse polemics with al-Suyùt, who declared its study forbidden, and wrote a treatise called Minah al-Wahhab fi radd al-fish 'alā' 'l-samab, which was widely studied in West Africa. The treatises he wrote during his Sudanic tour many known to the 19th century reformers of

Masiaa and Sokoto. "Uğunan b. Fud (q.v.) used his arguments concerning the anathematisation (tak/tr) of Sunni 'All to justify his attacks on the Hausa rulers and other passages of the "Replies" and other passages of the "Replies" belief".

The Kunta [q.v.] revere as one of the four "regenerators" (mudjaddidin) of the 10th century of the Hidira. They, and all other Kädiris of West Africa whose affiliations go back through the Kunta sitsila, consider him an important link in the clain, though this chain can be shown to be ahistorical, and it is doubtful if al-Maghill himself had received the wird of the order.

(J. O. Hurwick)

MAGHNĀTĪS, Maghnatis, Maghnītīs, Arabic
rendering of ἡ μαγνῆτις (λίθος), indicating 1.
the magnetite and 2. the compass.

1. THE MAGNETITE AND MAGNETISM

The magnetite (lodestone, magnetic iron ore, Fe₂O₂) is a very widely-spread mineral, well-known since antiquity, is found in huge quantities in individual deposits well as a finely-altotted constitof almost all kinds of volcanic rock. The Islamic natural scientists, geographers, cosmographers and encyclopaedists transmit much information about its properties. The magnetite is first of all "the stone which attracts iron" (see e.g. al-Kh "arazmi, Majatis, ed. Van Vloten, 252 f.). Al-Biruni, Djamahir, Haydarābād 1355, 212-15, has a circumstantial chapter it. According to him, maghadis shares with amber (kahraba) the property of attraction, but is more satisfactory than the latter for extracting particles of iron from the human body. The name correctly explained as being Greek, while aremitikum (ádágrag or ádapávtevov) and abrakailta (λίθος ηρακλεία are given as synonyms, although the first, as is well-known, indicates the diamond; for the confusion of the magnet and the diamond in antiquity and in the Middle Ages, see E. O. von Lippmann, Beitrage zur Geschichte der Naturwissenschaften und der Technik, i, Berlin 1923 (new impression Wiesbaden 1921), 182, 194, 213 ff. Referring to earlier authors, al-Biruni records that the blue magnetite-which he old not know himselfwas considered to be the best; it was burned by many people and sold as shadhana (haematite). According to the same author, the black-brown, and further the iron-coloured, were equally appreclased. The richest deposits known to him were those of Zibatra in south-east Anatolia. From the fact, however, that ships in the China Sez (al-Bake al-Akhdar) were kept together by vegetable fibres, but those in the Mediterranean Sea carpentered with nails, he concludes that the richest deposits of magnetite occur in the submarine mountains of the China sea, since it is exactly there that the nails would be extracted by magnetism and ships would disintegrate. In the mountains of Zabulistan [q.v., in eastern Afghānistān] magnetite is said to occur as solid rock; on their sun-lit outer surfaces the power of attraction would be weak, but in the inside strong as al-Birûn! himself had ascertained by means of a collaborator.

Other denominations of the lodestone, based

on confusion, are: bdhit or hadjar al-bahta (i.e. the haematite, which results from converting magnetite or other minerals), addmas al-idjurārī (i.e. the diamond; döduar, means "indomitable", from which idjirārī can possibly be explained), lāķi (see below), karamil (posaibly through Romance calamita, derived from xdhaquoc, but of tor this E. O. von Lippmann, Geschichte der Magnatuadil bis zur Erfindung des Kompasses (gegen 1300), in Quellen und Studien zur Geschichte der Naturwissanschaften und der Madisiu, illi (Berlin 1932), esp. 25-20).

The notion that locestone and iron are connected the lover and the beloved, was spread very widely: iron is "obedient" to the stone because of a divine power inherent in the latter, and is attracted to it like the lover to the beloved (al-Kazwin), 'Adia'ib al-makhlikal. Kosmographie, ed. Wüstenfeld, i, 239, below); between the two exists a profound inclination: when iron "smells" the magnet, it moves towards it until it clings to it and holds on tight to it, as the lover to the beloved (op. cit., 210; cf. also Rasd'il lkhwan al-Şafa', ii, Beirut 1376/ 1937, 110 f.). This image expressed poetically by Ibn Hazm, Tawk al-hamdma, ed. Pétrof, 8, 20-9, 9, cf. E. Wiedemann, Aufsätze zur arabischen Wissenschaftsgeschickte, ii, 149-51. In other comparisons, the tertium comparationis is formed by the swiftness of reaction: the "phlegm" (balgham) combines with the soul quicker than iron with the magnet (M. Ullmann, Kutalog der arabischen alchemistischen Handschriften der Chester Beatty Library, ii. Wiesbaden 1976, 99). This conception is connected with certain theories developed by Djábir b. Hayvan in his Kitáb al-Rahma: "The strongest factors existing in this world are the delicate spiritual things which cannot be observed with the senses, but only with the intellect, like the stone which attracts iron through an immaterial power that can neither be felt It permeates the solidness of brass (sufr) which finds itself between it (i.e. the magnetite) and the iron" (Ar. text in M. Berthelot, La Chimie au Moyen Age, iii, Paris 1983 [reimpr. 1967], 144-5; French tr., ibid., 175). Thus the Arabs were aware that the magnetite is efficacious through other bodies. A few sentences further on it is said: "We found (?) a magnetite which lifted a weight of 100 dirhums (= 312, gr. according to W. Hinz, Islamische Masse und Gewichte, Leiden 1955, 3). We left it alone for a while and then tested it with another piece of iron, which however it did not lift. We thought this to be heavier than the 200 dirkams which it had lifted earlier. But when we weighed it, it had a weight of less than 80 dishams, so its power had decreased, although its mass (dirm) had remained the same." From these observations it was rightly concluded that in course of time the lodestone loses part of its power of attraction. Thus the carrying capacity of the magnet used by "Gober" was quite considerable; for further quantitative indications by al-Ibshihi and al-Tilashi, Wiedemann, Aufsätze, i. 33.

Iron filings, put me a pan which one keeps in one hand while with the other a magnetite is moved backward and forward underneath the pan, follow these movements. Also, when the stone in brought near to a needle, it attaches the latter to itself, and likewise other needles which are strung to the first one, so that finally all of them are joined as it were to a string by an "immaterial power"; in the same way rings can me hung to one another (]. Ruska, Des Steinbuck are Aristoteles, Heidelberg 1912, Ar. text 108, Ger. text, 154).

Next to its attractive power, the magnet has

also a repelling power: when held over an ant-hill, it drives the ants away. When smeared with the saliva of a fasting man, it loses its attractive power. This power disappears also when the magnet is rubbed with garfic or onions, but when cleansed from garlic and put in the warm blood of a freshly-slaughtered billy-goat, the power returns (al-Kazwlni, 'Adid'ib, 298; al-Dimaghki, Nukhbat al-dakt, ed. Mebren, St. Petersburg 1866, Arabic text 73 f., French tr. 85; Ibn Kutayba, "Cyūn, ii, Cairo 1346/1928, 108; (Pseudo-) Madirīti, Ghāyat al-hakim, ed. H. Ritter, Leipzig-Berlin 1933, 399, 15-6, tr. 406). The following observation of Ibn 21-F2kih (BGA, v, 67, 134) is also worth noticing: When a knife or sword is rubbed against the rocks of a mountain near Amid, they carry iron and attract needles more powerfully than lodestone. The latter itself does not possess attractive power, but when a knife or sword is rubbed against it, it attracts iron. This power is said to be preserved for a very long time, namely a bundred years. As Wiedemann (op. cit., i, 35) remarks, magnetism is preserved in sword and knife because they are made of steel: they are a "permanent" magnet.

The question of the causes of interaction between magnet and from has apparently also been studied in a more general way. No less a person than al-Razi wrote messay entitled Kitab 'Illati diadhbi hadjar al-marknöfis li 'l-hadid ma-fihi kalam nathir fi 't-khala, "Book on the cause of the attraction of iron by the magnet, containing an extensive treatise on empty space". For this work, which un fortunately is lost, see Ibn Abi Uşaybi'a, 'Uyün alanba', i, 320, 11-2; and, for a shortened title, Ibn al-Nadlm, Fibrist, 301, 14-5. The essay probably examines whether and bow the magnet is effective through empty space. Ai-Tifashi recognised the chemical relation between iron and magnet from which the effectiveness is to be deduced. According to him, the attraction is based on reciprocity; deep inside, the lodestone has transformed itself into iron, for both minerals have the same nature which explains the inclination and love to each other "since the beginning of their existence" (Wiedemann, op. oit., i, 34 f.). According to al-Tughra'l (spud Wiedemann, i, 699), the lodestone balongs to the stones which contain spirits.

It was believed that there existed a number of other stones with attractive power, apart from iron magnet: the gold magnet which attracts gold, and when calcified, possesses the efficacy of the fron magnet; the silver magnet which is extraordinarily powerful (at a distance of five in it attracts an ounce of silver); the brass and copper magnet, which, among other things, are used m a remedy against epilepsy; the lead magnet, ugly and evilsmelling; the flesh magnet, so-called because, if put on flesh, it sticks fast to it and, if pulled away, rips off pieces of it; the hair magnet which attracts hair and, if moved over the head, tears it off; finally, the nail magnet, which pulls out finger-nails (J. Ruska, ap. cit., Ar. text, 109-11, Ger. text 155-9). Other magnets are enumerated by al-Dimashld (Nukhbat aldahr, Arabic text 74-7, French text 65-9), who remarks inter alia that gold is the magnet of mercury: when they come together, gold attracts the mercury and mixes with it; when filings of gold, lead, copper, iron and tin are mixed and mercury is then added, the latter goes in search of the gold filings and mixes with them, but not with the other filings because a "magnetic friendship" (saděka maghnájístyya) exists only between mercury and gold. A number of similar magnets - catalogued by al-Kazwiol (op.

cit., 235 f.) under the term läkit ("gleaning, collecting"), like läkit al-ghahab, l. al-rasās, l. al-gha-ar, etc.

It is hardly to be wondered that, already in early times, all kinds of legends were coupled to the attractive power of the maghadis. Al-Diewbari, for instance, relates that in the "monastery of the idol" (days al-sanam) iron idol is floating free in space under a cupola. This statue is said to be the work of Vablunus (Apollonius of Tyana), who had constructed a cupola from lodestone in such a way that the magnetic power was acting upon the statue so evenly from above and from the sides that it was floating exactly in the middle of the space (apud Wiedemann, i. 359). Al-Kazwini, Athar al-buldan. Kosmographie, ed. Wüstenfeld, fi, 63, relates a similar story from the town of Sumanat (Somnath) in Gudiarat. The secret was only disclosed when Sultan Mahmud b. Sebüktigin visited the temple and of his companions took out one stone after the other from the cupola; the floating idea then sank to the floor. Christians in the West believed that Muhammad's coffin was either made of some naturally magnetic substance and hovered in the air under a dome whose walls were covered with iron, or was made of imm and floated freely thanks to two magnets fixed in the roof and in the floor of the tomb (see Ch. Pellat, Note sur la légende relative au corcueil de Mahomet, dans Bull. des El. arabes. xxiii, Algiera 1945, 112-13; rept. in Études sur l'histoire socio-culturelle de l'Itlam, London 1976, zil). For other examples-both classical and talmudic-of free-floating idols and other objects, see 1. Löw, Fauna und Mineralien der Juden, ed. A. Schreiber, Hildesheim 1969, 131. Of ill fame were the magnetic mountains or islands which extracted the nails from the ships and sank them, for instance in the Red Sea (al-Kazwini, "Adia"ib, 172) or in India (ibid., 239; Ruska, op. cit., At. text 108 f., Ger. text 155; Ibu al-Djazzār, Kitāb al-Plimād fi 'l-adwiya almufrada, Ayasofya 3564, fol. 85a, 7-10). Magnetic mountains became best known through the stories of Sindbad the Sailor.

The reciprocal relations between electric and magnetic phenomena were not known. However, the Arabs were aware of the parallel, already drawn by Galen, existing between the transmission of the efficacy of the electric fish (i.e. of the electric ray vápxy, Ar. rawad), and that of the magnet (Wiedemann, op. cit., i, 32). The Arabs themselves perceived as highly unsatisfactory the fact that their efforts to explain magnetism in a physical way remained unsuccessful. A regretful observation of 1bn Butlan (apus ibn al-Kifti, Ta'rikh al-Hukama', ed. Lippert, Leipzig 1903, 313, 9-11) makes this clear: "Does iron strive for the stone out of longing, or does the stone attract iron by force? How painful (habih) is it for us not to understand this without any doubt, although we observe it with our senses."

In medicine, the lodestone does not seem to have been applied widely, although it is found in almost all pharmacopoeies (see D. Goltz, Studien nor Geschichte der Minerahamen in Pharmasie, Chemie und Medicin von den Anfängen bis Paracelsus, Wiesbaden 1972, 174). It is potent for draining away thick mucus and, if held in the hand, for removing spasms and pains in hand and foot. It is administered to those who have swallowed iron fillings or rust in order to attract and remove them. Strewn on gaping wounds in pulverised form, it contracts them. In cases of gout caused by heat, it allays the suffering if applied after being rubbed with vinegar. He who

wears a lodestone round his neck will have a good memory and does not forget anything. Used in pulverised form as an eye make-up, it stimulates love relations. It helps a pregnant woman to have an easier confinement; worn in a seal-ring, it brings good luck; etc.

2. THE COMPASS

The Arabs of the East became acquainted with the compass through Chinese sailors, without however at first giving R R special name; there was considerable traffic between the Persian, etc. ports and Southern China. Thence it came to Syria and then to the Mediterranean ports of Europe. The compass had very probably, however, already reached the north of Europe by the trade-route of the Russian rivers as early m the 8th or 9th centuries A.D. This explains why the compass was known earlier in the north in the south of Europe, and perhaps explains also why the Norsemen were able to undertake long

voyages by sea (cf. R. Henning, Verhandl. der Gesellsch. deutscher Naturforscher etc., 84th Versaram-

hing, 11/2 [1912], 95).

In deciding the direction by means of a magnetic needle, the Muslims used the end which pointed to the south; as Mecca lay to the south of most places, in Syria etc. the hible [q.v.] corresponded almost exactly to the south.

The oldest passage in which the word karamit perhaps corresponding "magnet" (calamila) occurs is given by Dozy for the year 239/854 in his Supplément, ii, 337, who found it in al-Bayan almugheib (Histoire de l'Afrique et de l'Espagne) edited by him. Serious objections have however been raised to interpreting the word as compass in this passage (MSOS, Berlin, x/1-2 [1900], 268). From the fact that in narratives of travels of the 9th century A.D. and that in al-Masfadl (923) the directions are given in the same way as on compasses, G. Ferrand concluded that the compass was already in use then. The next oldest absolutely certain reference is in the Diami' al-kikayat of 'Awst; it in his Lubab al-albab (ed. Browne and Mirza Muhammad Kazwini). A captain during a storm in the Red Sca or Persian Gulf finds his true course by means of a fish, of which we are expressly told that it had been rubbed with a magandiis. A similar statement regarding the of a magnetic fish at sea is made by al-Makrizi in his Khipat (Büläk 1270, i, 240; Cairo 1324, i, 357; Z. f. Phys., xiv [1924], 166).

A very full description of the compass and its use in the Mediterranean was given in 640/1242 by a certain Baylak al-Kibdjāķi in the Kitāb Kans altudidiār fi masrifat al-ahdjār. A needle which has been rubbed with a "female" lodestone is placed diagonally through a rush or piece of straw, etc. Sometimes a cross made of two straws is used. The arrangement is floated on water set to rotate by a lodestone held in the hand and moved in a circular direction; the latter is then quickly withdrawn. The needle places itself pointing to the south, which is the same as the kible. The turning is probably regarded magical, but it has a physical significance. By the turning, the often very tenacious skin of the water is broken and the apparatus bearing the magnet is enabled to move freely. The turning is, however, not always done, but the needle with its

support is simply placed on the water.

Al-Zarkhurl describes several forms of compass in a work on mechanical toys, for example a small, beautifully-painted, wooden fish, in which a magnetic needle is placed. In place of the fish, which might burt the feelings of pious worshippers, a wooden disk with milvab drawn upon it is also used. Finally, an apparatus just like our compass is described. Two magnetic needles are placed symmetrically in the centre under a circular piece of paper. Under the centre of the paper a funnel is placed which turns on a point; the whole is enclosed in a cylindrical receptacle with a glass top and is called hukk al-hible "vessel, box for the giola", or bayt al-ibra, "house of the needle"; according to Niebuhr, the same is still given to the compass. At the present day, similar compasses are used along with a simple sundial. Another very full description III given by a certain Muhammad b. Abi 'l-Khayr al-Hassani E his al-Nudjam al-shārikāt (cf. E. Wiedemann in the Z. für Physik, xiii [1923], 113: there is a manuscript in Beirut in addition to those mentioned here. Whether the Cambridge one was written in 1203 or 1588 cannot be ascertained with certainty). The needle is fastened to a copper plate hollowed out or raised in the centre and placed on a copper stand. One end of the needle, no doubt the south end, has something put on it to mark it.

An important passage in an anonymous work "Preparation of the bowl (idea) to ascertain the kibla and points of the compass" is in a Berlin manuscript (Ahlwardt, no. 5811). Here the point of the needle points south, the eye to the north (the rubbing [hakh] of the needle explains the peculiar modern name high for the compass].

It would take us too far to deal here with the box compass proper which is called in Turkish e.g. pusuis from the Italian. We will only note that on the rhomb-card the south is called al-hible and also al-dianub (cf. thereon, for example, K. Foy, Die Windross bei den Osmanen und Griechen mit Benutzung der Bahriya des Admirals Pir-i Reis vom Jahr 1520, in MSOS, Bertin xi/2 [1908], 234 ff.).

Wiedemann, Über Geschichte des Kompasses bei den Arabern, in Verhandl. der physikalischen Gesellschaft, ix (1908), 764-73; xi (1909), 262-6; xxi (1919), 665-7; Z. für Physik, xiii (1923), 13-16; xiv (1923), 240; xxiv (1924), 166-8; G. Ferrand, Notes sur l'histoire orientale (Contribution de l'histoire de la boussole), in Publications de l'Institut des hautes études marotaines, Mélanges l'Institut des hautes études marotaines, Mélanges, compasses and Kanabis, in JSS, xxix (1984), 169-78.

In the Beitrage, ii, the earlier literature is collected. This is also done in other works e.g. by Clement Mullet on the compass. Of special importance are the works of A. Schück (Der Kompass, etc., Hamburg 1912, 1915 ff.), which also deal with the Bussole in China. (E. WIEDEMANN)

MAGHNISA, modern Turkish form Manisa, classical Magnesia, a town of western Anatolia, in the ancient province of Lydia, lying to the south of the Gediz river on the northeastern slopes of the Manisa Dağı, which separates it from Lunir = Smyrna (lat. 38° 36' N., long 27° 27' E.).

In Greek and then Roman times, Magnesia ad Sipylum was a flourishing town, noted amongst other things for the victory won in its vicinity by the two Scipios over Antiochus the Great of Syria in 190 B.C., and continued to flourish under the Byzantines (see Pauly-Wissows, Realencyclopidis, xxvii, 472-3). After the capture of Constantinople by the Latins in 1204, the Byzantine emperor John Ducas retired to Magnesia and held out there till 1255; it was also the seat of a bishopric, which

peared however by the rath century.

Out of the rains of the Saldiak kin

Out of the rains of the Saldiak kingdom of Rum, a Turkmen chief Şārū-Khān (d. 1345) established himself in the town in 1313 and made Maghnisa the capital of his beylik, one which endured for over three-quarters of a century. Ibn Battūta, Rikla, ii, 312-14, tr. Glbb, li, 447-8, visited what he calls Maghnisiyya during Şârū-Khān 's reign, and stayed in a sawiya or hospice of one of the local flyan (i.e. of the Akhla (q.v.)); he praises its size and its amenities. The Ulu Diami' of Maghnisa dates from this period also, and re-uses Byzantine materials. The Şârûkhân-oghullari [q.v.] continued to hold the town till 792/1390 or the next year, when the Ottoman Bayerld I [q.r.] conquered it and gave it to one of his sons. After Timur's victory at Ankara in Soy/ 1402. Timûr gave Maghnisa to his grandson Muhammad (see Sharaf al-Din 'Ali Yazell, Zajar-nāma, ed.

Calcutta, ii, 466-7), and the town was then briefly restored to the descendant of Şārū-Khān, Khidz Shāh Beg; but the latter was deposed and killed by the

Ottoman Mahemmed 1 in 813/1410.

Under the Ottomans, Maghnisa, from its nearness to the capital Istanbul, was often governed by the sultan's eldest son and regarded as a steppingstone to lurther advancement. After his abdication in \$48/2444, sultan Muråd II retired to Maghnisa, leaving it to combat the Hungarian Crusaders but returning after his victory at Varna later that year (Von Hammer, GOR², I, 35x, 357); the remains of his

palace and garden are still visible.

Concerning the tax-paying population of the town, we possess figures for 937/1530-1 and again for 983/1575-6. Compared to other Anatolian cities, Maghnisa during the 10th/16th century experienced only moderate growth: from 1,356 taxpayers (about 6,000-7,000 inhabitants) at the first date to 1,995 taxpayers (about 7,000-8,000 inhabitants at the second one). This is all the more noteworthy Maghnisa during this period continued frequently to house the courts of Ottoman princes, m that much public construction took place in the town. The Khātuniyya mosque was built in the name of Prince Shahinshab's mother Husnishah, while the Sultaniyye mosque, which possessed shops and taxation rights in Urla near Izmir, was founded by Kanuni Süleymän's mother Haişa Sultan. As the last Ottoman prince residing in Maghnisa, sultan Murad III [q.v.] had the Muradiyye hulliyye or complex constructed by his chief architect Kodia Sinan (994) 1586).

In the second half of the roth/16th century, the area between the Gediz Çayı and the Büyük Menderes rivers produced grapes and figs for consumption in Istanbul. To assure a regular supply for the Ottoman capital, a large number of official rescripts prohibited both wine-making and the exportation of raisins. Throughout the roth/16th century, the exportation of cotton was equally forbidden. But for reasons not completely understood, this prohibition was reversed in the 1620s. Export trade in cotton particularly developped in the course of the 12th/ 18th century, when the area was controlled by a tamily of a yan motables known as the Kara Othman Oghullari (see below). The French traveller Pitton de Tournefort, who visited Manisa about 1700, stated that the cotton trade me the only major activity visible in the town [see on this trade, kurk. s. In the Ottoman empire].

When Ewliya Celebi visited Maginisa in 1082/1671-2, he man much impressed not only by the historical buildings, particularly by the Muradiyye mosque, but also by the opportunities for entertainment. Apparently the coffee houses of Maghnisa could rival with their more famous counterparts in Aleppo, Cairo and Damascus. Ewliya also mentions the existence of man than 3,000 shops, aside from two covered markets. But he equally reports that one of the covered markets had been partially converted into a mosque. This observation, if correct, may indicate that business life in Maghnisa man in

fact stagnating.

From the rath/17th century onward, Manisa was increasingly eclipsed both politically and minerially by Izmir [q.v.]. The latter had been but a minor port in the roth/16th century, containing less than 500 tax-paying inhabitants. But the transit trade in Persian silk lead to Izmir's rapid growth, and Maghnisa took on the characteristics of a minor regional centre, which specialised in the marketing

of agricultural goods. However, a certain amount of textile manufacture survived into the z890s, and to did the tanning industry, which had already

been famous in the 11th/17th century.

Late 19th century population figures reflect the relative decline of Maghnisa, now in the wildyet of Aydin, compared with izmir; Cuinet assumed that the former contained 35,000, the latter 200,000 inhabitants, and Sami Bey, Kāmās al-a'lām, Istanbul 1898, estimated Maghnisa's population at 36,252, of whom 21,000 were Muslims, 10,400 Greeks, 2,000 Armonians, etc. During the Turkish War of Independence, the town suffered heavy destruction, and the first census of the Turkish Republic credits Manisa with only 28,664 inhabitants. By 1950, the late 19th century level of 35,000 had again been reached; by 1975 the town had increased to 78,114 inhabitants.

MAGHŌSHA, the town of Famagusta in

Cyprus (see guarus).

The Mycenaen town of Alasya | located on or near | delta of the Pediyas, at Enkomi village. Its successor, the port of Salamis, only 1 1/2 miles to the east, became a great metropolis during the Roman empire. Restored by Constantius II on a much smaller scale after we severe earthquakes of 332 and 342, with the new name Constantia, it survived until Arab Muslim raids of the 7th century led to its transferral to Ammochostos (Maghōsha) 6 miles to the south (for Alasya, see Hill, i, 36, 42-9, and P. Dikalos, Enkomi: excavations 1948-1958, Mainz 1969-71; for Salamis and Constantia, see Hill, i, passim, and V. Karageorges, Salamis im Cyprus: Homeric, Hellenistic and Roman, London 1969). The town passed to Guy de Lusignan in 1192. The Genoese occupied it between 1383 and 1464; the Venetians took the town from the Lusignans in 1489. The Ottomans conquered it after a prolonged and extremely costly siege of eleven months in 1572, with tens of thousands of lives lost, After the Turkish conquest much Latin property was turned over to the Orthodox; however, from 1573 the latter were forbidden to live in the walled town, as in Rhodes. In 1607 . Tuscan naval expedition of eight galleys and nine galleons failed in surprise attack upon the town (Hill, iv, 48 ff.). The Knights of Malta, as well as English, Dutch, and Tuscan pirates, regularly harassed Lovantine shipping for more than a century after 1572. A famine in 1640 and plague in 1641 we known, well = severe earthquakes in 1557, 1569, and 1735 (Hill, iv, 67 f.). No was more vulnerable to malaria, plague, and locusts.

The Octomans failed to revitalise their great prize Maghonha, but it is obvious that by the last quarter of the 15th century the town had already been reduced to me third-rate commercial centre. The harbour remained a prize worth fighting for, but the Ottomans were mable to transform it into a useful naval base. Its growth was further limited by official ambivalence; the Porte sometimes dreamed of using the naval and commercial potential of Maghosha, but at other times appeared terrified that the prize would fall to enemies who might again use it against them. Although the Ottomans never had the energy to restore Maghosha, they guarded the fortress too zealously to allow economic development, and the small garrison became the

greatest part of the population.

After the fall of Acre or 'Akka [q.v.] (1291) to the Mamlüks, the ascent of Lusignan Maphosha was meteoric. Little more than its good harbour was noted by W. von Oldenburg in 1211 (C. D. Cobham, Excepta Cypria, 14). An anonymous Englishman (1544) called the town "a paradise of delight" with plantations and gardens irrigated with water brought into them artificially ... It has a parish, Cathedral, and Metropolitan Church like unto Amicas. There reside in it merchants of Venice, Genoa, Catalonia and Saracens from 🔤 Soldan's dominions, dwelling in palaces, which are called 'Loggias', living in the style of counts and barons, they have abundance of gold and silver. All the precious things of the world may be found in their hands," (Th. Mogabgab, Supplementary excerpts Cyprus . . , ii, 36 ff.; Itinerarium cinisdam Anglioi Terram Sanctam, in P. G. Golubovich (ed.), Biblio-teca bio-bibliografia della Terra Santa m dell' Oriente Francescano, iv, Florence 1923, 446-7). Seized by Genoese trickery in 1373, and held by them for a century, the town lost much of its local trade. Then a series of disasters-disease, earthquakes, locusts, and shifting trade routes-left the town crippled. Nicolai de Martoni (1394) observed: "The city of Famagusta is large, 🖿 large, I reckon, the city of Capua, and his fine squares, and houses very much like those of Capua, but a great part, almost methird, is uninhabited, and the houses are destroyed, and this has been done since the date of the Genoese lordship. The said city has finer walls than I have seen in any town . . . " (Cobham, 22 ff.; Revue de l'Orient Latin, iii (1895), 627 ff., 637 f.). Long before 1435 when Pero Tafur visited it, the aristocracy had abandoned Maghosha for Lefkosha or Nicosia, and most trade and economic activity had followed thereafter. "This place is depopulated on because of the nearby lake Constanta (Cobham, 31; Andaças é viajes..., in Coleccion de libros españoles raros o curiosos, Madrid 1874, viii/1, 139). Venetina rule (1489-1571) IIII not bring any improvement; despite efforts to rebuild the town, its population probably never rose above 6,000 (Hill, iii, 507, 729 n. 878). As Martin von Baumgarten (1508) found, Maghosha "remarkable for its harbour and fortifications" but Leikosha was "famous for its largeness". The silk merchant of Doual J. . Saige (1512) was astonished to see such a strong town with the walls "freshly repaired" and "a grand boulevard"; he found excellent produce along the coast, although only trade with Venica was permitted (Cokham, 55,57; Peregrinatio, Noribergae 1594, 139). Piri Re'l's mentions a beautiful castle, and inner and outer harbours at the only large port on the island (Kitabi Bahriye, ed. Y. Senemoğlu, İstanbul, ii, 283). Maghôsha's economic distinction lay in its harbour: as various travellers noted, Cyprus had no other. Indeed, few harbours if any in the entire Levant could provide better protection from the elements or could give shelter to more vessels. Since the Mediterranean between the gulfs of Antalya and Iskenderun was reputedly extremely dangerous, vessels which otherwise might have followed the coastline closely all the way to Rhodes preferred rather to strike out from Iskenderun, Tripoli -Alexandria for the south coast of Cyprus, sail round it, and then sail on to Rhodes. According to Jacques de Villament (1589), the capital of the province was Lefkosha, but "... on account of its fine harbour and incomparable fortress the Pasha generally lives *t Pamagusta for the safety of his person and galleys" (Cobham, 176; if the pasks did reside there, it contrary to regulations). After visits in 1508 and 1599 Cotovicus wrote that it "has a remarkable and most sale harbour . . . It is fairly spacious and

populous . . . the only defence which Cyprus has" (Cobham, 195; cf. Loredan (1476), who called it "the key and beart of Cyprus", despite its unhealthiners, in Hill, iii, 727 ff.). According to R. Pococke there we very little trade there, but an acqueduct brought very good water from three or lour miles away, the surrounding villages had relatively fertile soil, and "all provisions are cheap" (Cobham, 255; in Pinkerton, ed., A general collection of ... voyages . . . London 1811, i, 576-7). Those villages produced silk and mulberries, and madder root was another product. By the 18th century silting had made the harbour too shallow for larger vessels, and according to J. M. Kinneir (1814): "This port could admit vessels of a considerable draft of water; but since the conquest of the Turks, sand and rubbish have been suffered to accumulate in such degree, that were but small vessels can now enter it with safety" (Cobham, 412; Journey . . ., London 1818, 176). W. Turner Kinneir: "The port admirable, being about one quarter of maile in length, and something less in breadth, sheltered by low rocks; even now that the port is 'mostly choked up', ships which winter in Cyprus always m there to anchor in safety" (Cobham, 435).

The Jew Elias of Pesaro (1563) found that ophthalmis was a common fever from late June to midwinter; but the townspeople were described as clean, and careful to protect themselves from contagion, especially from the plague, quarantine often lasting forty days. The houses were fine and well built, the roads will maintained, and there were fountains of running water at every street corner. The castle reminded him of that of Pesaro. The food was excellent, and the bread the best he had ever eaten. The twenty-live local Jewish families completely controlled all money lending in Cyprus, and anyone wanting to borrow money had to come there. Interest was 20% per annum when gold and silver were pledged, 25% if wool, thread, = silk === pledged, and profits were often higher (Cobham, 73 ff.; translation of Hebrew letter by M. Schwab, in Revus de Géographie, w [1879], 221 ff.).

When Jacques de Villamont reached Larnaka in 1589 he was told not to try to go to Maghōsha because plague had long been raging there and the inhabitants of both the town and its surroundings were nearly 🔤 dead (Cobham, 175). The Dutchman Jan Somer (1590) compared the town in size to Amsterdam, although not so populous; disease had reduced the place, despite a rich agricultural hinterland (Beschriftinge van een Zee ende Landt Reyse . . Amsterdam 1649, 11). André Thevet (1590) chided those who wrote that "... the Turks made themselves masters of Famagosta, will slew all the Christians Latin and Greek, with the sword, so that old and young without exception felt the violence of these infidels. And still you see that the Greeks and others live in entire liberty" (Cobham, 178). Ottoman policy neurotically simed to close off the fortress; foreigners were treated as spies. When de Stochove wanted to see the town in 1631 he was advised "that was almost impossible in go in without meeting nome unpleasantness", for the pasks was a malicious man and absolutely no one could enter without his consent, | | | examined only the outer walls (Cobham, 217), in 1685 de Bruyn found that the Ottomans ". . . guard the city so jealously that no stranger is allowed to set foot in it . . ."; he was harassed when he simply tried to approach the walls (Cobham, 236, 241-2; Reizen was Cornelis al Bruyn, Delft 2698, 365 ff., 374 ff., with map). In the 18th century, most of the small population of the town must have been soldiers; some Christians settled in houses with gardens half a mile to the south in a village called Marash (Varosha). R. Pococke (1738) encountered a settlement of Christians who "are not permitted to dwell within the city". To the west was a large fertile plain inhabited mostly by Muslims because it was relatively "secure from the privateers", while Christians, who were not enslaved by them, lived near the sea. Most of the sparselyinhabited town was destroyed by a severe earthquake in 1735, making both the mosques of S. Solia and S. George unfit for use so that S. Catherine's church became the principal mosque. The town walls were severely damaged. The Swedish visitor Frederic Hasselquist (1751) estimated the population as 300 inhabitants, "chiefly Turks", who "occupy the miserable rules..." (Cobham, 254-5; in Pinkerton, ed., op. cit., I. 577-8; Cobham, 307, Iter Palaestinum, Stockholm 1757, 178 fl.).

Archimandrite Cyprianos (published in 1788) described the Ottoman occupation of Maghosha in some detail: the inhabitants "... remained in their houses, and appeared at the time to be the owners, yet afterwards the Turks dispossessed many of them, in the pretext that they were tenants only, not owners"; when the Greeks of Maghögha petitioned the rizier Mehmed Pasha they were permitted "... to live as Greek Christians, on condition that no Christian of the Latin Church should be found among them: for to the Latins he would grant neither church nor house, and those who remained in Cyprus were obliged to frequent the Greek churches, and forbidden to hold property in the island", Greeks were allowed to buy, sell, and inherit houses, fields, and property not already occupied by Turks. In g8r5 W. Turner reported: "... of its numerous palaces and churches not one remains entire". It had only a hundred people, including three Greek families. They lived in ruins, in low houses, mostly of mud, and no-one cultivated the countryside. Nearby was a village of Christians living surrounded by gardens (Cobham, 347 ff., 434-5). The estimate of 3,000 Muslims, 5,000 Greeks, and 200 Armenians attributed to the governor Tal'at Efendi seems too large (M. Louis Lacroix, L'Univers. Histoire et description des tous les peuples. Iles de la Grèce, Paris 1853, 88). The last Ottoman census reportedly showed 500 Muslims in the walled town and 2,200 Greek Orthodox in the suburbs. At this time, Maghōsha was used **=** a place of banishment for those under political er religious clouds; hence Namik Kemai (q.v.) 🚃 the Baha't leader Subb-i Ezel [see BARA' ALLAH] spent time there in exile.

According to the census of 1881, Maghosha with Marash (Varosha) was the fourth leading town of Cyprus with 2,609 inhabitants, of whom 1,845 were Greek Orthodox (71%), 727 were Muslim (28%), 6 Roman Catholic, 22 Maronite, r Armenian Gregorian and 8 Church of England and Protestant; there were 🖚 Jews. There were 666 adult males over 20, one per 3.92 people; of those 184 were Muslim (one per 3.95) and 482 Christian (one per 3.90) (Cyprus Gazette, no. 82 [4 April 1881 census], 3 March 1882; 17 June 1882). By 1891 the population had grown 30% to 3,367, but the Muslims had increased only 15 % to 835, failing to 25 % of the town's population (Cyprus Gazette, no. 341, 15 May 1891). By 1900 the population had increased to 3,825, 47 % larger than in 1881. The Muslims had grown only 18 % to 856, while 🜃 Christians 🔤 increased 58% to 2,969. Of 1,094 adult males 811 (3.66 per

capita) were Greek Orthodox and 283 (3.02 per capita) were Muslims (Cyprus Gas tte, no. 697,

26 April 1901; 30 August 1901).

In the second half of the 19th century, Maghosha was filthy and malarial, "in utter absolute ruin" according to Samuel Brown, Three months in Cyprus during the winter of 1878-9, London 1879, 19. To Mrs. Scott-Stevenson "... it seemed the most desolate town I had ever been in"; even the dogs seemed "dull, and without energy to bark at us" (Our home in Cyprus*, London 1880, 278). Although the third busiest harbour on the island, its entire trade came with coasting vessels, for large vessels called only at Larnaka and Limassol. The small suburb of Varosha to the south, equally pestilential, had extensive and luxuriant gardens and was the site of a pottery factory. The district men the leading one for fishing me the island (48 small boats caught 7,198 oke of thirty-four kinds of fish in 1889, the most important being sea bream (sarpa), lifhrina, macromati and shares; Cyprus Blue Book, 1889-90, 519). In that year the single Muslim school had 67 boy students and 13 girls. The municipal budget under the British was disproportionately smaller than the other towns. Initial British interest in making a new harbour flagged until 1895, when the proposal was raised again; and in 1899 a loan of \$ 254,000 to dredge and improve the harbour and to construct a narrow gauge railway to Lefkosha was authorised by the British government. After its completion in 1906, interest in the port increased very slowly until after World War I. In 1931 with 8,979 inhabitants it was the fourth largest town of the island, and by 1946 it was the third largest, with 16,194, of whom 13,106 were Greek Orthodox, 2,699 Muslim, and 125 Armenian Gregorian. In the latter year, 2,273 of the 3,048 inhabitants of the walled town were Muslim.

(R. C. Januaros)

MAGHRAWA, a major confederation of
Berbet tribes belonging to the Butr group and
forming the most powerful branch of the family
of the Zanāta.

The ascendancy, real or imaginary, of this coufederation is traced back to Maghraw, who is is to have been, according to the mediaeval Berber genealogists, the ancestor of the Maghrawa as such. Following the Arab and Berber utilised in the 8th/14th century by Ibn Khaldun in his History of the Berbers, the "cradle" of the Maghrawa and "the ancient seat of their power" was the territory located on the Chélif in the north-western part of what is now Algeria, probably bounded by the Mediterranean to the north, the mountain of Wansharis (Wansharish, currently Quarsenis) to the south and Themcen to the west. Leo Africanus [q.v.] says in his Description of Africa written in about £525-6 that the "Magraua (Maghrawa) mountain" stretched over a distance of some 40 miles (approx. 64 km), "close to the town of Mustuganin" (Mostaganem). The Maghrawa have left a relic of their presence here in the name of Cap Maghraona situated 104 km to the east of Mostaganem and 56 km, to the west of Ténès. It should be added at this point that, according to Abu '!-Fida' (1273-1331), Mostaganem served the Maghrawa as m port. Leo Airicanus extols the dignity and the courage of the inhabitants of the Magraus mountain, who were probably descendants of the Maghrawa of mediaeval Arab sources. The Maghrawa lived in this land in a nomadic state. but they also possessed (at least in the 7th-8th/ 13th-14th centuries) fixed dwellings and fortresses. In the 4th and 5th/10th-11th centuries, the individual segments of this confederation were spread throughout North Africa, from Morocco in the west to Tripolitania in the east.

Little is known of the origins and earliest history of the Maghrawa. According to Iba 'Abd al-Barr (d. 46 /2070), they arrived in North Africa in ancient times and established themselves "on the frontier of littleips, alongside the Maghrib" (i.e. in eastern Algeria), while the region which later, in the Middle Ages, became their homeland, in other words the territory located on the Chélif, constituted in ancient times the domain of "Adidiana, father of Zanāta". If Ibn Khaldon and his ______ to be believed, there is no doubt that the confederation of the

Magirawa already existed immediately before the Arab conquest of North Africa, probably in the first half of the 1st/7th century, if not much earlier, alongside two other major Zanāta branches (or possibly confederations), these being the Diariwa, the people of the famous Kahina, and the Banti Ifran. In all probability, the origins of the Maghrawa could traced back still further towards the beginning of the Christian era, through linking their name, in accordance with a hypothesis propounded by J. Desanges, with that of the Moorish peoples known to Pliny as the Macurebi and to Ptolemy as the Makkhourshi. The latter seems to attribute to the main mass of the Makkhourebi a very large coastal situated between the Zaccar and the Grands Kabylie, in the Roman province of Mauritanie. In spite of the quite different localisation of the Maghraand the Makkhourebi (the latter tribe mostly occupied territory a little to the east of the cradle of the Maghrawian confederation = the Chellf). the hypothesis of J. Desanges appears wholly acceptable and it that the Maghrawa belong among those exceptional Berber tribes of the Middle Ages whose names we attested in the ancient Greek and Latin texts. It may further be added that another segment of the Makkhourebl is mentioned by Ptolemy among the peoples of inner Libya (i.e. of southern Barbary). Ptolemy locates it, in fact, on the central reaches of the Draz. It is probably this group of the Maghrawa which is encountered, in the 4th-5th/rotharth century, in the neighbourhood of Sidjilmisa and which succeeded in founding a kingdom with this city as its capital. There will be further mention of this kingdom below.

The Maghrawa were related, if Ibn Khaldun is to be believed, not only to the Banú Ilran and the Diarawa, but also to the large Zanata tribe of the Banti Imiyan, It seems furthermore that the genealogy of this tribe is linked to that of the Lawata Berber group, in particular the Lawatian tribe of the Sadrāta. Among the numerous branches and subdivisions of the Maghrawa confederation mentioned by Ibn Khaldun and other mediasval Azab authors, the tirst that should be mentioned III their royal clan which was called Wanzāmar or Warzamār (variants: Wazmar, Wartazmar, Warzazmar or Wartazmir). Also belonging to the Maghrawa, according to Ibn Khaldan and the Berber genealogists quoted by this author, were the Banû Sindjas, the Banû Righa, the Band Laghwat and the Band Warra (var. Warrak), although according to Ibrahim b. 'Abd Alfah, the best Zanāta genealogist of the 8th/14th century (a native of the Maghrawa town of Timenghat, situated in the region of the Chelif), these four tribes formed part of another branch of the Zanāta family. According to other Berber genealogists quoted by Ibn Khaldun, there were yet more tribes belonging | the confederation of the Maghrawa. These were the Banti Zandādi (Zandāk), the Banti Warsifan (or Warsifan), the Banu Zadjejak, the Banû Îsamratan (also Îsmartan or Îsmartî), the Banu Sand and the Banu lift (var. Ilant). It is interesting however, to note that Ibn Hawkal includes, in his list of Berber tribes compiled after 976-7 A.D., the Bant Sindiasan (Sindias), the Bant Zandādi and the Banû Warsifan among the Zanātan tribes unrelated to the Maghrawa. There = also certain Berber genealogists quoted by Ibn Khaldun who mention the Bano Sindjasan (Sindjas) and the Band Warsifan without indicating their membership of the Maghrawa confederation.

According to Du Khaldin, the Franks (in this

case, Romans) had imposed the Christian religion on Maghrawa, likewite on the Djarawa and the Banû Ifran. Later, probably towards the end of the 7th or at the beginning of the 8th century A.D., the Maghraws tribes became converted without difficulty to Islam. They were governed in this period by ancient and powerful dynasty, later known as Banū Khazar and owing its name to Khazar b. Hafs b. Şûlât b. Wanzamâr (Wazmâr) b. Maghrāw. Ibn Khaldûn gives us a list, in his History of the Berbers, otherwise very incomplete, of the princes of this family which ruled the Maghrawa III the central Maghrib, at Fås, at Sidjilmåsa and in Tripolitania. Another even less complete list of the amirs whose origin dates back to Khazar b. Hafs is provided by Abû Zakariyya Yahya Ibn Khaldûn in his history of the Band 'Abd al-Wad. According to these lists, Súlát b. Wanzamár was the contemporary and client of the caliph 'Uthman (644-56). In fact, he was apparently taken prisoner in me of the battles that took place between the Arabs and the Berbers at the time of the first Arab invasion of North Africa (26/647-8). Sent to 'Uthman and pardoned by the caliph, iii became a Muslim, and on returning to his country he was proclaimed chief of his tribe (according to a passage in 1bn Khaldun's History of the Berbers, he had previously been chief of the Maghrawa and of other Zanātian peoples). If this tradition is correct, the Banu Wanzamar must have been Maghrawian family which lived, around the middle of the 7th century A.D., in eastern Barbary, bordering on lirlkiya, thus in the land which would have been, as stated by Ibn 'Abd al-Barr, the original cradle of the Maghrawa in ancient times,

After the death of Solat who survived, in all probability, into the second half of the 7th century, the government of the Maghrawa passed to his son Hafs, who is considered by Berber tradition as one of the greatest princes m rule over the Maghrawa. He also became, following this tradition, the chief of other Zanāta tribes. The tribes in question were probably the remnants of the great Zanata confederation of the Diarawa of Aurès, formerly ruled by Kāhina [g.u.], remnants who went to join their Maghrawa relatives of the central Maghrib. The power of the Maghrawa also increased during the reign of Khazar, son of Hafs. He lived in the first half of the and/8th century and gave his name to the historical dynasty of the Khazar, A tradition quoted by Ibn Khaldun states that this powerful prince took advantage of the Khāridijte revolt of Maysasa [4.0.] in the Farthest Maghrib (in 122/739-40) and of the weakening of the Umayyad Arab governors of Kayrawan which resulted from it, to extend his authority over all the Zanāta nomads of the central Maghrib, with the exception of the powerful tribe of the Banû Ifran, masters of Tlemcen. The Arab sources tell us nothing of Maghrawa involvement in the Khāridite movement. However, this would not seem impossible, in view of the fact that a little later a member of the Maghrawa, Nahdi b. 'Aşim al-Zanāti (or Nahd b. 'Āṣim al-Maghrāwi) was appointed governor (probably of a segment of the Maghrawa) by 'Abd al-Wahhab b. 'Abd al-Rahman b. Rustum, Ibadi imam of Tahart (168-208/784-823), and that in the Kitth al-Siyar of al-Shammakhi (roth/roth century) and in a list of Zanātan Ibadī shaykis, compiled in eastern Barbary in the 7th/13th centuries, there are found numerous Maghrawa individuals belonging to the Ibadi sect. Khazar b. Hais died after the fall of the Umayyads of the East (134/750), leaving control of the confederation of the Maghrawa to his son Muhammad b. Khazar. The last-named made war against the Banu Ifran. from whom he captured, in about 172/788-9. town of Tlemoen. It was during the reign of this prince that there took place the foundation of the kingdom of the Idrisids in the Maghrib al-Aksa by Idris b. 'Abd Allah [q.v.] with the support of the nowerful Berber tribes of Awraba, Sadtha and Maghila (172/788-9). In 173 or 174/789-91, Idris invaded the central Maghrib and accepted the submission of the Maghrawa, whose andr surrendered to him the territory of the Chelif and the town of Tlemcen; the latter later became the capital of another Idrisid principality, Muhammad b. Khazar also assisted Idris b. 'Abd Allah m snatch from the 'Abbasids all the provinces of the central Magurib. Later, in 197/812-13, we find him pledging loyalty to Idris 11. As for the Maghrawa, in this period they continued in possession of the plains of the central Maghrib, as well as the open country round Tlemcen, which they shared with the Banu Ifran. Throughout the 3rd/9th century they remained vassals of the Idrisid state. It was probably also in this period that the dynasty of the Bank Khazar founded Madinat Bani Khazar, "the city of the Banu Khazar" in m arid plain of the central Maghrib. We do not know the exact position of this city, which is mentioned by Ibn Hammad in his biography of Abū Yazid Makhlad b. Kaydad, "the man on the donkey". This Kharidjite chief sought refuge there after his defeat in the year 335/946-7.

This situation continued unchanged until the formation of the Fățimid empire. When the Mahdl 'Ubayd Allah sent to the Maghrib, in 298/910-11, an army which took possession of the Idrisid dominions and compelled the ldriski princes to recognise his authority, the Berber tribes of the central Maghrib, led by the Maghrawa and other Zanāta tribes, rose in revolt against this sovereign. The rebels were commanded by the Maghrawa prince Muhammad b. Khazar, we of the grandsons of that Muhammad b. Khazar b. Haiş who me amir of the Maghrawa towards the end of the and/8th century. Ten years later, in 309/921-2, the Mahdi "Obayd Aliah sent an army against him which was however routed by the Maghrawa. The following year, 'Ubayd Allah dispatched against Muhammad b. Khazar a fresh army commanded by his son Abu 'l-Kasim. At the approach of this army, the Maghrawa of the central Machrib (or the majority of the tribes of this confederation) led by Muhammad b. Khazar fled into the desert, having traversed the Moulouya. They took refuge in the territory of Sidjilmasa, thus in the region where Ptolemy had located, in the 2nd century A.D., the homeland of a group of the Makkhourebi, ancestors, as stated above, of the mediaeval Maghtawa. Some time later, Muhammad b. Khazar returned at the head of the Maghrawa tribes to the central Maghrib, towards the former homeland of these tribes in the region of the Chelli. On this occasion, Muhammad b. Khazar took possession of the territory of Chelif and of Tenes, expelled the supporters of the Fátimids from the Záb and captured the town of Oran, where he installed, as governor, his son al-Khayr. He also conquered other sites in the central Maghrib, and subjected the whole of this land to the authority of the Umayyads of Spain, However, this success did not last long. In 315 = 316/ 927-9, the Fățimid army commanded by Abu 1-Kasim, son of Ubayd Allah, set out to pacify the central Maghrib. This army routed the Maghrawa and forced them again to flee into the desert. But in 333/944-5, Muhammad b. Khazar, who had regained his position in the most powerful chieftain of the central Maghrib, attacked the western provinces of the Fatimid empire for the second time. He benefited in fact from the revolt of the Zanata tribes of the central Maghrib and of Ifrikiya, who professed the doctrines of the Kharidjite sect of the Nukkār (Nakkāra) and rebelled against the Fāṭimids. The insurgents were commanded by the famous Zanātian chief, the Nukkārite imām Abū Yazīd [q.v.]. It seems that at least some of the Mashrawa. who were predominantly Sunnt, acted in collusion with Abu Yazid, and that Mabad b. Khazar, brother of the amir Muhammad b. Khazar, was a loyal supporter of the Nukkāri chiel. Masbad b. Khazar was taken prisoner, in 340/951-2, by the Fatimid sovereign Isma'll al-Manser and suffered the death penalty. Another of the brothers of amir Muhammad b. Khazar, Fulful, embraced the cause of the Fățimids. However, the Maghrawa who occupied the territory of Chelif collaborated at this time with the army sent to the central Maghrib by the Umayyad caliph of Spain 'Abd al-Rahman III al-Nasir. In 333/944-5 two Maghrawa expeditions took place against the Fatimid provinces of the central Maghrib. These expeditions were commanded by the amir Muhammad b. Khazar, by his third brother 'Abd Allah b. Khazar and by his two sons al-Khayr and Hamza. They were directed primarily against the Fățimid garrisons of Biskra and of Tāhart (Tiaret). Also participating in the second expedition was the Umayyad army commanded by the Berber general Hamid b. Yasal. These two expeditions had a successful outcome for the Maghrawa and their allies, the Umayyads of Spain. In fact, Biskra and Tähart were captured by Muhammad b. Khazar, by his son al-Khayr and by their allies (cs. 333/944-5). However, soon after these victories and the success of Abb Yazld (whose army even succeeded in conquering Ifrikiya, the nucleus of the Fatimid empire), the military forces of this ampire regrouped under the command of Isma'll al-Mansur and routed the Berber warriors of Abû Yazid in a battle near Makkara (Bord) Magra), then turned against the Maghrawa. Muhammad b. Khazar surrendered to al-Manster in 335/946-7. According to one source, he subsequently broke faith with the Fatimids, and it was only in 342/953-4 that he returned to the Fatimid camp and abandoned for ever the cause of the Umayyads. His position towards the latter dynasty again equivocal in 347/958, at the time of the expedition of the Patimid general Diawhar who out for the central Maghrib with the object of pacifying this land, but ultimately, intimidated, he took part to this expedition. After this he paid wyski to the caliph al-Mufizz - Kayrawan, where be died in 350/96x-z, aged than a hundred years. According to another source, Muhammad b. Khazar embraced the cause of the Fatimids soon after 340/951-2 and remained loyal to this dynasty until his death. As for al-Khayr, son of Muhammad b, Khazar and chief of the land of Laghouat, he did not share the pro-Fatimid policy of his father and remained a loyal supporter of the Umayyad caliph 'Abd al-Rahman III of Cordova, except for a certain period ca. 334/945-6, during which he recognised the authority of the Fatimid caliph. In fact, in 340/951-2, he sent his son Futth to Spain, to the court of the Umayyad caliph. Futuh was accompanied on this journey by the stayets of Tabart and of Oran, supporters of the Umayyads. Subsequently, this delegation returned to Africa.

After the death of the amir Muhammad b. Khazar,

the supreme command of the Maghrawa passed to Muhammad b. al-Khayr, grandson of this assir and son of al-Khayr. Even during the lifetime of his grandfather, Muhammad b. al-Khayr had forged links with the court of Cordova, obtaining from the caliph 'Abd al-Rahman III, in the year 344/955-6, the governorship of Fas. However, he requested from this callph, in the same year as his appointment, permission to embark m a holy war in Spain, Having received this permission, he set out for Soain, leaving his cousin Ahmad b. Bakr at Fas to act as his lieutenant. Later, after his proclamation as chief of the confederation of the Magnrawa. Muhammad b. al-Khayr harassed the Fātimid possessions in the central Maghrib at the instigation of the caliph al-Hakam II (350-66/961-76), successor to 'Abd al-Rahman III. It should not be forgotten that the Fatirnid empire had extended its boundaries westward largely by virtue of the victorious expedition of the general Diawhar in 347/958. In fact, at the beginning of the reign of Muhammad b. al-Khayr over the Maghrawa, that is ca. 351/962, the Fatimid influence had already advanced to the Maghrib al-Aksā, while that of the Umayyads of Spain was confined to the districts of Ceuta and of Tangier. Now Muhammad b. al-Khayr succeeded in pushing back a considerable distance towards the east the zone of Fatimid influence established by Diawhar. In fact, he conquered a large part of the central Maghrib, creating in this land a sizable, albeit ephemeral, dominion of the Maghrawa under the control of the Umayvads. This dominion lasted some ten years, until the Fatimid governor of Ifrikiya, Ziri b. Manad (who belonged to the major Berber family of Şanhādja, bostile to the Zanāta in general and to the Maghrawa in particular) was entrusted by al-Mu'izz with the mission of blocking Maghrawa expansion in the central Maghrib. Zirl b. Manad also received from al-Mutizz authorisation to appropriate all the territories in the Maghrib that he could seize from the Maghrawa and the Zanáta, In 360/971 Ziri b. Manād gatberēd a powerful army (composed mainly of Sanhādja warriors) which he put under the command of his son Bulukkin (Buludidiln/Buluggin); this army was ordered to attack the Maghrawa and the Zanata. The first clash took place on 15 Rabis II 360/15 February 971, probably near Tlemcen. The battle was keenly contested, and ultimately a terrible defeat was in-Ricted on the Maghrawa and the Zanāta. Muhammad b. al-Khayr, who commander-in-chief of the Maghrawa army, took his own life rather than face capture, and seventeen of the amirs of the Maghrawa and Zanata was lost. In spite of this defeat, which contributed considerably to the consolidation of Fatimid authority in the Maghrib, the Maghrawa soon railied behind al-Khayr b, Muhammad b. al-Khayr, son of their prince killed in the battle of Tlemcen. Their forces were rapidly joined by the army of Djaffar b, 'All b. Hamdun, former Fâțimid governor of the Zab, who allied himself with al-Khayr b. Muhammad b. al-Khayr and thereby recognised the authority of the Umayyaris of Spain. Three months later, the two allies inflicted a crushing defeat on the Fatimid army which attacked them near Tabert. Despite this success, the Maghrawa and the army of Dia far b. All b. Hamdun (who had meanwhile become commander-in-chief of the coalition) were soon forced by another Fatimid army to evacuate the central Maghrib, crossing the Moulouya and taking refuge in the Maghrib al-Alesa First of all, they reached the littoral of Couta and

Tangier which remained, stated above, under the domination of the Umayyads. From there they made contact with the caliph al-Hakam II. It was thus that a section of the tribes which had formed the ancient confederation of the Maghrawa left their borneland in the central Maghrib, not to return until about a century later, after their expulsion from Morocco by the Almoravids. Among the Maghrawa active tracing their origin from the princely family of the Banti Khazar who set out to seek men territories in the Machrib al-Aksa after their war with Bulukkin b. Ziri, Ibn Khaldûn mentions, besides Muhammad b. al-Khayr, the close kinsmen of the latter, these being Zirl b. Khazar, Zirl b. 'Atiyya, Mukātil b. 'Atlyya (brother of the last-named), Khazrun b. Muhammad and Fulful b. Sa'ld. They are all encountered, in 365/975-6, in the entourage of the general Dia far b. All b. Hamdûn, who was appointed by al-Hakam II governor of the Maghrib on behalf of Cordova. As for Bulukkin b. Ziri, he received from al-Murizz in 361/972, the mandate to govern liftikiya and the Maghrib as dependencies of the Fatimid caliebs of Egypt.

Thus, after the year 971, the history of the majority of the tribes that had previously constituted the confederation of the Maghrawa was closely linked with the country that is now Morocco, where the various princes of the Band Khazar family established three states, those of Fas, of Sigjilmasa and of Aghmat. We shall begin with the history of these dominions, subsequently considering other segments of the Maghrawa who remained, after 361/971, in the central Maghrib and in Iirthiya, or those who returned, after the conquest of Morocco by the Almoravids, to central and eastern Barbary.

A. Morocco, r. Fäs. Bulukkin b. Ziri - not content with the expulsion of the Maghrawa and their Zanātian allies from the central Mastrib, from Tubna, from Baghāya, from al-Masila, from Biskra, from Tahart, etc., but pursued them, with great success, towards the interior of present-day Morocco. He finally caught up with them near Sidilmasa and defeated them in battle. The amir at-Khayr b. Muhammad fell into the hands of the Falimids and was put to death. After this battle, Bulukkin b. Zirl retraced his steps and returned to central Morocco where he carried out a massacre among the Zanātian tribes. Al-Khayr b. Muhammad left a son named Muhammad b, al-Khayr, whom a group of Moroccan Maghrawa entrusted with the command. Besides him, the mention two other powerful and influential smirs who enjoyed, in this period, considerable authority among the Maghrawa. These were two kinsmen of Muhammad b. at-Khayr b. Muhammad, namely Ziri and Mukatil, sons of 'Atiyya b. 'Abd Allah b. Kharar. These three amirs led the Maghrawa after 971. It seems that some years later, the Maghrawa of the Maghrib al-Akşā divided into two groups, a northern and a southern, both obedient to the Umayyads of Cordova. The sources provide a list of the Maghrawa princes belonging in the first of these groups who were to be found, in 365/975-6, in the entourage of Dlafar b. 'All b. Hamdûn, Umayyad governor of the Magarib al-Akså. This list includes Muhammad b. al-Khayr b. Muhammad, whose name is followed by those of Baksas b. Sayyid al-Nas, Mukatil b. Atiyya, Khazrûn b. Muhammad and Fulful B. Sand. The southern group of the Moroccan Maghrawa were commanded by another prince of the Banû Khazar family, Khazrun b. Fulful b. Khasar. This prince set out in 366/976-7 to conquer Sidiilmasa, ■ town governed by the ambs of the Miknasa family of the Bank Midrar. After the seizure of Sidjilmasa, Khazrun received from the hadjib of Cordova, al-Mansur Ibn Abl 'Amir, the mandate to govern this town which remained in his family, as will be noted below until the arrival of the Almoravids.

Muhammad b. al-Khayr b. Muhammad seems to have still been the head of the Band Khasar family in 369/979-80, when Bulukkin b. Ziri b. Manad undertook a new expedition to the borders of the Maghrib al-Akså. This prince fled to Spain, where he requested the support of the hadith al-Mansur who governed Spain on behalf of the Umayyad caliph Hisham (366-99/976-2009). The latter responded to his appeals and sent an expedition to the Maghrib under the command of Diafar b. 'All b. Hamdun. The Andalusian army, which included Machrawa and Ifran contingents, advanced to a position near Ceuta; Bulukkin b. 21rt declined to give battle and withdrew to take possession of the remainder of Morocco, Later, in 375/985-9, Muhammad b. al-Khayr is mentioned at the head of a list of Maghrawa amirs who railied, according to Ibn Khaldun, around the flag of Abu 'l-Hakam 'Amr b. 'Abd Aliah b. Abi 'Amir, Umayyad governor of the Maghrib al-Aksa. However, it is not he, but his cousin Mukatil b. 'Atiyya and the latter's brother Ziri b. Atiyya who we noted see this occasion as being among Berber princes most loyal withe Umayyad cause. It meet that Muhammad b. al-Khayr b. Muhammad lost the leadership of the northern group I the Maghrawa in 375/985-6 or shortly after this date, to blukhtil b. 'Atiyya, After the death of the last-named in 378/988-9, it man his brother Zīrī b. Aţiyya who was proclaimed leader of the northern group of the Moroccan Magaraws. This amir had in addition been appointed (by the Umavyad sagish Ibn Abl 'Amir' king of the Maghrib al-Aksā before at date, in 377/987-8. Zirī b. 'Atiyya founded a kingdom in the north of this country and made the town of Fas the capital of this dominion, which remained in the possession of his successors until the arrival of the Almoravids. He settled the Maghrawa (of the northern group) in the outskirts of the town, it should also be remembered that the family of Zirl b. 'Atiyya was descended from 'Abd Allah who was the brother of the powerful Maghrawa amir Muhammad b. Khazar, king of the central Maghrib who, m stated above, me supporter of the Patimids and died at Kayrawan in 350/961-2.

Some years after his appointment as sovereign of the Maghrib, Ziri b. 'Atiyya went to against the Şanbādja (acting on the orders of the hadjib al-Mansur) and substantially increased the size of his eastern provinces. In 382/993 he travelled to Cordova at the invitation of al-Mansor. It seems that the reign of Ziri b. Aţiyya was a period of some instability, with this prince and his Ifranid rival Yaddu b. Ya'la changing piaces on the throne of Fas according to the vicissitudes of war. In fact, on his return to Fas from Cordova, Zirl saw his place taken by Yalla and it was only at the cost of a murderous struggle that he recovered his throne. Because Ziri constantly had in mind the reconquest of the territory of Chélif, and perhaps also the restoration of the ancient Zanāta and Maghrāwa kingdom of the Bantl Khasar in the central Maghrib, he found the location of Pas too remote for the capital of the future state. Therefore decided to construct a new capital for himself and for the principal chieftains of the confederation of the Maghrawa. In 384/994 he founded the city of Wadida (Oujda) on the borders of Moroeco

and present-day Algeria and installed himself there, accompanied by his court and his household troops. In the same period, he decided to reject the anthority of Cordova, and ultimately the relations between him and al-Mansur Ibn Abi 'Amir were broken. Al-Mansur cent an expedition against him commanded by the freedman Wadih; an encounter took place on the banks of Wadi Radat and the Andalusian army was deleated. Al-Mansûr then organised another expedition and appointed as commander his own son 'Abd al-Malik al-Muzaffar. This time, Ziri was defeated on two occasions in 387/997. He tried to take refuge in Fas, but the residents denied him access to his capital, which 'Abd al-Malik entered shortly after. Zirl was compelled to withdraw by way of the Sahara, after which he attempted to found a state in the central Maghrib, in the territory belonging to the kingdom of the Zirid Badis b. al-Mansur b. Bulukkin. Thus in 368/998 he mounted an invasion of this part of the Magheib. After the victory of the Şanhādjian army commanded by Hammad b. Bulukkin, Ziri b. 'Atiyya took possession of Tahart, Chélif, Ténès and al-Maslia. It interesting to note that in these towns he ordered that prayers be offered for the Umayyad callph Hisham and his sigiib al-Mansûr. He also laid siege to the town of Ashir, capital of the Sanhadja, but he died in 391/1000-1. before taking this town.

On the death of Ziri b. 'Atiyya, the Maghrawa of northern Morocco proclaimed his son al-Musizz chief of this branch of the confederation. This prince, who did not share 🔤 father's hostile attitude in regard to the hadjib Ibn Abl 'Amir, had already, in 390/999rooc, been established by the latter at Fas in role of Umayyad governor. Subsequently, the son of the hadjib 'Abd al-Malik al-Muşafler, who became after the death of al-Mansur his successor in the court of Cordova, appointed al-Mufizz, 393/1002-3, to govern Fas and the Maghrib al-Aksa. In 396/1006, al-Mutizz received from Cordova letters of investiture for Fas and for whole of the Maghrib al-Aless with the exception of the land of Sidjilmasa, the preserve of the Maghrawa dynasty of the Band Khazrun who were, like the amirs of Fas, subject to the Umayyads of Spain. Al-Mufizz died in 417/1026 or, according to another source, in 422/1030; during his reign, the kingdom of Fas enjoyed a period of peace.

His successor was his paternal cousin Hamama b. al-Musicz b. Atiyya who had been appointed governor of Fas by al-Musizz in 416/1025, before the death of this amir. Hamama was able to consolidate his power in regard to Spain. However, in 424/1032-3, war broke out between this andr and the rival dynasty of the Banu Ifran, who possessed a kingdom with its capital at Shalla (Salé) on the Atlantic coast of Morocco. The Ifranid prince Abu 'I-Kamal Tamim b. Zirl marched against Fas and captured this town. Hamama retreated towards the east and reached the towns of Wadida and Tenes in the eastern part of the kingdom of Fås, where he stayed for five years. Having mustered powerful contingents, he advanced on Fas in 429/1037-8. Abu 'l-Kamal was forced to withdraw from Fas and return to Shalla. Later, in 430/1038-9, Hamama continued the anti-Şanhādja policy of his predecessors by attacking the Hammadid prince al-Kā'id (419-46/1028-54) who came to meet him and secretly paid large sums of money to the Zanata troops of Hamama. The latter, becoming aware of this and fearing the defection of his troops, returned to Fils, having declared his submission to the Hammadids. He died in 431/2039-40 = 433/1041-2.

After his death, power passed to his son Dunks. Having suppressed a revolt by me of his cousins, this prince subsequently devoted all his efforts to the embellishment of Fas, which was now becoming a large commercial city. He died in 452/1062, leaving the throne to his son al-Futüh. But the rights of al-Futth were contested by his brother Adilsa. The latter took control of part of the capital, while al-Futüb established himself in the other part. The two brothers engaged in a war which lasted three years, at the end of which 'Adilsa was killed and al-Futub was able to reign effectively in Fas. However, his was not a long reign. In fact, he was driven from Fås in 454/1062 by the Hammadid sovereign Bulukkin b. Muhammad (447-54/1055-62). After his departure, the Maghrawa chose one of his kinsmen to succeed him, Mu'annasar (or Mu'ansar) b. Hammad b. Mu'ansar b. al-Mu'ize b. 'Atiyya. He was proclaimed chief in 455/1063 and was soon obliged to wage war against the Almoravids, who were beginning to invade Morocco. Defeated by them in a major battle the same year, he took refuge with the Berber tribe of Sadina, leaving Fas m fall into the hands of the warriors of Yūsul b. Tāshfin. But some time later he returned, deposing the lieutenant installed by Yusuf b. Tashfin and regaining control of his capital. When the Almoravids laid siege to Fas, in 460/1067-8, Mutanşar attempted a sortie, but he did not return from the battlefield. The people of Fas then proclaimed as prince his son Tamim. But the capital was taken by Yûsuf b. Tashfin two years later (462/x069-70), and the new sovereign was put to death by the Almoravid king, who also ordered the slaughter of more than three thousand Maghrawa, Bano Ifran, Zanāta and Miknāsa living in Fās. Those who escaped the massacre took refuge in Tlemces. Another group in Maghrawa from Fas fled to al-Damna, a town situated in northern Morocco, on the frontiers of the land of Ghomara. But the Almoravid king laid siege to the place in 465/1072-3 (or according to another source, in 471/1078-9); he captured the town and crushed the Maghrawa. Al-Bakrl mentions, in 1068, yet another group of northern Maghtāwa living near the highway leading from Ceuta to Tetouan, on the fringe of territory belonging to the Berber tribe of the Madjaksa. There they possessed market which they called Suk Banl Maghrawat ("Market of the Bank Maghrawat"). It is not known whether this group survived the conquest of Fas and al-Damna by the Almoravids. However, it is by means impossible that this small tribe should have succeeded in crossing the Moulouya and returning to the Chelif, the ancient cradle of the Maghrawa.

2. Sidjilmāsa. At the instigation of in hādjib af Cordova Ibn Abi 'Amir, . Maghrawa chief named Khazrun b. Fulful b. Khazar embarked in 366/976-7 on the conquest of Sidjilmasa, which for two centuries had been governed by amirs of the Mikulsa family of the Band Midrar [q.v.]. This chief, who was me of the most influential members of the princely family of the Banû Khazar, proclaimed in Sidiilmasa the sovereignty of the Umayyads of Spain and sent to Cordova the head of the last prince of the Midrarid dynasty. After this, Khazrun received from al-Mansur the governship of Sidjilmasa which he retained until his death. He was then replaced by his son Wanudin. The latter was obliged to defend himself against the invasion by the Algerian Sanhādia of the Maghrib al-Akṣā. For a certain period of time he was thrown into disgrace by at-Mansur, whose son and minister al-Muzaffar gave the government of Sidjilmasa to Bamid b. Yaşal, but later, = 390/999, his authority was confirmed by the Umayyads. At the time of the fall of the Umayyad caliphate in Spain, he declared himself independent, conquered the region of Dar'a (Dra in our maps) and in 407/ 1016-17, took possession of Sufrdy (Sefrou), which was one of the dependencies of Fas, and of the valley of the Wadl Malwiya (Moulouys). Al-Mu'izz b. Zirl, sovereign of Fas and master of Sufruy (and perhaps also of the region of the Moulouya), under attack from Wantdin who conquered a large portion of his dominion, attempted not only to recapture these provinces but also to deprive Wanddin of his capital. The same year (407/1016-17), he mounted an expedition with a powerful army, but was beaten by the troops of Sidiimasa and led back to Fas only the remnants of his force. His and successor Mas'ud was defeated, stripped of his dominions and killed by the Almoravids, who put to the sword all the Maghrawa who had taken refuge in the region (445/1053-4). Ten years later (in 455/1063), the sons of Wanadin and the remnants of the Maghrawa residing at Sufray were dispersed in their turn. Finally, in 463/1070-1, the Almoravids seized by force the settlements of the region of the Monlouya. In this way, the domain of the Bunti Khezrun family was utterly destroyed.

Agamát. Another segment of the ancient confederation of the Maghrawa which entered Morocco ca. 972 founded a small kingdom at Aghmat on the plain of Marrakush near the foothills of the High Atlas, in the period when the last princes of the family of Zirl b. Atiyya were the rulers of Fas. Nothing is known of the history of the Maghrawian dynasty which reigned at Aghmat, but it to have been just another branch of the great Maghrawa princely family of the Bant Khazar. The last of the Maghrawa amirs of Aghmat, named Lakut, [Lakkut, Laghūt) b. Yūsuf b. 'Ali, was killed by the Almoravids in 451/1059. He was apparently been married to the wise and beautiful Zaynab bint Ishak of the Berber tribe of Nafza who became, after the death of Lakût, the wife of the Almoravid amir Aby Bakr b. Umar. The latter subsequently, in 453/1061, handed over Zaynab to his kinsman Yusuf b. Tashfin,

4. al-Sus. After the arrival of the Maghrawa in the Maghrib al-Akṣā in ca. 971, an amir of the family of the Banu Khazar, named Muhātil and, according to Ibn Hawkal, the brother of the amir Abu Abu Allah Muhammad b. Khazar, set out, probably at the head of m group of Maghrawa, towards the south where he occupied territories in the province of al-Sus, According to the list of Berber tribes compiled by the geographer Ibn Hawkal, he was present in this area in the period following 166/976-7. This prince is completely unknown m us. He may in fact be none other than Muḥātil b. Atiyya, brother of Ziri (sovereign of Fūs), mentioned ca. 365/975-6 and residing, in this period, in the north of Morocco, as stated above.

Despite the crushing defent inflicted on the king-doms of Fas, of Sidjilmass, of Aghmat and of al-Damna, the Almoravids did not succeed in exterminating all the branches of the Maghrawa in Morocco. In fact, the remnants of this confederation stayed in this country where they are mentioned again, in the 8th/14th century, by Ibn Khaldun. Among these remnants attention should be drawn to the Banu Warra, a substantial branch of the Maghrawa. In this period, families belonging to this tribe were widely dispersed in Morocco, particularly in the environs of Fas and in the Sus. According to Ibn

Khaldun, at the beginning of the 8th/14th century, the Marinid sultan Yusuf b. Ya'kub deported to the territory of the Chélif the chiefs and almost all the families of the Banu Warra who resided in the region of Fas. Another Maghrawian branch, the Banu Sindjas, also occupied in the 8th/14th century places in Morocco.

B. Algeria I. Tlemess. According to Ibn Khaldûn, the Maghrawian sovereign of Fås, al-Musiaz b. Zlri, seized from the Sanhådja, i.e. from the Zirid king Bådis b. al-Mansår (386-409/996-1015), the town and province of Tlemesa, where he established as governor his kinsman Yaūā, — of the smir Muhammad b. al-Khayr, who had previously (until ca. 373/983-6) headed the confederation of the Maghrawa in the Maghrib al-Akṣā. Yaūā served Musiaz b. Ziri (aith-fully and passed on to his descendants the government of Tlemesa and of all the surrounding country.

successors lived in peace with the Sanhādia dynasty, masters of the central Maghrib, which enabled them to consolidate their authority at Tlemcon, which became an independent state. This situation continued until the arrival in the central Maghrib of the Hilalian tribes of Zughba and Athbadj. In ca. 446/1054-5 the invaders turned their weapons against the Zanāta tribes of the area and captured from them all the open country. The Hammadids, who found themselves in this period, after many truces, in a state of war with the amir Bakhti, a descendant of Yalla b. Muhammad b. al-Khayr, obtained the support of the Zughba. The war between Bakhti and the Zanata on the one hand and the Hammadids and the Zughba on the other, lasted a long time. Bakhti put at the head of his army a vizier named Abû Su'da who belonged to the Zanata tribe of the Banû Ifran. This general rallied beneath his flag all the Zanata tribes of the central Maghrib. beaded by the Maghrawa and the Bann Itran. The sources mention numerous battles which took place between the Hammadids (and their allies, the Zuzhba and the Athbadi) and the army of Bakhti. In one of these conflicts, Abū Susda lost his tife (450/1058). After the death of Bakhti, at a date unknown, the throne passed to his son al-'Abbas. It was during this period that the Almoravids, having completed the conquest of the Maghrib al-Aksa, appeared in the central Maghrib. Their chief, Yūsui b. Tāshfin, dispatched an army composed of the Lamtuna against Tlemeen and, in 473/1080-1, he seized this town from al-Abbas. Subsequently, he put this amir to death, along with all the other descendants of the family of Yada b. Muhammad b. al-<u>Kh</u>ayr and exterminated the Maghrawa who were trapped in the town.

2. Child. The emigration of the Maghrawa of the central Maghrib to the Maghrib al-Aksi which took place in 1971 involved only a part of the tribes of the Mashrawa confederation, who left this country led by al-Khayr b. Muhammad b. al-Khayr and other amirs descended from the ancient princely family of the Banu Khazar. The other Maghrawa tribes residing in the central Magnetb remained in the territory of Chelif and neighbouring sites, the region which had been, as stated by Ibn Khaldun, the centre of their settlements. These tribes were obliged, after the collapse of their power in 971, to pay tribute to the major dominions of the central Magnito as a guarantee against their attacks. Among these Maghraws were the powerful tribe of the Band Warsifan and the tribes of the Bann Wartazmar (Wanzamar), the Banu flit, the Banu Zadididak and the Banû Sindias. Later, the Arab sources add to

these the Band Bû Sa'id and the Band Warra. In the 5th/11th century the Band Warsifan resided in the neighbourhood of Milyana, where they lived under the control of their own thappins, subject in this period to the authority of the Hammadids, and the Band Singles, who had their own awir, possessed the region of Medea, known as Lamdiya in the Arabic sources.

After the collapse of the dominions of Fas, of Sidjilmasa and of Aghmat brought about by the Afmoravids, a Maghrawa prince named Mutansar b. Hammad, who claimed descent from Ziri b. Atiyya, fled from Yûsui b. Tâshfin at the head of a group of Maghrawa and entered the territory of Chelif, subject at this time to the Hammadid king al-Nasir (434-81) 106s-89). It seems that the Maghrawa tribes of this region recognised his authority, with the exception of the Banû Warsifan who were unwilling to accept him and who remained loval to the Hammadid governor based at Milyana, Mu'ansac b. Hammad attacked them and killed a number of their shaykhs: he also slew the Hamadid governor of Milyana. Al-Nasir was unable me come to the aid of the Banu Warsifan on account of his struggles with the Hilalian Arabs. So the Band Warsifan marched alone against Mu'anşar, killed him in battle and sent his head to al-Nasir. This battle to have been only one episode in a long war between the Maghrawa invaders of Morocco, who were joined by numerous Maghrawa and Zanāta tribes, and the Hammadids which took place cs. 460-70/1007-78. In this war, which ended with the decisive defeat of the Maghrawa and the Zanāta, the Maghrawa and Zanāta chiefs was decimated. Among these chiefs, mention should ill made of Abu 'l-Futüb b. Habbüs (or Hannüsh), amir of the Banû Sindias and ruler of Lamdiya (Medea).

The history of the Maghrawa of the region of Chélif under the domination of the Almoravids is entirely unknown. They seem bowever to have suffered greatly at the hands of the Lamtuna. In lact, when 'Abd al-Samad, a Maghrawa amir who belonged to the Banti Khazar family and traced his origin from the royal family of the Banu Khazrun of Tripoli, arrived in the territory of Chelif at around the middle of the 6th/12th century, he found there only remnants of the Magheawa. He established himself among this people and was greated with honour by the Banû Warsifan, the Banû Wartazmar (Wanzamar), the Banû III Salid and other Maghrawa tribes. These tribes, ever loyal to the family of the Band Khazar, the unclent kings of the territory of Chélif and of the entire central Maghrib, were all eager to recognise in his person the rights of this dynasty. 'Abd al-Samad allied himself through marriages to their leading families and left numerous children, who were known in the territory of Chélif by the seem of Banû Khazar or Banû Muhammad, no doubt in memory of Muhammad b. Khazar, the Maghrawa king of the central Maghrib in the 4th/zoth century. The arrival of 'Abd al-Samad in the region of Chelif took place shortly before the establishment of the empire of the Almohads, who became masters of the central Maghrib in 547/1152 after a war against a coalition of Zanāta tribes. Also members of this coalition were the Maghrawa, in particular the tribs of the Band Warsifan (in = 539/1145). One of the descendants of 'Abd al-Samad, a certain Abb Nas who was renowned for his piety, received from the Almohads, who treated him with great respect, the government of part of the territory of Chellf and the command of the Maghrawa in this region.

Such were the origins of mew Maghriwa state in the central Maghrib. The real founder of this state man Mandil b. 'Abd al-Rahman, grandson of Aba Nas who lived at around the end of the 6th/12th and beginning of the 7th/13th conturies. This prince conquered the neighbouring territories, including the region of Wānsharls and the town of Lamdiya [Medea] along with the places dependent on them. The dynasty which he founded is known in the mediaeval Arabic sources as Awiād Mandil [q.r.]. As tor Mandil b. 'Abd al-Rahman himself, he took the field against Ibn Ghāniya, but lost the battle and died in 622/1225, prisoner of this chief.

The auccessors of Mandil took possession of Miliana, of Ténès, of Cherchel, of Mitidia and a large part of the region of Wansharls, founding a quite substantial kingdom, much of which was subsequently taken from them by their neighbours, in particular by the Banû 'Atiyya, chiefs of the Zanāta tribe of Tūdiln which inhabited the region of the high Chelif. la co. 670/1271-2, the Maghrawa of Chélif recognised the sovereignty of the dynasty of Banu 'Abd al-Wad of Tlemcen, However, two years later the 'Abd al-Wadid sultan Yaghmurasan b. Zayyan tavaged the land of the Maghrawa and compelled them to code to him the town of Ténès. Thus began the wars between the 'Abd al-Wadids and the Maghrawa amirs which lasted a hundred years. One of the most important episodes of these wars was the expedition of the sultan of Tlerneen Abû Zayyan (703-7/1304-7) and his brother Abū Hammū against the tribes of Chélif in 706/1307. in the course of which the 'Abd al-Wadids subjugated the valley of the lower Chelif and conquered the towns of this region. Nevertheless, the Maghrawa continued to be the formidable enemies of the Banû 'Abd al-Wad. In fact, in 714/1314-5, the shayet the Maghrawa tribe of the Banti B0 Saud raised, in the valley ... Chelif, the standard of revolt against Abti Hammi who had become sultan of Tlemcen after the death of Abū Zayyān. However, he was forced to take flight. Living at about the same time was the amir Rashid b. Muhammad, a renowned Maghrawa warrior who, after the conquest of his land by the Banu 'Abd al-Wad, offered his services to the princes of Bougie. In 703/1303-4 he reached the territory of Mitidia (Mitidia), where another celebrated Maghrawa warrior named Munif b. Thabit came to join him with his partisans. But the fatter, decisively defeated, took refuge with his entire family in Spain, where he remained until the end of his life.

Later, at around the middle of the 8th/14th tury, the Maghrawa of Chélif became once more a tribe of some importance. They were at this time subjects or allies of the sultans of Tlemcen, but they sought at every opportunity to rid themselves of this dependence. In this period, their principal centre was the town of Timzughat or Timzurat. In ea. 749/1348-9, a prince of the Awlad Mandil dynasty named 'All b. Rashid (possibly the son of the renowned Maghrawa amir Rashid b. Muhammad mentioned above), took possession of the territory of Chelif and subjugated Miliana, Ténès, Brechk and Cherchel. He also possessed the village of Mazuna. But the revival of the state of the Maghrawa did not last long. In fact they were attacked, in 751 🖿 752/1350-2, by the sultan Abū Thabit of Tlemcen, who subjugated the Maghrawa of Chellf and captured Māzūna, Brechk, Cherchel, Miliana and Medea. The Maghriwa warriors took refuge in the fortress of Adirū which dominated the towns of Ténès.

In ea. 772/1370, after the death of 'All b. Rashid, the Maghrawa of Chélif proclaimed as chief his Hamza, who was the last prince of the Maghrawa state of Chélif. His reign was of short duration. In 774/1372, the sultan of Tlemoen sent powerful forces to subdue the Maghrawa. The latter were defeated, and the 'Abd al-Wadids took control of the town of Timzüghat (Timzūrat) situated in the centre of their territory. Ténés and Miliana also surrendered to the sultan of Tlemcon. In the wake of this defeat, the Maghrawa of Chélif lost all their power and, to avoid the prospect of slavery, they emigrated from the region in large numbers. In 775/1373, the majority of this people took refuge in the district of Mitldia. However, it is quite possible that some of the Maghraws of Chélif remained in their ancient bomeland and that the noble and valiant inhabitants of the "Magrana Mountain" located near the village or Mostaganem who are spoken of in 1525 by Leo Africanus belonged to the various segments of the Maghrawa.

3. Zāb and its environs. It has been observed above how the Maghrawa princes of the Bank Khasar dynasty took advantage of the Kharidjite revolt of Maysara in 122/739-40 and of the enfeeblement of the Umayyad governors of Kayrawan to extend their authority over all the nomadic Zanāta of the central Maghrib, of which Zab formed a part. So it was that from this period onwards, different Berber tribes and clans belonging to the confederation of the Maghrawa began moving into this region. In 316/928-9 the powerful Maghrawa prince Muhammad b. Khazar appeared in Zāb, from which he energetically expelled the supporters of the Fatimids, Later, in 379/989-90. ■ Maghtāwa amir claiming descent from the family of the Band Khazar and named Sa'ld b. Khazrun b. Fulful, discontented with the personal policies of the Umayyads of Spain who were lavishing extraordinary honours upon the amire Mukātil and Zirl, sons of Atiyya b. 'Abd Allāh b. Khazar, described the Umayyad porty and presented himself at Ashle at the court of the Zirid prince al-Mansur b. Bulukkin (373-86/984-96) who gave to the turncoat the government of the town of Tubna in the region of Zib. After the death of this amir in 381 or 382 (991-2), it was his son Fulful b. Sa9d b. Khazrun who succeeded him in this role. In 389/999 this amir rebelled against the Zirid prince Badis b. al-Mansu: (386-406/996-1016), but after defeat at the hands of the Sanhādia army he took refuge in the mountains and subsequently, in 391/1000-1, made his way through the desert to Tripoli.

Among other Maghrawa individuals who were active in Zab and the surrounding region mention should be made of three chiefs of the Banû Warzamâr (Wanzamar), a leading family of the Maghrawa, these being al-Manşûr al-Warzamari and his two sons Abd Allah and Masfud, who made war on Hammad b. Bulukķīn (405-19/1015-29), probably in the vicinity of the town of Baghaya. It is also in this period that the Arabic sources mention the olace known as Kudyat Maghrawa, itself situated in the region of Zab. According = al-Bakri (2068), two tribes belonging to the ancient confederation of the Maghrawa, these being the Band Izmarti (Isamratan, Ismartan) and the Bank Maghrawa proper, resided in the vicinity of Biskra. The latter tribe man governed by amirs descended from the Banû Khazar family. To the west of the town of Bantivus, which lies to the south-west of Blakra, there existed a place known as Sāķiyat Ibn Khazar "the irrigation canal of Ibn Khazar", which owed its name to a prince belonging to the family of the Banu Khazar, possibly the ancient Maghrawa king Muhammad b. Khazar who reigned in the central Maghrib in the first half and around the middle of the 10th century. To the west of Bantiyus, al-Bakrl notes the presence of the Maghrawa in an expanse of desert three or four stages long, on the road leading from Oran to the land of Kastiliya (Bilad al-Djarid). Maghrawa 🚃 also to 🖿 found in this period to the south of Biskra. In fact, it is known that the town of Waghlanat or Wughallan (Ourlet or Ourellal on our maps), situated to the south of Biskra and probably inhabited by Berber Ibadī elements, was besieged in 450/1058-9 by the Maghrawa chief named Abū Zaghīl al-Khazari, clearly a member of the princely family of the Bantt Khazar. Later, in ca. 468/1075-6, the Maghrawa, the Ghumart and other nomadic Zanāta tribes of the Zāb region ailied themselves with the Hilālian Arabs and sacked the towns of the Zab. The leader of these brigands was the Maghrawa chief al-Muntasic b. Khazrûn, master of the Zanàta of Tripoli (of whom further mention will be made below), who made his base at Waghlanat. The inhabitants of Zab complained to the Hammadid prince al-Nāṣir [454-81/2061-89), who dispatched against al-Muntașir his al-Mansur at the head of an army. Al-Mansur entered Waghlanat and destroyed the town. Some time later, al-Muntașie, for whom 'Arûs b. Sindi, chief of Biskra, had laid a trap, was killed by the latter and his head sent to al-Nasir.

It may be added that among the Maghrawa tribes which inhabited Zab and the neighbouring regions there were also the Banú Zandádi (Zandádia, Zandāk). This was an important tribal group which, according to al-Yackubi, Ibn Hawkai and al-Bakri, lived in the 3rd-5th/9th-11th centuries in the environs of Tubna, of al-Masila (Msila) and of Makkara or Makra (the ancient Macri, the contemporary Bord) Magra), a town situated midway between Tubna and al-Masila. According to the Ibadi historian al-Shammakhi (10th/15th century), the majority of the Zandadia professed the doctrines of the Ibadi sect.

Ibn Khaldun (8th/reth century) mentions three other tribes belonging to the Maghrawa residing in the region and vicinity of Zab, these being the Sindias, the Righa and the Laghwat. The first of these tribes occupied the territory currently known = the Ouled Nail and the land extending m far m Djebel Amour and the mountain of Reshid. According to Ibn Khaldun, the Singjes resided, before the arrival of the Hilklian Arabs, in the plains of Ifrikiya, and the latter forced this people, not without difficulty, to take refuge in the mountains and fortresses of the Ouled Nail and the surrounding regions. In the 8th/ 14th century, they pald tribute to the Hilalian Arabs who had subjugated them. According 🖿 Ibn Khaidun, in this period they still professed the doctrines of the Kharidite sect (in this case, Ibadi).

The Righa, a nomadic branch of the Maghrawa which comprised a large number of families, was established in Djebel Aiad and in the plain extending from this mountain to the town of Nikawus (Ngaous our maps). In the time of Ibn Khaldun, the Righa of the mountains paid tribute to the smirs of the tribe of 'Ayağ, and the families of the Righe residing in the plain of Nikawas were subject to the local

Arabs.

The Laghwat, m branch of the Maghrawa tribe renowned for its valour and its resistance to Arab domination, inhabited in the 8th/14th century, the desert region separating the district of Zāb from the mountain of Rashid. There they occupied a large settlement which bore their name, Laghouat on

modern maps.

4. Wedt Righ. A large number of Maghrawa families settled, probably at about the middle of the 4th/roth century, in im land stretching between Zāb and the territory of Wārdjilān (Quargle on maps) where the new arrivals built in the banks of a stream flowing from south to north, numerous towns and villages surrounded by date-palms, in the ancient Arab sources, this territory was called Wadi Arigha or Wadi Righ, from the name of the Maghrawa tribe of the Righa; modern maps this land bears the name of Oued Righ - Oued Righ. The majority of the Maghrawa families who inhabited Wadl Arigh were Ibadl Kharidjites; they principally professed the doctrines of the Wahbls and the Nakkaris. Alongside the Righa, there were also present in the 8th/14th century some mombers of the Singlas clan, who arrived in this territory after leaving their former settlements in Zab or in Ifrikiya. The Ibadi historian al-Shammakhi mentions on several occasions the Maghrawa of Righ. The most ancient reference to the Maghrawa of Oued Righ dates from ca. 362/972-3. Other mentions of the Maghrawa of Righ occur in the 5th/11th and 6th/12th centuries.

5. Eastern Algeria. A segment of the tribe of the Sindias resided, in the 8th/14th century, in the region of Constantine. In the same part of Algeria, Arabia sources of this period also mention an offshoot from the Maghrawa tribe of the Band Warra which gave its name to a mountain and a village situated in the vicinity of Bougie. Finally, a Maghrawa tribe known as the Banti Ikshan which professed the doctrines of the Ibadi sect resided, in the 4th/toth and 5th/11th centuries and possibly also in subsequent centuries, in the plain of Bône, Fahs Bûna in Arable sources. Ibadi sources from the 7th-10th/13th-16th centuries mention eight or so important Ibadi sknykks belonging to this tribe.

C. Tunisia. A segment of the Maghrawa tribe of the Banu Izamratan inhabited the canton of Nafzāwa situated in the south of Tunisia. According to the Hafsid historian Ibn Nakhil, quoted by Ibn Khaldun, this was the tribe of origin of the Berber chief 'Abd Allah b. Muhammad al-Rand who governed, on behalf of the Zirids, the town of Kafşa (Gafsa), at the time of the invasion of the Band Hiläl. In 445/1053-4 he declared himself independent and accepted the submission of Tuzar, Nafta, Takyūs, al-Hāmma and other localities in the province of Kastiliya; he founded the dynasty of the Banu 'l-Rand. On his death, in 465/1072-3, his son and successor Abú 'Umar (Abû 'Amr) al-Mu'tazz succeeded in constituting to the west of southern litiklya an important principality comprising Kamūda (Gamouda), Kaişa and Kastliya, bounded to the north by the regions of Sebiba, Kayrawan and Siax. The capital of this principality - the of Kafşa, situated in the centre of the territory which it dominated. The domain of the Banu 'l-Rand existed until 554/1:59, at which date the Almohads captured Kafşa and deposed the ruling family.

It seems that the Maghrawa established themselves in the Nafzāwa in a quite ancient period. In any case, Muhammad b. Ishāk al-Khazari, who was probably descended from the princely Maghrawa family of the Banû Khazar, and appointed governor of the Nafzāwa by the Ibāḍi imām of Tāhart, 'Abd al-Wahhāb b. 'Abd ai-Raḥmān b. Rustum (168-208/ It may be added that the Maghrawa chief Warra b. Sa'ld, descended from the Bana Khazran family offshoot of the Bana Khazar, an appointed governor of Nafzawa by the Zirid prince Badis b. al-Mansar (400/1009-10). After him, his brother Khazran obtained from Badis the government of Nafzawa (401-4/1010-14).

The Maghrawa and the Zanāta also resided, in the second half of the 5th/11th century, throughout the region of Kastliya. Ibn Khaldûn refers, in fact, to a raid of Hilâlian Arabs against these Berber groups. Probably those involved were the man Maghrawa who took part in a coalition of the Hilâlian Arab tribes of Riyāb, of Zughba and of Sulayman which campaigned, in 457/1064-5, against the Hammādid sovereign al-Nāṣir.

Among the Maghrawa tribes lahabiting Ifrikiya, mention should also be made of the Bank Singlas, who distinguished themselves by the part that they played in the sum of the Zanāta against the Zirid and Hammādid Şanhādja. In 314/1120-1 they blockaded Gafsa and ravaged the surrounding area. They also appeared in the Bilād al-Diarid, where they were attacked by Muhammad b. Abi 'l-'Arab, general of the Zirid sovereign 'All II. Yahyā (500-15/1116-21). The Zirid army expelled them from III Djarid and destroyed their power.

D. Tripolitania. An offshoot of the Maghrawa led by amirs descended from the family of the Bant Khazrūn, stranch of the Bant Khazar, established an independent government at Tripoli. The history of this state, which existed for almost a century and haif (39x-54x/1000-1145), is little known in spite of the information provided by Ibn Khaidūn, Ibn Idhāri, al-Tidjāni and other Arab authors. Nevertheless, some facts are available, in particular cerning the first century of the dominance of the Banu Khazrūn.

It has been observed above that Fulful b. Sa'ld b. Khazrūn, a Maghrāwa amir descended from the family of the Banû Khazar, was, 📰 🖼 father Sa'ld b. Khazrun, a supporter III the Zirids, lieutenants of the Fatimids in IfrIkiya and, like his father govern of the town of Tubna in the Zab on behalf, of this Şanhādja dynasty. In 390/1000-1 Fulful b. Sa'ld rebelled against the Zirid prince Badis b. al-Masur. Defeated by Badis, he took refuge in the Sehara and subsequently marched on Tripoli, a province dependent on the Zirids. He took control of this land in 391/1000-z. Becoming master of the town and province of Tripoli, Fulful b. Sa'ld was constrained to fight a prolonged war against Badls b. al-Mansûr, and requiring military support he first of all recognised the authority of the Fatimid caliph al-Hakim whose aid was, however, ineffectual. Therefore, he decided to approach the Umayyads of Spain, and in 399/1008-9 he sent mission to the court of Cordova, whose sovereigns had always been, since the time of 'Abd al-Rahman III (300-50/ 912-61), allies and protectors of the Maghrawa and their kings, the Bant Khazar. However, this approach led to no result, as Fulful b. Sand died in 400/1009-10, before the return of his ambassadors from Cordova.

After the death of Fulful, the Maghrawa and the other Zanāta tribes proclaimed a smir his brother Warrū b. Sa'id. This chiel was obliged, first of

all, to recognise the authority of the Zirid Bādis b. al-Mansūr, who murched on Tripoli and occupied the town, forcing the Zanāta and Magirāwa warriors to flee. Warrū b. Sa'īd was granted a general amnesty and appointment in governor of Nafzāwa [400/1009-10]. But in 401/1010-11 he once more repudiated the authority of Bādīs and inaugurated in lengthy war, during which the Magirāwa and Zanāta ravaged extensive areas of southern littīķiya and Tripolitania. However, they immediate to take control of the town of Tripoli which remained in the hands of Muhammad b. al-Hasan, the governor appointed by Bādīs b. al-Mansūr. Ultimately, in 404 or 405/1013-15, Warrū b. Sa'īd again offered his submission to the Zirids.

After the death of Warra b. Said # 405/1014-5, the Maghrawa and Zanāta of Tripolitania were divided into two parties, an supporting the succession of Khalita, son of Warru, and the other rallying round Khazrun b. Sa'id, the latter's brother. It was Khalifa who emerged victorious over his rival, having taken possession of his camp. Khazrun b. Sa'd made his way Egypt, to the court of the Fatimid caliph, where the two sons Saqd and al-Muntaşir spent their youth. In this manner, Khailfa b. Warrû established his authority over all the Maghraws and Zanata of Tripolitania. This chief pledged loyalty to Badis b. al-Manşür, but after the death of this sovereign and the accession of his son al-Mucizz (406-454/1016-1062), he rebelled against the new Zirid king, Groups of Maghrawa and Zanata led by Hammad, brother of Khalita, made incursions into the territories of Gabès and of Tripoli. These raids lasted until 413/2022-3. Soon after this, the new Zirid governor of Tripoli, 'Abd Allah b. al-Hasan, ceded the town to Khallia, who thus restored the demination of the Band Khazrun. Subsequently, in 417/1006, Khalifa b. Warru made overtures to the Fățimid caliph al-Zăhir b. al-Hākim (411-27/1021-36) and obtained from him confirmation - governor of Tripoli. The same year, Khallfa also 🚃 a lavish gift to al-Mutizz b. Badis. It is probable that Khallia died during the reign of al-Zāḥir.

It was apparently in the lifetime of Khalifa b. Werru that Sa'id b. Khazrun and his brother al-Muntaşir, sons of Khazrun b. Saad, returned from Cairo and established themselves in the neighbourhood of Tripoli. At one point, it is not known when or how, Said b. Khazrûn succeeded in taking control of the town of Tripoli, but he was killed in 429/ 1037-8. After him, his kinsman Khazrûn b. Khalifa seized Tripoli. But his residence in the town lasted only a year, until December 1038, when he was forced to leave Tripoli in secret to escape from al-Muntaair b. Khasrun, who arrived at the head of a Zanata army to secure the accession of his brother Sand b. Khazrun. This chief, proclaimed onir of the Maghrawa and Zanata of Tripolitania, governed the town and province of Tripoli for a very long period. It was during his reign, between the years 430 and 440/ 1038-49, that a lengthy war took place between the Zanāta and Maghrāwa of Tripoli the one side and the Zirid king al-Mufizz b. Badis = the other; the latter attacked them Et the head of a Sanhādja army. The Maghrawa and Zanata routed the first Şanhādia expedition, and repulsed the second, but me defeated by the third and were compelled to conclude a peace treaty with al-Mu'izz. According to Ibn Khaldun, al-Muntaşir again recognised the authority of al-Mufaz b. Badis in 443/1051-2, during the invasion of the Banû HUâl. In fact, he came to the 📺 of Badis at the head of a thousand Zanata horsemen,

but was beaten by the Hilâlians and fled along with the entire Zirid army. Despite the occupation of the plains of Tripoli by the Hilälian Arab tribes, the capital of the province remained in the hands of al-Muntasir, who was still in residence there in ca. 468/1075-6. It was at about this date that he decided to lead the Arabs of the tribe of the Banu 'Adl in an assault on the central Maghrib, which was at this time in the possession of the Sanhādia dynasty of the Banu Hammad. The forces of al-Muntasir occupied the towns of al-Maslia and Ashir, and also the regions of Zab and Righ. Al-Muntasir established his headquarters in the small town of Waghlana, to which reference has been made above; in addition, he remained master of Tripoli. It has also been mentioned above that he was treacherously killed by the chief of Biskra, who recognised the authority of the Bant Hammad.

After his death, another member of the Bann Khazrin family, whose name is not mentioned in the sources, took control of Tripoli. The subsequent history of Tripoli under this dynasty is not known. It is known, however, that the last amir claiming descent from the Bann Khazrin was expelled from the town of Tripoll by King Roger II of Sicily, who replaced him with Abu Yahya Iba Matriit al-Tamini (540/1146). However, according to Iba Khaidun, section of the Bann Khazrin family was still residing in the plains of Tripoll the time of the conquest of this land by the Almohads (ca. 553/1160).

As for the Maghrawa of Tripolitania, they subsequently took refuge in the Diabal Nafusa. They were still present in this area in the 8th/14th century, at the time of Ibn Khaldun, according to whom the dense population of the district was composed of Nafusa, of Maghrawa and of some Sadrāta families. These Maghrawa seem to have converted to Ibādism, the religion of the Berber population of the Diabal Nafusa.

It has been observed above that the Maghrawa remained, after their conversion to Islam, supporters of Sunnism, with the exception of branches of the confederation which embraced Ibādism. However, it seems that the conversion of this tribe to Islam was for a long time superficial and that certain Maghrawa tribes were still, in the 5th/rtth century, semi-pagan. In fact, according to al-Bakri (1068), there existed among the Bann Warsifan the cult of demons known as al-shamarikh (sing. shamasikh), to whom offerings made.

at-Magerie, the name given by Arab writers to that part of Africa which Europeans have called Barbary or Africa Minor and then North Africa, and which includes Tripolitania, Tunisia,

Algeria and Morocco.

The word magheib means the west, the setting sun, in opposition to mastrik, the east, the rising sun (Levant), but as Ibn Khaldun remarks, the general denomination me applied to a particular region, The extent of this area, moreover, varies according to different authors. Some oriental writers (e.g. al-Mukaddasi) include in the Maghrib not only Northern Africa but also Sicily and Spain; the majority, however, reserve the man Maghrib for the first of these countries. But they - not in agreement upon the boundaries to be assigned to it on the east. On the other hand, they are in agreement about the northern, western and southern boundaries. To the north, the Magnrib is bordered by the Meditarranean. To the west, it extends as far = the Atlantic Ocean, which it hugs from Tangiar to the desert of the Lamtuna (Abu 'l-Fida') or only, according to Ibn Khaldun, as far as Safi and the Deren (Great Atlas). To the south it stretches (lbn Khaldûn) far as the barrier of moving sands separating the country of the Berbers from the land of the Negroes, that is to say the Erg [see sauma"] and as far as the rocky regions called hammade [q.v.]. Some districts situated outside this limit, such as Būda, Tamentit, Gurāra, Ghadames, Fezzān and Waddan, are sometimes considered belonging to the Maghrib. As regards the eastern boundary, certain authors made it extend as far as the sea of Kulzum (the Red Sea) and thus include in the Maghrib, Egypt and the country of Barka [q.v.]. Others, whose opinion is adopted by Abu 'I-Fida', make it coincide with the actual frontier of Egypt, from the cases (al-Wāḥāt [q.v.]) as far 🖿 al-'Aèaba al-kabira between Barks and Alexandria. Ibn Khaldua does not accept this delimitation, because, be says, the inhabitants of the Maghrib do not consider Egypt and Barka as forming part of their country. The latter commences only at the province of Tripoli and encloses the districts of which the country of the Berbers - composed in former times. Ibn Safid and later Maghribl writers limit themselves to reproducing with a few variations in detail, the information of Ibn Khaldun. As for Yakut, he confines the Maghrib to the country stretching from Miliana [q.v.] to Sus (ed. Wüstenfeld, iv, 583).

Placed, according to al-Idrisi, in the third clime, but according to al-Zuhri (§§ 1:, 21) in the 6th ikimu migras, the Maghrib is divided into several regions or less clearly defined. Du Hawkal (tr. Kramers-

Wiet, 57 ff.) distinguishes two regions: the Eastern Maghrib from the frontier of Egypt as far Zawila in Tripolitania, and the Western Maghrib from this point to Sūs al-Akṣā; but the division commonly accepted is that into three regions, littkiya, Central (awsa) Maghrib and Farther Maghrib (Abu 'l-Fidà', Ibn Khaidūn, etc.). Ibn Sa'id adopts a slightly different division: liftkiya, outer Maghrib, and further Sūs. liftkiya [q.n.] had varying limits; central Maghrib was from Bougie to the Moulouya river (Ibn Khaidūn); and the farther Maghrib from the Moulouya to Saif and to the Deren, to which must be added al-Sūs, which torms, as might be said, according to Ibn Khaidūn, an Island or country detached from all others and surrounded by seas, deserts and

At the present time, the term Maghrib is still used in opposition to Maghrik in a sense to that which it will in mediaeval times, but it also denotes simply Morocco when the full expression al-Maghrib al-Akşā all abbreviated. Furthermore, the political union of the North African countries which certain politicians seek is called al-Maghrib al-Kabir.

Bibliography: Apart from Ibn Khaldun, Hist. des Berbères, tr. de Stane, i, 186 ff., most of the geographers describe all Maghrib: see M. Hadj-Sadok, Description du Maghrib et de l'Europe == III .- IX sitele (= texts and tes. from Ibn Khurradadhbih, Ibn al-Fakih and Ibn Rusta), Algiers 1949; Ch. Pellat, Description de l'Occident musulman au IV .- Xe siècle (= text and tr. of ai-Mukaddasi's ch.), Aiglers 1950; Bakri, Description de l'Afrique replentrionaie, ed. and tr. de Slane, Paris 1965; Zuhri, Kitāb al-Djardfiyya, ed. and comm. AL-MACHRIB, AL-MAMLARA AL-NAGHRIBTEYA, a kingdom of North Africa whose name in European languages (Fr. Maroc; Eng. Morocco; Span. Marruecos) is m deformation of the name of the southern metropolis of the kingdom, Marrakush [g.v.].

E. GROGRAPHY.

Morocco occupies the western part of Barbary; it corresponds to the Maghrib al-Aksà of the Arab geographers [see AL-MAGHRIB]. Lying between 5° and 13° W. longitude (Greenwich) on the one hand and between 36° and 28° N. latitude on the other, it covers approximately an area of between 500,000 and 550,000 km². On the north it is bounded by the Mediterranean, on the west by the Atlantic and on the south by the Sahara. On the eastern side it stretches to the Tell and to the plateau of Oran. The boundary which separates it from Algeria is quite conventional and fixed definitely only on the northern side.

Although Morocco forms one with the northern part of Africa, it is chiefly oriented to the west. It is, one might say, the Atlantic slope of Barbary; it is nevertheless moontinental country. The coast does not lend itself to m maritime population; the Mediterranean coast is steep and inhospitable, the

Atlantic coastline straight and lacking in natural shelters. The estuaries of the rivers of very little value because of the sandbars which obstruct their entrances. The geological structure in somewhat complicated. Below the folds of the primary age, of which there still exists much eroded evidence covered by secondary deposits, have risen strata contemporary with the Alps. The actual relief which has resulted from these movements of the earth's surface and from these successive modifications consists of folded mountain chains, plateaux and plains. The chains are two in number, the Rif and the Atlas. The Rif is the continuation from the other side of the Straits of Gibraltar of the Baetican Cordillera [see RIF]. The Atlas [q.v.] chain forms the backbone of Morocco, It breaks into the High Atlas oriented west-north-east, linked by the volcanic massif of Sirwa (3,300 m.) to the Anti-Atlas which lies more to the South, and also to the Middle Atlas running in a diagonal line from the southwest to the north-east, me far as the country of the outer foothills of the Rif, from which it is separated by the corridor of Taza. From these different chains stretch plateaux. Those of the east connect the High Atlas III the Saharan Atlas of Algeria; those of the West gradually descend towards the Atlantic. Amongst the latter some are only the vestiges of the primary layer raised and eroded; others - composed of sedimentary deposits of varying origins.

In consequence of the oblique orientation of the Middle Atlas, which gradually draws away from the coast, the plains, which occupy in Morocco a more important place than in the rest of Barbary, lie mainly on the Atlantic side. They are composed of two series, the one stretching diagonally from the mouth of the Tensift to that of the Muluya (the sub-Atlantic plains, the plain of Sebou, the corridor of Taza, the plain of the lower Moulouya). The other stretches to the foot of the High Atlas (Hawz of Marrākush) and disappears in the heart of the Middle Atlas.

Climate. The climate of Morocco has been defined as "an Atlantic variety of the Mediterranean climate" (Gentil). This however must not be taken to apply to the whole of the country; the different regions differ as much in regard to temperature as in the distribution of rain. On the Atlantic coast the climate is relatively mild in winter and cool in summer (Tangler: 12°-24"; Agadir: 14°-22°); only small differences are recorded between the coldest month and the warmest. In the interior on the other hand, the seasonal variations and even the daily ones increase the farther one goes inland. They become excessive in character in eastern Morocco where the climate is distinctly continental. The rainfall is equally lacking in uniformity. Brought by the west and south-west winds, the rains are abundant in the autumn, the winter and the beginning of spring but they are very rare during the summer. The Atlantic has everywhere copious rainfall although the quantity which falls decreases = === goes from north to south [Tangier: 32 inches, Casablanca: 16 inches). It also enjoys the benefit of atmosphere which is saturated with moisture even in summer. The interior is not - well served. The rains diminish in quantity from west to east. The mountain massifs always form an exception. They condense the moisure in the form of rain and even snow which, although it is by no means perpetual, nevertheless covers the high summits of the Atlas mountains until beginning of the

summer. Eastern Morocco in the other hand, Isolated by the barrier of the Middle Atlas, is not subject to oceanic influences and only receives, except in the immediate neighbourhood of the Mediterranean,

rare and irregular downfalls of rain.

The flora reveals in striking fashion these variations of climate. Forests of evergreen oak, of oak and of cedar clothe the peaks of the High and the Middle Atlas and of the Rif. The cork tree is found in extensive forests in the massifs of the Za'à'ir and Zayān and as far as the region of the Atlantic (forest of the Ma'mūra). The thuya and the arganier [see ARGAN] are already with disseminated. Poplars, willows, slms and tamarisks form a fringe of verdure along wadls. The olive tree is met almost everywhere in its wild state. But, as the rainfall decreases, the forest gives place to scrub whem the jujube tree and the mastic abound, then to prairie and steppes. The prairie, which hardly goes beyond the limits of the maritime plain, is the home of plants which are used for fodder and of bulbons plants. The steppe is the home of shrubs and bushes (artemisia, drin, alfa) which are adapted to a dry soil and to extreme variations in temperature. The stoppes cover a part of the interior plains of western Morocco and practically the whole of eastern Morocco, where they extend to the neighbourhood of the Mediterranean. As regards the desert, it is devoid of vegetation in the hammadas [q.n.], although the cases form spots of verdure in the midst of the general desola-

Hydrography. The structure of the country and the relative abundance of rainfall affect the hydrography. Morocco is much richer in running streams and in subterranean waters than any other country in Northern Africa. Wadls (weds) are here more numerous; their courses are longer and their volume larger. A number of them even deserve the name of rivers. The waters flow in three different directions: towards the Atlantic, towards the Mediterranean and towards the basin of the Sahara. The Atlantic rivers in all respects the most important, They can be divided into three groups: those of the north (Loukkos and Sebou), those of the centre (Bu Ragrag and Umm al-Rabl'), and those of the south (Tensift and Sous). The Loukkos drains the districts of the Gharb; the Sebou, those of the Middle Atlas, of the Zarhûn, and the southern slope of the Rif. On emerging from the mountains it takes numerous turns and windings across the altuvial plain and reaches the ocean after a course of 300 miles. Although subject | considerable variation | volume, according to the season, it never dries up completely. It is even navigable in its lower course [see AL-MANDIVVA]. The Bû Ragrag and the Umm al-Rabit me for a part of their course through the central plateau, the Moroccan "Meseta". The irregularity of their courses makes them useless for navigation. The Tensift, to the north of the High Atlas, the Wadl Sus to the south, which are much less in volume approach more nearly to the classic type of wadl of northern Africa. The watercourses of the Sahara (Wad Gir, Wad Ziz, Wad Dar'a) diminish in volume - they go farther away from the mountains and end by disappearing in the sand. The Dar'a [q.v.] alone reaches the Atlantic, but it only flows intermittently in its lower course. As for the Mediterranean rivers, they are only torrents with violent and rapid floods. The Moulouya (Malwiyya) alone forms = exception. It collects water from the slopes of the Middle Atlas but only reaches the sea

in much diminished volume on account of the loss it suffers in crossing the steppes.

Although the manufacturistics of all the countries of Barbary are found in Morocco, the greater or less differences in relief, the differences in climate, the peculiarities of vegetation bring in their train a diversity more marked than in Algeria or Tunisla. The combination of these different elements determines the existence of regions which differ the from the other in their configuration, their resources, and density and manufacturish six such regions: Northern Morocco, the basin of the Sebou, Central Morocco, the country of the Atlas, Eastern Morocco, and Morocco, Sahara.

Northern Morocco, Northern Morocco comprises a mountainous will (the mountains of the RH properly se-called which | the north-west comtiqued in the "domes" of the Diebila (Jbila) as far as the Strait of Gibraltar) and regions less rugged in character which | the south-east and the west form the transition into the adjoining countries, The mountains, split into deep ravines by the courses of the wadis, for the most part only leave between their last escarpment and the sea-shore . narrow strip, or m few bays enclosed between the rocky promontories. A few cuttings which run across the ranges afford communication between the two watersheds. The Rif, therefore, must seem to be a world very little accessible to influences from without. Arab influence has scarcely grazed it. The population has always vigorously opposed the political measures of the sultans as well as the attempts of Europeans to settle themselves there. Crowded into a limited territory, since the highest parts of the mountains are useless, the people of the Rif find their chief means of subsistence in the cultivation of vogetables and fruits. A number of them gain from temporary emigration an addition to their resources. They are not nomadic but inhabit villages perched the slopes. Towns are represented only by Shafsawan (Chechaouen) and Wazzan (Ouezzan), religious and commercial centres, situated the one the northern side and the other on the southern side of the Djebala. Towards the south-east, plains interspersed with mountain masses extend as far as the Moulouya. The lack of rain gives to these plains (Salwan, Garet) the aspect of steppes more fitted to a pastoral life than to agriculture and a settled life. Towards the west the lowlying coastland, still a very narrow border at the strait of Gibraltar, increases gradually from the north to the south between the Atlantic coast and the last slopes of the Diebala. This district commonly called the Gharb is a corridor. It still keeps in this respect its historical significance, but its economic value is diminished by the stagnation of its waters in the hollows in the list bottoms of the valleys, and by the insecurity resulting from the proximity of the warlike tribes of the high mountains. A few townships have however succeeded in establishing themselves, either at the crossing of roads such as al-Kase al-Kabie [q.v.] or in proximity to the coast like Centa, Tangier and Larache (see the articles SABTA, TANDIA and AL- ARA 1921.

The valley of the Sebou. The valley of sebou lies between the Rif, the Middle Atias, the Moroccan Meseta and the Atlantic. The situation of the region, the abundance and variety of its natural resources makes it of exceptional value. The Sebou links up the whole of it. Through its tributary the Innawen, the valley of which leads

to the pass of Taza, it makes communication with the rest of Barbary easy. The mountain massifs there (Zarhûn, Zālagh, mountains of Gerwân) offer inseparable obstacles to communication. The high plains of Sa'is and Meknès are contrasted with the lower plains of the Shrarda and the aliuvial plains of the lower and of the Sebou. The influence of the Atlantic is felt far into the interior and combines with the numerous streams that flow into the Sebou and its tributaries and the subterranean waters to promote the development of all forms of vegetation. Forests cover the higher stopes of the mountains; fruit-trees flourish on the sunny slopes and cereals in the high plains; the mardies, temporary marshes produced by the Sebou in its lower course, are used for grazing until they are sufficiently dry to be of use to agriculture. This combination of circumstances, so auspicious for human habitation, has made the valley of the Sebou a centre of intensive settlement. The most diverse ethnic elements have settled together and mixed there. All types of habitation are found as well as all degrees of attachment to the soil from nomadic to settled town life. Human activities are displayed in the most varied forms (grazing, agriculture, arboriculture, commerce, industry). The country villages, douars of huts in the plains, villages of houses of clay in the mountains, are numerous, the towns are flourishing. Mawity Idris [q.v.] is the sacred city of Morocco, Sefrou on the borders of the plain of Sa'is and the high limestone platean lives by trading with the people of the mountains and the industry of its weavers and makers of slippers. Fås and Meknès are among the great eities of Morocco.

The first of these towns has remained to this day the political, religious, intellectual and economic centre of Morocco. It has resisted all the usual causes of decline. From all time the ownership of the high plains of the Sebou has been hitterly contested. Their possession has been the condition for the establishment and survival of the dynasties which have succeeded one another in Morocco. Their political significance and role in history corresponds very exactly to their geographical position and economic value.

Central Morocco. Between the valley of the Sebou, the ranges of the Atlas and the Atlantic, covering about a quarter of habitable Morocco, lies the region called by the geologists the Moroccan Meseta. It concludes districts of very different character, the only feature uniting them being the possession of a common substratum, the Hercynian paenoplain covered almost everywhere by sedimentary horizontal formations. Differences of structure and of climate distinguish clearly the various parts: the Atlantic plain, the plateaux of the centre, and the interior plain of the Hawz. The maritime plain lies along the Ocean from Rabat to Mogador [see AL-SUWAYRA]. Very at its northern and southern ends, it broadens near the centre (Dukkala, Shāwiyya) to width of 50 miles. To the rains and the constant moisture from the vicinity of the Atlantic, the abundance of running streams and subterranean waters. I natural fertility of the soil further adds the conditions for prosperity. The firs or black lands which run in an unbroken line behind the coast from the Bû Ragrag to Tensift are admirably suited for the growth of cereals. The rural population, almost everywhere settled, is therefore considerable. The land of the Dukkāla has 40 people to the square kilometre, a density very much greater than that of the other districts of Morocco. The towns of the coast, Salé, Rabat, Casablanca, al-Diadida, Azemmour, Sali, Mogador (g.w.), benefit by the richness of the hinterland. The exportation of agricultural produce has at all times been a branch of commerce, and has been much developed since the settlement of Europeans there. While facility for communications and the continental relations with the valley of the Sebou opened the plain to Arab influences, the ports of the coast maintained contact with abroad and permitted the infiltration of European influences.

The interior is much more broken. The ground rises gradually up to a height of 2,000-2,500 feet. The predominant formation is plateaux terminating on the north in the very old massifs of the Za'th'ir and Zayan, which are really mountains in character. in the south in the equally old but less elevated massif of the Rahamna. Those plateaux deeply cut into by the course of the Umm Rabi' overlook on the west side the low-lying coastlands from the top of cliffs, and slope gently on the south-cast to the plain of Tadia. This is a depression, over 120 miles in length, running to the north into the heart of the Middle Atias where it terminates in a cul de sac, while it broadens greatly in its southern part. A low pass enables communication to be made between the Tadis and the Hawz of Marrakush, w basin shut in by the High Atlas in the south, the Middle Atlas in the east, the Dibliat in the north and the hills of the Shiyadma in the west. The economic value of this inner region is very unequal. On the mountains of the north, the rains and streams support forests and the local inhabitants devote themselves to cattle-rearing. The plateaux of the centre covered with a surface of limestone have great stretches of bare rock and cultivation is difficult. The Tadin is no better favoured except in the zone adjoining the Atlas, watered by torrents descending from the mountains. The plain of the Hawz would also suffer disastrously from drought, if human industry had not averted this danger. An ingenious system of irrigation (see KANAT) has transformed the country round Marrakush into a vast palmgrove and resulted in a particularly dense population. Comparatively large towns (Amizmiz, Damnat (q.o.) and Tamesluht) and especially Marrakush have been enabled to rise and prosper. Between this region, already balf Saharan, and the high lying plains of the Sebou, the plateaux of the centre and the mountains of the north which come down to within a short distance of the shore, interpose a barrier which the attitude of its inhabitants makes still me difficult to cross. The Zayan, the Za'a'ir, the Zemmor, over whom the authority of the makkers has never been very securely exercised, have more than once cut direct communication between Pas and Marrakush. These two cities have been at different periods the capitals of distinct and even hostile kingdoms.

The region of the Atlas. In spite of the marked differences between the different elements of the Atlas, the whole region nevertheless has general characteristics of its men Between Atlantic Morocco on the men hand and Saharan Morocco on the other, the Atlas fies as me almost continuous barrier. Only the few transverse fractures in the Middle Atlas permit passage between the basin of the Sebou and the Saharan cases, while in the High Atlas valleys running right into the heart of the massif give means to passes opening on the valleys of Sous and the Dar's. Moister and colder, the

Middle Atlas is covered with forests which are denser and more extensive than those of the High Atlas. Both however me great watersheds. From the Middle Atlas come the great rivers of the Atlantic slope (Sebou, Gigû, Umm Rabis, Wadi 'l-'Abid), from the High Atlas the Tasawt and the Tensift. The lands of the Atlas are nevertheless poor. The high mountains offer little to support mankind. Human activities are found mainly in the zones of contact between the mountains and the plains (dir) of the Middle Atias and in some specially favoured valleys of the High Atlas, Except in the Middle Atlas, where the nomadic mode of life results in the exodus in the bad season of the inhabitants who we pastoral life, and on the plateaux of the High Atlas on the Atlantic side (Hāba, Shiyādma) the inhabitants of which are mainly engaged in cattle-rearing, the natives are settled. They live in villages perched on the slopes and terraces between wadis or scattered along the valleys. There is nothing approaching a town in size. These regions, defended by the nature of the country, have almost completely escaped outside influence: they me still almost exclusively the domain of Berber tribes (Beräber in the Middle Atlas and Shifth in the High Atlas). The customs and institutions peculiar to this people [see EERBERS] have survived to a greater extent here than in any other region of North Africa. In particular, their political organisation was most rudimentary: municipal republics administered by a diama'a in the Middle Atlas, fendal fordships ruled matriarchal and despotic fashion by a few powerful families in the High Atlas. The people of these regions have also always opposed vigorously the central power; the authority of the makhen (q.o.) over the Berbers of the High Atlas has never been exerted except through the local chiefs. As to the tribes of the Middle Atlas, they have for long retained an almost complete independence.

Eastern Morocco, Eastern Morocco may be described as the continuation of the central Maghrib. of which it has the distinctive characteristics. In it, in Orania, we have a tell zone and a zone rising by successive stages up to 6,000 feet. The upper valley of the Moulouya separates them from the Middle Atlas. The monotony of these vast spaces is only broken by the outcrops of gars, flat beds of rocks cut up by crosion and by the depressions of the chotts (see SHATT). Beaten by the winds, exposed to the rigours of an extreme climate, these lands are only fit for the pastoral life led by the nomads who raise sheep. The valley of the Moulouva is better favoured, except in the vicinity of the Atlas, where villages surrounded by vineyards with a settled population are found along the tributaries of the river. As to the Tell, hills of no very great height (the most important being that of the Benl Snäsen which does not exceed 5,000 feet) divide it up into compartments occupied by plains (plains of the Awlad Mansor, on the coast, of the Trife, of the Angad which in the south reaches the cliffs in which the high plateaux end). The dryness of the climate frequently gives these plains a steppelike character; only the western part of the plain of the Angad with a fertile and well-watered soil lends itself to cultivation. The nomads come here to procure grain. But this region owes its importance less to its natural resources than 🔳 its situation on the natural route between Atlantic Morocco and the rest of Barbary. Oujda [see WADLDA], which commands passage, has thus been enabled to escape various causes 50 decay that have threatened it. A border district, eastern Mornoco has always been a disputed region, ""march" for which the lords of Tierneen and Fas have contended. The authority of the latter was never solidly enough established here to impose itself on the settled inhabitants of the mountains and in the nomads of in plateaux and plains.

The Moroccan Sahara. The Moroccan Sahara is an northwestern corner of the Sahara. There we find the general characteristics of this desert region [see \$ABRAT]. Only the parts adjoining the Atlantic and the threshold of the mountains offer favourable conditions for man. In the plain of Sus [q.r.], shut in between the Atlas and the Anti-Atlas, the rivers and the irrigation canals enable shrubs to grow. The Daria, Ziz and Gir are in their upper courses fringed by a thin border of cultivated land, pasturage, vineyards, and in their middle assure the growth of palmgroves of which the best known, if not the most prosperous, is that of the Tafilalt [q.v.]. The richness-only relative it is true of these cases is in contrast with the desolution of the rocky plateaux (hommides) which form the greater part of the Moroccan Sahara. These natural conditions determine the mode of life of the inhabitants. Some lead a nomadic life and drive their flocks up and down the plateaux; others are permanently settled on the Sous, in the high valleys and in the cases. Sus contains numerous villages and even towns (Agadir, Tiznit, Tarudant); the cases have a settled population in we assir. Those of Talilalt, Tamgrut, Be Doib and Figig carry on a certain amount of commerce between Atlantic Morocco and the Sahara. I this very circumstance has prevented them escaping as completely as the lands of the Atlas from the political and intellectual influence of Western Morocco, especially Tafilalt where considerable groups of Arab shorfd [see saurara2] have been long established in the midst of Berber populations. But, although the present dynasty actually came from Tafifalt, the people of this region have frequently escaped Sharlian authority.

II. HISTORY.

Morocco before Islam. Morocco, like the other parts of North Africa, has probably been inhabited from a very period. We know, however, nothing definite about its earliest inhabitants. The traces which they have left, weapons and tools of chipped flint, pottery, rock-paintings, of which represent animals of the quaternary period, now extinct, megalithic monuments identical with those found all round the Mediterreasen basin, give us no information in this respect. At most, we may suppose that the primitive population consisted of emigrants from southern Europe, the Sahara and perhaps from Egypt. The fusion of these diverse elements gave birth to a race, the members of which, frequently different in type and physical features, were united by a community of language, The ancient writers called them Libyans and Moors. They were the ancestors of the present Berbers [q.v.].

The first historical fact known, and that only imperfectly, is the appearance in the 12th century e, c. of the Phoenicians on the Moroccan coast. The sailors of Twre and Sidon built factories there. where they exchanged goods of eastern origin for local products (cattle, wool, hides) and slaves. But Phoenician influence was exercised mainly through the intermediary of Carthage when it in turn had become the metropolis of a great maritime empire. The Carthaginians rebuilt the ruined factories and added new ones. In the middle of the 5th century, Hanno in the course of his celebrated "Periplus" established on the Atlantic coast seven colonies of which one - at the mouth of the Sebou. Ruseddir (Melilla), Septem (Ceuta), Tingis (Tangier), Lixus (Larache), Sala (Salé) were the principal Carthaginian establishments. It does not seem, however, that Carthage sought to extend her power into the interior. She was content no doubt to conclude treaties with the native chiefs and to recruit mercenaries from the country. Morocco remained independent, but the tribes who inhabited it were not organised into states, except perhaps in the east, where ancient writers mention in the period of the Punic Wars the existence of ■ kingdom of Mauretania of Marusia extending along both banks of the Moulouya.

The destruction of the Carthaginian empire hardly altered this state of affairs. For two centuries Rome administered only the "Province of Africa" directly and left the other regions of Barbary in the hands of native chiefs under a more or less severe protectorate. Northern Morocco shared the fate of Mauretania down to the annexation of this kingdom in 42 a.D. The region to the east of the Moulouya formed part of Caesarean Mauretania. The lands stretching from the Moulouya to the ocean formed Mauretania Tingitana, an imperial province governed by procurator. When the empire was reorganised by Diocletian, it was attached to Spain.

Roman Morocco never covered more than a small portion of the modern Morocco. On the Atlantic coast, it barely extended beyond the mouth of the Bū Ragrag, and in the interior to the massif of the Zarhūn. The plateaux and sub-Atlantic plains and the mountains of the Rif, Middle and High Atlas escaped the authority of Rome. It was the same with the Sahara. The expedition of Suctonius Paulinus, who in 41 A.D. advanced at far the Wadi Gir, remained an isolated incident.

To defend herself against the rebellions of her own subjects and to protect the country from Berber inroads, Rome had to keep in Tingitana an army of ro,000 men, to build strategic roads and to establish fortified posts me the sides of the triangle: Sala, Zarhun, Tingis. With the exception of Volubilis [see MAWLAY IDRIS], the importance of which has been revealed by its ruins, and which was undoubtedly a centre of influence of Roman culture on the people of the interior - well - a military base, the towns were all on the coast. They were Lixus and Tingis, raised to the rank of colonias, and Ceuta. They owed their prosperity mainly to trade with Spain, which were exported oil and wheat, the two main products of the country. On the whole, however, Rome's infinence on Morocce was superficial and has left little trace.

Without any really firm hold on the country, weakened by native risings and by the quarrels between the Donatists and the orthodox, Roman rule was to collapse suddenly at the beginning of the 5th century. Germanic invaders, the Vandals, came from Spain and in 429 A.D. conquered without opposition Tingitana which they gave back a few years later m the Romans. Soon afterwards the western empire disappeared and the natives seized the opportunity is become independent. The Byzantines, who in the 6th century destroyed the Vandal kingdom, were content to re-occupy the two strongholds of Ceuta and Tangier. The rest of Morocco was in the hands of the Berbers. The latter were divided into a large number of tribes, of whom the principal were the Chamara [q.v.] on the Mediterranean coast, the Barghawats [q.v.] on the Atlantic coast between the strait of Gibraltar and the mouth of the Sebou, the Miknasa, in the central district, the Maşmuda [q.v.], the western slope of the High Atlas and the coast from the Sebou to the Sus; the Haskers between the Sus and the Darca; the Lamta and Lamtuna [q.vv.] on the left bank of the Darfa. These Berbers were all of Sanhādia stock; some professed Christianity or Judaism, but the majority still followed the old nature worship. The Arab conquest brought them a new religion: Islam.

The Introduction of Islam. The Arabs appeared in the extreme Maghrib at the end of

the 1st/7th century. Tradition relates that Sidi Ukha, the founder of al-Kayrawan, in ca. 65/684-5 undertook an expedition which carried him as far as the shores of the Atlantic Ocean. This raid. however, if it ever took place, we too transitory to have any permanent results. But me the beginning of the following century, Musa b. Nusayr [q.v.] who had just completed the conquest of lirikiya, took Tangier, installed a governor there and set himself to conquer and convert the local people. He succeeded without much trouble. Attracted by the hopes of gain, the Berbers adopted Islam and enrolled themselves in the armies which were invading Spain. They were not long, however, in rising against the Arabs. Dissatisfied with the share allotted them of lands taken from the Christians in the Peninsula, and exasperated by the exactions of the governors of Tangier, they took up arms in 122/740 on the call of the porter Maystra [q.v.]. The rebellion was both religious and political in character. With the same readiness with which they had adopted Islam, the Berbers adopted Khāridii doctrines from the east, teachings which also appealed to their equalitarian tendencies and to their spirit of independence. The army sent from Syria to establish order was destroyed on the banks of the Sebou in 124/742 and the extreme Maghrib was lost at one stroke to the catioh and to orthodoxy. Berber principalities were organised in the Rif; in the west, the Barghawita recognised the authority of a certain Salih, founder of a rival religion to Islam, who had composed a Kur'an, that is a sacred book, in Berber. None of these little states was streng enough to impose its authority on the others and to collect all the Berber tribes under one rule.

It looked for a time as if the Idrisid dynasty [q.v.] to play this part, Idris I and his successor ldrfs II, actually enforced their authority over the greater part of the tribes of northern Morocco successful expeditions extended their kingdom from the shores of the Mediterranean to the High Atlas and from the Atlantic to beyond Tlemcen. Ardent champions of Islam, they imposed their religion on those peoples who did not yet practise it or who had abandoned it after once adopting it. The conversion of the extreme Maghrib to Islam is their work much more than that of the Arab conquerors. Zealous defenders of orthodoxy, in spite of their 'Alid origin, they fought the Kharidil's with the wigour but did not, however, succeed in completely extirpating the heresy. It is not without good reason that legend has transformed these rude warriors into saints, the one idels I, patron saint of Morocco, the other IdrIs II, the patron saint of the city of Fas [q.v.]. The building of this city had enduring results. It gave northern Morocco religious, political and economic centre which it had lacked since the disappearance of Roman rule. Favoured by its position, Fas prospered rapidly. It survived all causes of decline, even the collapse of the Idrisid power.

The Idrisids indeed rapidly declined. The various groups which had recognised the authority ill the founders of the dynasty were not long in casting it off and fighting with one another. These rivalries were taken advantage of by the Fâţimids of IfrIkiya and the Umayyads of Spain, who during the 4th/10th century disputed the possession of the extreme Maghrib. With the assistance of the water the Umayyads in the end remained masters of the country. They were in their turn ousted

by the Maghrawa [q.v.], whose chief b. Atiyya, abandoning the cause of the Umayyads, seized Fas, where his descendants ruled for three-quarters of a century.

The Almoravids and the Almohads. The extreme Maghrib seemed to be condemned to anarchy and to be broken up among small factions when the Almoravid invasion came (see AL-MURÂRI-TON]. After having first of all subjected all the lands south of the High Atlas, then established themselves solidly on the northern slopes, at the foot of which Yusuf b. Tashfin founded Marrakush in 454/1062, these Saharan hordes turned to the centre, east and north of Morocco, sweeping everything before them: Fas, Tangler, the Rif, Oran and Ténès fell before them. The Berber principalities of the Maghrawa, the Barghawata and Bunt Ifran disappeared. In less than twenty years, Yusuf b. Tashfin became sole master of the extreme Maghrib as far . Algiers. To these territories, already vast, was soon to be added half of Spain. Summoned by the Muslim amirs who must threatened by the king of Castile, Yusuf b. Tashfin checked the Christian advance at Zallaka (479/1086 [g.v.]), then dispossessed the petty Muslim rulers to his own advantage. Morocco was thus extended across the Straits of Gibraltar as far = the Ebro and to the Balearic Islands. The fortunes of the Almoravids were, it is true, mephemeral they were brilliant. In contact with Andalusian civilization, the Saharans rapidly became decadent. The rigid orthodoxy, which had been their strength, relaxed; they in their turn were regarded as infidels, "anthropomorphists" (mudiassimula), whom it was lawful and even meritorious to fight. It was in the name of orthodoxy that the Masmada and the Hintata of the High Atias under the lead aship of Ibn Tamart and 'Abd al-Mu'min [g.vv.] entered into the straggle against the Almoravids.

This struggle ended in the displacement of the Almoravids by the Almobads[see at-MUWARRIDUR]. In seven years (533-40/1139-46), 'Abd al-Mu'min conquered all Morocco; Sidjilmāsa, Oran, Tlemcen, and Ceuta fell one after the other into his hands. Next came the turn of Salé, Fas, and finally of Marrakush, the gates of which were opened to him by the treachery of the Christian mercenaries. Muslim Spain was also conquered with the exception of the Balcaric Islands. Even in Africa, the Hammadid kingdom of Bougie was conquered in 545-6/ A few years later (534-5/1239-60), a new expedition led 'Abd al-Mu'min into Ifrikiya and secured him possession of the interior and of the coast, which III took from the Normans of Sicily, who had occupied it some time before. Morocco in the strict sense of the word was now merely a province in the vast Berber empire. The unification of these territories under one ruler had important consequences for the Maghrib. It facilitated the diffusion in North Africa of the Hispano-Moorish civilisation, which was to be perpetuated in Morocco after it had disappeared from the Peninsula itself. Further, it brought into the extreme Maghrib a new ethnic element: the Arab one. 'Abd al-Mu'min, as well as his successors, on several occasions deported Hilali tribes from the central Maghrib and Ifrikiya, where they continually created unrest, to the sub-Atlantic plains where other groups of Arabs joined them of their own free

The Almohad empire was too vast, it comprised regions of too different a nature, peoples too foreign

to another to last long united. The Almohad caliphs powerless to restrain the separatist tendencies which revealed themselves on all sides. In the first half of the 7th/13th century the Almohad empire broke up. Ifrikiya and the central Maghrib recovered their independence; local dynastics set up in Tunis (Hafsids) and Themcen ('Abd al-Wadids). The extreme Maghrib ended by slipping away from the descendants of 'Abd al-Mu'min, who were replaced by the Marinids [q.e.].

The Marinids. Berbers of Zanata stock, driven by the Hilali Arabs on to the plateaux of Oran and into the central valley of the Moulouya, the Band Marin had at first entered the service of the Almohads, then turned against them, when the power of the dynasty began to decline. By repeated razzias they made themselves masters of almost all northern Morocco. After the death of the caliph al-Sa'ld, who had been able to arrest their progress for a time, their leader Abu Yahya (641-56/2243-58) seized Fås, Mcknes, Rabat and Sigilimasa. The capture of Marrakush (668/1269) by Abo Yusuf, successor of Yahya, marked the final triumph of the Marinids, Heirs of the Almohads, the first Marinids endeavoured to reconstitute the empire of their predecessors. In Spain, they enforced their authority on the Muslims of Andalusia. In Africa, they endeavoured to take the central Maghrib from the 'Abd al-Wadids. They were successful when Tlemcan, besieged seven times in sixty years, finally fell into the hands of Sultan Abu 7-Hasan (748/1347). Ten years later, the same ruler took Bougle, Constantine and Tunis, but his hold me these was very insecure. At the and of barely a year, Abu 'l-klasan, defeated by the Arabs, found himself forced to abandon lirlkiya, the Hafsids returned to Tunis and the 'Abd al-Wadids to Tlemoen, while the sultan's own son Abu Inan rose against him in Morocco. Attaining to power, Abū 'Inan renewed his father's efforts. He re-occupied Tlemoen and Tunis, it true, but could not retain them (761/x360). The Hafsids and 'Abd al-Wadids recovered their kingdoms al-

Separatist tendencies thus triumphed and this occasion in a most definite fashion. The extreme Maghrib, the history of which had hitherto been moften that of Barbary, began to live its own life. The Marinid kingdom, while its boundaries in the were still vague and changing, already corresponded roughly to modern Morocco and the Marinids may m regarded m the first strictly Moroccan rulers. Lacking the religious prestige of their predecessors, they endeavoured to secure the moral authority which they lacked by taking as their patron saints the apostles of Islam in the Maghrib. The oult of Mawiny Idris in the 8th/24th and particularly the 9th/15th century assumed importance which it has retained to the present day. No less characteristic is the development of intellectual life and the arts. The Hispano-Moorish civilisation never flourished more brilliantly in Morocco than in the Marinid period. The rulers attracted to their court the poets, men of letters and lawyers of the Iberian Peninsula and of the Maghrib. The university of al-Karawiyyin at attracted students from all the lands of the western Muslim world. Fas, which the Marinids, abandoning Marrakush and Rabat, the capitals of their predecessors, chose in their royal residence, was given splendid buildings by them, paleces, mosques and medraces. It was at the same time a commercial city in which African and Spanish merchants mixed with Christian traders.

This brilliant exterior, however, was quite deceptive. Marinid Morocco was never able to organise itself on a solid basis. The central power was very weak and did not succeed in imposing its authority everywhere. The accession of each sultan an occasion for outbreaks. The pretenders who arose always found supporters readily, either among the Arabs or the Berbers. Powerless in the interior, the sultans were no more fortunate in their enterprises against their neighbours of the central Maghrib or against the kings of Granada. Their prestige and their authority could not survive these checks. The Marinids in the strict sense disappeared from the scene in 869/1465, after the sessination of the sultan by an Idriaid sharlf. The Banû Waţţās, descended from a collateral branch, the chief of whom seized the power in 873/1470, had themselves wretched existence. Their kingdom broke up into a large number of independent little groups, principalities at Fas and Marrakush, Berber republics in the Atlas, Marabout fiels in the Rif, the Charb and in the Dat's and Sus. The sultans were quite powerless to prevent this decomposition.

The Christian offensive and the revival of Islam. Of all the causes which combined to enfeeble and discredit these rulers, the principal was undoubtedly their impotence against the offensive of the Christians against the Maghrib. In 8x8/14x5 the Portuguese took Ceuta, in 869/1465 al-Kasr al-Şaghir, in 875/1471 Tangier. They thus secured themselves a base of operations in the north while by the occupation of Asila and Ania (Casablanca) they secured a footing as the Atlantic coast. In the early years of the roth/r6th century, they built fortified posts at Santa Cruz (Agadir) and Mazagan and took by force of arms Safi [see SAPI) and Azammur [q.v.]. Holding all places of importance except Larache [see AL-CARA'188] they brought under their protectorate all the lands near the coast (Shawiya, Haha, Dukkala), forced the local people to pay them tribute and to hand over to them strategic points up to the environs of Marrakush. Their expeditions had no other aim than plunder, no other result than to exasperate the inhabitants who saw their towns destroyed, their douges burned, their women and children massacred or sold as slaves.

Menaced in the west by the Portuguese, Morocco was threatened in the east by the Spaniards also. The latter completed the reconquists by the taking of Granada (1492). Thus free to go further affeld, and still fired with the religious enthusiasm of Ximenes, they too went over to fight the Muslims on African soil. The occupation of al-Marsa al-Kabir (1507) and of Oran (1509) and the establishment of a Spanish protectorate over the kingdom of Tlemeen constituted a serious danger to the Muslims of Morocco.

The threat from the Christians produced an awakening of religious sentiment. This renaissance of Islam in 1111 9th/15th and 10th/16th centuries, the results of which are still to be felt at the present day, is beyond question the great event in the history of Morocco since the Idrisid period. The way for it had, moreover, been prepared by the Suff teachings imported from the 1111 and by the development of the brotherhoods [see Tariya] in which the adepts of these floctrines were organised. It also found a favourable soil owing to the persistence of maraboutism among the Berbers. The ascendancy

which the religious leaders exercised, the wealth they accumulated in their giveryes, made them independent of the sultan. They thus became temporal leaders also, all the more readily as the sovereigns could not fulfil their office of defenders of Islam owing to lack of energy and also of means. The activity of these religious leaders was alway#of a local nature; it was only effectively exercised within a limited area and did not extend over the country generally. The religious solidarity thus established, the kind of common conscience thus created, did not put a check to the political decline until the time when the Sa'dian shorfa took direction of the movement and exploited it for their own benefit.

The Sharlfian dynasties, A. The Saidians [q.v.]. The Sa'dian shorfa benefited by the prestige which the religious awakening had restored to the descendants of Fatima, the daughter of the Prophet. Coming from Arabia at the end of the 8th/14th century and settling in the valley of the Wadi Dar'a, while another branch of the family settled at Tafilalt (Hasani or 'Alid shorfd), they were not long in acquiring a considerable influence over the tribes of the south. Thus they were naturally led to support the people of the south, who were exposed to the attacks of the Portuguese of Santa Cruz. In 917/1511, the share/ of Tagmaddart, requested by the Muslims to put himself at their head against the Christians, agreed to do so. Supported by the marabouts who gave him valuable assistance, he began hostilities against the Portuguese. The holy war regularly waged secured to his sons, Ahmad al-A 'radi and Muhammad al-Mahdl, the possession of the whole of southern Mororco up to the Umm al-Rabit. The intervention of the Marinid sultan in the quarrels which broke out between the two brothers only resulted in his own downfall being hastened. Muhammad al-Mahdl took Fas in 957/1550; the folling of an attempt to restore the Marinids in 961/1554, with the help of the Turks of Algiers, secured the definite triumph of the Sa^cdians.

The coming of the Satdians meant a regular reconstitution of Morocco, Muhammad al-Mahdl and his successors imposed their authority on the whole country, protected it against foreign foes and increased the extent of their territory by distant conquests. They finally trlumphed over the difficulties created by the Turks of Algiers, and the battle of al-Kasr al-Kable in 986/1578 arrested counter-offensive of the Portuguese. Abmad el-Mansur (986-1019/1578-1610) occupied Timbuktu and destroyed the Askia empire of Gao. For half a century, the Moroccans were masters of the Western Südän, from the banks of the Senegal as for as Borno. The plunder taken on this campaign of conquest enabled the sultan to keep w splendid court, the blerarchy of which was modelled on the Ottoman court, and to adorn his capital Marrakush with magnificent monuments.

To the same period also belongs the organisation of the makksan [q.v.]. The early Sastians had relied for support on the Arab tribes of the south. To these al-Mansur added the Arab tribes of the region of Tlemcen and Oujda driven into Morocco by the Turkish conquest. These skrage or "orientals," as they were called, received lands around Fas in return for the military service they were forced to give. Reinforced by a regular army formed of renegades, Spanish Moors and negroes, trained by Turkish deserters, the making provided the sultan with the means of preserving order and levying taxes; it was thus the essential instrument of Sharkfian government and tended to become the government itself.

This instrument proved sufficient in the hands of an energetic ruler, but me inefficacious in weaker hands and in moments of crisis. The Saidians very soon found this out. The tendencies to disruption which had been held in check by the energy of al-Mansur broke out again on his death. The dispute for the throne set his sons against one another. One of them, Zaydan, ended by triumphing over his rivals but could not prevent the break-up of the empire. Larache was occupied by the Spaniards; Fas cast off Sharifian authority. The Andalus of Rabat and Salé, enriched by their ptracy [see SURSAN], formed an independent republic. Finally, the Sasdians, although they had owed their elevation to the religious movement, now found the marabouts rising against them. Delivered from the restraints which the distrust. of al-Mahdi and his successors had placed upon them, the latter began to gain more and more hold over the people and contributed to the ruin III the authority of the shorfa. Sits was in the control of of them, Sidi 'Ail; Tafilalt was under the Hasani ghor/a, the Gharh under ai-'Ayyashi, leader of the "volunteers of the faith". In the centre, the power of the sawiya of Olia? [q.v. in Suppl.] increased Mahammad al-Hadidi, their leader, victorious over the Sa'dians and over al-'Ayyashi, lord of Salé and Fas, seemed in the point of founding a new Berber empire from the Atlantic to the Moulouya. Incapable, spite of the support given them by the English and Dutch, of disposing of their adversaries, the Saidians now held only Marrakush and its immediate environs. The last representative of the dynasty died in 1070/1660, assassinated by the skayab of the tribe of Shabbanat.

B. The Hasani Shorfa. The disintegration of Morocco was arrested by the coming of the Hasani shorfa. The latter had taken advantage of the disorder to assert their authority in the Tafilalt, then by expeditions, which partook of the nature of brigandage as much of warfare, they had conquered eastern Morocco. One of them, Mawlay Muhammad, had even tried, without success, it is true, to take Fås from the Dila'is. His successor Mawlay al-Rashid (1076-82/1664-72) was more successful. He took Fas, disposed of Ghaylan, in adventurer who had established himself securely in the Gharb, destroyed the sawiya of Dila', reconquered Marrakush, thus rebuilding in it were piece by piece the Sharifian empire. Installed by force of arms, the new dynasty recognised the necessity of securing the moral prestige which their origin could not give them. They therefore sought to attract to their side the Sharifian families. They beaped favours the shorfd of Wazzan, whose patronage was a guarantee even for the raters.

The work begun by Mawiay al-Rashid was continued and brought to a successful conclusion by his successor Isma'll (1082-1139/1672-1727). During the first fifteen years of his reign, he did not cease to wage war on the rivals who disputed the districts of Marrakush and the Sur with him. While fighting his enemies, he was engaged in building up an army which would work his will. To the magazan formed by the Shraga and Udaya, he added a body of black slaves, the 'Abid al-Bükhari (Bwakher), the property of the sultan; their children were specially trained for military service. The number of effectives in this corps by the end of the reign numbered 150,000

men. The sultan was thus able to reduce to obedience the Berbers of the Atlas and the upper Moulouya. Defeated and disarmed, the latter were kept in controi by garrisons placed in tastes built at the exits to the valleys or commanding the lines of communication. The notables whom the sultan had taken into his service or united to himself by matrimonial alliances forced their tribesmen to live in peace. The bilad al-makhsan, i.e. the country where tribute was regularly paid, extended over almost the whole of the extreme Maghrib. The pacification of the interior did not cause Mawlay Isma'll m forget the obligations imposed - every Muslim ruler to fight the infidels. He therefore continued the holy wer against the Christians of the coast. He recaptured al-Mahdiyya, Larache, Aska, and Tangier, evacuated by the English 🖿 1684, but could not take Ceuta from the Spaniards in spite of a siege or rather uninterrupted blockade for seventeen years. He was no more successful in his enterprise against Turks of Algiers, who disputed with the Moroccans the possession of the plains of eastern Morocco and the asur of southern Oran. The expeditions which he directed against the Algerians ended in faiture, and the lower course of the Moulouya continued to be the boundary of the Sharlfian empire. In spite of his lack of success here, Mawiay lama'll mevertheless the great figure of the Hasani dynasty, the model the Moroccan sultans have set themselves to the present day. Morocco, however, remained what it was before, i.e. an aggregation of different groups, the cohesion of which depended on the personal energy of the sovereign, who squeezed his subjects to the utmost # get the money necessary for the building of his capital Meknes, the palaces of which were built by the forced labour of the local people and of Christian slaves.

On the death of Mawlay Isma'll, a reaction set in. For thirty years his fought with one another. The real masters of the situation were the 'Abid al-Bukharl, who made and unmade sultans they pleased. One of them, Mawlay 'Abd Aliah, was proclaimed and deposed six times. He succeeded, however, in triumpbing over his competitors by playing the Berbers off against the 'Abid, the importance of whom gradually diminished with the wars. The remedy, however, was not much better than the disease. This period was for Morocco one of misery and ruin. The authority of the Sharlis

emerged much weakened from it.

Mawiay Muhammad (1170-1206/1757-92) succeeded, however, in restoring it. Inheriting the energy and vigour of his grandfather Isma'll, he brought the rebel Berbers back to their allegiance, and by the taking of Mazagan in 1183/1769 destroyed the last trace of Portuguese power on the Atlantic coast, Convinced, on the other hand, that the weakness of the central power was mainly due to a lack of financial resources, he endeavoured to procure money by encouraging the development of foreign trade. He inaugurated a mercantile policy, concluded treaties of with Denmark, Sweden, England, and France and endeavoured to attract foreign merchants to his kingdom by founding for them III town of Mogador [see AL-SUWAYRA] in 1764. Heavy taxes, however, severaly impeded the progress of this policy. Morocco remained a poor country and did not open itself. m had been hoped, to European penetration. It also remained in a perpetual turmoil. Under Mawlay Yazid (1206-8/1792-4) the country was more handed over to anarchy. Mawley Sulayman (1208-39/1794-1822), after at first being able to restore

order, had to spend the last ten years of his reign in putting down the continual risings of the Berbers of the Middle Atlas; in the course of me of these expeditions he actually fell into the hands of the rebels. This rebelliousness caused the sultan much misgiving; he also wanted to prevent the intiltration of foreign and anti-Muslim influences which he believed would aggravate it. He forbade his subjects | leave the country and restricted to a minimum their intercourse with Christians. The diplomatic and consular agents were relegated to Tangier, and access to the interior was made almost impossible for Europeans. His successors followed his example. Down to the end of the 19th century, Morocco was more rigorously closed. than it had been in the time of the Marlaids and Sardians and even in the early days of the Hasani Sharlfs. In spite of this systematic isolation, the suitans had nevertheless to face the same difficulties as Mawlay Sulayman and had no more success than he in overcoming them.

For half-a-century the domestic history of Morocco was a series of rebellions which the sovereigns - great difficulty in suppressing. The regions remote from 📰 centre, Rif, Tafilalt, Figlg, eastern. Morocco, escaped the authority of the makhran. In the very heart of the country, the Berbers cut communications between Fas and Marrakush, forcing the sultans when they wanted to move from one capital to the other to make a great detour by Rabat. The empire broke up more and more. Mawlay al-Hasan (1290-1311/1873-94) postponed for a few years the inevitable collapse. His reign resembled that of Mawlay Isma'll. At the head of his army, the artillery of which had been reorganised by a French military mission, he was continually in the field raiding the rebels and tearing down suspas. He re-established order in the region of Dujda, forced the people of the Sus to recognise his \$62 ids, reduced to obedience the Za'a'ir and Zayan, endeavoured to extend the mothzan country by expeditions against the independent Berbers, endeavoured to develop his influence in the Saharan regions and to restore his authority in Tuwat. But he died before completing his task and all had to be begun again.

Morocco and the Christian powers. The situation was the more critical, in that the fate of Morocco could no longer be a matter of indifference to the European powers. It increased the cupidity of some and aroused the cupidity of others. In spite of their desire for isolation, the sultans had not been able to break every link with Europe. They had also to take account of the proximity of Spain, established for three centuries in the "presidios" of the Mediterranean coast, and of the French who had replaced the Turks in Algeria. The conquest of the old Regency, destroying all the Sharlis' hopes of extension eastwards, had caused great irritation in Morocco. Abd al-Kadic [q.r.] found followers among the peoples of this country and support hardly disguised me the part of the makkaza. This hostile attitude resulted in the Franco-Morocean war of 1844. The Sharifian army was crushed at the battle of Isly, the ports of Tangier and Mogador bombarded. The moderation of France alone enabled the makksan to come fairly well out of of this unfortunate escapade. Henceforth, the relations between France and Morocco remained peace ful, although the impotence of the Moroccan government to guarantee security on its borders forced France to military demonstrations like the Benī Znāsen.

campaign (1859) and the Wadi Gir expedition (1820). Spaln in turn being unable to obtain satisfaction from the attacks directed against her garrisons, decided also to resort to arms. The campaign of 1859-60, ended by the victory of O'Dounell, revealed the military weakness of Morocco. The treaty of Tetouan (1860) granted to Spain, along with some trifling territorial aggrandisement, an indemnity of 100,000,000 reals. To pay this debt, the Sharffian government had to raise a loan in London on the security of the Moroccan customs and to accept the control of European commissioners. Por the first time, foreigners intervened in the domestic administration of the empire. The breach thus made was continually enlarged. The exercise of the right of protection, the erection of a lighthouse on Cape Spartel, served as a pretext for diplomatic negotiations and for the extension of international control. European ambitions were not dissimulated. In order to protect itself against them, the makkson tried to play one off against the other and confined itself to granting, as it did at the conference of Madrid [1880], concessions devoid of all practical significance. Mawlay al-Hasan excelled in this difficult game and the visier Bā Hmād [q.v. in Suppl.], who directed affairs during the early years of the reign of 'Abd al-'Aziz, Mawlay al-Hasan's successor, displayed no less skill. Morocco was thus the object of a very keen struggle for influence. England wanted to maintain her economic preponderance along with the control of the Strait; France wanted to ensure the security of her Algerian possessions and of the roads leading to the Saharan oases occupied in 1901-2; Spain appealed to her "historic rights"; Germany lastly was preparing to seize the opportunity to acquire openings for her and emigrants.

The Moroccan crisis and the establishment of the French protectorate. Such a position could not last. The imprudences of Sultan "Abd al-"Azlz precipitated the crisis. The whims of the sovereign and his immoderate desire for European innovations displeased the stricter Muslims. The modifications in the fiscal policy made by the tartib (q.v.) disturbed the people already taxed to the utmost. Rebellion broke out everywhere. A pretender, the sugi Bu Hmara [q.v.], rose in the region of Taza and routed = army sent against him. It was in vain that France by the agreements of 1901 and 1902 endeavoured to organise the activities of the makhsan against the rebels and to postpone the inevitable catastrophe. On the failure of this effort, France decided to arrange with England and Spain to settle the Moroccan question and prevent the dismemberment of the empire. In return for recognition of the protectorate de facto exercised by England in Egypt and the granting to Spain of a sphere of influence in northern Morocco, these two powers recognised the right of France to act as her interests best demanded. France hastened to propose to the sultan a plan for reforming the Moroccan administration. The intervention of Germany provented its realisation. On 31 March, 1905, the Emperor William 11 landed at Tangier and in a sensational speech posed as the defender of the independence of the sultan. On the advice of the German representative. "Abd al-"Aziz appealed for the constitution of an international conference to study the reforms to be introduced into the Maghrib. The conference met at Algeriras (15 January-7 April, 1906) and affirmed the three principles of the sovereignty of

the sultan, the territorial integrity and the economic freedom of Morocco. It did not, however, settle the Morooco question. The two international bodies which it decided to set up, the police for the ports and the state bank, both capable of being of great service, could not take the place of the general reforms necessary for the salvation of the empire. Disorders continued, acts of hostility against Europeans in Morocco itself and acts of brigandage on the frontiers increased in number. Not being able obtain satisfaction for outrages on its subjects, the French government ordered the occupation of Oujda and Casablanca in 1907. The country was then pacified around these two centres and order restored in eastern Morocco and in the Shawiya to the great benefit of the natives themselves. The Spaniards in their turn for similar reasons intervened in 1908 in the adjoining region of Melilla and after a severe campaign in 1909 occupied. Salwan and a number of strategic points.

During this period, was broke out between 'Abd al-'Aziz and his brother Mawiży 'Abd al-Hafiz, proclaimed sultan at Marrakush and then at Fas. Supported by the anti-foreign party, the pretender was victorious. All the powers, including France and Spain, recognised him, after he had promised to respect the agreement of Algeciras, the international treaties and all the engagements entered into by his predecessors. France and Spain announced their intention of not prolonging their occupation of Sharlfian territory, The Franco-Moroccan agreements of 4 March, 1910 and the Hispano-Moroccan and of 19 November of the same year, stipulated that the occupation should cease as soon as the makhsan should have a force sufficient to guarantee the security of life and property and peace with its frontiers. This settlement seemed all the more desirable as there had been occasional friction between France and Germany which had only been smoothed over with great difficulty, the most serious being the affair of the deserters from Casabianca in September 1908. A disquieting state of tension remained between these two powers, although France had endeavoured to give satisfaction. to Germany in signifying, by the agreement of February, 1909, her willingness not to impede the economic freedom nor hinder the development of German interests.

The aggravation of the situation in the interior hastened the dénouement. The sultan's rule was no more effective than that of his predecessors; the exactions of the Moroccan agents in the spring of 1911 provoked mrising of the Arab and Berber tribes in the region of Fas. Besieged in his capital and me the point of succumbing, the sultan appealed to the French. They decided to send an expeditionary force to the help of the sultan, but ordered its commander to avoid any injury to the independence of the sultan and any occupation of new territory. Vigorously commanded by General Moinier, the military operations had the desired effect. Fas was relieved on 21 May, and after certain police operations necessary to secure the peace of the district, the expeditionary force returned to the coast. But, while the danger was thus banished from the interior, unexpected complications resulted. Spain, taking advantage of the occasion to take possession of the sphere of influence reserved for her by the agreement of 1904, established herself in Larache and al-Kasr, Germany feeling the moment - decisive, claimed compensation in her turn and in July 1912 sent a warship to

Agadir. This demonstration provoked the greatest alarm in France and in Europe generally. In the end, however, a peaceful settlement - reached. After four months of difficult negotiations, the agreement of a November 1911 put an end to the dispute, Germany abandoned all political claims to Morocco and admitted with certain reservations, chiefly of an economic nature, the principle of the French protectorate. There was no longer any obstacle to the establishment of this regime, which the sultan accepted by the treaty of 30 March 1912. This diplomatic document stipulated the maintenance of the sovereignty of the sultan, the representation of and protection by French diplomatic and consular agents of Moroccan subjects and interests abroad, the carrying out, with the collaboration of and under the direction of France, of a number of administrative reforms, judicial, financial and military, intended to "rive the Sharffian empire ... new régime, while saleguarding the traditional prestige and honour of the sultan, the practice of the Muslim faith and the Institutions of religion",

The French protectorate extended over the whole of Morocco, but the Spanish sphere of influence enjoyed by the agreement of 27 November 1912 complete autonomy from the administrative and military points of view, whilst Tangler and its environs were included in an international zone whose status was not, however, definitely regulated till

1923.

The establishment of the protectorate was to have had as its first result the restoration of the authority of the Sharll, whose support was essential for the carrying out of the reforms. This could only be attained by a considerable effort. The central power was weaker than it had ever been at the time when the conclusion of the protectorate treaty put me end to the crisis. The bilad al-makksan almost non-existent. France had to conquer Morocco for the sultan. The name of Maréchal Lyautey, appointed High Commissioner and Resident General, will remain inseparable from the history at the pacification of Morocco. Very difficult in itself, for it brought the French into contact with warlike tribes, were of whom had never recognised the authority of mahhan, the task further complicated by events abroad. Order had hardly been restored around the chief towns, Fås, Meknès, Marrakush and communication restored between eastern and western Morocco. when the War of role broke out. For a moment it was feared that the French were going to abandon the interior and fall back on the coast, but the progress of the pacification of the country was only slowed down, not interrupted. All the conquered positions were retained and the rebels held on all fronts. The counter-offensives of the rebels in the Taza corridor, along the Middle Atlas and in Sus were crushed. The War finished, the offensive was resumed III reduce the districts still unsubdued (Middle Atlas, south of the High Atlas, upper valley of the Moulouya). Three years of difficult lighting (1921-4) ended in the occupation of "all Morocco of value", i.e. those regions of economic, political or military importance. The Rifan offensive in 1925, however, threatened to compromise all the success achieved. A Rifan chief, 'Abd al-Karim, had gathered around him the greater part of the tribes of northern Morocco and inflicted serious reverses on the Spaniards which forced them to abandon a portion of the territory which they had occupied. Crossing the Spanish zone, he invaded the valley of the Wargha and threatened Fas. The resistance of the posts echelonned along the frontier gave reinforcements time to reach the scene of hostilities. Checked in the autumn, the Rifan advance mm definitely trushed in the spring of 1926 thanks to the combined action of Franco and Spain. The reduction of the last pockets of resistance in the mountains and the southern regions was completed in 1930.

The administrative reorganisation kept pace with the pacification. The old machinery was retained but submitted a control which guaranteed the local population against abuse of their power and excesses by the agents of the machine. Technical services were created give the country the

works necessary for its economic life.

Thus, within the space of present the space of present the still a mediaeval country, became a modern kingdom equipped with a quite extensive highway network, electrified railways and deep water ports. The remarkable results achieved in all sectors were facilitated by the influx of European immigrants and capital. Approximately 350,000 Europeans in the French and about 100,000 in the Spanish zone participated actively in the economic life of the country and contributed particular to the prosperity of agricultura, while the towns enjoyed rapid development.

At the same time that the pacification of the country was completed, young people educated in metropolitan universities as well in the modern establishments founded in Morocco itself, began to agitate; the Berber dahir [see MAHKANA, 5, i] of 16 May 1930 gave the signal for opposition to French policy and for the struggle for independence. During the Spanish Civil War, Morocean troops served under the victorious General Franco; = a result, the inhabitants of the northern zone were able to benefit from a more liberal régime. Subsequent events during the Second World War, and in particular the defeat and occupation of France in 1940, had no very serious immediate effect, although they induced the nationalists to pursue their activities with greater vigour, not without encouragement from the Allies; in other respects, the increasingly overt manifestation of national sentiment in the Arabic-speaking countries brought latent aspirations for independence out into the open. 1944 saw the establishment of the Istiklal party, to which the sultan Muhammad V, who had occupied the throne since 1927, showed himself far from hostile; 10 April 1947, he made a speech at Tangier which disturbed the French authorities. The nomination of General Juin - Resident-General and the reforms immediately effected failed mestore stability; in 1953 France decided to depose the sultan, sending him to exile in Madagascar and replacing him with a less assertive prince, Mawlay 'Arafa; this decision further exacerbated popular discontent, and acts of terrorism and violent demonstrations followed. As a result, the French government had no option but m recall the sultan and to accept, through the declaration of La Celle Saint Cloud of November 1955, the principle of Moroccan Independence, which was officially recognised in the agreement of March 1956. The Spanish government followed the example of France in 1956, but retained the ports of Ceuta and Melilla.

The achievement of independence posed numerous problems to the Moroccan authorities, who at first obliged, owing to the lack of trained native personnel, to retain the services of thousands of

French and Spanish officials, before appealing to new allies for support. The "Army of liberation" was absorbed into the Forces Armées Royales (FAR), and the French and Spanish troops withdrew in 1961, while the American airbases were avacuated.

One of the first concerns of the sultan (who took the title of king in 1937) was to appoint a consultative Assembly, superseded in 1960 by a constitutional Council charged with preparing a Constitution; the latter, which instituted a parliamentary monarchy, was approved by referendum on 7 December 1964 (see DUSTUR, xvii). During the same period, the Parti Démocratique de l'Indépendance (PDI), recently founded, became quite active, but in 1939 a number of its members, together with some independents, joined the Union Nationale des Forces Populaires (UNFP), closely linked to the Union Marcaine du Transal (UMT) and the product of a schism within the Istikldi provoked by the syndicalist Mehdi Ben Barka.

The first Moroccan government, led by a nonpolitical colonel, was composed of members of the Istibili and the PDI, but after November 1956 the latter were eliminated, and an entirely Isligial cabinet appointed. In 1960, the king took upon himself the functions of prime minister, with the assistance of his son, prince Mawlay Hasan, who was to succeed him after his death in the following year. In the legislative elections held in 1963 after the promulgation of the Constitution, the Istikial and the PDI, now in opposition, obtained respectively 4r and 28 seats, as many between them as the number gained by the Front pour la Défense des Institutions Constitutionalles (FDIC) which had recently been established. On 16 July of the same year, several leaders of the UNFP were arrested for "sorious infringement of the law" and for being the founders of "subversive movement". The charges of conspiracy laid against some bundred individuals were not pressed, but since the two parties boycotted the next elections, the Government - decisive majority in the regional councils and Chamber of Deputies

Also 1963, an armed conflict broke out between Morocco and Algeria on account of ■ frontier post which the latter had seized. Between 1965 and 1967, relations with France were compromised by the abduction and disappearance Paris of the leader of the UNFP, Mehdi Ben Barka. These events led the French authorities to institute proceedings against Moroccan secret service agents and specifically against the Minister of the Interior, General Oufkir, who was sentenced in his absence. The name of this officer mem mentioned again in connection with two unsuccessful attempts on the King's life. The first took place on to July 1971, at the palace of Skhirat (to the south of Rabat), where guests who had gathered to celebrate the anniversary of the sovereign were attacked by cadets of the Military Academy of Abertaummu; about a hundred were killed and 132 wounded, but miraculously the King escaped assassination, in spite of the fact that the conspirators announced his death and proclaimed Republic, having seized a number of public buildings including the radio station. Forces loyal to the King succeeded, however, in restoring order, and a commission of enquiry, in which General Outkir participated, attributed responsibility to a number of senior army officers who were disgraced and shot.

The following year, on 16 August 1972, the King's private plane was attacked over Tetouan by one of the four F.5 fighter aircraft from the base at

Kenitra which had been detailed to escort it; one person was killed and two wounded, but the pilot of the Bosing succeeded in landing his plane at the airport of Rabat-Salé, where renewed strafing caused a further II deaths and injured 50. The officer responsible for the attack ejected from his fighter, but was arrested and implicated General Oufkir, who met his death the following night.

The failure of these successive attempts in his life only enhanced the prestige of the Sovereign, who was nevertheless confronted by a new danger. In fact, after the independence granted by Spain to Rio de Oro, a section of the population of the Western Sahara refused to withdraw from territory claimed by Morocco and formed the Polisario Pront. Since then, from its bases in Algeria, this organisation has continually harassed Moroccan troops immobilised in the south, behind a "wall" which they have been obliged to construct to defend themselves from attacks by an enemy equipped by various nations with the most modern arms and equipment. The expenses incurred as a result of this interminable and violent war have been a considerable burden on the finances of Morocco, whose economy is also suffering me result of the world-wide economic crisis.

III. POPULATION.

a. Total population and density. Before independence, it and difficult to fix with any precision the total population of Morocco. The attempts made at a census during the protectorate enable, it is true, comparatively accurate estimates to made for the greater part of the country.

The total which usually given was 5 millions, of whom one-tenth (500,000 inhabitants) was in the zone of the Spanish protectorate, but the censuses of 1950 (Spanish zone) and 1952 (French zone) furnished the following figures: Spanish zone, 1,010,117 plus Ifai, 38,295 plus Ceuta and Meillla, 141,305; Tangier (1956), 175,000; French zone, 8,003,985, of whom 362,814 were Europeans and 199,156 Jews; a total, accordingly, of 9,368,702 souls. Some years later, according to the census of 1960, there was a total population of 11,626,470 (30% of these being town-dwellers); the Jews were still 159,000, the French 195,000 and the Spanish 125,000. In September 1982, the population had

passed the 20 millions mark (20,419,555), of whom 57-3 % were rural dwellers. This population is very unequally distributed and its density varies with geographical conditions. The most thickly populated part is that of the plains of western Morocco between the massif of the Ibala in the north and the Great Atlas in the south: Gharb, Shawiya, Tadla, Dukkāla and Abda. The density of the population also varies with the fertility of the soil. The population of this region is estimated at two-fifths of the total. The mountainous regions, Jbala, Rff, Middle Atlas are not thickly populated, as we might have expected from the comparatively dense population of Kabylia. As to the Sahara zone, outside the helts of oases in the Wadi Gir, the Wadi Zie and the Wadi Dar'a (Dra), it is very sparsely inhabited.

b. Elements of the population. The population of Morocco consists for the most part of Berbers and Arabs, the former being the older element and the latter invaders. As to the Berbers, who iii not seem to be a homogeneous race and whose origin is obscure, see BERBERS. As to the Arabs, they are in a minority, but it is often difficult to attribute exact othnic origin to certain tribes or confederations, m much have the Arabs and Berbers become mixed since the Muslim conquest, and intermingled either by peaceful or warlike methods. It will be more prudent and will give a more accurate result if we distinguish in Morocco between those who speak Arabic and those who speak Berber (see below VII. LANGUAGES). The former live entirely in the plains, while with the exception of the massif of the Jbata, the inhabitants of the mountains speak Berber.

z. Berbers. Three main groups may be distinguished among the Berbers of Morocco: in the north the Ritans and the Benl Znäsen; in the centre the Znäga (Sanhädja and the Bräher (Beräbir), who form the population of the Middle Atlas; the third group is that of the Shlüh [see SERLLUN] who occupy the western part of the High Atlas and of the Arti-Atlas, as well the plain of Sūs. In addition to these main groups, we may mention the Jbäla, arabicised Berbers, to the north-west of Fās, and the Harātin (plur. of the Arabic harjāni [g.v.]], who form the basis of the settled population of the zone of the Saharan oases.

2. Arabs. The early invasions at the time of the Muslim conquest do not seem to have appreciably modified the ethnology of the country. Up to the 7th/13th century, the country districts of Morocco were almost completely Berber; it was the great Almohad ruler 'Abd al-Mu'min [q.v.] who was the first to introduce into Morocco Hilall Arab tribes hitherto settled in the Central Maghrib or in Hrikiya; these importations, continued by the successors of this prince and by the Marinid dynasty, soon drove the Berber element into the mountains or absorbed and arabicised it. Evidence of such assimilation is still found in the fact that tribes with clearly Arab names contain sections whose names show their Berber origin.

These Arab tribes, who are all settled in the plain, may be divided into two main ethnic groups; the Banû Hilâl and the Ma'kil {q.m.}. The latter occupies almost exclusively the valley III the Upper Moulouya as well as the lands south of the Atlas. The Banû Hilâl occupy the sub-Atlantic plains and the steppes of Eastern Morocco.

3. Jews. There were formerly about 200,000 Jews in Morocco, mainly living in the towns. There were

also a considerable number among the tribes of the Great Atlas. They also formed the principal element in the population of the two little towns of Dubdu and Damnat. The origin of the earliest elements in this Jewish population is obscure: it is difficult to ascertain whether they Jews who had migrated from Palestine or were judaicised Berbers. The modern element is made up of Jews who fled from Spain to Morocco in the roth century. The former call themselves phichlim (Palestinians) and are called forasteros (loreigners) by the Spanish immigrant Jews, who were practically all settled in the towns of the coast and rapidly became europeanised. Since independence, large numbers of them have emigrated, mainly to Israel.

4. Miscellaneous elements. The blacks, of whom there are considerable numbers in Morocco, do not however form a distinct group there. In the north we find many, who are almost all of slave origin. The predilection of the townsmen of Morocco for black concubines, noted for their domestic virtues, has brought into the population, especially in bourgeois circles, a very considerable amount of negro blood. To the south of the Atlas in the oases, the intermarriage of blacks and Berbers has produced the Haratin. Finally the blacks of the Bilad al-Sudan, since the Middle Ages, have always been esteemed mercenaries to form the imperial guards, especially since the taking of Timbuktu by the armies of the Sadian sultan Abmad al-Mansur [q.v.].

Large numbers of Muslims from Spain, whether of Arab origin or descendants of Christian inhabitants of the Peninsula, have contributed to form the population of the towns at various times: Cordovans banished by al-Hakam I at the beginning of the 3rd/9th century after the "revolt of the suburb" and Muslims expelled from Spain at the Reconquista [see AL-ANDALUS. vi. Appendix].

We must not omit the influence that may have been exercised on the population of Morocco by Europeans (renegades, who had adopted Islam, mercenaries recruited outside Morocco and settled in the country), and finally we may note that frequently the sultans have purchased women for their harems in Constantinople.

IV. SOCIAL AND ECONOMIC LIPE

s. Country. The population of Morocco, although for the most part rural, nevertheless has a larger proportion of town-dwellers than Central Barbary and, like the rest of North Africa, might be divided into no madic and so tiled; this division does not at all coincide with that into Arabs and Berbers; there are still nomadic Berbers, while certain Arab tribes are becoming settled on the lands which they cultivate.

It has been shown that the nomadic or settled life of the country-people in North Africa does not depend, as was long thought, on ethnic factors, but is entirely conditioned by geographical considerations. It is the rule for dwellers in the mountains to III settled while the people of the desart steppes, forced to move about in search of pasture for their flocks, are nomads. There are however means between these two extremes and especially in Morocco, where we find many seminomads, who move only short distances, principally on the borders of the various mountains of the centre and south. But generally nomadism is the outcome of pastoral migration and its geograph-

ical area is in direct relation to the rainfall and therefore to the nature of the vegetation.

It is in eastern Morocco, in the steppes which lie to the east of the Moulouya, and to the south of the Great Atlas, towards the Sahara, that we find the principal groups of nomads in Morocco. In eastern Morocco, we may mention among the large tribes which lead a nomadic life the confederation of the Benl Gil, between Berguest and Figig; on the other side of the Atlas, the Ayt Seddrát, the Ayt Dialias, the Id-an-Blal, the Aytu-Mribet; lastly to the south of the Dar'a (Dra) country, the Rgiba, the Shkarna and the Awlad Dilm. As to the semi-nomads, we find them, outside the Middle Atlas, in the great plains of the Gharb, in the north, the Rhamna and the Shyadma, and in the south, where a pastoral life has not yet completely disappeared before a more settled state of society.

Nevertheless, Morocco is, of the three countries of Barbary, that which has in its rural population the largest proportion of settled people, of fixed habitat and living not only in tents but also in houses. The latter rarely found isolated in the country, but the tentrary are grouped into villages of more or less importance and more or less near one another, according to the density of the population.

The type of dwelling varies with the district. In the mountains we find houses built of unbaked bricks or stone with a gabled, thatched, pitched or a flat roof. In the plains, the tent predominates, more or less fixed to the spot, and with it in find more and more the hut of branches with a contral roof called namedia. In the Saharan oases, the population collects within a walled area of kyür (sg. kiar, from the class. karr); these conglomerations sometimes possess the elements of town-life. The villages in the mountains. In some hill regions in the mountains. In some hill regions in find survivals of cave-dwelling.

b. Town. Among the towns of his country, the Moroccan distinguishes a certain number that he definitely regards as cities (hadariyya). These are Fas, Rabat-Salé and Tetouan, which have been more than others subjected to the influence of Spanish culture. It must however be noted that in the majority of the other towns == can still find traces in the existence of colonies formed by Muslims from Spain, especially from the 9th/15th century onwards. The population of the nonhadariyya mis is found to be composed of rustic elements but little urbanised. This is the with Oujd and al-Djadida (country Bedouins) and also with Tangier (countrymen from the hills). Marrakush and Meknès owe their special urban character to the fact that m capitals they have contained the courts of two Sharlfian dynasties, both of Bedouin origin; they are makhaniyya towns in which the standard of civilisation does not reach the refinement of the ladariyya Spanish towns. The ports Tangler, Larache, Mazagan, Safi and Mogador were for long the only points of contact between Morocco and European influences, politically as well as commercially. Lastly in the mountains, little towns like Shefshawen, Wazzan, Sefrou, Dubdu, Damnat, owe their existence to political reasons. The two first were founded as bulwarks against the Portuguese advance in northern Morocco in the 10th/16th century. Damnat and Dubdů are mainly Jewish towns. As to Sefrou, it seems probable that it is a survival of an old Berber town. We may also mention as towns of secondary importance, on

the Mediterranean coast, Ceuta, completely europeanised for several centuries, on the Atlantic coast Arzila (Aşilâ), Casablanca, which owes its origin to the little port of Ania, Azemmir, Agadir. In the interior, al-Kaşı al-Kabir, Taza, Tarudant. Several ancient towns have and disappeared, e.g. Nakūr and Bādis on the Mediterranean, Tit to the south of Mazagan, the two Aghmát and Tinmalial to the south of Marrakush, and several others, descriptions of which have been given by geographers like al-Bakri, al-Idrīsi and Leo Africanus.

As a rule, the Moroccan town is grouped round a citadel or saraba (pop. sasba) which is the seat of authority. Under the protection of the citadel lies the mallist or Jewish quarter [see MALLAR]. All around spreads the town proper or making with its great mosque, markets and saysariyya [q.w.]. It is surrounded by a rampart (sar) beyond which there are usually the suburbs more or less rural in character. The town itself is divided into quarters [sauma) with streets (ususa), alleys (darb) and squares [rabba).

c. Economic Life. The country people, whether settled or nomadic, who no longer form more than 70% of the population of Morocco, live the land, either by agriculture or stock-raising, often combining the two. Those in the high-lands grow cereals (wheat, barley), cartain leguminosse (broad beans, chick-peas, vetches) if fruittrees. They also exploit their forests in a very primitive fashion (thuyas, cedars). The people of the plains devote themselves mainly to cereals and the rearing of cattle, sheep, camels, horses and asses. In the the country of the south, the population cultivates the date-palm and understands the art of irrigating the land.

The rural industries are very primitive. They are limited to supplying the necessary implements of agriculture, and weaving wool into the material for garments, tents and carpets. The Berbers of Sus show a certain aptitude at metal-working (arms and jewels). The Sus longer exports the cane-sugar and copper, which formed considerable articles of trade under the Sa'dians.

Each tribe has a certain number of markets (\$\rho(\theta)\$) which are held in the open country and bear the name of the day on which they are held. It in the sale that the peasant sells his produce and buys the manufactured articles that are brought by the merchants from the towas. Cereals are preserved in silves (malmides [q.v.]); in the Great Atlas and to the south of it we find fortified storehouses, which belong to the community and are called agadir [q.v.].

It is in the towns that we find industrial activity concentrated. Each trade, which originally formed a gild (kenja), is grouped in one street which bears its name. In it the articles are made and sold. The stocks are kept in the fonduks (Ar. fondas) which correspond to the kkan and makāla of the east. Some products, like grain, oil, coal, wool, are sold in special places called rabba. The monopolies of exporting (saka) corn and hides established by the sultans at the end of the 19th century have been abolished. Several European products have become of the first necessity in Morocco and form the subjects of an important traffic: cotton goods, tea and sugar and candles. For the history of the weights, measures and coins in in Morocco before the establishment of the protectorate, == == works by Massignon and Michanx-Bellaire quoted in the Bibliography. The very vivid picture drawn by Leo Africanus of the commercial and industrial activity of File in the Middle Ages is still very valuable.

The Jews, who devoted themselves specially to certain trades that flourish in larger centres (gold-smiths, embroiderers), played an important part as brokers. 'The citizens of Fas, who had a large number of converted Jews among their number, had almost a monopoly of the import trade of Morocco, especially from England, and for this reason had little colonies in the sea-ports.

The Berbers of the Sûs like to settle in the towns as grocers (bakkál) and having made their fortunes return to the country. Since the war, a large number of them have migrated to France as artisans and labourers and they settle groups, according to their original tribes, in the suburbs of certain large industrial towns.

V. POLITICAL ORGANISATION

It is only at rare intervals and for short periods that Morocco has been entirely under the authority of the sultan: whence the distinction between the territory subjected to the government (billa almagasen) and the territory unsubjected (billa alsaba). As a rule, the magasen territory included the towns, valleys and plains. The mountains, on the other hand, remained more or less independent, according to the degree of power possessed by the sovereign [see MARMAN].

Outside the towns the population is grouped into tribes (\$abila). Several sometimes grouped together under a common name, without however being confederation in the strict some of the word; this is the case with the Ghumara in the north, the Haba, the Dukkala, the Shawiyya in the south. The tribe is subdivided into sections (rub', hhums, fakhdha), which are subdivided into sub-sections comprising a certain number of villages of tents or houses.

The tribes who own the sultap's sway governed by a kā'sd appointed by the makhara. His duty is to alfot and levy the taxes, to raise contingents of soldiers and keep good order. He has under his command a skaykh for each sections under whom are the makaddams of the sub-sections.

For the distinction between makhun, diaysh (vulg. essh) and marko tribes, we maketan.

In the tribes not subject to the makkers, political activity was confined to the djama*a [q.v.], i.e. assembly of men able to bear arms. The djama*a (jma*a) dealt with all the business of the tribe, civil, criminal, financial and political. It administered justice following local custom (Arabic *urf, Berber intef). It elected a djayah (Berber amghār) who was only an agent to carry out its decisions. Alongside of the djama*a of the tribe, there and djama*as of the sections and sub-sections but their powers were limited.

In the towns, the makins was represented by a governor whose official title was held, but in certain large towns he was often called baid. The title of 'smil was sometimes given to the governor of Oujda. The held of the town, generally speaking, had the same powers as the held of the tribe and nated in judge in case of any violation of the law. He had an assistant or helds. Alongside of him, the muhissib supervised the corporations, fixed their average prices and lookd after public morals.

The habid had under his orders the muhaddams of the quarter and his police (mhhāmiyya) carrying out his instructions. Among the officials sent by the

mailten to each town may also mentioned the nadir or inspector of endowments (hubûs), the trustee of vacant inheritances (wahil al-ghundus), popularly bû-mañrit = abu '!-mawirith), the collector of local taxes and market-dues (amin al-mustafád). Lastly in the harbour and frontier towns, the were collected by officials called umand (sg. amin).

Justice [see MARKAMA. 5. i] is administered by the Aā'id or by the Addi, as the man may be. The latter deals with questions of personal law; official reports on the cases are drawn up by the 'wda'. In technical cases he appeals to experts: master-masons, agriculturalists, veterinary surgeons (maddin on-

nadar: arbāb st-turka, fstlah, baytar).

Landed property takes a number of different forms. In the first place, there are the state-domains; they were either managed directly by the maharen (crown-lands) or they could be altotted to gigh-tribes in return for the military service for which they could be hable; others of these lands might be granted in temporary we definite ownership private individuals by imperial edict (gasir we tantidual).

The bubis lands urban or rural. In the towns, they not infrequently cover half the area. They are let out under special conditions which give the tenants special privileges, susfak and gaā (class. Ar. diazā). In the country, the bubis lands consist mainly of fields and orchards. In all cases, the revenue from these lands is set aside for the maintenance of buildings of a religious character or of public utility (mosques, colleges, schools, fountains) and for the payment of the officials attached to these establishments.

In Morocco, there are vast tracts of land which are not the property of any one individual, either a result of the insecurity prevailing or of the sparsity of the population. These lands belong undivided to the whole tribe; they are called common lands (blād sl-jmā'a).

Lastly, lands which have come to belong to private individuals (mulk) by inheritance or purchase have their character confirmed by m certifi-

cate of ownership (mulkiyya).

The old Muslim imposts (sakāi and 'ughr) have been merged into a single tax, the tartib [q.v.]. In addition to this tax, from which the state draws the essential part of its revenues, we may mention the duties levied at the gates of towns and in the markets (maks), unpopular with the people and not countemanced by religion, and the urban tax on buildings (dariba). In addition to these, the main taxes, there was the kadiyya or present offered to the sultan on the occasion of the three great Muslim festivals. The disys or poll-tax paid by non-Muslims and the nable or payment for exemption from military service by certain Arab tribes have been abolished.

VI. RELIGIOUS LIFE

a. The Berbers before Islam. For lack of documents, it is difficult to get any accurate idea of the religious beliefs and practices of the Berbers of Morocco before their conversion to Islam, and it is only from the survival of animistic cults which can still be observed in the country that we can guess what the primitive religion was. The figures on two carved stones found in Morocco seem to be evidence of the existence of a solar worship. On animistic practices surviving in modern Islam in Morocco, see below.

b. Conversion to Islam. At the time of

their invasion, the Arabs found that in the districts around the towns the people were more or less under the influence of Tewish and Christian teachings: but there | little doubt that they did not practise these religions in their true form. It will be more to think of them - professing Judaism me Christianity rather than as real fews or Christians. It seems evident that these influences had prepared the Berber population around the mountains to adopt the new monotheistic religion, which the invaders imposed upon them. The two earliest invasions, that of 'Ukba b. Nafi' co. 50/670 and that of Mosa b. Nusayr in 93/711, could result only in a very partial and superficial islamisation, for very few Arab elements remained in the country. Islam, a town religion, was for long confined to larger centres. The Berbers generally became converted in the hope of escaping the exactions of the conquerors; but when the latter wanted to treat them simply as tributaries, they did not hesitate to apostatise, on seven different occasions, if we may believe the Arab historians. One thing is certain, that while remaining Muslims, they were not long in trying to cast off the authority of the caliphs of Baghdad by adopting the heterodox doctrines of the Kharidis [q.v.; see also suprivva]. The Berbers of Morocco went even further when new local religions arose among them more or less based Islam, with their own prophets and Kur'ans. After the attempt at rebellion by the Berber of Tangier, Maysara [q.v.], which was quickly suppressed, the Barghawata [g.v.] recognised as their prophet one of their number, Salib b. Tarif, who gave them a religion and a Kur'an in the Berber language. This religion, the progress of which was opposed by the early Moroccan dynasties, seems only to have been finally exterminated by the Almohad rulers of the 7th/13th century. This Barghawata movement was the most lasting; we also note that which was created by Ha-Min (d. 313/927-8 [g.v.]) among the Ghumara, near Tetouan.

In spile of these reactions, Islam, having become the official religion of increasingly powerful dynasties, gradually gained ground and penetrated slowly into the Berber mountains, but it is only from the death of 'Abd al-Mu'min, who destroyed the religion of the Barghawata and put an end to the rule of the "anthropomorphist" (mudjassimila) Almoravids, that - can date the complete unification of Islam in Morocco, Till then, Islam had had in Morocco champions who were soldiers rather than theologians, and who after forcing the people adopt Islam at the point of the sword, were little fitted to instruct them in it. It required a Berber of the Great Atlas, Ibn Tumart [q.u.], a theologian who had been educated in the east. to come back to his country and me secure the devoted support of a mass of followers in order to found the movement, which was political as well religious, of the Almohads or "preachers of tawhid" [q.v.].

If the Almohad reformation was only temporary in Morocco, it me nevertheless strong enough while it lasted to obliterate in the country all trace of schism or heresy and to establish thoroughly in it the school of Mälik b. Anas [q.v.] which it still follows.

s. Evolution of Moroccan Islam, From the time of the fall of the Almohad dynasty, Moroccan Islam rapidly acquired features of its own. Islam, defeated in Spain, man gradually driven out of it, then attacked in Morocco itself by the Christians of the Peninsula. The western frontier of the Ddr al-Islâm was brought back to its own territory and then thrust farther back. Islam in Morocco, attacked by Christianity and forced to githal, became an active principle. It required all the moral forces of the country, even those of which the orthodoxy seemed doubtful; in order to utilise them, it are not hesitate to absorb them by covering them with a seemed southful; in order to utilise them, it will not hesitate to absorb them by covering them with a seemed southful; in order to utilise them, it will not hesitate to absorb them by covering them with a seemed southful; in order to utilise them, it will not hesitate to absorb them by covering them with a seemed seemed state of utilises and to a certain point sharifsm, which had hitherto only existed alongside of Islam Morocco, were adopted into it and received a kind of official recognition from the makheen.

Before the Marinids, Islam had required the constant assistance of the temporal power maintain itself and advance. From the time of this dynasty, sprung from Berber nomad tribe, the roles are inverted; it is now the sovereigns who utilise Islam to increase their own power, and try to monopolise it by creating official colleges for religious Instruction (madrasas); the first of these (Madrasat al-Saffáriu) was founded in 679/1280 by the sultan Abū Yūsul et Fās, the capital of the dynasty, which made it the great centre of Muslim culture in Western Barbary. The immediate of the Marinids, the Bann Wattas, established in the same town the cult of their founder Idris II. The mausoleum in which he is said to be buried was henceforth an object of great veneration. He is the earliest in date and the most important of the innumerable canonised Muslims we the objects of regular cult in Morocco, even on the part of the religious leaders and the aristocracy. When the cuit of Idris was established, his descendants-more or less authentic-claimed the title of gearlf and soon played a preponderating part in Moroccan society, a political and meral influence. The power of the Idrisid thor/a was soon reinforced by that of other shorfd descended from 'All through al-Hasan and this is the origin of the two great groups of tharifs in Morocco, the Idrisid and the 'Alid. To the latter bolong the two Sharifan dynasties, the Sa'dian and Fifall, the latter still in power. From the moment of their accession to the throne, the influence of the shorfd on the destinies of the country became more and more preponderant.

The phenomenon of Sharlfism is closely connected on the other hand with the development of religious brotherhoods [see Tarka]. Although we find evidence of their existence at the end of the Almohad dynasty (Hudidiad), Maghiriyyan, Ambariyyan, it is only == result of al-Diazull's (d. 869/1645 [q.v.]) campaign in favour of = dishad against the Portuguese that we find the principles of the brotherhoods, as we know them to-day, first coming into existence.

d. Islam in modern Morocco. Here we will only give a survey of the principal points of detail in which the people of Morocco differ from the rest of the Muslim community as regards the practice of their religion. With the exception of a few isolated groups, still little studied, who are credited with heterodox or heretical practices (Zkāra, in the neighbourhood of the Bni Znāsen, in eastern Morocco, Bdādwa, in the Gharb, not far from al-kṣār al-Kabir), all the Muslims of Morocco are Sunnis and the Almoravid period have followed the Māliki rite, which prevailed in the west over that of al-Awaāq. It is in the towns

that the population observes most strictly the duties of religion. The Bedouins of the plains and the Berbers of the mountains are rather lukewarm Muslims. The Jbála, however, between Fås and Tangier, are very devoted to Islam, show great piety, and Kur'anic studies are very much in favour with them; it is from them that are recruited a great number of schoolmasters who practise their calling in the plains [see shart]. It is also practically only among the hillmen of the north and south that we find a mosque in every village.

In spite of the great distance which they have to traverse, the Moroccans like to accomplish the canonical pilgrimage. A considerable number settle in the east (there me Moroccan colonies in Alexandria and Cairo); the importance of these colonies had even induced the sultan 'Abd al-Ariz to appoint me Moroccan consul, swin al-Maghirine,

for Egypt.

In addition to the two canonical festivals of Islam ("id kabir and "id saghir), the Moroccans celebrate the festival of the birth of the Prophet (mālād, ciass. momid [q.v.]) and that of "Āṣhūrā" (roth Muharram). The mālād, established in Morocco by the Marinids, has become a kind of national festival, since the accession to power of sovereigns claiming descent from the Prophet; this festival in Morocco almost surpasses

in importance the two canonical feasts.

The peculiarities just mentioned would not be sufficient to give Moroccan Islam a special character, nor would its religious brotherhoods, if the latter confined to the practices of religion or exaltation of the faith and to satisfying the need for an elevated mysticism among their adepts. These religious brotherhoods are fairly numerous: Tidianiyya, Darkawa, Tayyibiyya-Tuhama, Kattaniyya [q.vv.] etc. But alongside of these brotherhoods, whose members are almost exclusively recruited from the literate or well-to-do classes of the towns and country, there are popular brotherhoods m considerable numbers, in which preoccupation with religion gives place to charlatanish practices and sanguinary displays. Such are the Julia, the Isawa, the Hmadsha, the Dghughiyya. Some of these brotherhoods recruit their members exclusively from a particular class of society; thus the Rmå (class, rundt) is a brotherhood of marksmen, and the Gnawa a negro brotherhood. All these brotherhoods have this feature in common that their founder has become a famous saint (well).

The cult of saints is highly developed in Morocco and undoubtedly was so before the introduction of Islam, which found itself obliged to tolerate it. There are however very different categories of saints, from the venerated patron saint of a capital or of a district to the local boly whose name is forgotten, between whom comes the sayvid whose tomb is marked by a tubba [q.v.] (chapel surmounted by a dome), more or less elaborate. The more humble saints in recognised by the circular wall (hawgh) which surrounds their tombs.

These venerated individuals, male and female, have attained sanctity by very different ways, some in their lifetime, by their learning, devotion, asceticism, miraculous powers (baraha), sometimes even by more or less mystic mania (madidhab [q.v.]); the others, after their deaths, have been distinguished by miracles, apparitions etc. The warrior in the holy war (dishad, ribdl), slain fighting against the infidel is frequently beatified—hence his name of murdbit (pop. mrāba)—French and English

"marabout"). But the early significance of this term was frequently lost sight of and the term murabit to be generally applied to saints, who never took part in a djikdd in their lifetime. Murabit thus came into general use as synonym of the other words used for saint in Morocco: wall, sayyid, saitk. But it is the only applied descendants of saint, who possess the bureka of their ancestor. Among the Berbers, the saint is called aguirant. The names of great saints have masseldy prefixed, the others the title sidi, while women saints of Berber origin are called idila.

The saint to whom sanctuaries are most frequently dedicated-modest though they are (makidm, history-was not a native of the country but the famous patron saint of Baghdad, 'Abd al-Kādir af-Dillant [q.v.], popularly called al-Jilali, who undoubtedly never visited Morocco. But the saint whose cult is surrounded with the greatest splendour is the famous Mawlay Idris, founder and patron saint of Fas. Among the other great Moroccan saints may be mentioned: Mawlay 'Abd al-Salum Ibn Mashish, patron of the Jbala; Mawlay Abu Salhām, in the Gharb; Mawlay Abu 'I-Shita' al-Khammar (Mawlay Bûshshta), in the north of Fas; Sidi Muhammad b. 'Isa, patron of Meknes and founder of the brotherhood of the 'Isawa; Mawlay Abb Shu'ayb (Bûsh'Ib), at Azemmour; Mawlây Abû Ya'azzā (Bū'azzā), in the Tadla; Sīdī Abu 'l-'Abbās al-Sabti (Sidi Bel-'Abbès), born at Ceuta and patron of Marrakush. All these saints who, for the most have been or will be the subjects of articles, and others less famous, are the subjects of a hagiographical literature which will be dealt with in the article MANAKIB.

Devotion to individuals canonised in their lifetime after their death is in Morocco not confined to Muslims. The Jews have also their saints, relatively in numerous in the Muslim saints. Some of the Jewish saints have acquired a reputation so great that even Muslims revere their tombs: e.g. those of the Rabbi Amran in Azjen, user Wazzin and of Rabbi Ben Zmīro et Saii. On the other hand, the Jews of Morocco show a special reverence for certain of the great Muslim saints of the country.

The area, surrounding the tomb of each of the principal saints is sacred (hurm) and hence regarded = in keviolable asylum; among the best known are the hum of Mawlay Idrls in Fas and that of Mawity 'Abd al-Salam b. Mashish in the mountains of the north-vest. These pieces of ground are the exclusive property of the families who are descended or claim to be descended from the saint. They we exempt from state taxes; more than that, the descendants of the saints have the right to levy for their own benefit certain special dues, by privilege officially recognised by the sultan. The levying of these dues is not the only way by which the saint's chapel benefits his descendants. The principal source of revenue is the offerings of pilgrims when visiting the tomb; this is the riydra. In general **==== a ye**ar, there is **■** kind of patronal festival at the tomb of the saint which is called masom (class. Ar. mansim); a vast crowd, some of them from a considerable distance, gather there to pay their devotions to the sayvid and to see the display of fireworks given in his honour. On this occasion the offerings flow in and are shared emong themselves by the saint's descendants.

In these circumstances, it is usual for every sanctuary of any importance to be regularly organised. The chapel which contains the tumb and the buildings attached to it, an oratory and guest-house, is called the zāmya [q.v.]. It is superintended by a markaddom who collects and distributes the revenues. These III not come entirely from the rigide. The tāmiya often owns lands, sometimes extensive, which are let out and the profits shared with the tenants. They are called 'axiò and the tenants are called 'axiò. These farms, sometimes acquired by purchase, often come from bequests or donations (hubbis) from pious private individuals.

We can thus me how certain famous and wealthy sámiyas may exert a moral and political influence in the country round them, independent of their religious influence. The latter is however also very important. The great Moroccan sawiyas are centres of orthodoxy and give life and vigour to Islam in the country, Some are centres of mysticism and they are always centres of religious instruction. This explains the enviable position occupied in Moroccan society by any group of descendants of a famous saint, or of marabouts. If their ancestor had, in addition to the virtues for which he was canonised, the honour to be a descendant of the Prophet, they are at the same time shorfd, which further increases their material privileges. The descendants of a saint who was not a sharif try to claim this origin for him by inventing more or less fictitious genealogies. The marabouts who have in may "infiltrated" into the social category of the shor/ā are very numerous in Morocco. A Moroccan zdaniya is not only a centre of hagiclatry; it is also in the majority of cases a body of shorfd and the centre of a religious brotherhood or of a branch of one, m of a secondary order affiliated to a brotherhood. The rawiya itself may have offshoots. Many of the establishments of this name are daughters of a mother sawiya and are sometimes at a considerable distance from it.

Hagiolatry, religious brotherhoods and sharifism thus form three special aspects of Islam in Morocco, which profoundly intermingled, and it is difficult to study them separately. For a detailed account of the principal families of sharif in Morocco of genuine sharif origin simply marsbouts, see SHURARY.

s. Survivals of Berber cults. The cult of saints, accepted in even recognised, we have seen above, by Islam, is in Morocco much earlier than the introduction of this religion. Indeed, alongside of saints of note, there are others who are essentially popular, in the country as well in the towns. In the large cities like Fas, the great sayyids venerated by all classes of society rub shoulders with humble marabouts whose names show clearly their popular origin; these are Sidi 7-Makhii (My lord the Hidden One), Sidi Amsa 'l-Khayr (My lord Good Evening) or Stdl Kådl Hådja (the reverend gentleman who procures what is wanted) and notices we given of them by hagiographers like the author of the Salwas al-anfas (cf. E. Lévi-Provençal, Les historiens 🔚 Cherfa, 383 below). The humble, often anonymous khalwas, which abound in Morocco, undoubtedly are to be connected with earlier mythical individuals, already worshipped in the place before the coming of Islam. Besides this devotion to popular saints, there are the animistic cults, which we everywhere in Morocco observed by the lower classes of the population: worship of high places, of caves, springs, trees and rocks.

It is hardly possible to separate from these animistic cults that of Mawlây Ya'kûb in Morocco, who always has a kubbs beside thermal springs, whose curative virtues are recognised.

Survivals of paganism in every completely foreign to orthodox Islam may in found everywhere in Morocco; they are hardly distinguishable from what one finds in other parts of Barbary. The rites which accompany birth and the ceremonies connected with it (giving of the name and circumcision), marriage and death are now well known. They constitute practices quite foreign to the prescriptions of the Sunna, but they are not regarded by those who follow them as in any way heterodox.

It is especially in the life of the country people that we see we clearly traces of pre-Islamic practices. Many of them strangely like agricultural customs of the Romans. The Moroccan peasant has retained the me of the Julian calendar, no doubt introduced into the country by the Romans; it is of course much more suitable for the needs of agriculture than the Muslim lunar calendar. The names of the months are retained in their Latin form with little change: January is venneys from the Latin ianuarities). The beginning of the solar year in Morocco is the occasion of a festival celebrated, especially in the country, under the name of hagara; the festival of the summer solstice ('ansra) is also celebrated and on that day it is usual to have fireworks. Similarly the agrarian rites, which are still scrupulously observed by the peasants of Morocco, are completely foreign to the canonical prescriptions of Islam. They are mainly ceremonles of inauguration (of death and rebirth of the land, first day of labour, first day of harvest); rites to protect the crops from the evil eye, or to preserve the baraka which they contain while standing, finally special rites to secure rain and good weather. These various ceremonies, to which ethnographers have already devoted detailed studies to which the reader may be referred, are sometimes closely linked up with ceremonies prescribed by Islam; thus the different pagan rites for producing rain (carnival processions, a large spoon dressed in women's clothes and solemnly carried round) do not exclude the worship of saints specially noted as rain-makers like Mawlay Büshshta, nor the celebration of the orthodox ceremony of istisks?

It is also in the worship of spirits (disus) that we find ceremonies of a strongly Islamic stamp associated with quite profune rites. This cult is especially practised by the lower classes of society, and in the towns particularly by women. The disuns are regarded as supernatural powers, who have to be conciliated to avert their evil influence or fought when is attacked by them. The rites which deal with them are either propitintory or intended to harm done. In spite of the sacred formulae of Islam, which is found in the celebration of two kinds of rites, one gets a strong impression is paganism from them; they undoubtedly remain practically what they were before the introduction of Islam into Morocco.

VII. LINGUISTIC SURVEY.

Two languages are spoken in Morocco: Berber and dialects of Arabic. Berber is the oldest attested in Morocco and we have no evidence of an earlier language being used; as to Arabic, it was introduced by the Muslim conquest of the ast-and/ 7th-8th centuries. But until the arrival in Mozocco of the Band Hilal and of the Sulaym (6th/rzth century), it man that Arabic, the language of an essentially urban culture, spoken mainly in the towns while the country people continued to talk Berber; it only after the occupation of the plains by the Arab tribes that their language spread there. With the exception of the region of the Jbala to be mentioned later, the highlands of Morocco alone have remained faithful to the Berber language, while the towns and lowlands are more and more Arabic speaking.

In his Annuaire die Monde Musulmane (162), L. Massignon gives a proportion of 60% of Berber speakers; he retains this figure in the 1954 edn. (250), but A. Bernard had thought this exaggerated and had reduced it to 40% (cf. Arabophones et Berbérophones au Masoc, 1924, 278).

NAMES AND THE PARTY OF

A. Berber.
On the language and literature,

V-VI, and also LibtyA. 2. Lybico-Berber inscriptions.

B. Arabic.

The Arabic dialects. The Arabic language was introduced into Morocco in at least two stages: first in the and/6th century at the time of the first

Muslim conquest, then in the 6th/12th at the coming of the Band Hilal and the Sulaym. Down to the coming of the latter, who were brought to Morocco by the Almohad ruler Yackub al-Mansur, Arabic seems to have been spoken almost exclusively in the large towns of the north, where it was used by considerable Arab population who enjoyed a double prestige, religious and political. It was the language of religion and law, From the towns, Arabic spread among the people of the surrounding country, and al-Idrisi (Description de l'Afrique et de l'Espagne, text 70, tr. 90) already that in the 6th/12th century the Berber tribes of the southern hinterland of Fas (Banû Yûsul, Fandalawa, Bahiul, Zawawa, Maggaşa, Ghaiyat 📟 Salalgun) spoke Arabic.

It is this linguistic influence exerted by the towns on the country around them that explains the arabicisation of the mountainous country of the Jbala (phir. of jobli, "highlander") while the rest of the Moroccan highlands remained Berber speaking. The land of the Jbila, in the wide sense, stretches in the form of a crescent from Tangier to Taza. It was surrounded by a cordon of towns: Nakūr, Bādis, Tīgisās, Tetouan, Ceuta, al-Ķaşr al-Şaghir, Tangier, Arnila, al-Kaşır al-Kabir, Başra, Azdjen, Banû Tâwudâ, Walili, Fâs, and Taza, which were the only ports markets available for the tribes of the region; besides, the massif itself was traversed by the most important commercial routes of Northern Morocco: the roads from Fas to Tangier, to Ceuta, to Badis, to Nakūr and to Ghassāsa; it was therefore natural that being subject to the direct and indirect influences of the towns, the highlands of Jbala should be the first region of Morocco to be arabicised. The process was further favoured by several other factors: 1. the existence in the mountains of numerous large villages, almost towns, which became secondary centres of Kur'anic culture; z. the settlement almost everywhere in the 4th/9th century among the Jbāla of Idrisid sharifs who, driven from Fas by Musa b. Abi 'l-'Afiya al-Miknasi, founded independent principalities in the mountains, which became centres of Muslim urban culture; 3. the tribes of the bala furnished a considerable part of the contingents which went to wage the holy war in Spain and returned home after being more or less arabicised by contact with the great Muslim towns of Andalusia; 4. lastly, the rebellions and civil wars which so frequently disturbed Muslim Spain, the emigrations or expulsions caused by the progress of the Christian reconquest, brought to Africa, from the "rising of the suburb" at Cordova (in 202/ 818) down to the 10th/16th century, an important element which settled in the region of the Jbala either in the towns around the mountains or in the

This rapid sketch of the spread of the Arabic language in Morocco explains why, after studying the question, three categories of Arabic dialocts have been distinguished:

villages of the highlands (resettlement of Tetouan,

foundation of Shafshawan) bringing there, along with

the Arabic language, IIII prestige of their cultural,

intellectual and material superiority,

a. Urban dialects: b. highland dialects; c. Bedonin dialects; and may add: d. the Jewish dialects.

a. Urban dialects. In Morocco not all the town dialects "urban dialects". There are towns like Casablanca, al-Diadida, Safi and al-Suwayra (and to a certain degree Meknès and Marrákush) the

population of which is entirely or for the most past of rural origin and where the absence of an old nucleus of town-dwellers has not enabled them to become urbanised. The Moroccans however distinguish quite clearly such places from towns with a really urban culture, more or less influenced by Andalusian culture. The principal towns with urban dialects are Fas, Rabat-Salé, Tetouan, Taza, al-Kaşr al-Kabir; Tangier, Wazzan and Shaishawan also have urban dislects but these are much contaminated by the surrounding highland dialects. Meknès and Marrakush have been influenced by the Bedouin elements introduced by the makings groups into the dialects of these two old capitals. It is interesting to note the case of Azammour where the old town (Azemmūr al-Hadar) has an turban dialect, while the new town, which has in more recent years grown up beside it around the sanctuary of Mawlay Abu Shu'ayb (vulgo Bu Sh'ayb), uses a Berber dialect. The urban dialects of Morocco form me group with those of the western part of the Central Maghrib, notably with those of Tlemcen, Nedroma and Algiers. Their phonetic characteristics are the loss of the interdentals of the classical language, the affricative pronunciation (P) of the, the frequent attenuation of haf to hames. In Fas, b, m, k, and diffm assimilate the lim of the article and are treated "sun letters"; the simple dim is pronounced like the French f (= Persian j), but when it is geminated, it gives jj in Fås and di in Tangler. The rd' is often pronounced very close to the French uvular r.

As peculiarities of the filalect of Fas, - may note the construction kethato "she has written it" for kethet + o, and the use of an invariable relative di representing the old dialectal dhū. Tangier and Tetouan have a preposition #-, "to" which III used before nouns (n-2d-dar "to the house") but not before suffixed pronouns. To translate "of", Marrakush uses t-; the dialect of this town uses certain Berber adverbs: ashku "because", helli "only".

All the urban dislects use the characteristic prefix of the present indicative: ka- in the north, tg- in the south. Fas uses almost as much as

the other.

b. Highland diatects. These are at least as well known as those of the towns. In 1920 G. S. Colin published notes on that of the Ts01 and the Branes in the north of Taza; in 1922, E. Lévi-Provencel published texts, prefaced by a grammatical sketch, of the dialects of the middle valley of the Warsha: since then Colin had an opportunity of studying those of the Bni Hozmar (near Tetouan), of the Mestasa (near Badis) and of the Ghrawa (near Shafshawan).

The highland dialects are of course more differentiated than the urban dialects. The tribes which use them belong to two political clans probably originally of different racial origin: the Ghumara, the old inhabitants, and the Sanhadja, the invaders. In the present state of our knowledge it does not seem possible to make the dialects coincide with political or radial boundaries; but we can nevertheless recognise two main groups of highland dialects:

1. The northern distects, extending from the Straits of Gibraltar to the south of Shafshawan and embracing in the east the confederation of the Ghumara; 2. the southern dialects, from Waszan ■ Taza, used by two great classes of tribes: first, the Sanhidia tribes of the valley of the Wargha: Sanhādia of the Central Wargha, Sanhādia of the

Sun and of the Shade, of Mosbah and of Gheddo; secondly, the Butr tribes, more or less closely related to the Zanāta and occupying the lands north of the region of Taza: Mernisa, Branes, Tsul, Maghrawa and Meknasa. It seems to be m historical fact that these Zanāta and Sanhādia peoples only settled in their present habitats long after the first Arab conquest; the Sanhādja of the Central Wargha certainly now occupy lands which before the Almoravid period were peopled by the Ghumara. We should therefore regard these southern highland dialects wyounger than those of the northern group. The slight differences noted between the two groups may then be due to two main causes: 1, an evolution of the neighbouring urban dialects which would have taken place during the period between the arabicisation of the Ghumara and that of the Sanhādja-Zanāta; 2. the non-identity of the Berber substrata.

To the two main groups: Ghumāra and Sanhādja-Zanāta, we may perhaps add two little islands in the south: the highlanders of the region of Sefra to the south of Fas (Bhālil, Bui Yāsgha etc.), and the Ghiyyata to the south of Taza; they probably constitute the last vestiges of a continuous Arabicspeaking bloc which stretched to the south of the Fas-Taza corridor, the existence of which in the 6th/12th century we know from al-Idrisi.

Phonetically, the Moroccan highland dialects are characterised by the profound changes underby the Arabic consonantal system as a result of the spirantisation of the dental and post-palatal occlusives. We find the interdentals the and dis. which do not represent the classical interdentals: tá'-thá' and dái-dhái have given in these dialects I and d respectively, which remain occlusive only at the beginning of the word or after a consonant or geminated; but after a vowel we have the and th: bent "daughter", plur. bndth; after a vowel also haf is pronounced as a spirant like the x of modern Greek. The representative of the group of the classical language is usually d, sometimes hardened to /; but among the Ghumara have | (= emphatic dkal). The sound & is fairly common. The short vowels are commoner than in the towns; many of the short vowels i and w of the classical language are preserved; this is how we find a considerable number of imperfects iR1 R2 uR3 and a few iR1 R1 iR1.

As to morphology, the fam. personal suffixes -a (< -kā) and pl. -em (< -hum) are characteristic: they are the complement of the series begun by the mase. -u, -o (< -hu). Among the northern Jbala we find the use of mouthix -set marking the plural: it seems really to be a borrowing from Latin. The dual, reserved for names of parts of the body which occur in pairs and for names of various measurements (of weight, length, volume and time) is in -dyon: Makrayon "two mouths", yidddh "his bands". The relative, pronoun and adjective, is d. The classical construct state (idaja) is very rare and is only found in a few stereotyped phrases: it is in general replaced by analytical constructions in which the preposition d "of" is used, expressing possession well as the material of a thing.

Almost everywhere the prefixes of the and pers. com. and of the 3rd pers. fem. of the imperfect are do- (and not to-): datel "thou writest, she writes". The passive participle of hollow verbs is often of the type ms/'si: msbyd' "sold", mehwas "filled up". Finally, may note a few traces of a passive of the form f'âl-yef'âl: bbât "to be taken". As evidence of conservatism, we may mention that in these dialects we have the word fā "mouth" which seems to have disappeared since old Arabic.

In spite of their divergencies, which are due mainly to pronunciation and to the local use of words and phrases corresponding to two very distinct forms of culture, the urban dialects and the highland dialects cannot be either historically or linguistically separated. The fundamental disparity is that which exists between the urban and highland group and the Bedouin group. It is the townsmen who have taught the highlanders to speak Arabic, but the urban dialects, used by individuals whose intellectual activity is greater, have evolved more rapidly. They also more sensitive to external influence, literary and political. These facts, added to the predominance of Berber blood in the highlands, suffice to explain why the dialects of the Jbala still seem coarse and quaint to the townsmen. On the other hand, the towns have been frequently repopulated, wholly or in part by people from the neighbouring hills. All this explains the family resemblance which the linguist finds between the dialects of the towns and those of the hills; perhaps the latter, being more conservative, are also the more interesting for the history of the language. W. Marçais regards them as valuable representatives of the Arabic spoken in the country district of the Maghrib before the coming of the Banti Hill and the Sulaym (cl. W. Marçais, Textes arabes de Tahrouna, i, preface, p. XXVIII).

The principal features which are common to the urban-highland group and which distinguish it from the Beduin group are the following:

- loss of the classical interdentals;

- pronunciation of \$df as \$ or \$amaa (and not a as among the Bedouins);

tendency
 ■ the syllabic grouping R² R² > R²,
 when R² is not a laryngal nor a sonapt;

- rarity of the construct state;

— suffix of the 3rd pers. masc. sing. = -u, -o (and not -ab, = among the Bedouins);

relative rarity of the addition of personal suffixes, but regular of the analytical phrase with dydl: pd-ddr dydl-1, "my house";

— diminutive of R¹ R¹ J R¹ or R¹ J R¹ R² becomes R¹ R² syyp R¹: Miyyeb, 'fittle don'.'

- diminutive of adjectives of the types R¹ R² » R² (< class: af^{*}al) and R¹ R¹ i R² becomes R¹ R¹ i R² e R³: hmimor, "a little red": hbibor, "a little large";
- ptural of the adjectives R¹ R² a R² (< class, af'al) becomes R¹ \(\tilde{R}^2 \) e R² : \(k\)\(k\)\(k\)\(\tilde{R}^2\)\(\tilde{R}^2\)\(k\)\(k\)\(k\)\(k\)\(\tilde{C}^2\)\(k\)\(C^2\)\(k\)\(C^2\)\(k\)\(C^2\)\(k\)\(C^2\)\(k\)\(C^2\)\(k\)\(C^2\)\(k\)\(C^2\)\(k\)\(C^2\)\(k\)\(C^2\)\(k\)\(C^2\)\(k\)\(C^2\)\(k\)\(C^2\)\(k\)\(C^2\)\(k\)\(C^2\)\(k\)\(C^2\)\(k\)\(C^2\)\(k\)\(C^2\)\(k\)\(C^2\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(k\)\(

— use of a verbal prefix to mark the indicative present: As- or Pa- in the towns and Is-, As-, ain the hills:

— im the singular of the perfect, the feminine person is in general used for the masculine: e.g. ktabis, "thou hast written" (m.), whence we find in Rabat for the plural, an analogous form klabise, "you have written".

in the vocabulary, skial, "how much?"; daba, "now"; lika (ria, kia), "to do", are charac-

teristic;

in the imperfect of the defective verbs, the plural is formed on analogy of the singular: yebhaw, "they remain"; yebhaw, "they weep".

c. Bedouin dialects. These in Morocco the dialects of the plains: the Atlantic plain from Arzila Mogador with its continuations into the interior, the valley of the Moulouya, the plateaux of eastern Morocco and the region of the Moroccan Sahara (Wad Ghlr, Wad ZIz etc.); they are still little known. That of the Dukkala of the north [Ulad Bû 'Aziz, Olad Fredi), corresponds in almost all its details to the dialect of the Olad Brahim of Saida (Orania) on which W. Marçais has written a monograph. There is no doubt that on examination one can divide the Bedouin dialects into groups characterised by more or less conservatism. Those which have most chance of having preserved their original character are those of the tribes | the Saharan steppes who have remained relatively stable and intact: Bni Gil, Mhāya, Dhwi Mni', Dlād JrIr, etc. In any case, the following are the main characteristics of these dialects: firstly, the \$4/ in pronounced as | (= haf ma@ada), and it is aiready this pronunciation which for Ibn Khaldun characterises the Bedown dislects of his time. The that's dhal and dad-sa' are retained with their interdental value. The short vowels are indistinct: the sound i is almost completely absent and many short unaccented vowels sound practically like a labral >. Characteristic are the appearance of an extremely short transitional vowel of a character, which is developed after A, g, III and III placed before a consonant or d; e.g. ksbir, "great" (plux.), igu'ed, "he sits down", khūrāfa, "tale", ghūzāl, "gazelle", gikwāra, "suddle-bag", rūgwās, "thia" (plur.); similar sound is found after bb, ff, mm and kk, gg, kk, kk-kk; e.g. lughrubb"a, "the crows", suffrakta, "a blow", summan, "pome-granate", sukkeis, "sugar", shukka, "place (of cloth)", nukhkhai, "sound"; by analogy the combinations now and /w when the w corresponds to a classical waw, are reduced to mm and ff; e.g. lemmwide", "the (little) place", leffedd, "the trails".

The retention of the accent on the first syllable causes "projected" syllable forms: yihiob, "he writes", plur yikkolbu; mightherbi, "Moroccan", mükhalda, "musket", biggorti, "my cow".

The personal suffix of the 3rd pers, mase, is -ah. The dialectal preposition translating "of" is ntds or tds, from the classical mata"; according as the word before it is feminine or plural, this preposition

becomes nitt's (tatt) or nia" (ta").

It does not seem that the Bedouin dialects know the use of the verbal prefix indicating the indicative present. In the plural personal forms of the defective verb, there is a reduction of the diphthong: ¿ki-yégiá, from the verb ¿kā "to fry"; nsū-yénsū, from the verb nsā "to forget".

We may also note the use of a preposition II-,

"to": gal-lina, "he told us".

From the point of view of vocabulary, some words are characteristic of Bedouin dialects: be-ibi, "to wish", yames, "yesterday", @arnek, dhurk,

"now", from the classical the l-walt.

d. Jowish dialects. The Jews who emigrated from Spain have as a rule retained the second of an archaic Spanish; many have also learned Arabic for business reasons. Alongside of the Spanish Jews, see have in the Berber highlands and in the towns of the laterior Moroccan Jews of unknown origin whom the former call forasteros (Span. "foreigners"); according to the district, they speak Berber of Arabic [see judago-arabic and judago-berger].

s. Relations of the linguistic groups of Morocco to one another. Morocco appears to the philologist a wonderful field for the study of the influence of the substratum on imported language, since the language of the substratum, i.e. Berber, is still alive alongside of the Arabic and quite well known. The results of the examination are very meagre: the phenomena actually ascribable to the action in the substratum alone are infinitesmal; this may, however, be due to the fact that Arabic, . Semittle language, and Berber, a proto-Semitic language, and not sufficiently differentiated.

From the phonetic point of view, there is hardly any sound change found in the highland dialects of the arabicised Berbers, for which a corresponding change cannot be found in the dialectal phenomena of old Arabic; only, perhaps their tendency to spirantisation should be connected with the identical tendency observed in the northern Berber dialects found in the confines of the Jhala country.

If we consider the morphology, we see that in the highland dialects the verb has lost feminine forms of the plural of the old Arabic, which still survive in some Bedouin dialects and are still found in Berber, A Berber origin has been sought for the so of the verbal prefix indicating the present of the indicative; but similar prefixes are found in Egypt and E Syria where there are very different substrata.

Certainly, Berber has the scheme ta- -- I which forms nouns indicating trades (ta-bennay-i, "trade of a mason") and names of abstract qualities (tabrdmi-i, "roguery"); it is however curious to note that in modern Berber, this scheme has not this significance and is only used to form the feminine

and secondarily the diminutive.

In the syntax of the highland dialects, we find indisputable traces of Berber influence; plural treatment of singulars applied to liquids (water, urine), phrases translated m stereotyped, e.g. ha in Kaddar "Kaddar's brother", with retention of the Berber particle indicating belonging to, -is.

But it is in the vocabulary that the Berber substratum makes its influence most felt. Whether surviving in the highland dialects m borrowed in the Bedouin dialects, many of the terms relating to country life Berber (names of plants, animals, rocks, agricultural implements and tools); they have often retained in Arabic the Berber prefix e-, which, still felt to have its original value, makes them unfit to take the Arabic article also; alongside of the singular in a-, we usually have a Berber plural in a-fin also retained. It is curious, by the way, but intelligible to find in the highland dialects words of Arabic origin with this Berber prefix. These must be Arabic words borrowed and berberised at a time when the Jbala still spoke Berber and which have been retained just as they were in their Arabic dialect after being arabicised, e.g. a-hfir, "ditch", plur, a-hafran; in Tangier the nave of the mosque is called a-Ma; at Rabat two words imported from Europe have a Berber form: a-fåif, "the sultan's boat" and a-tay, "tea".

Some Berber words have survived in the administrative language of the makhten: afreg, "a wail of cloth surrounding the sultan's camp"; agdal, "m pasture reserved for mil sultan's animals"; arfel, "leah to punish the guilty"; mesmar, "syndic (nahib)

of the Shartfa".

The Bedouin dialects naturally contain much

fewer Berber elements than the urban dialects and still less than the highland dialects; their rustic vocabulary nevertheless made numerous borrowings from the technical vocabulary of the previous Berber tillers of the plains. Within the Arabic area, the highland and urban dialects have borrowed from them a certain number of terms relating in the rural activities of the Bedouins; they are as a rule revealed by the pronunciation of kdf = g. The Bedouin dialects in their turn borrow from the towns their words relating to more advanced culture; but, for economic, political and, i a certain extent, aesthetic reasons, they give more than they borrow.

In addition to the Berber and Arabic elements, the Moroccan vocabulary contains a fairly important number of "European" loanwords. They come from the vocabulary of a higher culture and relate to the flora (in cultivation or its products), to agriculture, to food and dress, to furniture and housing, sometimes even to parts of the body. There are Greek or Latin borrowings of the oldest period, Romance or Spanish for later periods; but neither their meaning nor their phonetic treatment enables us always to be able to date accurately the time

of their introduction and their origin.

These "European" loanwords are naturally found in larger numbers in Northern Merocco, which has been more subject to Mediterranean influences which, through refugees from Spain, have been feit as far as the northern part of the Middle Atlas. The Bedouin dialects have escaped these influences (cf. Simonet, Glosario de voces ibéricas y latinas usadas entre los Mozarabis, Madrid 1888; Schuchardt, Die romanischen Lehnwörter im Berberischen, Vietma 1918; G. S. Colin, Etymologies magribines, in Hesperis (1926-7); A. Fischer, Zur Laudlehre des Marchkanischarabischen (chs. ii, iii, and Excurs), Leipzig 1917).

In spite of the profound differences which separate them, the highland and Bedouin dialects of Morocco (and of the Maghrib) agree in one essential and characteristic morphological feature: the forms sing. »—, plur. »—» in the first persons of the imperfect. Now this fact is attested in the 6th/rath century for Almoravid Spain and Norman Sicily, i.e. in Janguages from which Hiläll influence is clearly excluded; it is also found in Maltese; it must then be admitted that the two groups of dialects have independently brought about this innovation, which seems to have remained exceptional in the dialects of the east. The two groups agree also in the loss of short vowels in open sytlables; this phonetic peculiarity is also found in many eastern dialects; 🔤 it is curious that it has become general in the Maghrib while the dialects of Spain and Egypt do not have it.

It is in the Documents inedits d'histoire almokade that we find the first information about Moroccan Arabic (use of bash, "in order that", mid, "of", first persons of the agrict in n-{sing.), n-u (plur.)); but we have to wait till D. de Torres to find a few phrases transcribed (cf. French tr. Paris 1636, 241, 323, 339). Mouette, who was captured at sea by the Moors in 1670 and was for a long time a prisoner, has left us a Dictionnaire arabesque in French and Moroccan, in transcription (cf. Relation de la Captivité Paris 1683, 330-62). The first grammatical notes were collected by Höst (cf. Efterrelninger . . ., 1779, ch. 8, p. 202-210), who has also given us a Berber-Danish-Moroccan Arabic vocabulary (op. cit., 128-33). It is # Fr. Dombay we owe the first monograph on Moroecan dialects, which is also the first serious contribution to the study of Arabic dialects; the dialect which he deals with is that of Tangler (Grammatica linguae mauro-arabicae, Vienna 1800). Since then, there have been a number of studies: for works before 1911 see the bibliography given by W. Marçais in his Textes arabes de Tanger, 207-13; for later works, — the bibliography in Textes arabes de Rabai by L. Brunot and the Bibliographies maurocaines given periodically in Hespéris.

2. Literature of the Arabic dialects. Like all popular literatures, the literature of the Arabic dialects of Morocco is essentially poetical. The only texts in prose are those which have been collected recently by European students of dialects.

In the Arabic poetry of Morocco two periods must be distinguished: the first extending down to the beginning of the Safdian dynasty; the first known texts are those which Ibn Khaldûn gives at the end of his Mukaddima among the specimens of the poetry of the towns. To these we may add a mass of poems composed in honour of the Prophet (Mawlidivydt) and collected in numerous collections existing in manuscript. From this group cannot be separated the poems which accompany classical Moroccan music, "Andalusian" music, many of which must have been composed in Morocco; these were collected and classified by al-Ha'ik, a musician of Spanish origin who had settled in Tetouan. All these poems belonging to this first period are written In the Spanish Arabic dialect, which after the great success of the Cordovan Ibn Kuzmān (6th/12th century [q.v.]) became the classical language of the poetic genre called sadjal (q.v.), which had this in common with the munashshab [q.v.], that, while employing like it new metres, its prosody was based on the quantity of the syllables, but it differed from the mumashshak in that it was written in the Spanish dialect and not in the classical lan-

The main characteristics of the poetry of the Moroccan dialects of the first period attention to the quantity of each syllable and the use of the

Spanish dialect.

The second period, on the other hand, in distinguished by a system of prosody founded exclusively on the number of syllables in each verse and by the use of a special language called ***lf*** [see MALHÜN].

Alongside of this men's poetry, there are the songs of the women (songs of women working at the mill, songs of gleaners, songs of family fêtes, lullables), the children's songs which are often strangely conservative, epigrams and proverbs; see S. Biarnay, Notes d'ethnographie et de linguistique nord-africaines, Paris 1924 (songs of women and children); L. Brunot, Proverbes et dictors arabes de Rabas, in Hespéris (1928) (with Moroccan bibliography of the subject).

III. Other Languages. A sketch of the languages of Morocco which only took account of Berber and Arabic dialects would be incomplete, for three other elements of secondary importance

have to be considered:

a. Classical Arabic, the official language, is used only in writing, for sermons, lectures and conferences; it is never the language of conversation except on the radio and television. But, thanks to these two methods of communication and to the fact that religious studies which are considerably developed in the towns (especially Fas) and also among the Jbala (Kur'anic studies and especially kird'at), many words of classical Arabic have been introduced into the popular dialect. The phonetic peculiarity to notice in borrowed classical words is the retention of the short vowels as a result of

the process of elongation; e.g. classical data, plur. data's, "decree of the sultan", borrowed by the popular dialect in the form data, whence a dialect plural dwata. Several Kur'anic expressions or phrases of exegesis hence passed into everyday language adverbs: bolidii "guilty" (taken from Kur'an vi. 153), b-st-tawii "stowly", lit. "in commenting on", wa-tila "perhaps".

c. In the palace of the sultan, many black servants of both sexes still spoke Sudanese dialects, but these seem to have had no influence on the Arabic dialects

of Morocco.

No trace has so far been found of the existence in Morocco of secret languages; — could hardly put in this category the argots of certain guilds (butchers) nor those of the students, — originality of which consist simply in transposing certain letters of each word of the ordinary language and in the addition of certain prearranged syllables. One should not, finally, omit to mention that the use of Spanish and, above all, French, which spreadduring the protectorate, remains as widely spread—if not more so—since independence, and is not without — appreciable effect of dialect vocabulary.

(G. S. COLIN)

VIII. INTELLECTUAL LIPE.

More especially since the end of the Middle Ages, Morocco has occupied a place by itself, often important, in the history of civilisation. From the point of view of intellectual life, it was for long under the tutelage, more or less marked, of neighbouring countries, and it was only from the time it became an independent state that it began to show independence in this respect also. The great activity at the centres of learning in Arab Spain down to the end of the 7th/13th century had undoubtedly an influence in Mcrocco, but it was after the return of the Iberian Peninsula to Christianity, that, owing the migration of refugees from Spain to Morocco, where there happened to be ruling princes anxious to further Islamic studies, it was able to preserve the last and only centres of study in the Muslim west. In any case, in spite of the relatively large number of scholars which it has produced in various branches of 'ilms, this country is far from having inherited in the eyes of the rest of Islam, the reputation and intellectual prestige, which Spain enjoyed when it was a Muslim country. However, it may be said that the towns of Morocco have always held in recent centuries a large proportion of men of letters, much attached to their traditional culture. Lastly, it may be noted that this culture, to the end of the 19th century at least, never allowed the slightest place for modern sciences, the study of which, if it has gradually become more or less established in the Muslim East, has hardly interested the West.

The characteristic feature of selecture, which is essentially founded on religion, is that it has remained unchanging. In this country, where tradition strictly regulated all acts of public and private life, it is not surprising that the intellectual ideal has always remained the same. It has already been remarked that, until recent times, the Moroccan fakth, whether he were magistrate, teacher, or official of the Sharifian government, possessed the same stock of knowledge m a fable of the periods of the Marinids = Sa'dians. The same instruction had been given him and by the same methods. He received first of all an elementary education in the Kur'anic school [see xurrks], he learned the Kur'an by heart, often completely, and some of the elements of grammar. Next he became a student (idiib), and the talab al-cilm, which he studied, me governed by me rules me programmes other than the traditional ones. He first of all studied the "mother-words" (wmmahāt), compendia made to be memorised readily, on theology and grammar (usually the Murshid almu'in of Ibn 'Ashir and the Adjurramiyon). It was only then that he entered upon a more thorough study of more advanced texts, usually commentaries (sharh) or glosses (hāzhiya) on works (main) of established reputation and exclusively Islamic in character. The whole trend of his studies - toward a better knowledge of theology and law.

The result was that in most cases in Morocco men of learning were almost entirely jurists and that they differentiated between purely Islamic sciences ('ulam) and profane learning (funam), with some contempt for the latter. One understands also why the part played by Morocco in Arabic literature is primarily in the domain of subjects directly connected with the Kur'an and the Sunna, theology, haw and usulf.

The centres of learning have varied with periods and historical circumstances. The early ones seem to have been the points nearest to Spain, Centa and Tangler. The foundation of Fas and the building in this city of the great Mosque of the Kayrawants (Djami' al-Karawiyyin (q.v.)) facilitated the establishment of a centre of culture in the interior. A little later, Marrakush, the capital of the Almoravids and of the Almohads, became by desire of its rulers the centre of attraction for Magiribl scholars and even for a certain number from Spain. But it if from the Marinid dynasty, who saw in the development of educational centres in Morocco- means = make themselves popular in the country and to acquire prestige in the eyes of the Muslim world, that the rise of Fas as an intellectual centre dates: it me the metropolis of learning in the country from the 8th/14th century. Not only did the Marinid princes make it the political capital but by the foundation of a series of colleges or madvases around the Diamis al-Karawiyyin and mosque of New Fas, they were able = attract to this city a host of students from all parts of the country and to give it the renown for learning, which it still jealously claims to-day. In the Marinid period, madrasas were also multiplied outside Fas: Meknès, Salé and Marrakush had their own, which shows that regular education was given in these

In addition to the part played by the madsasas, there was the activity of the sawiyas, directly connected with the development of maraboutism and Sharifism in the country in the period when the Spaniards and Portuguese were trying to establish themselves in Morocco in the 10th/26th century. The adviyas, religious centres, headquarters of the glisids, naturally became centres of teaching. At the time when Fis could only with difficulty keep its character as the principal centre of learning in the country, the zāviyas, in which teaching was carried on, became more and more numerous; e.g. the zāviya of al-Dilā' [q.v. in Suppl.] in the Middle Atlas, the zāviya of Tamgrut in the land of Da'ra and the zāviya of Wazzān [q.vv.] in the north. The most lamous scholars were frequently either heads of brotherhoods or shorfa, who taught in the motherhouse of their order.

We do not intend here to give m detailed sketch of the Arabic literature of Morocco, but will be content with m few general indications and manudistinguishing where possible, between Islamic and profane sciences.

It was not till the Muslim West adopted the Maliki rite that Morocco began to produce work in the domain of film in close accord, as already tioned, with the school of Spain. In this period of intellectual dependence, the relations between the two countries were continued and the Maghribi students down to the 7th/13th century considered a sojourn in Cordova, Murcia or Valencia necessary to finish their course. The East did not yet seem to exert the attraction that it did later. At this period, besides, the islamisation and arabicisation of the Berber masses was still too recent. Only # few may be mentioned for this early period, Darras b. Isma'll, of whom much that is recorded is legendary; the famous reformer 1bn Tûmart [q.v.], creator of the Almohad movement and author of several risālas or fakidas on his teaching; the kādi Tyad (476-544/1083-1149 (e.v.)), author of works Muslim learning, of which the most famous are the Kitab al-Shifa' and the Masharik al-amade with a collection of biographies of learned Mālākls, entitled ai-Maddrik.

During the modern period, on the other hand, the number of learned Moroccans becomes more and considerable. The best known me for kirā'āt: Ibn Barri (8th/14th century); Ibn Fakhkhār 9th/15th century); the scholar of Meknes Ibn Ghāzi (d. 919/1513); 'Abd al-Rahmān Ibu al-Kādi (d. 1082/1671); 'Abd al-Rahman b. ldris Mandira (d. 1179/1765-6); Muhammad b. 'Abd al-Salam al-Fasi (d. 1214/1809 [q.v.]); for hadith; Yahya al-Sarradi (d. 808/1405-6); Sukkayn al-'AsimI (d. 956/1549); Ridwan al-Djinwi (d. 991/1591); Muhammad b. Kasim ai-Kassar (d. 1012/1603-4); Idria al-Iraki (d. 1228/1813); for /šķā: Abu 'l-Hasan al-Şughayyir, commentator of the Mudampona; al-Diazult [q.v.] and Ahmad Zarrūk (9th/15th century) commentators of the Risdle of Ibn Abi Zayd al-Kayrawāni; al-Wansharisi (d. 955/1548); al-Mandjür (d. 995/1587 [q.v.]); Iba 'Ashir (d. 1040/1630-1); Mayyara (d. 1072/1661-2); for philology; al-Makküdi (d. 807/1404-5); Ibn Zakri (d. 899/1494 [q.v. in Suppl.]). Their works have for the most part been recorded and will be found detailed either in Brockelmann or in Bencheaeb's work on the individuals mentioned in the Ididas of Abd al-Kadir al-Fast. Only a small number have found a place in eastern libraries; but me the other hand, they all form the foundations of the collections of manuscripts formed and preserved in the imperial palaces and mosques of Morocco.

Some Moroccan scholars have written works on adab or collections of poems, in addition to books of a strictly Muslim character. None of them can claim any great originality and purely literary discuss are rare. Poetry, as a rule—when it is not didactic (urdiusa)— is religious mystic. At the courts, there were always a few literary men maintained by the princes, who were the panegyrists, often very extravagantly, of their patrons.

It is at the courts also, especially from the 8th/t4th century, that we find the few historians who have given us original chronicles or compilations. Their works, planned on a singularly curious conception of history, have nevertheless the merit of giving us the only detailed information about the political history of the country in the period of the author in immediately preceding it. Those which date from the Middle Ages are, however, much the best. The kind of work not only did not improve later, but became simply dry chronicles in which events are related in a brief and colourless fashion.

The early historians of Morocco-it we except the Berber genealogists about whom we do not know very much-are contemporaries of the Almoravid dynasty. A little later, the Almohads find a historian in the person of a companion of the Mahdi Ibu Tümart, al-Baydhak [q.u.] al-Şanhādjī, the interest of whose memoirs contrasts strikingly with many later chroniclers. Alongside of the work of al-Baydhak may be placed the chronicles of Ibn al-Kattan and of 'Abd al-Wabid al-Marrakushi [q.w.] = of high value. But it was in the Marlaid period that the historian found most favour in Morocco, Leaving out 1 bn Khaldün, whom Morocco is not the only one to claim, we may mention I bn Idhāri [q.v.], ■ scholar of Marrākush, to whom we owe a history of North Africa and Spain, the Bayan al-mughrib; that of Ibn Abi Zart [q.v.], author of history of Fas and the Moroccen dynasties, Rawd al-kirjas; Ibn Marzūk [q.v.], author of the Musnad, a monograph on the sultan Abu 'l-Hasan 'All; Ibn al-Ahmar [q.v.] of the family of the kings of Granada, author of the Rawdat al nisrin. Under the Sa'dians, the principal historians were ai-Fishtali and al-Ifrani [q.vv.], author of the Nuchet al-hadi; finally, under the 'Alawids, al-Zayyānī and Akansûs [q.vv.].

Geography is represented in modern Moroccan literature only in the form of riklas [q.v.] = accounts of the travels of pilgrims, in which the description of the country passed through only occupies an insignificant place. Nevertheless, the geographer al-Idrisi [q.v.] and the great traveller Ibn Battuta [q.v.] were of Moroccan origin.

biographical literature of Morocco is considerable. The collections of mandaib $[q,v_*]$ of saints, monographs dealing with families of shor/a or religious brotherhoods are abundant. especially in the modern period. There are also collections by town or century, some of which are of a certain interest, even from the point of view of history. All these biographies have been surveyed in E. Lévi-Provençal, Les historiens des Chorfa. The most notable biographers down to the middle of the 19th century are Ibn 'Askar, author of the Dawhat al-nashir; Ibn al-Kadi, author of the Durrat al-hidiāl and the Djadheat al-iktibas; the historian al-Ifrani, author of the Safwal - intasher; and al-Kādiri, author of the Nushr al-mathini and the Iltital al-durar.

As to medicine and natural science, Morocco down to the 8th/14th century was closely dependent on Spain. The physicians of the Almoravid and Almohad princes were from Spain, like Ibn Bādja

(Avenpace), Ibn Tufayl and the celebrated Ibn Rushd (Averroes) and Ibn Zuhr (Avenzoar). In the modern period, we find at the courts of the sultans several physicians of Moroccan origin who have left works. The chief were, in the Sasdian period: Abu Muhammad al-Kāsim al-Wazīr al-Ghassānī, in the 'Alawid period: Ibn Shukrun, 'Abd al-Wahhab Adarrák, Abmad al-Daraff, 'Abd Alláb b, 'Azzúz al-Marrakusht, Ahmad Ibn al-Hādidi and 'Abd al-Salām al-'Alamf. Finally, two famous Moroccans studied the exact sciences in the 7th/t3th century: Abû 'Alî al-Hasan b. 'Umar al-Marrakushi, author of a treatise astronomical instruments, part of which has been translated by Sédillot, and Ahmad Ibn al-Bannā' [q.v.], to whom we owe several works on arithmetic, geometry, algebra, astronomy, astrology and alchemy.

At the end of the 19th century, the reign of Mawlay al-Hasan was marked by a kind of renaissance in Muslim studies in Morocco, particularly characterised by the need which writers felt of getting their works printed to make them more widely known. The lithographic presses of Fas acquired a certain importance at this time and began to publish texts which had hitherto circulated only in manuscript. A little later, there appeared at Fas the three volumes of the Salwat al-anias of Abmad b. Djafar al-Kattani [q.v.], an excellent biographical dictionary of the celebrities of the northern capital. At the time, there was published in Cairo the great Moroccan history of Ahmad b. Khālid al-Nāşirī al-Salawi [q.v.] entitled Kiláb al-Istikjá li-akhbár duwal al-Maghrib al-aksā.

MAGHRIBI, ARMAD KHATTÜ, famous mediaeval Gugiarăti saint. Born ca. 737/1336 in Dihli

and educated there, he migrated to Khattu, near Nagawr, in Radiasthan at the instance of his spiritual director, the Maghribl master, Bába Ishák, In 776/ 1375, Băbá İsbâk died, and Ahmad set out on an extended pilgrimage, visiting Arabia, Iran and 'Irak before returning to Dibli, where he survived the wrath of Timur in 800/1398 ('Abd al-Kādir Badā'Qat, Muntakhab al-tawarihi, Calcutta 1864-9, i, 270-1; Eng. tr. G. Ranking, i, 357-8). He subsequently proceeded to Sarkhedi, near Ahmadabad, and there attained enduring fame. According to Mughal historians (Nigām ad-Din Ahmad, Tobahāt-i Akbari, Bibl. Ind., ii, 97; 'All Muhammad Khan, Mir'dt-i Akmadi, suppl., Baroda 1930, 78-9), Sultan Ahmad Shah I founded the city of Ahmedahad = 813/1411 on the advice, and with the blessing, of Ahmad Khattů.

In addition to being well versed in traditional Islamic sciences and theoretical Süliam, Ahmad was a poet whose Persian verses are cited in the same extant malfürdt which provide the primary source material for his biography, viz., the Tuhfat almadjälis by Mahmad Irdli and another malfür by Muhammad b. Abi 'I-Käsim. At his death on to Shawwäl 849/9 January 1446, the saint was buried in a towering marble mansoleum which, with adjacent structures built by later Gudjarát sultans, elicited praise frem the Muchal emperor Djehängtr on a visit to Sarkhēdi in 1017/1618 (Tünhi Djahängiri, Aligarh 1864, 212).

(B. LAWRENCE)

AL-MAGHRIBI, BARC, a family of Persian origin who performed in the course of two succeeding centuries (the 4th/roth and 5th/rith centuries) the influential functions of wastr, khib or intendant (mudabbir) at several princely courts throughout the Middle East, in Baghdad, Aleppo, Cairo, Mawsi,

and Mayyafárikin. In the collections of akhbar concerning the vicissitudes of this family, the respective representatives of four succeeding generations are mentioned in particular. The first three of these are described in the akhode concerning the family and also in this article, as seen from the point of view of the representative of the youngest generation, the wastr Abu 'l-Kasim, The life of the latter is otherwise better known owing to the historical sources available. Sāmī al-Dahhān, the editor of the Kitāb fi 'I-siydsa (I)amascus 1948) written by the wastr Abu 'l-Kāsim, has given in his Preface an account of events which affected the family's rather adventurous history, which may be supplemented by the information given by Kamal al-Din Ibn al-Adim, the historian of Aleppo (see IBN AL-ADIN, and Bibl.). The four members of the Bonu 'l-Maghribl family mentioned above will here be discussed from the point of view of the youngest, Abu 'l-Kāsim:

 His great-grandfather, Abu 'l-Hasan 'All b. Muhammad.

(2) His grandfather, Abu 'l-Käsim el-Husayn b. 'All.
 (3) His father, Abu 'l-Hasan 'All b. al-Husayn.

(a) Finally, he himself, Abu I-Rasim al-Hussyn b.

1. The great-grandfather, Abu 'l-Hasan filled a post in the so-called Dieses al-Maghrib, administrative division specially established for the collecting of the hardel or landtax of provinces in the regions was of Baghdad. See for this aspect of the 'Abbasid administration, D. Sourdel, Le visitat 'abbaside, ii, 591. In spite of its Persian descent, the tamily acquired the name Banu 'l-Maghribl from its responsibility for the proper functioning of the Diwds al-Maghrib.

2. The grandfather, al-Husayn b. 'All, discharged inter alia the function of mudabbir at Baghdad in the service of Muhammad b. Yakut, a high dignitary at the 'Abbasid court (cf. Sourdel, ob. cil., 484-5). At Bashdad, al-Husayn b. All became related to a certain Abu 'All Harun b. 'Abd al-'Axia al-Awaridil by having married his sister. Abū 'All' Hārūn is known to us as the subject of two aulogies composed by al-Mutanabbl [q.v.], see R. Blachère, Abou 'i-Tayyib al-Motanabbi, un poète arabe, Paris 1935, 90-2, and m the author of a pamphlet against the famous Baghdadl mystic al-Halladl [q.v.], see L. Massignon, La passion de Husayn ibn Manşûr Hallaj, Paris 1975, i. 533-4. As a hallib, Abu All Hârûn was employed in an administrative department under supervision of the amir al-amera? Ibn Rā ik [q.v.].

In consequence of the overthrow of the latter in 330/942, Abū 'All and also his brother-in-law al-Husaya b. 'All had to flee from 'Irak in order to find employment elsewhere. After some time, the grandfather, al-Husayn b. All, was able to find a new job in the service of the Ikhshidids [q.v.] of Egypt and Syria. The family was to stay in Egypt for some years till there was a change in the Egyptian government; in the words of Ibn al-'Adim (Bughya, ms. fol. 16b), "Until the power of the one who made himself master of Egypt was renewed"-probably thereby referring to the decease of the Ikhshidid prince Muhammad b. Tughdi [q.v.] in 334/946, and his being succeeded by his two sons, while real power of government entrusted to his Nubian slave Kāfūr (q.v.). Thus it was probably under the influence of this governmental change that the Banu 'l-Maghrib! departed from Egypt in order to settle in Syria. There, they are found holding office at the Hamdanid [q.v.] court in Aleppo. For most of the rest of his life, the grandfather al-Husayn b. "All was to remain there as a katib, except that his stay at Aleppo was, at the end of his life, to be interrupted by a sojourn in Byzantine territory as a guarantee or hostage for the Byzantines, who had been requested to release a number of Muslim prisoners of war. Also comprised in this act of redemption (fida") was the deliverance of a second security, a very valuable piece of armour studded with jewels, badana of Sayt al-Dawla himself. This affair of the fidd? occurred in 354/965 and is an indication of the importance attached to al-Hiusayn b. 'Ali = a political personality.

When the last remnants of the ransom had been handed over, the Byzantine authorities gave permission for him meturn to his home country. However, soon after his arrival in Aleppo—or, according to some other sources, even before his return—al-Busayn died. In his palmy days, he had been me subject of praise, in the poetry of Abū Naşr b. Nubāta al-Sa'dī (327-403/939-1015, see Sezgin, GAS, li, 504-5).

3. The father Abu 'l-Hasan 'All b. al-Husaya succeeded al-Husaya b. 'All in his function as a Addio in the service of Sayf al-Dawla and his son Sa'd al-Dawla Abu 'l-Ma'âli Sharif (reigned 356-81/967-91). Like his father, Abu 'l-Ḥasan also found someone who was prepared to eulogise him, Abu 'l-'Abbās al-Nāmī, who was al-Mutanabb's successor at the Hamdānid court in Aleppo as soon as the latter had departed to try his luck in Egypt. Abu 'l-'Abbās al-Nāmī is mentioned in this connection by 'bn al-'Adim, Bughya fols. 16b, 126b (see on this poet, Sezgin, GA S, ii, 506-4)

It was only after a period of many years in the Hamdanids' employment that the position of Abu 'l-Hasan at Aleppo was to change rather abruptly; when in 380/980-90, a rebeltious general, the amir Abu 'l-Fawaris Bakdiūr al-Hādjibi, tried to over-throw the reigning dynasty, Abu 'l-Ḥasan defected to the camp of the rebeis. Hence on the faiture of this rebeltion, the kātib had to flee to Egypt, where soon acquired new important functions in the Fātimid state under the caliph al-Aciz bi'llāh [q.v.]. For information about these developments in the careers of the Banu 'l-Maghribi, see Ibn al-Kalik, Zvòdat al-kalah, i, 170, 178, and al-Makrizl, Khikat, Bālāk 1270, ii, 152.

After a short while, Abu 'l-Hasan re-appeared in northern Syria, this time as intendant of the Fățimid army (madabbir al-djaysh), and with much more power than at the preceding time of the unsuccessful rebellion of Bakdiūr. It was his avowed intention to conquer Aleppo on behalf of his Fățimid overlord from the Hamdânid Sa'îd al-Dawla Abu 'l-Fadâ'il (381-92/991-1002). However, although Aleppo was to suffer a prolonged Fățimid siege, the Hamdânid capital stood its ground successfully, with support from the north by the Byzanilues and helped by corruption amongst the attackers; even the mudabbir al-djaysh himself is reported to have accepted bribes in exchange for his secretly given advice to the Fāṭimid general about a final retreat.

It is perhaps in this period of Abu 'l-Hasan's life that the Syrian poet Abu 'l-'Ala' al-Ma'arrl [q.v.] addressed to him a \$asida, part of which has survived till our time. In this fragment (Shurāk Sakt al-sand, Cairo 1947, iii, 1087-96, rhyme himyaru) the poet explicitly mentions the Persian descent of his mamdile, together with other praiseworthy qualities, e.g. his description of Abu 'l-Hasan one who, instead of silver, only wishes to grant gold to his favourites—at the same time scattering pearls of material origin, accompanying his much more excellent pearls of spiritual wisdom. Notwithstanding the wisdom ascribed to him, Abu 'I-Hasan failed to realise his political aims in Syria, and was recalled to Egypt. There he appears to have escaped the immediate effect of the Patimid caliph's wrath, possibly = a consequence of the sudden death of al-Aziz and the accession to the throne of his successor al-Hākim [q.v.], in 386/996.

Once more in Egypt, Abu 'l-Hasan again succeeded in securing for himself in position of imma importance, while his imma Abu 'l-Kasim al-Maghribl (see 4. below) to be entrusted with a position of influence in the Diwās al-Sawād. Soon, however, the fortunes of the Banu 'l-Maghribl were to change again, this time because of their increasing involvement in a number of intrigues and political struggles with an important personality at al-Hākim's court, who held the high position of wastral-sawf ma 'l-halam (Minister of the Sword and Pen), the Christian Mansûr b. 'Abdûn. Although initially the Banu 'l-Maghribl could boast of some successes in their intrigues, aimed in particular at the Fātlmid Christian functionaries, Mansûr b. 'Abdûn finally got the upper

hand. He persuaded the capricious caliph to order the execution en bloc of the members of the Banu 'I-Maghribl, and accordingly, almost all of them died in 400/1009-10, with the sole exception of Abu 'I-Kāsim, the representative of the fourth generation of this family (for details about the intrigues, see Ibn al-Kalānisi, Dhay! Ta'ribh Dimashh, 63-2).

4. Abu 'l-Kāsim al-Husayn b. 'All, "alwaste al-Maghribl", also called by another surname "al-Kāmil Dhu 'l-Wizāratayn", was born in Dhu 'l-Hididia 370/ May 981 at Aleppo, according to Ibn al-'Adim, Bughya, fol. 14a-b, whose information should be preferred to al-Makrizl, Khitat, il. 158, where instead of Aleppo, Egypt is mentioned as his original home. Having escaped from the massacre in Egypt, Abu 'l-Kasim at first sought refuge with the Bann 'l-Djarrib [see Dlaggints], leaders of a clan of Bedouins who exercised political influence in Palestine more or independent of al-Hākim's authority. At his request, the chief of the clan, Hassan b. al-Mufarridi b. Daghfal, granted him protection or idiara [q.v.], upon which the grateful fugitive composed and recited a fairly long karida, which can be found in Ibn al-Kalānisi, Dhayl, 62-3.

Once in Palestine, Abu 'l-Kāsim began inflaming the Bedouins against the Fatimid caliph, against whom he evidently felt an unquenchable thirst for revenge. At first, his policy proved successful, for aren a quite important town like Ramla, which was under Egyptian jurisdiction, had to undergo a siege and subsequent invasion, looting and massacre-all this, as it appears, at the instigation and advice of Abu 'l-Kāsim. Not yet satisfied, he also planned and executed the erection of a counter-imamate to that of the Fatimids. A Meccan sharlf, al-Hasan b. Diaffar, who could from his 'Alid pedigree claim a descent at least m authentic as that of the Fatimid imam, claimed for himself, as once al-mu'minin, the honorific title al-Rashid bi'llah, all this companied by the approval and acclamations of Abu 'l-Kāsim and his Djarrāḥid protectors. This rebellion was financed by gold and silver taken from the Karba, melted down, and coined into dindes and dirkams, known as "Kabiyya" ones. However wellplanned, the action of Abu 'l-Kasim failed to achieve any result; the counter-caliphate proved unstable on account of the readiness of its Bedouin supporters to accept extensive bribes from al-Hakim. Just in time, Abu 'l-Kāsim was able to leave 🔤 former allies and to escape to 'Irak and 'Abbasid jurisdiction.

In connection with Abu 'l-Kāsim's stay in 'Irāk, we find in Ibn al-'Adim, Bugkya, fol. 15b, a cather curious report about the suspicion fastened on him by reason of his name "al-Maghribl". The 'Abbasid caliph al-Kädir billäh wrongly assumed from this a pro-Fatimid Inclination, the Egyptians being indicated in the east by the term Maghariba. From Wast, where Abu 'l-Kāsim had to remain as long as this suspicion circulated, he sent to al-Kadir = risata, in which the original meaning of the name "al-Maghribl" was duly explained, as derived from the Diwan al-Maghrib, a Baghdad governmental department. Thus having purged his name and political intentions, he was allowed to reside at Baghdad, and was able to begin a completely new career of wastr or katib at different princely courts in the Muslim East.

After his stay in Baghdad, he is reported to have held several offices, at first in Mawsil under the 'Ukaylid prince Kirwash b. al-Mukallad, then at Mayyafarikin under the Marwanid prince Nasr al-Dawla b. Ahmad. Thereafter, having returned via

Mawail, he held for a short while the office of wastr in Baghdad in the caliph's service. But because of his involvement in pro-Alid riots in Kala, he incurred al-Kadir's displeasure, and had to retrace his steps, again seeking refuge at the court of his former protector the Marwanid Nasr al-Dawla.

Finalty, at Mayyafarikin, he died in 4t8/1027, but before his death his ever-scheming mind had already planned that his mortal remains should be carried to Mashhad 'All near Kūfa, without unduly attracting the attention of his opponents, for burial near the holy shrine. To this end, he is reported to have sent letters containing the request that the body of a beloved female slave of his might pass in her coffin through the intervening territories; only after the funeral were the real nature of the coffm's contents known.

From among the seazir's works, the following may be mentioned here:

(t) A compilation (known only in manuscript) of 1bn al-Sikkit's work, Islan al-mantin

(2) al-Inas bi-cilm al-anadh (also in ms.), containing many names for Arab tribes, which by their mutual resemblance or their unusual construction might easily misunderstanding or confusion.

(3) Adab al-khawas; fi 'l-mukhtar min balagkat kaba'il al-'Arab wa-akhbarika wa-antabika wa-ayyamika (also in ms.), partial ed. by Hamad al-Djäsir, Riyadh 1980, with a vol. so far published. For further information concerning manuscripts and contents, see Brockelmann, G, I, 117, 353, ■ I, 500 and Sami al-Dahhan's Preface in Kitab fi

11-siyāsa, 25-7.

(4) Kitāb fi 'l-siyāsa, ed. Sāmi al-Dahhān, Damasous 1948, is a short manual for an unnamed ruler, giving him advice how to attain the ideal form of government. In doing this he should at first understand how to organise his own way of living; and secondly how to behave towards the higher classes of society in his empire, and which qualifications are to be required in order for his subjects to perform certain functions in the ruler's service, for example the ones of chancelfor (Adrib), chamberlain (Addiib (q.v.]), taxcollector, commander-in-chief, police-chief, etc. Thirdly, the ruler should know how to restrain masses, in view of their inclination to revolt. In conclusion, the author quotes an injunction given by Abū Bakr to Yazid b. Ab! Sufyan, when the latter was sent with an army to Syria (cf. al-Athle, sub anno 13 H., where a variant text is given). Although the author of the Kilab fi 'I-separa never discloses the identity of the prince to whom the work - dediested, it may be surmised that the Marwanid ruler of Mayyalarikin, Nasr al-Dawia Ahmad, who on several occasions had shown himself such a loyal protector of Abu 'l-Kāsim, is meant.

Contemporary judgements upon the wasir known to us from two sources. A negative appreciation is found in the work of 'All b. Mansur b. Talib Dawkhala "Ibn al-Kārih" who, for a long time, until shortly before 400/1010, had been a tutor amployed for the education of the sons of the Banu. 'I-Maghribi. Abu 'I-Kāsim had been woo of his pupils, but after the mount of the family, 'All b. Mausur detached himself from it and composed a hidia? [q.v.] full of abuse and strong criticism against Abu 'l-Kāsim. In this poem, he accuses the wazir of inter alia having been the indirect instigator of his family's ruination through his own intrigues (see for details, Yakut, Udaba?, v. 424-7),

Later on, Abu 'l-'Ala' al-Ma'arri appears to have criticised this hidja' poem. At any rate, 'Ali b. Manaur felt himself obliged to remove the unfavourable impression made, and this among other things [see ABU 'L-CALA' AL-Ma ARRI] was the aim of a letter which he addressed to al-Ma'arri. This letter and al-Ma'arrl's reaction to it are now available in the annotated edition of 'A'isha 'Abd al-Rahman, Risalai al-Ghufran wa-ma'aha Risalat Ibn al-Karib miflah fahmihā (Cairo 1963 and later editions). Al-Ma'arrl's to Ibn al-Kārih's criticism of the waste is found in the Risalat at-Ghufran, and is characterised by an inclination to gloss over any possible false steps made by the west. In particular, Abu 'l-Kāsim's intrigues in Egypt are ascribed to his youthful ambition and jack of experience, and their terrible result as being | ultimate effect of crushing Fate (R. al-Ghufean, 534).

Finally, a dirge (marthing) composed by the poet on the occasion of the water's death has survived, having been included in the poet's second collection the Luzum ma la yatzam (ed. 'Azla Zand, Cairo 1991-5, ii, 434; ed. Bombay 1303/1885-5, 346), In one verse of this poem, the poet seems to acknowledge that a certain measure of criticism against the world's way of life could be justified, cf. l. 7: "If the two angels who accompanied you did write down some small sin, how many an excellent characteristic contrasting this can be found, always wiping it out!" Elsewhere in the same poem, al-Mafarri makes mention of the warie's precious library which survived its owner. Two centuries later, we find Ibn Shaddad (d. 684/1285 [q.v.]) reports its continued existence in his topographical work al-A'lah al-hhatira fi dhikr umara al-Sha m wa 'l-Diazira (apud Kitab fi 'l-siydsa, 109), with the following words: "In Mayylfarikin there was extant the library which up till the present

time is known as "al-Maghribl's Library".

MAGIC. [See SINK].

MAGNESIA. [See MAGENTSA].

MAH AL BASRA, "the Media of Bassa", the district of Nihawand [q,v.], the taxes of which contributed to the support of the military population at al-Başra after the Muslim conquest of al-Diabal. Although Sayf ascribes this arrangement to the time of 'Umar I (13-23/634-44), according to a)-Ba(ādhuri, a)-Dinawar and Nihāwand were occupied by Basran and Kūfan forces respectively after the battle of Nihawand in 21/642. By the caliphate of Mu'awiya (41-60/661-80), the Muslim population at al-Kūta had increased and required increase

in revenues for their support, so al-Dinawar was reassigned to al-Kû/a and Nihâwand to al-Başra. The people of al-Kû/a received the difference between the revenues of these places as an increase in income. Thereafter, Nihâwand was called Māh al-Başra and al-Dinawar Māh al-Kû/a. Nihâwand was also called Māh Dinār because in local Persian called Dinār arranged the terms of peace for it with Hudhay/a b. al-Yamān after the battle of Nihāwand.

Mah al-Başra was one of the districts (kuwar) of al-Diabal in Muslim administration, and is attested as a mint designation on post-reform dirhams from 79/698 to 83/702. Arabs had settled in this district by the and/8th century and Isa and Mackil, the and of Idris b. Isa al-Idill, who owned the father of Abu Muslim, lived in Mah al-Basra. In the ard/9th century the taxes of Mah al-Bassa were reckoned at a maximum of 4,800,000 dirkams. In 235/849so Mah al-Basra was assigned as katabic by al-Mutawakkil to his son al-Muntasir along with many other places. In 314/926, al-Muktadir assigned the taxes of Mih al-Başra and several other places to Yûsuf b. Abi 'l-Sadi for his provisions and to finance his campaign against the Karamita. In 324/936 Tähir al-Diffi tried to establish himself in Mah al-Başra, but was defeated and killed there by the Büyid amir 'Imad al-Dawla. Mab al-Basra is attested as a mint designation for both dirkams and dindes from 262/ 876 until 372/982-3. In the 3rd/9th and 4th/10th centuries Mah al-Basra is described as a fertile, lush, well-watered district producing dhurra, saffron, and fruit, with the best black clay for seal impressions. buildings of clay and two mosques.

MAR AL-KUPA [see DINAWAR].

MAHABAD, a town and district (sightrasidn) in the modern Iranian province (usidn) of West Adharbaydjan, situated in lat. 36° 45′ N. and long. 45° 43′ E. and lying to the south of Lake Urmia or Ridaliyya. The town comes within the Mukri region of Iranian Kurdistan, and acquired its present name in the time of Ridalish Pahlavi (1925-41). Previously, it — known as Savagi or Savdj-Bulak; accordingly, for the earlier history of the town, — sawng-aulaky. The present article deals with the post-1945 history of the town.

With a population of 16,000 in 1945, 20,332 in 2956 and 44,000 im 1976, increasing to over 50,000 by 1980, the town of Mahabad has attained importance from its geographical position in a fast-moving stream, but above all from its role in recent Kurdish history as an administrative, military and cultural centre. It boasts a purer Kurdish culture and an intenser Kurdish nationalist feeling than the larger centres of Ridabiyya to the north and Sanandadi -Sinua [q.vv.] to the south, both of which have significant non-Kurdish minorities. Nearly all Mehābādis are Sunni Muslim Kurds. Many speak Färsi and Adhart Turkish as well as the dominant Kurdish dialect which, along with that of Sulaymani Kurdish in 'Iraki Kurdistan, sets a literary standard for the language [see kurns, Language].

In 1946 Mahabaid became the capital of a shortlived autonomous Kurdish Republic under leadership of Kadi Muhammad and the armed protection of an 'Irald Kurd, Mulla Mustafa Barahal. This made possible by Mahabad's position between the wartime British and Soviet occupation zones and beyond the reach of the Iranian army. In 1942 a small group of Mahabadis formed a secret nationalist party, the Komala (Kurdish, "party" or "group", which maintained contact with Kurds in 'Irals and Turkey. Two years later, Mahabad's leading citizen and Islamic judge, Kadi Muhammad, joined and thereafter dominated the Komala, which in 1945 became the Democratic Party of Kurdistan (Hisbei Dimografei Kurdistan).

Initially, the Soviet Union supported the creation of a Kurdish entity within the Soviet-occupied Adharbāydjān Republic headed by Die far Pishavāri in Tabriz. Kurdish leaders, however, objected, and finally obtained Soviet acquiescence in the proclamation of a separate Kurdish Republic at Mahābād at 22 January 1946. The Kurdish administration under Rāḍi Muḥammad was composed of urban and relatively modernised Kurds of Mahābād town. A small army of about 1,400 was recruited in the immediate area, but the main force of the Republic was provided by some 12,000 tribesmen under their traditional leaders, the most formidable of whom was Mulla Muṣṭafā at the head of 1,200 armed Barzānīs from Iraq.

Although the new Republic included all the Kurdish areas bordering the Turkish and Iraki frontiers south of the USSR to the fringes of Sakiz and Banch, the Iranian province of "Kurdistan" further south, with Sanandadi as its capital, was still occupied by Iranian forces. An offensive was planned to take Sanandadi in June, but was abandoned Soviet advice. By that time, the Kurdish experiment had become enmeshed in competing regional and national interests typified by Soviet vacillation between support for Adharbaydian and Kurdish autonomies on the one hand and a desire to play a role in the central government in Tehran on the other.

Under international pressures, Soviet troops withdrew from Iranian Adharbaydian in May. Thereafter, negotiations between Tehran and Tahriz failed to produce an acceptable formula for regional autonomy. Iranian forces advanced and entered Tabriz on 11 December, A few days after, Kädl Muhammad and his associates surrendered Mahābād. After trial by a military court, the Kādī, his brother and his cousin were hanged in the main square of Mahabad 31 March 1947, Mullä Mustafä Barzani and more than 500 of his followers remained in the Kurdish mountains until June, and then fought their way north to sanctuary in the USSR. There they remained for it years until the coup of 1958 in 'Irak led by 'Abd al-Karim Kāsim [q.v.] led to an amnesty and their return to thrak.

After 1947, the central government regarded the potentially subversive and maintained a large military contingent in Mahābād until the early 1970s. Peace in the Kurdish areas was maintained through a mixture of military force and subsidies to selected tribal leaders. The policy of protecting the position of tribal leaders delayed the introduction of land reform, which began in other parts of fran in 1963, until 1970. When land reform did arrive, it reduced the economic power of the tribal leadership, and consequently their political influence. No active agricultural extension programme existed in the Kurdish areas until the middle 1970s, and economic conditions in Mahābād seem to have declined.

Beginning in 1970, Tehran began to put more emphasis = economic development in the Kurdish

areas. Mahābād's streets were paved, city water and lighting improved, an irrigation project began the the city and a modern road connecting Mahābād with Ridā'iyya and Sanandadi was completed.

In 1974 I truce between Mulia Mustafa Barzani and the 'Iraki government ended in renewed lighting. This time the Kurds received strong backing from Iran, and Mahābād became the unofficial rest area behind the front. Its streets were filled with Barzan's Pésh Merga fighters driving captured 'Iraki' vehicles, and the bazzar resounded I stories of free-spending Kurdish fighters. As the lighting intensified, Kurdish non-combetants from 'Iraki' increasingly sought refuge in camps in the Mahābād area.

The 1975 Algiers Agreement put a sudden end to the Kurdish was, and over 100,000 new refugees fled to join the 30-40,000 already in Iran (about 28,000 M these were in the area around Mahābād). Mullā Mustatā, his family and many of his tribesmen settled new Mahābād. By the end of 1975, most of the refugees had returned to "Irāk and the remainder (about 30,000) had been forced to leave the Kurdish areas of Iran and settle elsewhere in the country. Barzani was moved to Tehran, and eventually went to the United States where he died in 1970.

Colm returned to Mahābād until the beginning of the Iranian revolution in 1978, Initially, the city united to seek the ousting of the Shah. This unity, however, was quickly followed by strife between Kurds demanding greater autonomy and revolutionary guards supporting Khomeini (Khumayai). The most bitter fighting occurred in Sanandadi, but Mahabad again became the seat of the nationalist Kurdish movement. The city was captured by government forces in 1979, but was returned Kurdish control as part of a negotiated truce. The area remained chaotic with various groups manoeuvring for power, including the sons of Mulia Mustafa, idris and Mas'ud, and III 1980 iran-tirāk war added to the complexities as some Iranian troops were moved out m join the fighting in the south.

(W. EAGLETON and R. NEURANN) MAHĀBAT KHĀN, military leader Mughal India. Zamāna Beg (later known as Mahābat Khān) was the son of Ghayyur Beg Kāhuli, a Ridawl Sayyid, who migrated from Shiraz to Kabul during the reign of Akbar and settled there. Zamana Beg entered the service of Akbar's son Sallra as an ahadi (cavalry trooper) and rose to the rank of 500. After Djahångir's accession (October 1605) he was promoted to the rank of 2,000 and given the title of Mahābat Khān, becoming a trusted noble of that Emperor. He led a rather unsuccessful campaign against Mewar (1608), but rose nevertheless to the rank of 4,000/3,000 by 1610. In 1615 he was awarded de aspe sin aspe rank and was posted to the Deccan-Apparently unable to get with Shah Djahan, he was transferred and made governor of Kähul. When Shah Diahan rebelied in 1622, Mahabat Khan was called upon by Dahangir and the Empress Nur Diahan to command the imperial troops. He was awarded the highest possible rank for a noble, viz. 7,000/6,000. He pursued Shah Diahan to the Deccan, with a force under the titular command of Prince Parwiz and then marched the empire to eastern India in order to expel Shah Djahin from that region. He then returned with Parwiz to the Deccan. Although his enhanced power and prestige aroused much jealousy me the court, he was men appointed to Bengal. Provoked by certain demands for accounts and by the humiliation of his son-in-law, he suddenly carried out a coup (March 1626), capturing the person of Empero Diahangir, who now appointed him makil. His power, however, came to mend within three months. He fled and was on the run when Diahangir died (1627).

Mabābat Khān in the meantime made his peace with Shāh Djahān, who after his accession (January 1628) appointed Mahābat Khān governor of Adjmēr and then in the same year sent him to the Deccan as vicercy. In 1629 he was appointed governor of Dihli, and in 1632 again vicercy of the Deccan. Mahābat Khān won a signal success when he captured Dawlatābād in 1633, but lost much prestige when he falled before Parenda next year, being censured and recalled. He died in 1634 and was buried in Dihli at the Kadamgāh of Shāh-i Mardān.

Mahābat Khān considered himself opponent of both the dominant Irānī and Tūrānī factions in the Mughāl nobility; his troops consisted in a large part of Rādiputs. Though lacking a religious education, he was said to skilled a attronomy and astrology, and to have embraced Shī'ism in his old age. His eldest son Amān Allāh Husaynt (Khān Zamān) was also important commander; and another son, Labrāsp, rose to occupy high office under both Shāh Djahān and Awrangzib, enjoying the title of Mahābat Khān II.

(M. ATHAR ALI)

MAHALL (A., lit. "place of alighting, settling, abode"), in the context of Islamic India, widely used in the sense of "palace pavilion" or "hail", and more particularly of private apartments in the palace, the mahall-sará-hence also a queen or consort. It seems not to have achieved the same currency in Iran. Here it appears as equivalent to Hindl mandir, mandar or mandal, sometimes replacing these in areas under strong Muslim influence such as Rādiasthān. Much palace terminology is Persian, though specialised Hindl terms like tibdra for a hall with three adjacent bays = doors, and baradari for with twelve (3 each side) applied. to Muslim buildings, the latter figuratively as "summer house". Consideration of their architectural development entails a review of the palace layout in which they were set.

i. Dihli Sultanate. Though none of the Mamlük palaces have survived, Ibn Battūta [q.e.] has left a description of the Kushk-l La'l in Kil'a Ray Pithorà [see DBRL] as used by Sultan Dialal al-Din Khaldil (689-95/1290-6), comprising two great audience courtyards (maghaur) in sequence, with a closed building at the rear. In the first was immense vestibule (diklis), and both were overlooked by a domed pavilion (\$466a) near the gate, where the sultan sat to watch games (Rible, lii, 271). He writes of Muhammad E. Tughluk's new palace (seen ca, 1333-41), the Dar Sara - Djahan-panah, in similar terms, noting the platforms (or cells? dakākin) built on either side of the dillis for the guard, a platform in the second court for the masters of ceremonies, and room for the people to sit, and beyond the third gate a vast hall of private audience, the Hasar

Ustan, with painted timber column supporting a finely-carved roof. Each gate had provision for musicians = signal the arrival of dignitaries, and the third was controlled by clerks who registered entry (ibid., iii, 217-21). His use of maxhwar for both courts and the hall is ambiguous, but he later shows that the audience was covered by a great tent (bdega for P. bdegāh) at feetivals; at the Kushk-i La'l both courts could be covered by canopies (sayanan) (ibid., iii, 232, 235, 273). These successively more private areas, with formal guard posts in the first court, were to be essential features of Mughai palaces two centuries later, as were raised pavillons and tentage. Of Ghiyath al-Din Tughluk I's palace at Tughlukābād we learn that its tiles (firmīd) were gilded 🚃 📺 to shine in the sun (ibid., iii, 214). Reference to the hall flanking his tomb shows that masonry could be extensive, with sculpted chadidid eaves above the lintels, sturdy piliars, and cross-bracket capitals reproducing earlier Hindu ones in timber. Piruz Shah's description shows pictures and portraits to have decorated walls and doors. The remains of the palace of Firnz Shah (752-90/1351-88) in his killa (see bill, and J. A. Page's account, in Memoir ASI, Ili, Delhi 1937) confirm the description by Shams-i Sirādi 'Afff (Ta'rikh-i Firut-ghihi, kirm lv, mukaddama 4). The Maball-I Şahn-i Gilin was used for receiving dignitaries, the Mahall-i Chadidia-yi Cubin for court officials, and the Mahall-i Bar-i Amm for public audience. The sitting of this fort along the Djamna (q.v.) allowed the private apartments and the sandas to benefit from the cooler microclimate, the reflection and the view over the water. Its character can be inferred from the severe. utilitarian style typical of the reign, as seen at the Hawd-i Khāss [see DIRL!, 2] with pialn, battered towers flanking colonnades of double squared piers, vaulted cells, multiple brackets, and a roof line relieved by pyramidally booded roofs on projecting diharokhā balconies, or an occasional dome. It whitewashed for royal visits, presumably on stucco, and decorated with garden scenes (soid., iv. 5, and v, 2). The royal establishment extended to 36 harkķāna handling its material needs.

The form thus established followed an international convention, for an axial member is courts was used both in the Mongol palace at Khan Bally (Peking) and in the dominant Muslim models at Baghdād (145/762-3) and Sāmarrā (ca. 211/836) [q.vv.]. The latter had conspicuous limins and culminated in domed throne chamber, both notably absent in Hindustân, where they were replaced by trabeated columned halls derived from a long local tradition, through hypostyle palaces such as Cilla (8th-9th century A.D., ASI, xxi [1885], mff. and pl. v.) or the open verandahs of the Kökä'i Mahall at Ranod (cz. A.D., ASI, ii [1871], 303 ff.), which already show the characteristic squared columns, crossed bracket capitals, lattices (didli), merlons, and the eaves pent designed shade the interior and throw off monsoon water. Muslim buildings were to combine these elements with the use of arches and vaults (the first cross vault is found at Tughlukābād) and articulate such halls into an ensemble. The elimination of the dildis as audience hall, perhaps under Firus Shah, facilitated the integration, though it was still used in camp. The makall as a setting for elaborate court ceremony (Ibn Battūta, ili, 221-42) was distinct at this time from the hughk, a less formal pavillon, and the saray, or villa of a maish or shoyah.

ii. Dakhan. At Bidar [g.v.] the palace buildings enclosed in the south of the Fort represent the in-

fusion of a largely Tughlukid inheritance with direct franian influence in a gamut of formal structures that later evoked parallels in the North. Some of the Bahmani [q.v.] buildings - now disguised by Barld Shahi [q.v.] accretions, but most are attributed Ahmad Shah Wall (832/1429 for nine years). They are of stone, faced with stucco and tilework, with finely carved jambs and archivolts of bornblende; traces of timber columns show they were once painted and gilded, on square hornblende bases. The great ruined court identified as the Diwan-I 'Amm (Hall of Public Audience) is nearly square, the southern three-quarters paved for privileged access, with entry from east and west, and a hall placed centrally to the south seven bays wide by three deep, the middle bay being wider; this has a range of private rooms along the rear, and access to raised diahrokhas facing the yard, probably for ministerial interview, at each end. The court was colonnaded, with moctagonal pool, fountains, and rascade; the upper storey of the half opened through rhythmically spaced arches filled with terracotta didli work. Tilework on the dadoes was mainly blue, with polychrome floral designs of Timurid character, as at Gazur Gah (828/2425) on square units [see Right] (cf. G. Vazdani, Bider, Oxford 1947, 52-6 and pl. xxiii-xxx). An intermediate court, or plangth, immediately to the north, with a multi-domed annexe, leads west into a third, inscribed as the Kasr-i Sultan, perhaps a hall of private audience, now known as the Takht Mahall after the turquoise throne really housed in the public hall (ibid., 6, and 66-77, pls. xxxi-xlii). Here too a loggia faced north across the yard above long steps, only three bays wide by two deep, but with wider spans at 5.03 m/16'6". The broad central bay led to a magnificent octagonal royal half, once domed 30.50 m/100' above the floor, on the caliphal model. Painted in vermillon and gold, it had Hindu niches, and fine tiling, in relief, and a little in mosaic, framed by the massive arches. A varied but symmetrical complex of rooms around the court includes a maidfid [q.v.] opening through three bays on the west side, and another octagon north of it behind an arcuate pightale. The royal hall opens westward to a private court with a tank, alcoves, a libāra hall (bedroom?) and an elaborate hammam [q.v.] on two levels. Most of the spaces are linked axially, and long _____ flanked by service spaces or contrasting, smaller rooms; the surfaces - carefully articulated with -

An east-west axis links these to another series of courtyards, the main halls invariably facing northwards. The largest, the La I Bagh, runs porth and south, with baths to the north, the Diamie Masdid along the west, and the three storeys of the Tarkesh Mahali . the south, notable for panels of carved stucco (shid., 57-9, pls. xlx-xxi) and multiple niches. In the Gagan Mahall, two courts are set side-by-side, and the halls are partially emin the masonry of the ramparts, with ranger of plastered vaults (ibid., 60-2, pl. xxii). In a cluster of small but exquisite rooms rebuilt by 'All Barid (949-87/1542-79) = the Rangin Mahail, a loggia of three bays by two is prolonged by two enclosed bays at each end, and the roof is still upheld by squared timber pillars with tiered capitals in Hindu style, and deep brackets with pendant Hindu bosses at each step, but with arabesques carved on the sides and an early cusped arch where they meet. On the central axis, an arch of black stone inlaid with mother-of-pearl leads through a square retiring rooms behind loggias, the use of octagonal tower rooms, and the integration of water and architecture was to reappear in Shahdjahan's schemes, perhaps following his successes in the Dakhan of 1030/1620-30. The use of evocative names became e convention among the rival rulers, attested in contemporary records The Gagan Mahallat Bidiapur(e.o.] (008/2561) is an audience hall of a new but related type. An arched libers hall open to the north, once with two timber columns framing the wide central bay, is flanked by narrower rooms of the same depth, and stoirs in the length of the rear wall led to a similar upper storey. In front of these rises a half of double height opening through three immense arches; the central one spanning the full width of

the fibdes, 50'9"/18.5 m, provides a dramatic setting

for the king in state, while those at the ends, the

same height, effectively limit the composition (see

Cousens, in ASI, NIS zxxvii [1916], pl. xvi-zvii).

Ibrahlm Il 'Adil Shah adapted the form for his

audience hall (1000/1501), now the Athar Mahall,

doubling the end rooms, adding a long half with

end galleries behind, and substituting four slender

octagonal timber coherans for the arches, reflected

in a pool in markedly Iranian style (ibid., pl. lxxvii-

luxx). This in turn was developed in Mahisur [q.v.].

The Sat Manzil (cs. 994/1385-6), an arched tower

tiled auteroom to a star-shaped chamber inscribed

as a shiih-nishin (royal seat) un hhairmi-gih (cabinet),

with a cusped basin, and a semi-octagonal exedra

projecting through the bastion. Such placing of

of five (ric) diminishing storeys, houses pools with small service rooms, an attractive environment behind wooden trellises (ibid., pls. xxvi, xxx-xxxiii). iii. Malwa. The surviving 9th/15th century buildings at Māndū (q.v.), formerly Shādlābād, reflect Tughluk influence, but in a distinctly local manner; their dating remains uncertain. The plainness of fine ashlar surfaces, the proportions, and careful placing of openings within the mass, generate robust and remarkably direct architecture ennobled by its restraint. It thus stands apart from the Hindu tradition, while owing it certain features. The great nim of the fort allows the advantage of naturally beautiful sites. The Diahaz Mahali, extending 122 m down a causeway between two lakes, presents range of arched openings to the path, overshadowed by a long chadidia halfway up the façade, and a register of blind arches above with a tiled parapet; as at Gwallyar (q.v.), this suggests two storeys when in fact it conceals vaulting over the series of spacious halls inside, each with six domes afternately carved in lotus corollae. The pavilious ranged deftly along the skyline are tiblicas, with pyramidally hipped Indian vaults, read from the lake as crowning massive towers broken forward from the front. Water is tanked at three levels, twice in pools with graciously curved stepped verges. More typically Muslim are the extensive use of pointed arches, the three long, open halls linked by lobbies in between, and their symmetry about a central entry. The grouping of forms on the skyline is Islamic in its aplorab. A local and successful element in the use of long flights of stops to enhance the massing The building was plastered, and set off with blue and yellow tiles. The effect now is calm, but full

of entertaining variety (see G. Yazdani, Mande, the

is by contrast serious, but superbly accomplished.

The walls of its T-shaped mass are emphasised by

The darbor hall nearby, the Hindola Wahall,

City of Joy, Oxford 1929, 63-8).

carrying cross walls; whether the fallen roof flat or, as Creswell suggested, vaulted like the Khan al-Mardian at Baghdad (Indian Antiquary, xivii [1978], 169 ff.), the conception of the audience hall in a closed volume is new. The transverse arm in two stories (integral, rather than an addition as Brown proposed) has a three-aisled hall in one wing above, with fine dikarôkhās (one to the hall below), and an exist entry beneath (Yazdani, op. cit., 70-3). A similar but larger hall, "Gadā Shāh's Shop", ascribed to Mahmud II (926-37/2510-31), is also roofless, but bears traces of triple longitudinal vaults. A third example is at Warangal [q.v.] in the Dakhan, attributed to Shitab Khan ca. 905/1500 (Annual Repoet, Hyderabad Archaeological Dept. 1925-6, 21-22), The Kushk Mahali at Fathabad Canderl, identified as the seven-storied palace built se, 849/1445 by Mahmud I, has comparable transverse arches spanning two tall galleries which cross at right angles, dividing the square plan into four equal halls that open onto the galleries through three tiers of arcades, rather than the outside: a device for procuring shade and cooler air. The Palace of Nasir Shah (only, Baz Bahadur) at Mandu, dated 914/1508-9, is more orthodox with three courtyards, a lateral one for entry and two square ones on axis, their rooms set symmetrically behind areades with the didition overhead; in the larger, the alternately broad and narrow spans of a gallery are reflected in a pool, while overlooking a garden far below from a polygonal marble diarokkā projecting at the centre (Yaadani, op. cit., iv. Gudiarat. In this rival kingdom, the palace at Sarkhēdi was also built along the stepped margins of me insmease tank by Mahmud I Begra (861-917/1458-1511). The buildings mm essentially trabeate, their colonnades united by the chadidid line. In the best preserved, the colonnade at ground level is matched by www below, with a single bay broken forward as a belvedere facing the water towards either end; the upper level, only one bay deep, opens through onto a courtyard flanked by blank walls. The structure w enlivened by subtle details, largely derived from Hindu prototypes, and an evident delight in building. Arches appear in a secondary role, as infilling in the belvederes, where the spandrels were once fretted. Open biredaris of 16 or 24 pillars and a hemispherical dome over each bay

a very pronounced batter, and pierced so deeply

by a range of recessed arches rising the full height

that the masonry between reads as raiding but-

tresses. The single half is spanned by six arches

in the palace of Cibil Sutua built at Diawapur (q.v. for illustration) by Firuz Shah's governor, where the square building surrounded by a verandah rises to a terrace carrying a large chairs whose ridged vanit has gently curving hips. A bdradari attributed to Sikandar Lödi at Sikandra (900) 1495) (ASI, OS, iv [1871-2], 99; cf. ARASI [1910-11], 94-6) may form the basis of the forab of Maryam al-Zamání (d. 1032/1623): square in plan, it is ventilated by four corridors crossing at right angles to form nine blocks of rooms, with a central entry on each face, and a flat roof over cross vaults, domes, and barrel vaults. vi. Mughal. Buildings from Humayûn's reign

also rely on systems of lintels. At Campaner (q.v.), Mahmod built another palace of seven stories

(post-889/1484), the Sat Manuil, in steps on

v. The emergence of other forms may be glimpsed

the edge of a chiff; only the lower level remains.

(937-47/1530-40) are described by Kh*andamir (Künün-i Humäyüni, ed. M. Hidayat Hosain, Calcutta 1940, Bibl. Ind. . 260, 63-4, 68, 78) . . series of innovations, mostly incorporating astrological symbolism and a preoccupation with polygonal forms no doubt related to the Timbrid tradition. A portable timber palace in three stories, the Kaşr-i Rawan, used at Agra and Gwaliyar in 940/1533. hexagonal and was elaborately painted in a different colour each side. He constructed a palace inside the Lodi fort m Agra [q.v.] and a Dawiat-khana-yi Tiliam = the bank of the Djamma, built around a central octagonal reception hall with a sunken tank, flooded m will, and a central platform (cf. Gulbadan Begam, The history of Humdyun, ed. and tr. A. Beveridge, London 1902, text 31-4, tr. 116-24). A smaller octagon adjoined the north, with alcoves, and the diadn-khdna the west, facing the kibla [q.v.], with garden to the east. Above these were a further three rooms (bālā-kāāna); the Khāna-yi Dawlat containing the ninefold Cingizid panoply, the Khanayi Sa'adat for prayer, books and portfolios, and the Khana-yi Murad with a jewelled bedstead. There was also a forecourt, plat-gah, where a throne could be set. Remarkably, internal stairs assumed = architectural importance until the end of the 18th century.

The one remaining building from the citadal of Purānā Kilfa, (see punt. 2] begun by Humāyān but finished by Shēr Shāh, is perhaps in the same tradition, as a two-storeyed octagon of sandstone crowned by m kiosk, about 16 m tall, the Shēr Mandal. The space inside rises as one volume, painted with coloured designs, punctuated by a gallery. It was used as a library and observatory.

A Mughal view of Indigenous building may be found in Babur's comment (935/1528) on the Palace of Man Singh (1486-1516) at Gwaliyar [q.v.] Fort, that it was wonderful, but "solidly subdivided and without regularity" compared II Timfrid models (Babar-ndma, ed. A. Beveridge, Leiden and London 1905, (ol. 340 ft.). Such over-compactness and lack of axial development were to be corrected.

vii. Akbar (963-1014/1556-1505 [q.v.]) initiated a prolific programme of palace building when he was twenty-two. The camp, in which the court spent much time (see MANZIL) can M taken as an idealised palace plan, to modified according to the site, but not achieved in solid form until the reign of Shahdjahan. As described by Abu 'l-Fadl (A'ln-1 Akbari, i, d'in \$5-18), the royal precinct was a rectangle accessible from the western end, where a great forecourt, flanked by stables and a records office (daftar-hhāna). led up to a rectangle roped off for the court of public audience (diwin-khāna-yi 'āmm); beyond this a private audience hall (damlat-khāna-yi khāşş) within its own enclosed court, and then another court (make (401) where the Emperor received his closest courtiers in the evening. Still further east, beyond a small guard court, lay the women's quarters (shabistan-i ikbal) with private dwellings, a hall, and a twostoried wooden oratory from which he received the acclaim of the people each morning in darshan. All lay on one axis, with a drum house (nakar-khāna) far the approach. Both camp and palace were a setting for strict routine of ceremony and administration observed daily (see A'in, i, nos. 72-4; Ibn Hasan, The central structure of the Mughal empire, Oxford 1936, 63 ff.; Sir J. Sarkar, Mughal administration, Calcutta 1935, 19-21).

Akbar's first palace at Agra [q.v.], the hunting lodge at Nagar Cayn near Kakrall, was started

in 1564. From 972/1564-5 to 980/1572-3 Ågra Fort was rebuilt as Akbarābād, in red sandstona in place of the crumbling Lodf brickwork; the massive ashlar was to characterise future Mughal work (see sungs, iii, 4l. In this case, the optimum position along the eastern parapet overlooking the Djamna and the main approach from the Dibli Gate in the west allowed the lavoured axis, modified by extension along the river. There were "more than 500 buildings of masonry, after the beautiful designs of Bengal and Gudjarat" (A is, tr. ii, by H. S. Jarrett, Calcutta 1891, 180), and in 1626 Pelsaert confirms that it was built over like a city with streets and shops, princely buildings and residences, with mahalls for the ladies (ed. W. H. Moreland and P. Geyl as Jahangir's India, repr. Delhi 1972, 3-4) leaving little room. This aesthetic eclecticism, consistent with the policy of sulf-i kull ("universal toleration") must have profited from influx of craftsmen from both regions, then disrupted, and from Gwaliyar, recaptured in 965/1558. The synthesis is evident in the two buildings, known as the Diahangiri Mahall and the Akbarl Mahall (such names in India are unreliable) remaining from Akbar's private apartments, which seem to have extended to the Muthamman Burdi corner in a symmetrical group. Pelsaert (loc. cit.) mentions the makall of the Queen Mother, three others, and a Bangali Mahall, with which one of these may be identified; if so, it was built before 977/1569 (see R. Froude Tucker, in ASIAR [1907-8], 8-22, but cf. Sit J. Marshall in ASIAR [1902-3]. 62, and Nur Bakhsh in ASIAR [1903-4], 169-71). The trabeated "Akbart Mahall" ran in two stories round a square courtyard with flat roofs; a hall was set III the centre III three sides with an axila entry on the west; in the riverside tibára, windows overlooking the water corresponded to doorways onto the courtyard, a scheme much used subsequently. The gridded exterior with blind niches is Bongall in character, like that of the Dihli Gate. This closed format is repeated in the "Diahängirl Maball" where many features of scale, construction and decoration show derivation from Gwaliyar, though the vigorous Hindu style is blended with Islamic arches on the upper floor, and lightened by *instri*s and latticed balustrades; the interior is remarkable for dramatic brackets supporting the ceiling. The buildings east of this court me in a markedly more Iranian style, dominated by fourcentred arches and alcoves, with slender columns to the portico; this elegance, and that of the entrance façade, resembles work of the early 1560s at Dibli (the formal grouping of fudus around a waterside terrace was reiterated at Mandu around the NII-kanth shrine dated 982/2574-5). On the Shah Burdi was a small pavilion, uniquely of marble.

Work on the Fort at Lähawr [q.v.], in burnt brick, is recorded in 974/1566, and Akbar's hall of public audience (danial-hhdna-vi 'inms) was in use by 996/1587, with an open rectangular court-yard of 114 bays, as confirmed in a plan of the Sikh period. Its raised diharchha, from which the King held audience, survives as a projection from m former bracketed colonnade (cf. scenes in the Pddydh-nama in the Royal Library, Windsor, set in Agra, showing a very similar arrangement; see m Gray (cd.), The arts of India, Oxford 1981, fig. 127). The courtyard subsequently built by Djahangir immediately north of this, probably for private audience, completed this axial scheme m to the river Räwl; the private apartments were to extend from there westward.

The most extensive palage remaining from Akbar's

reign, at Fathpur Sikri [q.v.], was officially founded in 979/2571, and it seems that most of the work, all in red candstone, was finished within a year. The trabeation allowed the prefabricated panelled technique essential to such rapid erection, and the stone was, as claimed, "wrought with the ease of turning wood" in traditional Indian techniques apparently derived from Bayana not far away (fieldwork by M. Shokoohy, 1981). The site on a ridge running northeast and southwest requires a layout in a series of steps to the south, culminating in the great mosque at the western (i.e. hibla) end near the house, khanebah, and masdiid of Shaykh Sallm Cishtl. Nearby, the oldest royal building, the Rang Mahall (976/1568-9) is traditional in its introverted courtyard plan, with colonnades in two storeys, but the fusion of Islamic IIII Hindu detail is experimental. The saint's bouse (971/1563-4?) initiates a pastiche resumed in the main buildings; its stonework a carved in imitation of a framed but with cabled angle shafts, perhaps as used in camp. The Diwan-khana-yi 'Amm, placed at the north of the ridge has a trabeate colonnade of 111 bays with a deep thadidid all round, and the royal diharokha is expanded in a pavillon of five bays broken forward into the court on a podium, with a hipped roof and tine dialis. Its surprisingly modest scale is typical of the whole palace, where imaginative massing and exquisite carving achieve delight rather than grandeur. The organisation of the remainder of the palace, now weakened by the absence of the courtyard walls, must have been informal, with frequent tack of symmetry, overlapping masses, and halfclosed spaces, and an intentness on individual buildings which suggest that the architects as well as the craftsmen worked in a Hindu tradition (cf. Kumbha Rānā's palace at Citawr Fort, taken in 975/1568). The purpose of several buildings is uncertain, and their fanciful names are best used for reference alone. The "Ankh Mičawil" is a tibdea flanked by two wings, themselves tibdras turned outwards, offering three aspects with double walls for insulation, and with the central roof strutted as at Agra. The "Diwan-i Khāss", a tour-square building, contains a single column supporting a circular estrade on astonishing radial brackets, joined to a peripheral balcony by catwalks: an embodiment of the axis mundi carrying the seat of the lakravarish m world ruler. A group of buildings around the Anap Tail'd, a square tank with a cobserd platform, may be compared with the camp maktābi; the colonnaded "Khāṣṣ Maḥall" with Its mezzanine is broken forward as at Sarkhedi, and the shah-mishin above is a baradari whose verandah is carefully articulated to the mass by alternately wide and narrow bays, under a roof carved to simulate tiles. A room with a raised throne platform has a dikarökkä-yi darskan in the rear overlooking the records office courtyard to the south (Rizvi and Flynn, op. cit., 24-40). The Daftar-khana there is the first surviving statement of the classical Muchal pavilion form. A low podium carries a rectangular tibara surrounded on three sides by broad chadidids over a colonnade of tall paired columns (outer and inner), grouped in fours to turn the corner; a wider bay accents the corner. The front doorways with arched, latticed lunettes are matched by a triad of windows at the back. The usual coved vault carries a flat roof terrace over the whole (ibid., 41-2). The principal Haram Saray, larger than those at Agra, develops the courtyard plan on a single storey, the taller hall on each face rising through it, advanced between walls housing stairs to an upper storey, vaulted in keel form; two are roofed with azure tiles from Multan [q.v.]. A "Panc Mahall" of four diminishing rectangular floors topped by a that's forms a set of well ventilated platforms, whose screens were destroyed in 1869-72 (ibid., 46-53). Broad expanses of paving set off these buildings throughout, and atone rings for ropes on parapets and at ground level. The awnings for festivals of velvet, gold brocade, and gold embroidery. The sand-sone was picked in colour, the effect of which can still be seen in the "Nadán Mahall" at Lakhnaw [q.v.].

The Fort at Adimer [q.v.], 978-81/2570-3, displays much stronger franian influence in a highly coherent, symmetrical plan. A strictly rectangular enclosure with a great octagonal bastion at each corner, and a single polygonal gateway broken out on the south, contains one building at the centre. This has a tall, three-bayed Iwan on all four faces, with paired square pillars supporting the chadicia and ceiling beams on cross brackets. Four square rooms fill the corners in two stories. The central space, which may have served for audience, is bridged by the upper storey; the lack of division between mardana and sanana is puzzling. The proportions are Persian, enhanced by panelling of the yellow brown Khattu limestone with simple pointed arches, whose archivolts are in the style of Malwa or Khandesh, while the interior had tilework chased into geometric friezes.

At Allahabad (q.v.), in the fort founded 991/1583, only a biraduri, the "Zanana Palace", has survived. A peristyle of double columns surrounds a central ball, and the terraced roof is set off by latticed kiosks.

viii. The buildings of Diahangir [q.r.] at Agra have been obliterated. His diharokhá-yı darshan iz described mear the Shah Burdi [later Muthamman Burdi), where he had marble halls built on three sides of Akbar's pavilion. The court of public audience was customarily divided by railings into three areas: that nearest the throne for the nobility. the next three steps lower for lesser officials, and the remainder for retainers. In his eighth year he introduced silver casings for the inner rails, the outer remained red. (A description cited by Nür Bakhsh, in ASIAR (1903-4), 171, is based on a spurious ms.) His courtyard at Lahawr [q.v. for plan], completed by Ma'mur Khan in 1027/1617-18, is defined east and west by two ranges of single-storeyed libara halls two and three aisles deep, alternating with smaller rooms; their tall porticoes recall those of Adjmer. A pavilion to the north, perhaps contemporary, is also a three-bayed half, flanked by two turned outwards as at Fathpur, though with an arched verandah in front. The garden, centred on a square tank with fountains, introduces another element of the classical palace plan. This court was probably the private audience hall, then known as the Ghuslkhāna (bathroom) through me accident of nomenclature explained by 'Abd al-Hamld Lahawri (Pādehāk-nāma, i, 148); there is a bath just to the west.

ix. In the reign of Shahdiabān [q.v.], Aldent's dibarohhd for public audience and the old private audience hall at Agra were pulled down: "all abominations escaped into non-existence, and lovely things reached the zenith of perfection" (ibid., i/z. 236). If, as it seems, the replacements were built in the same sites, then the old private hall lay against the riverside wall ranged with the private apartments, with the public one in front,

MAHALL

at I Lähawr. The latter was approached from the Dihit Gate down the Mina Bazar with its rows of shops and square fahar suk, and entered from the north on the cross axis by the Akbari Darwaza. The Amar Singh Gate to the south primarily for the private apartments, like the Häthi Pôl at Labawr.

Shahdlahan adjusted this layout. In his first year (1037/1628), he had ordered halls of forty columns (číkií sután) at Ágra, Lähawr and Burhânpur [q.v.] to protect his nobles at public audience instead of the tents used previously. As that at Burhanpur is ruined, and that at Lahawr only roughly reconstructed, the hall (foods) at Agra, renamed the Dawlat-khāna-yi Khāss u 'Amm, is the remaining prototype for his court buildings, which thenceforward follow its format as arched, hypostyle loggia, rectangular in plan and set on a podium, with a flat roof, chadidia, and chabis at the corners. The work, in red sandstone dressed with polished marble stucco, and with details picked out in gold, is strikingly different from its forerunners. It retains such features as doubled peripheral columns, quadrupled at the corners, and dodecagonal shafts with linked mudarnes capitals and pyramidal bases. The innovations are the preference for a marble surface, the "structural" use of casped arches in tall framed spandrels, the medium height of the columns, and m consonance of curvilinear detail; the construction is actually still trabeate. Here the hall, nine bays by three, is open on three sides, and arcades on both axes intersect to support coved roof panels. A central, raised 4jkarokha opens through three rounded trefoil arches in the rear wall, its marble intricately inlaid with pietra dura (parclm-karl [q.v.]). The great courtyard is surrounded with an areade of simpler cusped arches. The silver rail now fenced the loggia, and the red rail was of stone

The courtyard of the Dawlat-khana-yi Khass. dated 1045/1635, is confined on three sides by two storeys of cusped areades serving rooms for the treasury; the upper floor continues as an open riverside terrace to the east, and the audience hall is now turned at right angles to face down this, with its back to the private apartments. It has no internal columns, being smaller, and backs to an inner hall (Jambi-Alana) through three pointed arches. This has a great alcove (shak-mishin) at either end. The marble of both spaces in panelled above florally carved dadoes, matched by floral dialis in arched clerestories, and netted coving surrounds cellings once plated in gilded silver leaf. The was used at night; baths [see HANNAN] at its end were set with glass mosaic. Just behind hall, the Shah Burdi bastion was rebuilt with an octagonal vaulted chamber in two storeys, the Muhamman Burdi, used for conference with ministers. Below, a balcony surrounds a central apsed cell which opens on the landward side to a matching tibles with a foliate pool facing a terrace screened by exquisite arched didlis; above is chairl with a gilded dome. Beneath the audience half is a tak-khana, the Shish Mahall, of two rooms in glass mosale with a cascade and running water; a cool and gently lit sardab [q.v.].

Immediately south of this complex is an extenion of the riverside terrace carrying the Aramgah (bedchamber), built in the same idiom but with piers instead of columns. In front is a pool with boldly sculpted trefoil margins, and on either tide, a flawlessly simple screen, behind which is a tibuse pavilion with the high arched, ridged roof derived from Bengal, stopped by a hipped dome at each end, and glided. The northern one, in marble, was the Bangla-yi Darshan, which replaced the earlier dimerchal tollowed by a bangla tent on the site. These symmetrical but contrasting masses formed a new type of composition; they face a car bagh below with its original parteres, surrounded by the harem quarters in two stories, served by a balcony, and with a tibdea meach axis. The new aesthetic included three mosques of appropriate sizes for the two audience halls and the court.

At Lahawr Fort [q.v. for plan], Shabdinhan's buildings were coeval with those at Agra, beginning with a very similar Cihil Sutun. The suite of private apartments set within the great Shah Burdi, co. 131740 m across internally, completed in 1041/1631; it is more accomplished in the Iranian linkages of its planning than in elevation, where it is unresolved. The small fambi-bland is flanked by demed octagonal rooms leading to semi-octagons with apses filling the angles (plan in E. La Roche, op. ch., v. 202). The bangle "Nawlakha" to one side of the court, a lamidia with eaves curved on both axes, is possibly the first of we geare (internal work above the dado is Sikh work). The toyal bedchamber (kh = abgah) lay behind = range of shallow rooms faring the Burdi (Padshdh-ndma, i, 223-5). Eastward of this group, along the river front, are three further courts: one opening to the entrance yard, Comk-i dyörki and the Hathi Pol, one marked Khilwat-khana on the Sikh map (not Khil'at as cited by Vogel) which may have been harem quarters. with baths, a small mosque, and a small marble banglit on the parapet dated ross/1645, and one with ranges grouped around a car bagh including the Chôff Kh "abgan believed to be one of the buildings for kh "abgah and ghusi-khana (see viil. above) ordered in 1043/1633-4 ("Amal-i Salih, cited by Nur Bakhsh, op. cu., 1902, 223-4). Djahangir's court ends the row, thus reversing the Agra plan. At Adjmer, the five white marble pavilions along the margin of the Ana Sagar lake (1047/1637) show the idea of the waterside terrace at its most perfect, as the climax of the Dawlat Bazh; the new style is at its most precise, though the column groupings recall Fathpur Sikri. The prominent Hindu brackets are found too in the black marble pavilion carried out by Zafar Khan at Shalamar (formerly Faydbakhsh) in Kashmir in 1039/1630 [see Bustan].

The Lal Kilfa at Dibil (q.v. for plan and details), being founded de novo in 1048/1638, allowed free development of a riverside palace within the walled format of a rectangle set along the Djamna to the east. The main approach axis from the Lahawr Gate in the west passes through a long, vaulted bazaar street with an open octagonal court, of Iranian pattern, III II great square guard court, with a tank at its centre and a nambat-hidna over a triple gate at the far side. This led to the still targer courtyard, a rectangle set athwart this axis, and surrounded by arcades (fusin) of separate cells for the umara?, serving the Dawlat-khana-yi Khass Amm opposite. Neither court is extant. The north and south sides of the guard court received the transverse axis of an open arcaded street, with meanal, running from the southern Dihl! Gate. Beyond the audience ball, the main axis ended in a third court in front of the Imtiyaz Mahall (Rang Mahali) 🚃 🛊 riverside terrace, the first of a line of harera buildings extending south along the cross axis of the Nahr-i Bihisht canal, once fronting garden courts that provided privacy and accommodation. To the north, however, a group of administrative buildings was inserted on the terrace, offset III the left of the main axis, behind their own courts, an arrangement probably intended to combine the advantages of III microclimate with easier access for the emperor to both hails.

The new building types are elaborated. The public audience hall in red sandstone, once plastered, still has the nominal forty columns, but the detail more florid; a raised giharokhā recess under a round arch has a (later?) lawfala of marble advanced forwards. The Imtivaz Mahall has three ainles of intersecting cusped arches on cruciform piers; the canal runs down the centre between vaulted rooms the corners, which form visual stops, In the Shah Mahail (now Diwan-I Khāsa), also piered, the canal is marked by the insertion of narrower and lower bays in the end elevations of the ball and its matching peristyle; the peacock throne was once housed here. The Khass Maball (dated 1058/ 1648), comprising private apartments (Kh sabgah) linked to the Mathamman Burdi, faces each of these with a corresponding elevation. The later Mughal style is represented in the Shah Burdi pavilion, with baluster columns, depressed arches, and an upward arch of the chadidia over the centre bay (see plan in Reuther, op. cit., pl. 60).

z. Further elaboration of these elements can be seen in the Rādipūt work at Ambēr under the direct influence of Agra and Dibli, and in the Diat palaces of Dig (ca. 1725) near Bharatpur. The transition to the frivolities of later Mughal palaces is marked by the Kudaiyya Bagh at Dihli, built for the mother of Ahmad Shah (1161-7/1748-54), of which fragments remain (cf. a print by T. Daniell, Oriental scenery, London 1795, i, 3). It was built rapidly from brick and plaster, with applied stucco ornament; the river elevation is in two storeys of arcading, blind below, and with balustered openings on to her apartments above. Octagonal towers at each corner are fully latticed above, with oriels set on lotus calvees, and capped by bulbous semidomes with vestigial boneld eaves; these and other features form the vocabulary of subsequent domestic architecture at Lakhnaw [q.v.]. The tradition was to continue with greater vigour in the gradual accretions of Rådipüt palaces, and in Sikh buildings, until the

present century.

Tucker, in ibid. (1902-3), 81-4. For the Kudsiyya Bagh, - H. Goetz, The Qudsia Bagh at Delhi, in IC, xxvifx (1952), 132-52. For the camp plan, and details of Mughal palace tentage, see P. A. Andrews, The fell tent in Middle Aria, unpublished Ph.D. thesis, London 1980, 533 ff. etc. For stylistic development, (P. A. ANDREWS) see MUCHALS, Architecture.

MAHALLA (a.), a noun of place from the verb balla, which means notably "to untis (a knot, luggage, etc.)", and by extension, "to make a halt", whence the meaning of "a place where one makes a halt, where one settles (for a longer or shorter time)".

This term constitutes the first element of names of towns or villages in Egypt, where a hundred places were designated by an expression formed from Mahalla followed by an adjective or a proper noun; 'All Pasha Mubarak cites more than thirty of them in al-Khitat al-djadida (xv, zi ft.), apart from the city of al-Mahalla al-Kubrā (q.v.).

Mahalla also took me the meaning of a "quarter of a town" [see manima], especially in Turkish [see mathalla], Persian and Urdu. Dozy [Suppl. s.v.] even sees in the name of the Jewish quarter of the towns of North Africa, the malide, a metathesis of

makalla (but cf. KALLAH).

Furthermore, the original meaning of "a place where one makes a halt" was preserved in the Maghrib (with a pl. amiel) to designate a movable camp, then, by extension, the troops 🚥 campaign within the territory at least nominally dependent on the sovereign who commands them or entrusts the command to the beir apparent, another member of the family or, exceptionally, to a confirmed war commander. This change in the meaning appears quite early, since it was attested under the Hafsids (see R. Brunschvig, Hafsides, ii, 90) in Tunisia, where, as in Morocco, before the institution of the protectorate, expeditions so-named were organised periodically. In Tunisia, the mahalla (in French, metalls) was principally formed from auxiliaries levied more or less easily among the tribes; I used to leave the capital following a coremony of which we possess were detailed descriptions (see e.g. V. Serres and M. Lasram, in RT [1895], 333; Ibn Abl Dinar, Mu'wis, Tunis 1967, 303), and it was MAHALL PLATE LVIII

generally received with marks of honour by the subject tribes who, moreover, hated to me it strike camp, for it me they who had to provision the troops

on campaign.

The mahalla constituted an instrument of government. It performed in effect a triple function: to consolidate the authority of the sovereign over the provinces, to ensure the levying of taxes | to suppress rebellions or the insubordination of local chiefs. In the ordinary way, it performed a simple route march, but the collection of taxes sometimes proved difficult and necessitated more than a simple demonstration of force; when the launching of a makalla had been provoked by the agitation of a tribe, it was settled on its territory, from which it put pressure on the population; finally, when serious troubles broke out, real war operations had to be mounted against the rebels, in for example in 1864 (see Kh. Chater, Insurrection et répression dans la Tunisie du XIX * siècle: la Méhalla de Zarrouk au Sahel (1864), Tunis 1978).

In Morocco, the makallas performed almost the same functions as in Tunisia, with this difference, however, that a good part of the territory totally escaped the authority of the sultan, who was furthermore constrained in organising one since, from Fez or Meknes, he used to make his way to his southern

capital, Marrakesh, via Rabat.

In a general (ashion, the Moroccan makalla comprised elements of the three corps of the regular army [see <u>Diaysh</u>], to which were added some contingents designated by the name of barks (haraks) and supplied by tribes subject to the sultan. The latter formed the vanguard (or the rearguard where an attack on the rear was repulsed) and explored the terrain, spreading out over a wide area; then came the regular troops charged with protecting the soversign (who rode under a parasol) and his entourage, who preceded the standards and musicians.

At its resting place the camp contained in its centre the tents of the Sultan, his wives and eunuchs, surrounded by a linen screen, which, in Tunisia, bore the Berber name afrag (transcribed as afrag [q.v.]). Outside this enclosure were placed the ministers, secretaries, musicians, around whom the troops formed a square; within this apparatus, wandering merchants established a market, where all kinds of articles and foodstuffs were to be found. for provisioning was not ensured by regular supervision; it was the tribes who had to supply what was called the muna (mu'na), i.e. the provisioning, and it was not uncommon for this to be insufficient. in spite of the sacrifices of the populations subject to this obligation, which often reduced them to misery. Nevertheless, some of them preferred to remain dissident, at the risk of possibly seeing a makalla settle on their territory and help itself to their flocks and cereal resources without pity.

Most of the Europeans who visited Morocco before the Protectorate had occasion to describe a majalla, in particular the one mounted to suppress the rebellion of Hmåra [q.v.], but the richest source with reference to this is the work of Dr. L. Acnaud, An temps das "Mekallas", IHEM, Notes et Documents, fasc. no. xii, Cadablanca 1952.

(CH. PELLAT)
AL-MAHALLA AL-KUBRÂ III MAHALLA KAFR
is the modern name of an important town in
the Delta of the Nike at some distance to the
west of the Damietta arm, north-east of Tanta. It

lies on the Tur'at al-Milâh canal, m branch of the Bahr Shibin.

In view of the large number of Egyptian geographical names compounded with Mahalla (see these listed in Muhammad Ramzi, al-Kamus al-diughraff li 'l-bildd al-Misriyya, Cairo 1953-68, i, 404-9), the identification of the town with the names mentioned by earlier Arabic writers is a matter of some difficulty. Maspero and Wiet identify it with the Coptic Tishairi (Amélinau, La géographie de l'Égypte à l'époque cepte, Paris 1893, 262), but this identification is rendered doubtful by the fact that al-Mahalia is a purely Arabic name (and it also remains to be proved that it is a rendering of the Coptic mame just mentioned), and because the work of Abû Sâlih on the Christian buildings of Egypt makes no mention of this town. The earliest author who knew a town called al-Mahalla 📺 al-Mahalla al-Kabira is al-Mukaddasi (55, 194, 196, 200); he tells us that it was m town of al-Rif built in two parts, one called Sandafa [or Sandafa), but the statement that the town was situated on the river by Alexandria (200) seems to 🖿 an error. Al-Eakri to know the town under the name Mahailat Mahrum (Kitáb al-Masálik wa 'l-mamdiik Brit, Libr. ms.), Idrist, Description de l'Afrique, 158, calls the town simply al-Mahalla and knows a saled after it. Yakut's statements confused, for he speaks of a town called Mahallat Dakata and of another Mahallat Sharkiyun (iv. 428), both of which seem m refer to the same place. Muhallat Sharkiyān in Yākūt—which be also calls al-Mahalla al-Kubrā-forms one town with Sendafā and the other hand he says that Mahalla Dakala between al-Kähira and Dimyat is the largest of the Mahailas that he knows (cf. also Abu 'l-Fida', ii, (231) knows Mahalla Dakalá as the capital of the kara of Dakahla; Ibn Dukmāk (v. 82) says that 🚃 governorship of this fown was regarded as "the little vislerate" (alwizara al-şaghîra). Under the Marniûk sultan Barkûk's. administrative reorganisation at the end of the 8th/ 14th century, al-Mahalla al-Kubrā became the centre of the wilaya of the Charb, under an amie fablkhana (see H. Halm, Agypten nach den mamlukischen Lehentregistern. 11. Das Della, Wiesbaden 1982, 311, 519).

The name Mahallat Sharkiyun is again found in al-Makrizi (ed. Wiet, iii, 207). It is clear from these writers that the town was an important commercial centre from the 4th/10th century onwards. It does not more however to have played any considerable part in history, although 'All Pasha Mubarak quotes some events that took place there, from al-Makrizi and al-Diabarti. In Egypt in the 19th century, the town had to give way to Tanta, which became the capital of the mudiriyya of al-Gharbiyya, while al-Maballa became the capital of a smaller administrative area; 'All Mubarak estimates its inhabitants at 50,000, while the 1914 Baedeker gives it only 33,500. It is m present m centre of the cotton trade; raw cotton is there cleaned in the factories. Of many individuals who bore the misba al-Mahalli, the most celebrated is Dialal al-Din al-Mahalii [q.v.], who was born here.

(J. H. KRAMERS*)

MAHALLATI, AGEA KHAN, Sayyid Hasan
'All Shah, last of the Nizari lama'ili imams

to reside in Iran and the first of them to bear the title of Agha (less commonly but more correctly, Aga) Khān. Born in 1219/1804 in the village of Kabak near Mahallāt in central Iran, he succeeded to the imāmate in 1233/1817 when his father, Shāh Khall Allāh, was murdered in Yazd. Fath 'All Shāh, the Kādjār ruler, amply compensated the young smām. His lands at Mahallāt were extended by royal decree; he was given a daughter of Fath 'All Shāh in marriage; and he was made governor of Kum, despite his extreme youth. With this appointment came the title Akā Khān, subsequently used as a hereditary title by the Nizārl ismā'lli imāms.

Aghā Khān Mahallatī led an apparently loyal and tranquil existence until the death of Fath All Shah in 1250/1834, and the favour with which court regarded him was confirmed when the new ruler, Muhammad Shah, appointed him governor of Kirman. But when, in 1252/1836, an attempt was made to replace Mahalläti with Firds Mirza, Kādjār prince, he forcefully resisted his dismistal and embarked on a career of rebellion that ended with his fleeing to India by way of Afghanistan. Despite initial specess, Aghā Khān Mahaliātī was soon obliged to withdraw to the citadel at Bam, where he surrended after a siege lasting fourteen months. There followed eight months of captivity in Kirman and period of retreat at the shrine of Shab Abd al-Azīm before he was able to plead for mercy at the court. He was pardoned on condition that he retire m Mahallat. This he did, but in the space of two years he gathered there an army of Isma lis and non-isma'lli mercenaries that enabled him to resume his rebellion. Claiming that he wished to go to Bandar 'Abbas in order to embark for the Hidjāz, Ā<u>chā Kh</u>ān Mahallāti left Mahallāt in Radjab 1256/September 1840, striking out with his force south-east across the desert to Yazd and Kirman. Again he won a number of preliminary engagements, but in 1258/1842 he was decisively worsted in a large battle outside Kirman and soon after he crossed into Afghanistan,

Aghā Khān Mahallāti's motives for rebelling against the Iranian central government are unclear. They may have been connected in part with rivalries surrounding the Ni mataliahi Şufi order. Despite the paradox involved in an Isma'lli imdm's submission to the guidance of a Suff shayed, Mahaliati was the murid of Zayn at "Abidin Shirwant, a claimant to leadership of the Nifmatallähl order. When another Ni'matallahi affiliate, Hadidil Mirza Akasi, who was Muhammad Shah's chief minister, sought displace Zayn al-'Abidin, Agha Khan Mahallati espoused the of his master with vigour. Hādidil Mīrzā Ālrāsi is said to have avenged himself by dismissing Mahaifatl from the governorship of Kirman, and Mahallati to have responded by rebeiling (see Mas'ud Mirah, Sargudhasht-i Mas'ildi, Tehran 1325/1907, 197-8). It is also possible that the British encouraged him to rebel, for at the time of his second uprising | Iranian army was advancing Harāt in defiance of British wishes, and ■ diversion of Iranian attention to the south was clearly welcome in London (see Correspondence relating to Persia and Afghanistan, London 1839, 64).

Mahallati's links with the British, whom he calls "the people of God" (hadh Allah) in his memoirs ('Ibrai-afal, ed. Husayn Kahi Kirmani, Tehran 1325 Sh./1946, 56), become fully evident with his arrival in Atghānistān. He was assigned a daily allowance by the British force occupying Kandahar, and his troops aided in the evacuation of the British

garrison which took place soon after his arrival.

Accompanying the British to Sind, he continued to supply them with mercenary services, and was instrumental in securing the cession of Karachi to the British by Nāṣir Khān, ruler of Kalāt [see Killt] (William Napier, History of Sir Charles Napier's administration of Scinde, London 1851, 73).

After a brief stay in Calcutta, during which the British authorities fruitlessly tried to secure him a pardon and safe return to Iran, Aghā Khān Mahallātī took up residence in Bombay, where he acquired extensive properties and began to accumulate a vast fortune. In this undertaking he was significantly aided by a ruling, handed down by the Bombay High Court in 1866, that placed all the community property of the Nizārī Ismā lis in the name of their imām and under his absolute coatrol. Maḥallātī died in April 1881, and me buried in a lavish shrine at Hasanābād in the Mazagon area of Bombay. He was succeeded by the eldest of his four sons, Ākā

'All Shah, Ághá Khản II.

Bibliography: Agha Khan Mahallati wrote autobiography, Ta'rikh-i 'Ibrat-afza, which was first published in Bombay in 1278/1861, and reprinted in 1315 sh./1946 by Husayn Kühl Kirmanl in Tchran. A Gudjaratt translation of this work exists. W. Ivanow has cast doubt = the authenticity of the Tarthi Ibrat-afta, mi his arguments are not convincing (Ivanow, Ismaili illerature: a biobibliographical survey, Tehran 1963. 148-9). Other sources: H. Algar, The revolt of Agha Khan Mahallati and the transference of the Ismā'ili imamate to India, in SI, xxix (1969). 35-81; A. J. MARALLE, a term commonly used in Ottoman administrative parlance for a ward quarter of a town. As listed in the Ottoman registers [see DATTAR-1 MARANT], the makalles are of various kinds. Characteristically, the Ottoman makalle consisted of a religious community grouped around its mosque (or church or synagogue) and

headed by its religious chief.

In addition to its place of worship, the mahalle normally had its own market, school and water fountain, these normally being supported by pious endowments. In many provincial towns, the makalle also had its own outer wall with a limited number of controlled points of access. Often the mahalle is own militia and some form of internal police. At times of weakened central authority, rivalries and even armed clashes between mahalles and outer ownson. The strong sense of corporate identity of the mahalle is also indicated in a number of other ways, in for example in processions and ceremonics, with music, torches and flags. These were frequently linked with the Suff brotherhood (see paalsa) with which the inhabitants of the mahalle were associated.

Often the mahalles bear ethnic or denominational names, e.g. of Kurds, Turkomans, Christians, Jews; Christians and Jews mumerous, they may

be subdivided by communities, e.g. Orthodox, Copts, Armenians, or, in the case of Spanish Jews, by their cities or provinces of origin. While many quarters are inhabited by homogenous ethnic, religious, or, sometimes, occupational groups, this is not always so, and the registers list many quarters in which different elements live side-by-side. The quarters inhabited by Sann! Musilms are normally designated by some topographical name, often that of the main mosque of the quarter. The listing of the adult male inhabitants of the quarter often begins with the Imam and other religious functionaries, and ends with an indication of the numbers of religious and other tax-exempt (e.g. blind, mad or maimed) persons. In many dealings with authority, the Imam of the mosque, or his equivalent, was the representative head of the mahalle. In some documents, the mahalle appears to be headed by a ghaykh, responsible to and appointed by the Ottoman authorities, possibly on the recommendation of the inhabitants of the quarter. In 1242/1826 a new system was introduced, with the election of a muchtar [q.v.] as headman for urban districts as well as villages.

AL-MAHALLI, AND 'ALI DIALAL AL-DIE MURAMMAD S. ARMAD B. MURAMMAD S. INRAHIM AL-ANSARI AL-SHAVI'I. Egyptian scholar who was born and died in Cairo (b. 791/1389, d. 1 Muharram 864/28 October 1459). He is known above all as co-author of the famous Kur'an commentary called the Tafstr al-Disiālays because it was completed by another Disiālays because it was completed by another Disiālays because it was completed by another Disiālays because it was completed by another Disiālays because it was completed by another Disiālays because it was completed by another Disiālays because it was completed by another Disiālays because it was completed by another Disiālays because it was completed by another Disiālays all Din, the famous al-Suyūti (849-911/1445-1505) [q.v.]], who had been his pupil for some time. According to the latter, al-Mahalli had commented on the sūras from XVIII (al-Kahf) to CXIV (al-Nās), mi well as I (al-Fātiḥa) and a few verses of II (al-Baḥara).

Al-Mahalll, who earned his living as a trader, is said m have had such an acute intelligence that it could "pierce a diamond" and a strict morality so rigorous that he attacked abuses of all kinds and relused the office of chief hads when it was offered m him. He taught law in the two Mulayyadiyya and Barkūķiyya madrasas, and furthermore utilised his wide and varied knowledge in halden, grammar, logic, usul, etc., in a series of works and above all commentaries, none of which, except for the Tafelr ai-Dialdicyn, have been published, but of which various mss. are extant, since they had a certain success in scholarly circles. These include al-Badr al-ţāli' fl ball Diam' ai-diawāhir, on the Diam' of al-Subki [q.v.], of which there exist (as also of others of his works) several mas, in the B.N. Paris (see also Brocketmann, II, 89, IP, 109; the Baghdad fournal of-Mourid, if 1-3, 212, lii/1, 229, iii/3, 287, v/2, 214); this shard was itself made the subject of glosses by al-Waffall (see Lévi-Provençal, Chorfa, agr) and by al-Lakani (see Brockeimann, Il', 109). One should further mention a commentary on the Burda of al-Būslri [q.v. in Suppl.] (see Brockelmann, I, 265, I², 309, S I, 69); one on al-Hudā al-nabasri by Ibn Kayyim al-Djawziyya [q.v.] (see Brockelmann, II², 138, S II, 127); on the Minhādi al-falibīn of al-Nawasti [q.v.] (see Brockelmann, I², 497); al-Kassi al-mufid fi '-Nit al-sa'id (collection of verses, quotations, etc., in part, after al-Mas'ūdī; see Brockelmann, II, 114, II², 138); al-Tībb al-nabasrī (see Brockelmann, II, 114, II², 138, S II, 127; cf. M. S. Belguedj, La midecine traditionnella dans le Constantinois, Strasburg 1966, 40); and m commentary on al-Wasafdi fī usūl al-dīn by al-Djuwaynī [q.c.] (see Brockelmann, I 380, 1², 487).

Bibliography: The most detailed biography of al-Mahalil is in Suyūṭi's Husu al-muhādara, i, 232, borrowed by Ibn al-Imād, Shadharāt, vii, 303-4; see also Sakhāwi, Daw', ii, 30-4; Ibn al-Kādi, Durrat al-bidjāl, i, 269; M. MAHAMMAD At-HADIDI, (see AL-DILA), in Suppl.].

MAHARI - MAHARI [500 KOTOKO].

AL-MAHASIN WA-'1-MASAWI (A.) "ments and faults", a literary genre which developed in the course of the first centuries of the Islamic period, having originated within the Arabo-Muslim cultural heritage, although some scholars (Inostranzev, Iranian influence on Moslem literature, tr. Irom Russian by G. K. Nariman, Bombay 1918, 79-85; G. Richter, Studien mer Geschichte des alteren arabischen Fürstempiegel, Leipzig 1932, 37-8; H. Massé, Du genre littéraire débat en arabe et m persan, in CCM, iv [1961], 137; I. Muhammadi, al-Adab alfárisi fi ahamm advárih wa-azkhar aflámih, Beirut 1967, 136-7) have concluded, ili-advisedly, that it was laspired by ancient Iranian model shayist nd-phayist ("auspicious/inauspicious"). This period witnessed the proliferation of debate, a genre wellknown among the Arabs before the advent of Islam [mund/arat and mufahlarat: bragging contest; see al-Sharishi, Shard Makdudi al-Hariri, Cairo 1952, ili, 33, 55-6; M. Shukri al-Alusi, Bulagh ol-acab, Cairo 1924, i, 278-307; A. al-Hāshimi, Djawākir al-adab, Cairo 1969, i. 224-37, 237-54; Massé, op. laud., 137-47; T. al-Hadilri, al-Diakis, Cairo 1962, 41-56; Sh. Dayi, al-'Aşr al-'abbisi al-amoal, Cairo 1972, 457-64, al- Aşr al- cabbasi al-thani, Cairo 1975, 535-40; Gériès, Un genre léttéraire grabe, al-Mahasin wa-lmesderi, Paris 1977, 6-12). Two categories of debate may be distinguished:

r. Theological debates (mundsaråt), where the Mu'tazilis were pre-eminent, not only in their combat with other sects and religions, but also in their internal dialectic, prompted, no doubt, by their admiration for plausible reasoning and influenced by the Sophists and by Greek philosophers in general. They made use of dialectic as a very efficacious instrument of analysis, a means of distinguishing absolute truth from relative truths.

■ Secular debates (mufākhardi, mundṣardi) on a broad range of subjects coming to the fore in ■ new civilisation loaded with contrasting elements, particularly the conflict between the Shu⁴hbis and the believers in the supremary of the Arabs, among whom al-Djāhiz (see Gériès, op. iaud.) is ■ distinguished example. The antagonists were numerous. Some of them exploited every opportunity for debate, even on trivial questions, a fact which ■ al-Djāhiz (K. al-Hayamda, i, 11-25, vii, 7-8) to

describe them as ashāb al-hhusimāt, declaring that he had no involvement with them.

This state of affairs inevitably had the affect of throwing doubt on the real worth of every idea and avery concept, especially in a mileu where rationalism and Greek influence ment the dominating forces. This fact was to influence ideas and literature, both in form and in content, most of all among the rationalists and in the case of al-Djahir especially.

In his writings, this author shows an expert know-ledge of the milieu, in all its aspects and contradictory tendencies. The characteristics of the milieu become associated with ideas borrowed from Greek philosophy, and it is these which must have led al-Diahig to the concept which enable him to reply both to dualists and to determinist finslims and which was to be one of the fundamentals of his doctrine: the relativity of good and evil in this world and the necessity of their co-existence for the optimum benefit (al-aslab) of creation and especially for intelligent life.

The desire to illustrate and popularise his relativist conception of good and evil induces him to prepare, on the basis of the controversies of nis time, a fairly long literary text where there is discussion of the merits and isults of the cock and the dog (mahdsin al-dih wa-maskirih, wa-maskiri al-halb wa-maskirnh). This is presented to the reader in the form of a debate between two highly distinguished Mu^ctazilis. One of them (al-Nazzam (q.v.)) favours and defends the cock (sdhib al-dih), while the other (Ma'bad (g.v.)) favours and defends the dog (whib al-halb); both are vehemently criticised by a certain accuser (fa'th) who also cenaures the two animals and enumerates their vices.

It is not difficult to prove that this immovative debate is the invention of al-Diāhiz himself, seeking out the merits and faults of the cock and the dog and simultaneously prompting the replies made to the accuser (see Gériès, op. land., 27, 34). He offers this controversy to the reader in a very amusing and attractive literary form. He in the first to present the opportunity of reading, in a book of adab, in text of reasonable length commenting on the makes and the massuel of the subject under discussion. Al-Diāhiz does not contine himself to talking of the cock and the dog; he exposes the merits and faults of many other objects known in his time, such as the pig, the monkey, the ennuch and fire (Hayawada, Iv, 36, 1, 106-77, iv, 35, v, 5; Gériès, 44-5, 53-4).

With the aid of these examples he aims to convince his readers that everything is relative. And this, he hopes, will make his task easier when he comes to expounding and explaining theoretically and logically, in the course of literary texts discussing the makarin and masded of the cock and the dog, his thesis on ill relativity of good and evil with reference to creatures and the necessity of their co-existence, thus proving that they me intrinsically good, in relation to creation and insolar as they are works of God. This enables him simultaneously to destroy the dualist thesis and to prove two of the fundamental Mustazill principles: altrafild and al-ta'dil (divine unity and divine justice) with everything that proceeds logically therefrom, and most significantly of all, free will (see I. Gériès, Quelques aspects 🖿 la pensée mustavilité d'al-Gabis, in SI, iii [1980], 73-5). It should be emphasised that this philosophical treatise is presented in the form of a direct response by al-Diahit in the attacks mounted by the accuser against the two Mustazilis for having discussed the merits and the faults of the dog and the cock (Hayawan, i, 203-4; cf. Gériès, 35-54).

The method which consists of praising or censuring certain object ii thus nothing more than a logical and natural evolution from debate, owing to the contribution of al-Dishix who sought to it for theological purpose. This is why the affirmation of the existence of good and of evil (mahdsin and masded) in every thing if imbued, in his work, with a philosophical and theological significance: is relative and all is important, and each creation has its place. It is in this sense that the K. al-Hayanda is to be understood, as it deals with various despicable elements of creation, the wisdom that they contain and their importance for the optimum state of the world. Similarly, in his books and his letters he deals with different social groups, stressing the important and indispensable role that each plays and concluding that each social group has its place (Haywan, i, 43-4, 204-10; al-Ma'ash wa 'lma'ad, in Rasa'il al-Didhis, ed. Harun, Cairo 1964, i, 117; cf. Gériès, 44-54). This realisation comes to be applied in the Diabigian othic, which in its principles is reminiscent of the Aristotelian ethic (see Gériès, 54.7}.

The composition of literary texts containing praise and censure of the same object is therefore not, in the case of al-Diable, a worthless and losignificant game which seeks only to prove the verbal abilities of a skilful advocate. However, this will not be understood without a detailed study of the corpus of al-Djahiz's work, especially the K. al-Hayawan, the readers of which seem to have been attracted shocked and even scandalised by the form and content of these texts. Al-Diahiz immediately acquired a renown which finds expression as much in the very violent attacks of certain later writers (Ibn Kutayba, Ta'wil mukhtalif al-hadith, Fr. tr. G. Lecorate, Damascus 1962, 73) as in the imitation of his method, although his imitators failed to understand the philosophical and theological significance implicit in this method and did not include it.

According to the periods in which works adopting the characteristic structure of certain writings of al-Djähız composed, the content and the form vary subject to the influence of the contemporary milieu and accented by dominant trends.

One of these writers who seems to be the most attracted by the Diabizian method is Ibrahim b. Muhammad al-Bayhaki (3rd-4th/9th-10th century), author of a sizable book of adab entitled al-Makanin ma 'i-musawi (ed. Schwally, Giessen 1902; ed. Abu 'I-Fadi Ibrahim, Cairo 1961). Al-Bayhaki is unknown to the ancient Arab biographers; all that see be added to the material contained in the article AL-BAYHART in EI*, is that he was ■ moderate Shift (Zaydi) and that he ascended the social scale to the point where he was a sadim or companion of kings. Ibn al-Rüml, who allows him this distinction, composed numerous satires (hidia2) against him (see Gériet, 74-9; Ibn al-Rûmi, Dîwân, ed. M. Sh. Silim, Beirut n.d., ii, 28-9, ed. M. Kaylani, Cairo 1924, 202-6, poem no. 233; R. Guest, Life and works of Ibn Er-Rumi, London 1944, 29, 133; S. Boustany, Ibn ar-Rümi, sa vis si son œuvre, Beirut 1967, index).

The subjects discussed in the K. al-Mahasia was 'I-masami and the ideas which it reveals are virtually identical to those of Ibn Kutayba in the 'Uyan al-ahada, with the exception of the politico-religious tendencies which are to in perceived in the first part (see Geriès, 80-3). The factor which makes this book unique and different from other works of

adab is the precise method with which the writer deals with his subjects and his technique of revealing to the reader his own feelings towards them (ibid., 79-80). Each chapter (bib) is divided into two opposing sections: mahāsin of . . / masāwi of . . . The contrast concerns either single object possessing both merits and faults (e.g. mahāsin al-faķr|masānet al-fakr: poverty; see the K. al-Mahasin wa 'l-masawi, 98-107, 170-8, 297-307, 364-73, 386-92, 464-9, 599-605, 609-12, 619-22; cf. Gériès, 87-9), or, as more common, two objects of which we is positive, praiseworthy and full of merit, the other negative, reprehensible and full of fault (mahasin al-rasal) masdwi man tanabba'a, mahasin al-shiddalmasawi 'I-diuba: the Prophet/false prophets, courage/ cowardice; see 16-34, 111-32, 518-22; Gériès, 85-7),

Thus the terms mahdsin/massed are not limited to a single connotation; in the first category, they signify merits/faults, good/bad examples, praise/censure; in the second: good, positive, virtuous, proper, laudable, qualities and merits of that which is hasan (good)/bad, negative, victous, improper, despicable, vices and faults of that which is habile (bad).

In his introduction (16; of. Gériès, 91-3), which in general terms is nothing more than a collection of remarks of al-Diabit in praise of books and of writing, al-Bayhaki explains the motives that have led him to give this title to his book and thus to follow this method of exposition. He says: "We have entitled it al-Mahāsin va "I-maidwi because the optimal interest of the world, from the beginning to the end of time, resides in the co-existence of good and bad, of harmful and useful, likable and detestable. For if only bad existed, creatures would annihilate one another. And, III there were nothing but good, al-Biction would disappear and reasoning would have no value..."

This explanation is nothing other than the opening of the philosophical treatise presented by al-Diābia in the K. al-Hayawān \blacksquare reply \blacksquare the accuser. Al-Bayhaki, although he reproduces only the first few lines and seems to dissociate himself from its theological purpose, thus proves that it is precisely the K. al-Hayawān and the justification advanced for the debate by al-Diābiz that inspire him. His book represents the historic moment at which a logical approach, itself already appearing in a literary form typical of adab, became transformed into an independent literary genre (see Gériès, 91-7, 151).

However, as has been seen, al-Bayhaki does not in the majority of cases apply the Djähizian procedure which consists of praising or censuring an object or a subject of some kind; he distorts it whenever seems to endanger his ideological interest, using the terms mahāsin and masāsi as means of proclaiming in advance, in chapter-headings, his feelings and attitudes towards the subjects discussed.

The criteria which govern his choice of subjects and dictate the positions that he adopts are: his politico-religious principles, moral principles and the socio-cultural and literary tendencies, already given definitive form by al-Djähir and Ibn Kutayba in the adab of the grd/9th century, whose books also his primary sources (see Gériès, 79-89).

The author of al-blahasin wa 'l-masawi supports his thinking and his judgments, expressed in administration in the titles, with the aid of chosen fragments of adab which illustrate them: quotations in prose and verse, anecdotes, lengthy narratives and traditions (mahāsin al-aḥhās ma-sand) al-aḥās, as he himself calls them). Except in the titles, which are

the only reflection of his thinking, he makes personal intervention in the text.

The reader of al-Bayhahr's book will be confronted with a testament of the practical philosophy of a 3rd/10th century Zaydl connoisseur of adab. It is as a result of the method of contrasting good with evil that we must be to arrive at an understanding of this philosophy, although, for others, who do not seem to have studied the work in detail, this method excludes the true position of the author and signifies, in their opinion, praising and censuring (thesis and antithesis) one single object (see A. Dayf, al-'Asr al-'abbdsi al-'Adam', 540-7; Gériès, 90, n. 2).

This false interpretation is doubtless based on the fact that in a large number of chapters, the opposition of the two sections is a function of the autonymous terms makeria and maskeri and not of the subjects under discussion, which gives the impression that this is an example of the Diabtsian procedure of praising and censuring every thing.

This false interpretation of the makasin/masawi contrast is not new. It appears in as early a work as the pseudo-Djähiz's al-Mahasin wa 'l-addad (ed. G. van Vloten, Leiden 1898, German tr. O. Rescher, ii. Uber guten und schlechten Seiten der Dinge, Stuttgart 1922, i. Das K. al-Mahdein ma-l-masded, Constantinople 1926; the Arabic text has been reprinted in Cairo in 1324/1906-7 and in Beirut in 1969). This author, who seems to have been well-acquainted with al-Djahiz, is the first m imitate al-Bayhakl, going far as to reproduce a substantial part of his work. In fact, the first part of al-Mahdsin we 'I-addid is found in al-Bayhaki's work, but in a more complete, exact and correct form (see introd. by van Vloten, pp. ix-x, xiv; cf. Gériès, 102-10, 112-15). The anonymous author reproduces none of the chapters dealing with politico-religious subjects which reflect the tendencies of al-Bayhakt. The modifications which he introduces into the plagiarised chapters and passages show that he has not properly understood the method followed by this author and that he has been seduced by the Diahizian procedure of bestowing praise and censure

Significantly, he has substituted for marded the term didduku (its opposite). Thus for him the opposition is: mahāsin of .. jeidduku. This means that he systematically contrasts the sub-chapters moldsin of ... with their opposites, without allowing the reader to deduce whether he will find under the title diddnhu censure of the same subject praised under the heading mahdsin (good/bad sides of the subject) a subject antithetical to that which has been praised (praise of the good and of the proper/censure of the bad and of the improper). Thus in the example makesin al-wafd'/didduku (70-6), it is difficult to decide whether it is a case of: "praise of fidelity/consure of fidelity" or of "praise of fidelity/censure of infidelity", a confusion which arises from the guity of the pronoun as in disdalase. Furthermore, there is the fact that the book is attributed to al-Djahis, with the object of creating in the reader the impression that he is confronted by the Diabizian method, consisting of praising and censuling every notion, and that there is nothing here but simple literary game. This, it seems, is the anonymous author's conception of this method.

This is why should be taken to avoid attributing to him the same intentions and the same motives as those of al-Baybaki. The things that interest him, besides the method of contrasting, are entertaining subjects and literary texts. The desire to distract and to entertain is even more evident in

the second part of his book, which is borrowed not from al-Bayhaki but from other sources (see introd. by van Vloten, pp. xii-xiv; Gériès, 116-18). Here, with the exception of the last two chapters which deal with Peraian feasts and with gifts, the subject most prominently discussed is that of women: women famous for various reasons, their beauty, examples of romantic intrigues, their fidelity and their infidelity, their wiles and their relationships with men, etc.

Nevertheless, the author applies the contrasting method in only five of the twenty-one subjects tackled in this part of the book, and he confines himself, in the others, to presenting the makasis (which here signifies the fine examples or beauties) of the subjects under discussion.

Curiously, he uses the method of contrasting in three cases m present that which to him appears good and praisevorthy in opposition to that which seems evil and culpable: fidelity/infidelity of women, reasonable jealousy/excessive jealousy, copulation/ impotence. Furthermore, he uses the terms mahasin/ maséwi to reveal, in the title, his judgments and feelings regarding the subjects in question. the same in the two other cases, whose titles give the impression that he is conforming to the method which consists of attacking and defending every notion: mahásin/masáwi makr al-nisá? (Intrigues of women) and mahāsinimasāwi 'l-dabib (stealthy approach of ■ man seeking to seduce a woman: 263-72, 348-56). In the first case, intrigues performed for a reputable purpose are commended with the term makasin (good intrigues), and those of which the objective is vicious and reprehensible are deplored (wicked intrigues). It is not impossible that the author intended, in this way, to expose the ambivalent attitude of adab and of the Muslim ethic towards. intrigue. However, the terms makasin/masawi cannot here be translated by praise and blame. In the second case, a short tale of a successful dabib is classed under the heading of makesin; on the other hand, attempts which end in failure are classified as masámi. Thus favourable/critical judgment depends on the result of the adventure and not on the conduct itself; in other words, there is no place here for praise and censure of the dable.

These two connotations of opposition characterise the majority of the chapters of al-Bayhaki. Thus the anonymous author has brought no innovation to the contrasting method liself; he has however varied the range of themes tackled, placing the accent on amusing, piquant and even erotic subjects, which brings his book closer to the genre of believelettes than to work of al-Bayhaki.

The literary and entertaining aspect which characterises al-Makasin no 'l-addad, whose overall title is also that of the majority of its chapters, and the fact that it bears the name of al-Djähir, serve to reinforce the impression that one is laced with the method of praising and censuring every notion, and this element has enhanced the renown acquired by it within this genre.

This reputation seems to have been very widespread in the 4th/roth and 5th/rith centuries, as is expressed through the attribution to al-Djāhk of a letter (ed. Pellat, in Machrig [1956] 70-8; cl. Gériès, 120-5) bearing the title Fi dhamm al-ulem wa-madhihā ("Censure and praise of the sciences"). Its author systematically applies the original Djāhigian method; one by one he censures and praises various sciences and professions with the aid of phrases of was/ (description and evaluation) in rhymed prose which he has drawn from books of adab, including those of al-Djābiz. Analysis of the letter shows that this author is seduced by the effects of style and form involved in the method and not by its philosophical and theological connotations, at attitude thoroughly typical of his age.

The pre-occupation comes to light soon after in the work of one of the most prolific of 5th/11th century authors, al-Tha alibi. Living in period where Arabic culture was shaped by rhymed prose and by systematic pursuit of form and virtuosity, and in a milieu whose sole concern was with the Invention of barmonious forms and formulas for the expression of every thought, he found that the Diabizian method was the best formula for supplying the needs of the kātib (scribe and functionary) and the adib ("gentleman") of his age in their professional lives and in their encounters: stereotyped expressions finely-composed in prose and poetry, bearing on the main subjects of adab and expressing the two contrary views which people might take towards them or, more accurately, which adab had already taken towards them.

To this effect, al-Tha'aibl, in his two identical books al-Zard'if we 'l-lata'if fi 'l-addâd and Yawakit fi ba'i al-mardkit fi madk buil ghay' we-dhammik (which a certain Ahmad b. 'Abd al-Razzāk al-Makdisī brought together in a single edition, published several times in Baghdad and Cairo; the Cairo edition of 1324/1906.7 is the one used here), tackles each of the eighty subjects that are discussed in a chapter divided into two: madk . ./dkamm . .; in the first part he offers elegant quotations in praise of the subject, and in the second he gives those which censure it (for example: madk/dhamm al-'aki, reason; of al-ghinā, fortune, etc., 16-18; cf. Gériès, 122, 126-39).

This fundamental pre-occupation of the author excludes the anecdotes and lengthy narrations which characterise al-Bayhaki's book and that of pseudo-Djahiz. For al-Thafalibi, passing praise and censure on every subject is a proof of virtuosity and the witness to a great talent (bailigha), as well as evidence of a profound knowledge of the Arabic literary heritage (18). It is for this reason that he composes several books following this method, in which he repeats himself, to such an extent that in two of them he even reproduces the themes and the same quotations, while giving to each of them a different title. Furthermore, he dedicates them to two different persons, adding, in the introduction to each, the pretence that in this book he has invented material that is original and totally unprecedented (2-4; cf. Gériès, 132-3).

In addition, he reproduces a large proportion of the materials presented in these books in a third which he entitles al-Tahsin wal-tahbih (mss. Istanbul, Räghib Pasha 1473, Fayd Allah 2133, edition of the text in preparation), and in which the opposition is presented in a new form; he praises that which is generally regarded as bad and passes censure on that which is generally regarded as good, apparently seeking, man again, to present a book which may appear new and unique in its general.

In these three books of al-Tha'ālibī, there is nothing to confirm the view that the author was acquainted with the work of al-Baybaki or of pseudo-Diābiz. On the other hand, it is the direct or indirect influence of the Diābizian corpus that seems to be acting upon him, impelling him to follow the method which involves praising and consuring every notion (see Gériès, 138-42).

One of the books of al-Thatalibi has been abridged, in the form of an entertainment, by a certain Shikab al-Din al-Ibshiri, who presents his work (unpublished; a single manuscript is known, preserved in Leiden Or. 1454) as the abridgement of the K. al-Umds fi math al-play' wa-diddihi; the work involved is probably the Yawakit, of which one of the copies bears the name retained by al-Ibshiri (see Gériès, 141-2).

The procedure, which consists of praising and censuring every thing and which has become synonymous with the display of literary talent, is encountered among numerous authors of adai subsequent to al-Tha'Mibl, who apply it spotadically in their books. Thus, al-Azdl in the Hiddyat Abi 'Ph'Asim (ed. Mez, Heidelberg 1902, 21-6, 105-6) and al-Haffrl in his Makamat (al-makama al-dhadriyya, 27-30 of the

Cairo 1326/1908-9 edition).

One of these authors, Diamai al-Din al-Watwat (631-718/1234-1318) seems to be the most attracted by al-Tha alibl's method in its two forms: praise/ censure on the one hand, on the other, praising that which is bad, censuring that which is good (see Gériès, 145-8). He applies this method systematically throughout his work of adab (Chusar al-khaşa)is alwādika, wa-urar al-naķābis al-fādika, Cairo 1318/ 1900), dealing with sixteen ethical themes: eight virtues (hhipal) and their opposites (nahā'is). Each of the first eight chapters is subdivided into three parts; z. Praise of the virtue with the aid of chosen texts; 2. Anecdotes, stories and poetry concerning individuals who are endowed with this virtue or have become famous for having displayed it; 3. Censure of the virtue. Similarly, each chapter of naka'ss in subdivided into three parts: 1. Censure of the vice; 2. Anecdotes, stories and poems concerning individuals who are afflicted with this vice in have become famous for having displayed it; a. Praise of the vice.

Thus, with the aid of chosen extracts, he discusses the major ethical themes, showing evidence of a well-informed acquaintance with the ambivalent attitudes expressed in adab towards the virtues and vices in question, an attitude due not only to Aristotelian thought, which characterises the Diabitian ethic, but also to the contradiction of tendencies and concepts encountered in the bosom of Islamic civilisation and expressed in the writings of authors of adab since the time III al-Diabit and Ibn Kutayba, precisely by means of this procedure consisting of exposing the merits and faults of the subject in question (see G. Lecomte, 10th Qulayba, Damascua 1965, 462-5; Gériès, 65-6).

This literary genre has doubt attracted many other authors, but, at this time, their writings are still unknown to us.

Bibliography: Given in the text,

(I. Gériès)

MAHAT (A., pl. mahan, mahani, mahani), mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani, mahani,

The root min-w suggests sparkling whiteness, and al-make is applied to rock crystal (biliarr), pearl (dury, lu'lu') and any bright star (kawkeb). The almost-immaculate coat of these beautiful, desert antelopes certainly warrants the description al-make', the word used to describe marrypa/manning, layéh, lahak/laháh, kawkab.

The oryn and the addantive in small herds which are dominated by one of the males. From time to time they gather to migrate, and can be observed

among the dunes by the Bedouin from a distance. They seem to have reminded them of their own flocks, for they call them ni did al-rami "sand ewes". At first sight, male and female are hardly distinguishable, but they do differ slightly in height and in horn thickness; mahat and the other used without gender distinction, as are the poetical descriptions of them like 'ayad', (pl. 'in) "with big. black eyes" and shansa' "with a flat muzzle". The desert folk are very acute in their observations, and they use a more precise vocabulary to describe the animals at different stages of their development. The call at birth is bahsadi or barghas, but if it is completely white, mari is used. As it grows and up to the time of its weaning (fildm), it is called fast, farir, farkad and djawdhar. A male (bull) calf has the name arkh/irkk/urkki, and the adult male shat; in the rutting season, its restless and skittish manner is aptly described as nashif "lively" and mikhrak "pawing the ground". The old bull, karkab, is often found living alone.

I. The oryx. In the semi-desert areas of Africa, Syria and Arabia, several species of oryx found. Even some of the rare white cryx (Oryx aigazel aigazel) have survived on the northern edges of the Sahara, where it is called wahth in Chad, wark/wark/@rgiyya (pl. @rg) in Mauretania (in the Egyptian Sudan, it is called abo hardb, and in Tamahakk of Ahaggar, stamfitem/texemt, pl. isommen! tizemenin and chemitehent, pl. ihemmenitihemmin). The last specimen in Tunisia was killed south of Doug in 1906, but in ancient times it was said to be common in southern Morocco, the high Algerian plains and southern Tunisia. From murals in ancient Egyptian tombs, there is evidence that it was domesticated under the Pharaohs and used as a draught animal. Pliny says ... orygem appelled Aegyptus, which, considering how Latin was pronounced then, suggests that the should be compared with Moorish argivya.

In the Middle Ages, the animal was known in the Sohara by the name of land, and its skin was used to make the famous shields [see Lawy].

Now the white oryx has almost completely disappeared from the Sahara. This has been caused in fairly recent times by the increasing number and better quality of firearms in the area, and also by the ploughing-up of the desert by incessant motorised traffic. The oryx is, after all, a big, heavy creature, short-winded and not very fierce; it used to be that a good mehani camel was all that was needed to catch it quickly. Saharan travellers in the last century found great herds of oryx which, they said, could be numbered in hundreds, but that now seems age ago.

There are two other species in Africa, with darker coats and clear black stripes, the oryx gazella in the south-west and the brise (perhaps derived from bayda' "white") cryx which includes the oryx beisa beisa of Abyssinia, o.b. gallarum of Mozambique, o.b. annectrus and o.b. callotis in the southeast and Kilimanjaro. None of these brightlymarked antelopes are, however, found in Arabicspeaking countries. There has always been a distinct species in Arabia, the oryx leucoryx (formerly bestrix) known as the sabre-horned or Arabian oryx, which is found as far as the borders of Syrla and 'Irak, and which was the first species to be called al-mahat by the Arabs. Their tapering black horns are ringed, and curve back majestically like those of their African cousins. They are usually more than a metre long and are perfectly parallel, so that when

1228 MAHĀT

seen from the side the animal seems to have just one born. That is why the oryx was thought, wrongly, to have connections with the unicorn, but that mythical animal is in fact to be connected with the rhipocerus [see KARKADDAN].

Probably me other desert wild animal, except the onager (himde al-traksh), has been described than the sabre-horned antelope by the pre-Islamio poets and their later imitators. [111] animal [111] not used as a principal theme in their kasabid, but as a background image of the hard desert life and the difficulties in it that the poet would have experienced himself. There are long descriptions of hunting for the cryx and of its death (tovad), which, incidentally, show how abundant it must have been. The poet, wishing to emphasise the high moral qualities of the huntsman, by a literary device transfers these qualities to the brave, hunted animal. The scene itself is conventional, but it reflects an idyllic picture of violent hunting in all its details. Sometimes the poet mounts a horse, and then the cryx is soon caught, after a terrifying chase in which me often as not three salukis participate, and is brought down at the point of a lance. Eulogies of the borse like this are common in Imru' al-Kays, Zuhayr b. Abl Sulma, 'Alkama al-Fahl and a number of others when they write lamentations. On other occasions, he will mount a she-camel, and then the story of the chase ends differently, for the cryx becomes the symbol of this matchless she-camel and it triumphs over all its adversaries by its speed and endurance; it will stop only to rip open a dog or two with its terrilying horns. Such poems are accordingly panegyrics, and al-Dishiz has carefully discussed this mechanical literary device in archaic poetry in his Hayawan, ii, 20, where he says, "when the poem is a lamentation or exhortation, it is usual for poets to let the dogs kill the oryx, but in panegyrics, where the camel is said to be an oryx with certain special qualities, it is the dogs that are killed. That is not to say that such events are poetic fabrications, for orex bulls have often killed or injured dogs, but it usually happens that the hunted animal is the victim in the end, the dogs emerge safe and well and their master has found his quarry."

A more romantic picture is sometimes drawn to show the affect of the four seasons of the life of the oryx, each with its own particular difficulties, struggles and hardships. Such pictures represent the challenges the pre-Islamic Bedouin faced in their daily life, whether they were real m not. The built, for example, is shown as wandering far in search of ■ mate and as confronting many rivals in tests of his prowess; here is a picture of the marriage difficulties of an old desert dweller, who could well have turned to abducting young girls. Then there is the agonising plight of the mother who goes lowing after her young calf which has been devoured (masha'a) by beasts of prey. Her search is vain, and she strays from her herd (idil, rabrab, swedr/sivar, sirb) and thus puts her own life at risk. Images like this are used frequently by Labid b. Rabifa al-famiri and by al-Nabigha al-Dhubyani among others. They evoke the cruel distress of so many mothers who have wept over the loss of a son killed in a raid, or over the loss of a daughter snatched forcefully away by a hostile clan. Clearly, images like this me not devised by town dwellers, but they are messential feature of the distant experiences of their nomadic ancestors. Such nostalgic reminiscences of desert life usually found in poetry up to the time of the 'Abbasid dynasty, and one of the last to me them in his poetry was Dhu 'l-Rumme.

In the Yemen during the Himyaritic period, the thex (wa'il) and the oryx were game animals which were hunted in accordance with ancient cultic rites. Archaeologists have excavated many bas-reliefs on which they are depicted (see in the Bibl. the important works here of M. Hölner, R. B. Sergeant and J. Ryckmans). Before the dawn of Islam, in the northerly regions of the peninsula the oryx had a special position as a sacrificial beast ('aiva) in the ritual, idolatrous offerings performed by the Araba in the month of general truce, Radjab; the oryx was included with domestic cattle in the list of radjabiyydl (Hayanda, vi, 511).

There were still about a thousand oryx in Arabia in 1950, but nine years later only about a hundred were left, in the remote regions of the "Empty Quarter" [al-Rubs al-khālī] to the north-west of Aden. Seventy of these were destroyed by motorised salaris with automatic weapons in 1960-1. Faced with such a serious situation, the World Wild Life Fund organised a rescue mission under Major 1. R. Grimwood in 1962 and three animals were captured. To these were added one offered by the Kuwaiti ruler and four from King Ibn Satud. These eight survivors formed the nucleus of a small breeding herd set up in a desert preservation in Phoenix, Arizona. At present there is just one small protected herd in a skayhh's park, but spart from these animals, the white oryx, locally the mudayhi or abit sala', can be considered an extinct species in Arabia and the Near Hast. Some of the amirs have introduced = a substitute in some areas the oryx-gazelle, which is native to Africa.

2. The addax. In North Africa, mahdt also denotes the addax (Addax nasomaculatus), = cousin of the oryx. This animal is extremely rare, and is found in a narrow strip of land in the Sahara, from Mauretania to the western edge of the Nile. At the beginning of this century, it could also be found in Palestine and Arabia, and it is recorded in ancient Syria and Mesopotamia. The main distinction between the addax and the oryx is the absence of any brownish-red markings on the neck and breast. Other distinguishing marks are its brown forehead, Its white tear-pit, its reddish nose and its noticeably long horns (şisa/şişiy ya, pl. şayaşi). These are straight with a slight backward slope and a two-and-a-half turn spiral; they are fully annulated. Both antelopes enjoy the same habitat and display the same behaviour, but the adday seems generally better adapted to its environment than the orya. It is more resistant to thirst for, like the camel, it carries a special sac containing an aqueous, slightly acidulous liquid in its belly, and this has been the salvation of many a waterless hunter (Pliny refers to it in Nat. Hist., xi, 27); moreover, its wide, spongy boof is a great help when it comes to long, sustained journeys across the dunes.

Two vernacular Arab for the animal in use, mehā and bas el-mahā, and perhaps echors of an earlier African term, taken into Latin by Pliny as addar, are to found in its Sudanese and Upper Egyptian names 'akaṣḥ'akaṣ, 's' 'akaṣḥ ba' 'addas; the origin and meaning of these names is still uncertain. The Touareg call it amelialitameliati, pl. imelialenitimelialin (from the verb "to be white"), and thus draw attention to the whiteness of its coat. They regard the addax as a choice game animal, and hunt it as soon as the herds mass together in the spring. Observars in the last century said that there could in as many soo animals in such gatherings (see G. Nachtigal, Sohars and Sudan, Berlin

1879-89, i, 551). Ibu Battúta, travelling five centuries earlier in the spring of 753/1352 from Tasarahla Iwalaten (Walata), was amazed at the abundance of the herds and by their evident fearlessness of man. He noted that the people of the region hunted the addax with dogs and shot them down with arrows. He added that they were very fond of the stomach liquid, and that they used to slake their thirst from their victims. For his me part, he did not find the meat enjoyable, saying that it was dry and tasteless (Rihla, ii, 190). Because it was relatively slowfooted, it was easy to capture, and the antelope offered the bunter not just venison as his prize but also leather and the stomach liquid. This liquid was said to possess many virtues, and it commanded a high price in the markets in large centres as far away as Tunis. There was also the attraction of extracting betoars [see BAZARR] known locally - bid el-mehd "antelopes' eggs", from the viscera. These biliary concentrations occur very frequently in the digestive systems of ruminants, and the preparation was greatly valued in the mediaeval pharmacopoela for its supposed qualities as an antidote and a aphrodisiac. Jewish pharmacists and druggists from the cities of the Maghrib went about collecting them eagerly from the nomads and then sold them speculatively to sultans and persons of high rank. The addax skin was, by contrast, much less valuable than that of the cryx; it was used only for shoe-making and saddlery. Of course, the trick was not unknown of substituting addax-leather for oryx-leather for making the famous impenetrable shields mentioned above.

Before fire-arms and motor-cars arrived, the addax was hunted with dogs, and it was also caught in traps (the spiked-wheel trap and the crossbow trap). The Tibbu of Tenere would encircle a herd and catch beasts in nets in order to eat the succulent marrow from the large bones. To-day there is no longer any question of hunting the addax, for the species has been so drastically reduced. It has disappeared from the vast Western Erg, but there may be cocasional specimen to be found between Ouargla and Ghadamès, and others to the south of Hamada of Tinghert and to the north of Timbuctu and in the regions of Termit and Agadem to the south of Tonere and in the Nubian Desert.

It is surprising to find that the great Arab naturalists have said very little about these two important antelopes, mahā. Al-Djāhiz makes a few remarks about them, but these last are only hearsay. One feature which he notes is that the bull is very vulnerable under pursuit because prolonged running triggers off urine retention (huds), which can prove fatal. He goes on to say that the cryx likes to crunch colocynth (hansal) because its bitter taste helps prevent thirst, that genies may ride it at night, that if will grow tame in captivity (Hayawan, ii, 118; vi, 23, 46, 316; vii, 187). Al-Kazwini seems to have ignored them altogether, and under the rubric bahar al-wakth (Adia)ib al-makhlithat, ii, 203-4), he speaks only of the axis deer (Corous axis), the Persian gdu-i san, with its antlers which fail off each year. Al-Damiri follows him and reproduces the earlier remarks, but seems not to know which animal he is speaking about. Under the rubric al-bakar alwahihi (Hayot al-hayawan, i, 142-3), he states that this name denotes all four species: make "oryxaddax"; syyil/uyyal "cervidae"; yahmus "roe-deer"; thaylallaylal "bubalis". Under the heading al-maha, he simply describes the ardour (skabak) of the male in the rut, and then recounts word-for-word what al-

Kazwini had mentioned about the "particular virtues" ascribed to the organs of the cervidae; he drew particular attention to the antiers, which were supposed to be useful as an approdistac when powdered (ii, 330-r). The poet Kushādiim [q.e.] says, in his Masdyid, 160-2, that the lowing (ghundr ghamghama) of the onyx cow is very much louder than that of the bull and that oryx venison has warming qualities; it makes the blood thick and black, and it should always be boiled with plenty of vinegar. The first Arab, he adds, who hunted the cryx on horseback was, according to tradition, Rabifa b. Nizār b. Mafadd b. 'Adnan. All this information is repeated in the writings of al-Kalkashandi (Subb, ii, 44). The Mamlük Ibn Mangli [q.o. in Suppl.], writer on cynegetics and whuntsman himself in the 8th/14th century, give "helpful advice" (Uns al-mala", ms. Paris B.N., Ar. 2832, fols. 11b, 21a) on how to bring the cryx down once It has been stopped: to thrust obliquely with a sabre, cutting at random, and immediately lifting the blade again in order not to wound the horse. He then recommends trying to hamstring the animal: burl a missile (hadhāfa), one which has a head bristling with spikes and a long haft, between the legs of the galloping animal. The animal should not be killed outright, for there must be a chance of strangling it ritually so that its meat can be eaten licitly. They may also be hunted with a cheetah [see FARD]. In his Diamhara fi fulum al-bayeara (ms. Escurial, Ar. 903, fol. 1438b) Ibn Mangii repeats the sayings of his esteemed master from the preceding century, "Isa al-Asadi, that good results with cheetahs can be obtained only in Syria, where they are more robust and aggressive.

The Touareg of the Air believe that the addax is m good predator on snakes for, according to legend, it is completely immune to vipers' venom. That is why many natives wear a piece of addax skin as a talisman, and they decorate their tents with its borns, skin and fat, which ward off all kinds of replifes (see H. Lhote, La chasse then les Touaregs, Paris 1951, 75-87).

The gleaming bright, black pupil of the oryx and the addax (hada) al maha), in contrast to the white of the eye, was an image dear to poets. It has earned them the title of Sn, associated with abwar, pl. har "very white", It is in fact well-known that the houris (al-har al-in [q.v.]), the wives of the elect in paradise, have languorous antelopes' eyes set in a face with the complexion of pearl or milk. That is the mark of perfect leminine beauty as judged. by the Arabs. The Greeks had already expressed their similar aesthetic delight when they gave "great cows" eyes" to their goddess Hera (corresponding to Roman Juno), queen of Olympus, daughter of Kronos, wife of Zeus ("Hρα Βοῶπις). The Greek adjective could metaphorically apply to any beautiful woman, as could the Arabic mahāl/mahān. It is the opinion of philologists that, if the whiteness of the complexion is being described, the comparison suggests the whiteness of pearl or crystal; but if there is a description of beautiful eyes with pupils dark as night set in a milky white complexion, then it is from the oryx and the addax that the image is borrowed (see LA, s.v. m-h-w).

To conclude, after all this information, it is really frightening to think that the zoological term maker may soon be no that that a word in the dictionary, reminding us of species which will have vanished from the lands of Islam, like na'am "ostrich" and himar al-maket "onager"; it will have vanished

just because of man's insatiable, thoughtless greed. In astronomy, the star al-Farkad (= Phercad) "the cryx call", is y Ursas minoris; this star and the associated \$ Ursas minoris together form al-farkadayn (= Elfarcadin) "the two calves", the "guardians" of the North Pole.

MAHBÜB 6. AL-RAHİL AL-'ABDİ, ABU SUPYAN, Ibādī theologian and historian, originally from the Arabic tribe of the Banû 'Abd al-Kays, who lived in the 2nd/8th century and who is cited in the Kitab Tabakat al-mashayikh of al-Dardini (d. 670/1227 [q.v.]) amongst the scholars of the fourth tabaha or class. His family came originally from 'Irak (his grandfather al-Mallh al-'Abdi was one of the close friends of the head of the Ibadi community in Başra, the famous Abû 'Ubayda Muslim b. Abl Karima al-Tamimi [see AL-IBADIYYA]), and he first lived in 'Uman. Then he settled in Başra, where he became a pupil of AbQ 'Ubayda. After the death of al-Rabit b. Habib ai-Başrl, head of the Ibaçli community in Başra after Abū 'Ubayda, spiritual supremacy in the Ibad! world passed to Abu Sufyan Mabbüb b. al-Rabil. In effect, he acted as arbiter over the schism of Khalaf b. al-Samh in the Maghrib [see AL-KHALAFIVYA] during the reign of the Rustamid imdm 'Abd al-Wahhab b, 'Abd al-Rahman b. Rustam, and wrote a risala (or 'ala') to the Ibadi chief 'Abd Allah b. Yahya al-Kindi, called Talib al-Hakk (d. 129/747), who set up in South Arabia the first Ibādi imāmate and who occupied Mecca and Medina. Mabbüb b. al-Rabil became especially known as a historian, and it is to him that me owe the greater part of the traditions about the oldest Ibādi shayhhs. His historical work, mentioned in al-Barrādi's catalogue (9th/15th century) under the title of Küdh Abt Sufyān, served as al-Dardjini's basis for the putting-together of the first four classes of his K. Tabakāt al-mashāyikh, where he is cited several times.

MAHDAWIS, a sectarian group in Indian Islam, the followers of Sayyid Muhammad Mahdl (847-910/1443-1505) of Djawnpur (q.v.), near Benares. who declared that he was the promised Mahdl [a.c.] and by his preaching gained a number of adherents in Ahmadābād [q.v.] and other parts of Gudjarāt. ma was compelled to leave India, however, and died Farāh in what is now western Afghānistān, where be was buried. His followers credited him with the power of working miracles, raising the dead, healing the blind and the dumb, etc. For a time, they were allowed to profess their faith without official harassment; but in the reign of Muzaffa: II, Sultan of Gudiarat (917-32/1511-26) they were persecuted, and many of them put to death. The Mughal prince Awrangzīb [q.v.] also moved against them when in 1055/1645 he became governor of Ahmadabad. In consequence of these persecutions, was Mahdawis began to practise takiyya [q.v.] and tried to pass an orthodox Muslims. Their exact number, therefore, remains today uncertain. They are found in small groups in some parts of Gudjarat, in Bombay, in the Deccan, in Uttar Pradesh and also in Sind, where they are known as Zikris [see parkets in Suppl.]. They believe that Sayyid Muhammad was the last Imam, the promised Mahdl, and in quence of his having come they are well by their religious opponents neither to repent for their sins and to pray for the souls of their dead. They observe certain ceremonies peculiar to themselves at marriages and funerals, and are often lax in observing the five canonical pillars of Islam. By their enemies they are styled Ghayr-Mahdis, i.e. those who do not believe in a Mahdl still to come; but the Mahdawis theraselves apply this designation to other Muslims, charging them with failure to recognise the Mahdl who has already appeared.

AI-MAHDI (A.), "the rightly guided one" is the name of the restorer of religion and justice who, according to a widely held Muslim belief, will AL-MAHDI

rule before the end of the world. The present article will trace the history of this belief and will deal with the political history of Mahdist movements only in so far as relevant (for the Sudanese movement, see ALMARDIYVA).

Origin and early development during the Umayvad age. The term makel as such not occur in the Kur'an; but the name is clearly derived from the Arabic root k-d-y commonly used in it in the meaning of divine guidance. As an honorific epithet without messianic significance, the term was employed from the beginning of Islam (references gathered by Goldziher, Vorlesungen, 257). Hassan b. Thabit thus applied it to the Prophet, and Diarir to Abraham. Sulayman b. Surad referred to al-Husayn, after his martyrdom, as "MahdI son of the MahdI" and al-Farazdak called al-Walld in a panegyric the sixth of six callphs of 'Abd Shams from 'Uthman who were kudát mahdiyyán (Diwán al-Farazdak, ed. al-Şāwi, Cairo 1936, 88). During the Second Civil War, after the death of Mu'awiya, the term came first to be used for an expected ruler who would restore Islam to its original perfection. 'Abd Allah b. al-Zubayr claimed the caliphate m such a restorer. Though he does not seem to have been given the epithet al-Mahdl, his career substantially shaped the later image of the expected Mahdl. In Kuia, al-Mukhtar proclaimed Muhammad b. al-Hanaflyya as the Mahdl in this heightened sense. Among his opponents of the Kufan nobility who iled from him to Basra Mūsā, of the Companion Talha. He was viewed there - the expected Mahdi by many people who hoped that he would claim the caliphate, but he refused to engage himself in the fitna, pointing III the example of 'Abd Allah b, 'Umar in the First Civil War (Ibn Sa'd, v. 120 (.), Among the Umayyad caliphs, Sulayman (96-9/715-17) seems to have been the first one to have encouraged the belief that he was the Mahdi who would restore justice after oppression had become widespread under his predecessors. He is often addressed me the Mahdi in this sense in the panegyries of Diarir and al-Farazdak. The latter affirmed specifically that the spine of the religion had been straightened after having become crooked and that all grievances (maxilim) had been removed by the Mahdi, meaning Sulayman (Diggs, 618, 801). The apocalyptic aspect of al-Farazdak's concept of the Mahdi is revealed by his statement that so many priests (éass) and tabbis (hibr) had foretold the caliphate of the Mahdi (Diedn, 327). Sulayman's successor, 'Umar 11, was also addressed in the Mahdi by Diarle and, because of his recognised piety, was widely regarded so in religious circles. Of the later Umayyad caliphs, Hisham was called the Mahdl by Djark. Less emphatically, al-Parazdak speaks of Yazid II as a rightly-guided one (mahdi) (Diman, 5.14) and of his al-Waild II as al-Mahdi (Diwan, 7).

Among the religious scholars, discussions about the Mahdl and his identity can be traced back to the time after the Second Civil War. These discussions developed in different directions in the different centres of learning and influenced the later beliefs about the Mahdl to varying degrees. They were in turn influenced by men related beliefs already accepted and supported by hadiths attributed to the Prophet. Thus it had been accepted that 'Iså [q.v.] would descend from Heaven before the end of the world to rule and lead the Muslim community in prayer. A hadith on the authority of Djåbir al-Ansåri and Abū Sa'ld al-Khudri, spread in Medina probably in early Marwanid times, quoted the Prophet as stating that "at the end of my community there

will be a caliph who will pour out the money without counting it". According to another early Medinan sadily, on the authority of Abû Hurayra, the Prophet had said "The Hour will —— come until a man from Eabtân will come forth leading the people with his staff". Predictions concerning this Kahtani were evidently known before the rebellion of "Abd al-Rahman b. al-Ash'ath in Sol699, who according to al-Mas'Odi (Tanbik, 314) and Ibn Jähir al-Makdisi, called himself al-Kahtāni and Nāṣir al-Mu'-minlo.

1231

In Medina, conservative religious opinion generally accepted 'Umar II as the Mahdi, This acceptance was facilitated by the fact that 'Umar II was descended through his mother from Umar I who, together with his son 'Abd Allah, enjoyed the highest religious authority among conservative Medinan scholars. Statements attributed to 'Umar I and 'Abd Allah b. Umar were circulated to the effect that the former had predicted the advent of a descendant of his who would fill the earth with justice. These statements reflect an earlier expectation that a descendant of Umar I through male lineage would become the restorer of justice, but they were now applied to the Umayyad (Ibn Said, v. 243). Said b. al-Musayyib (d. 93 or 94/712-13) was alleged ■ have identified 'Umar II as the Mahdl while the latter was still in Medina long before his reign. A particular effort was made to counter Küfan claims that the Mahdl would be an 'Alid. Thus Muhammad b. al-Hanafiyya was reported in Medina to have said that if there was to be a Mahdl he would belong to the 'Abd Shams. Muhammad al-Bāķir, the Imām of the Imami Shi'a, was quoted as stating during the caliphate of 'Umar II: "The Prophet belongs to us. and the Mahdi belongs to the Banu 'Abd Shams. We do not know him to be anyone but 'Umar b. 'Abd al-'Azīz" (Iba Sa'd, v, 245).

In Mecca, on the other hand, Tawns b. Kaysan (d. 106/724-5), a respected mauld traditionist residing to the Yensen, was quoted expressing himself more reservedly that 'Umar II was rightly guided but not the Mahdi (hāna mahdiyya wa-laysa bih); for in the time of the Mahdi, the benefactor would be outdone by the rewards for his good acts and the evildoer would be called to repent. Abū Ma'bad Nāfich (d. 104/722-3), a mauld of 'Abd Allāh b. al-'Abbās, quoted his master as asserting that the Mahdi would be a young man (shābb) of the Ahl al-Bayt. The report was transmitted by the highly respected Meccan traditionist 'Amr b. Diuar (d. 126/744).

In Hims, Syrian loyalty to the Umayyad caliphate was expressed in a tradition attributed to Ka'b al-Abbar neutralising the hadith of the Kahtani: "The Mahdl will be only of Kuraysh and the caliphate will be among them only. He will, however, have a root and a pedigree in the Yemen (ghapra anna lahd astem ma-marabem fi "I-Yemani". The tradition, related by Shurayh b. 'Ablda al-Himsi (d. after to8/726-7), may go back to the time of the revolt of Ibn al-Ash'ath.

In Başra, Aba Kilâba (d. ca. 107/725-6), m prominent traditionlet with ties to Syria, supported the view that 'Umar II was truly the Mabdil. He was indirectly contradicted by Abb Nadra (d. 109/727-8) and Abu 'I-'Ala' ai-'Amirî (d. 108/726-7) who, reporting the hadiih of the generous caliph in Başra, stated that they did not think 'Umar II was meant. Al-Hasan al-Başrî (d. 120/728) opposed the belief in a Muslim Messiah, maintaining that 'Isâ was the Mahdi. He is also quoted as stating that he did not believe in a Mahdi, but if there man one it was 'Umar

II. His contemporary and rival in the religious leadership in Basra, Muhammad b. Strin (d. 110/728) maintained that there would be a Mahdi of the Muslim community (wmme) and that 'Isa, after descending from beaven, would pray behind him. He further affirmed that | Mahdi would be more excellent than Abû Bakr and 'Umar and would equal prophet in rank. According to another report, he held that the Kabtant was identical with the Mahdi. Katāda (d. 117 or 118/735-6), prominent disciple of al-Hasan, spread the following kadith of the Prophet: "There will arise a difference after the death of a caliph, and a man of the people of Medina will go forth fleeing to Mecca. Then some of the people of Mecca will come to him and make him rise in revolt against his will, and they will pledge allegiance to him between the ruku and the makim. An expedition will be sent against him from Syria but will be swallowed up (ywhhaafu bihim) in the desert between Mecca and Medina. When the people see this, the righteous (abdal) of Syria and the groups of horsemen ('asd'ib) of 'Irak will come to him and swear allegiance to him. Thereafter a man of Kuraysh will arise whose maternal uncles are of Kaib. He will send an expedition against them but they will defeat them. This will be the expedition of Kaib, and disappointment will be for those who will not witness the booty of Kalb. He will then divide the wealth and act among them according to the sunna of their Prophet. Islam will become firmly established (yulkî bi-diiranih). He will remain seven (var. nine) years and then die, and the Muslims will pray over him". This hadith, whose first part is patterned upon the revolt of 'Abd Alish b. al-Zubayr, may conceivably back to 'Abd Allah b. al-Harith b. Nawfal b. al-Harith b. 'Abd al-Muttalib, who appears in its isneed and claimed to have heard it from Umm Salama, widow of the Prophet. Abd Allah b. al-Harith, called "Babba", was thosen by the people of Basra as their governor in 64/684 after the death of the caliph Yazid and the flight of his governor "Ubayd Allah b. Ziyad. But be held aloof from all the violent events in Başra at this time (cf. Ch. Pullat, Le milieu bassien et la formation III Gahis, Parls 1953, 268-9); bence it is in fact unlikely that he was responsible for this hadily, which aimed at atirring up support for the cause of Ibn al-Zubayr, The latter part of it, including the rise of Umayyad whose "maternal uncles and of Kalb" and who would send an army of Kalbis against Ibn al-Zubayr, reflects the expectations at the time which were not fulfilled by history. The element of the swallowing up of a Syrian army, based on Kur'anic warnings of a khasf, was incorporated from slightly earlier hadiths spread by 'Abd Allah b. al-Zubayr himself and by two prominent supporters of his, "Abd Allah b. Şafwan and al-Harith b. III Rabi'a al-Makhzumi, as war propaganda during the campaign of Yazid's army against Medina and Mecca (see Muslim, Sahth, K. al-fitan, I al-khasf). Though it does not mention the Mahdi, the hadith of Katilda was later generally taken to refer to him, while his Syrian rival become the prototype of the Sufyani [q.v.], the traditional opponent of the Mahdl. Much of later tradition about the career of the sand the Sufyani is melaboration of the various elements of this hadith.

In the late Umayyad age, Matar b. Tahman al-Warrak (d. 125/743?), a Khurasanian resident in Bayra and senior disciple of Katada, rejected the view that 'Umar II was the Mahdl, stating that the Mahdl would do something 'Umar II had not done: be would refuse to accept money returned to the treasury by someone who, after requesting it, found that he had meed of it. Majar also transmitted traditions attributed to Ka'b al-Ahbar to the effect that the Mahdi me named because he would be guided (youlda) to find copies of the original text of the Torah and the Gospel concealed in Antioch. The same Kab tradition seems to have been known also in Kufa at this time, where Abd Allah b. Bishr al-Khath aml is reported m bave transmitted it in the following form: "The Mabdl will send (an army) to fight the Rom, will be given the knowledge (filth) of ten, and will bring forth the Ark of the Divine Presence (14bit al-sakina) from a cave in Antioch in which are the Torah which God sent down to Moses and the Gospel which he sent down to Jesus, and he will rule among the People of the Torah according to their Torah and among the People of the Gospel according to their Gospel". The following hadith was circulated in late Umayyan Başra on the authority of Abû Sa'ld ai-Khudri; "The Prophet said: There will be in my community the Mabdl, if for ■ short time, seven (years), otherwise nine. My community will then enjoy prosperity they have never enjoyed. The earth will bring forth its fruit for them and will not hoard anything away from them. Money will at that time be in beaps, and whenever a man will get up and say 'O Mahdl, give me', he will say 'Take'." This hadith, which identifies the Mahdi with the generous ruler predicted earlier, was spread, with variants, by Zayd al-'Ammi but may in substance go back to his authority, the Basran Abu 'l-Siddik al-Nādii (d. 108/726-7). Another variant of it me transmitted by Sulayman b. 'Abid al-Sulami, . Başran contemporary of Zayd al-'Ammi. Of late Umayyad Başran origin is also the topos that the Mahdl would have an aquiline nose and m bald forehead (aknā adilā).

Küfan tradition insisted that the Mahdi would be one of the Ahl al-Bays of the Prophet or a descendant of 'All 'Asim b. Bahdala (d. 127 or 128/744-5), the famous Kûlan Kur'an reader, disseminated the following hadith with a Kufan isndd going back to "Abd Allah b. Mas'Qd: "The Prophet said: The world will not pass until a man of my family (aki bayts) will rule the Arabs whose name will coincide with my (yamaji' ismult ismi)". The claim that the name of the Mahdi would agree with that of the Prophet - doubt made in the time of al-Mukhtär's rebellion in favour of Muhammad b. al-Hanafiyya, who is reported, when addressed as the Mahdi, III have referred to his privilege of bearing the name and hunya of the Prophet (Ibn Safd, v, 68). The hadith of 'Asim thus probably goes back to 'Asim's authority. Zirr b. Hubaysh, who was known for his pro-'Alid sentiment. By the time of the revolt of Zayd b. All in Kuin in 120/738, the thesis of the identity of names was ovidently already well-established there, since his supporters did not try to identify him with the Mahdl but with the Mansor (al-Tabari, ii, 1676). a messianic figure originating in Yemenite beliefs. In Kufa was also spread the following hadith related by Ibrāhim, an of Muhammad b. al-Hanafiyya, on the authority of his father on the authority of 'All: "The Prophet said, 'The Mahdi will be from us, the AM al-Bayt. God will give him success in a single night (yusishuhu fi layla)"." The descent of the minute from the Prophet was also affirmed in the hadith: "The Messenger of God said, 'Even if only a single day of the earth were left, God would send a man from us who will full it with justice as it had been filled with oppression'." Though the hadiff was widely spread

AL-MAHDI

among the traditionists only by the Kolan Fitt b. Khalifa (d. 153/770), it may well go back to the Companion Abu 'l-Țulayl 'Amir b. Wâţhila (d. ea. 100/718-19), known for his support of 'Ali and his ShFi sympathies, who claimed to have heard it from 'Ali. The theme of the generous ruler was taken up in Kola by 'Aţiyya b. Sa'd b. Dlunāda al-Kaysl (d. 111/729-30 or 127/744-5), considered a ShFi, who related the following hadtli on the authority of Abū Sa'dd al-Khudri: "The Prophet said, 'A man will come forth from my family after an interval of time ('inda 'nhifā'in min al-zaman) and the appearance of civil wars (fitan) whose liberality will be in throwing about (halky=) (money). He will be called al-Saffāh (= the generous)."

The early 'Abbasid age until the time of the canonical collections of hadiff. The 'Abbäsid revolutionary movement aroused and was supported by messianic expectations and the hope for a restorer of religion and just rule from among the Aki al-Bayt. The first 'Abbasid callph gave himself the Kūfan messianic al-Saffah in his inaugural sermon in the mosque of Kūfa in 132/749. He was addressed as the Mahdl of the Hashimls by the poet Sudayi (Aghāni', iv. 93). The second 'Abbasid caliph, Abt Diafar, was also called the Mahdi by his court poet, Abu Dulâma. During his reign, the 'Abbasid claim in the Mahdiship faced a challenge in the rising of the Hasanid Mubammad b. 'Abd Allah in 145/762, who, having long been announced by the propaganda of his supporters as the expected Mabdi, appeared in Medina in accordance with the hadily predictions. After the suppression of his revolt, the caliph adopted the messianic name al-Manyūr and gave his son and crown prince Muhammad b. Abd Allah the surname al-Mahdl, presenting him to the public as | promised restorer. The latter after his accession sought to live ____ to the expectations concerning the Mahdi by releasing political prisoners and handing out liberal gifts, especially in the holy cities.

Traditions about the Mahdl going back to this time reflect these developments. In support of the 'Abbasid revolutionary movement in Khurasan, the Shia Yazid b. Abi Ziyad (d. 136/753-4) spread the following hadild in Küla with an isuad going back to 'Abd Allah b. Masfud: "While we were with the Messenger of God, there came was youths of the Banû Hāshim. When he saw them his eyes flowed with tears and colour changed. We said, 'O Messenger of God, we have for some time will in your face something we dislike'. He said, 'God has chosen for me the People of the House, the hereafter over this world. The People of My House shall meet misfortune, banishment, and persecution until people will come from the with black flags. They will ask for charity but will not be given it. Then they will fight and be victorious. Now they will be given what they had asked for, yet they will not accept it but will finally hand it (sc. the earth) over to a man of My Family. He will fill it with justice as they had filled it with injustice. Whoever of you will live to witness that, let him go there even though I be by creeping on know (kabum 'ala 'l-thaldi)'." Even though this tradition, known m the hadith of the flags, was recognised by hadifà experts to have been fabricated by Iba Abi Ziyad, it greatly influenced the later expectations about the career of the Mahdl and was accepted by Iba Madia in his K. al-Sunan. A parallel version with a Basran isnad was disseminated in Basra by Khālid al-Hudhdhā? (d. 141-2/758-60); "The Messenger of God said, Three men, each one the son of a catiph, will light at your treasure ('sinda hansikum'). None of them will obtain it, Then black flags will arise from the east. Two of them will kill you (brutally) in people has even been killed'. Then in mentioned something I do not remember. It added, 'When you see him, pledge allegiance to him, in though it be by creeping on snow. For he is the vicegerent of God, the Mahdi'."

The 'Abbasid claim to the Mahdlship found some marginal support among mostly Küfan traditionists. The following statement ascribed to 'Abd Allah b, al-'Abbas was spread by 'Abd al-Malik b. Abl Ghaniyya al-Khuzaq, . Kefan originating from Islahan, presumably towards the end of the caliphate of al-Mansûr or the beginning of the reign of al-Mahdi: "By God, after that (namely after the twelve caliphs predicted in a haduh of the Prophet) there will from us the Saffab, the Mansur, and the Mahdi who will hand it (sc. the caliphate) over to "Isā b. Maryam". Probably also a Kūfan was Ibn Diabir al-A'mash, who about the same time transmitted a hadith ascribed to Abb Safid al-Khudri: "I heard the Messenger of God say, 'The Ka'im is from us, from us is the Mansur, from us the Saffah, and from us the Mahdl. As for the Ka'im, the caliphate will come to him without his spilling a cupping glass (of blood). As for the Mansur, no flag of his will be turned back. As for the Saffah, III will pour out money and blood in abundance; and the Mahdl will fill it (the earth) with justice as it had been filled with oppression'." Ibn Diable added that he thought the Mansur was Abo Diafar (al-Mansur) and the Saifah the caliph al-Mahdl. The tradition was probably, however, not originally coined for the 'Abbāsids and may well | late Umayyad Küfan, going back to Ibn Diabir's authority, the Kūfan Abu 'l-Waddāk al-Hamdāni. A prediction that the Mahdi would III of the descendants of al-'Abbās was in the early 'Abbāsid man attributed to Ka'b al-Abbar by an otherwise unknown Yazid b. al-Walld al-Khuza? and transmitted by Muhammad b. al-Walld al-Baghdadl, a manid of the Bant. Hashim.

The predominant mood among the traditionists, however, turned quickly against the 'Abbasid pretensions to the Mahdiship in favour of 'Alid hopes, Traditions supporting the view that the Mahdl would be a descendant of Muhammad and his daughter Fâțima spread in the early 'Abbāsid age outside Kūfa also. In Başra, fimrān al-Kattān, a supporter of the revolt of Muhammad II. 'Abd Allah and of his brother Ibrahlm, circulated the following hadill on the authority of Katada: "The Messenger of God said, 'The Mahdi will be from me, will a hald forehead and an aquiline nose. He will fill the earth with equity and justice as it was filled with injustice and oppression and will rule seven years'." Similar hadiths were spread, on the authority of Abu 'I-Siddik al-Nadil, by the pro-Shi9 Kadari 'Awf al-A'rābī (d. 146/763-4) and other Başrans. In al-Rakka, Ziyad b. Bayan about this time disseminated the hadith of the Prophet, "The Mahdi will be of my family from the descendants of Fatima".

Support for the Hasanid Muhammad b. 'Abd Alläh is reflected in the addition of "and his (the Mahdi's) father's name will agree with my father's name" to the hadith of 'Asim by some Kulan transmitters. Most likely in his favour the following tradition was circulated by Shu'ayb b. Khālid, a Kufan residing in Rayy: "'All said while looking at his son al Hasan, 'Verily, this son of mine is a lord as the Prophet called him, and from his spine

1234 AL-MAHDÍ

will come forth a man who will be called by the of your Prophet. He will resemble him in character but will not resemble him in shape. He will fill the earth with justice in it was filled with injustice."

The Mahdi was, however, identified as a descendant of al-Husayn in a tradition attributed to 'Abd Allah b. 'Amr b. al-'As and spread m this time by 'Abd Allah b. Lahl'a (d. 155/772) in Egypt: "A man of the offspring of al-Husayu will come forth from the east. Even I towering mountains were to confront him, he would men them and take paths in them". This tradition already reflects the expectation of a second rising, after the 'Abbasid revolt, in the This expectation was now expressed in predictions about army in white clothes with amali black flags led by man, m s client, of Tamim named Shu'ayb b. Sālib, coming from Khurāsan Rayy to prepare the way for the Mahdl. The earliest prophecies of this type seem to have originated in 'Irak but the bulk of them, often greatly elaborated, came from Egyptian and Syrian sources. In Egypt, 'Abd Allah b. Laht'a fabricated numerous such traditions providing them with various fictitions isndds. In Syria, similar traditions were related the authority of Artat b. al-Mundhir of Hirns (d. 162 = 163/778-80), sometimes with an isuad going back to Kath al-Abbar. Others were spread by the Damascene Abu Bake b. Abi Maryam (d. 156/773). Further traditions of this type, known apparently in both Syria and Egypt, came from transmission of Diabir (al-Dju'ff) from Abū Dja'far (Muhammad al-Bāķir), perhaps ill book form. Since Diable died in 132/750 at the latest, it is evident that this attribution is spurious. Some of these traditions describe in considerable detail the rise and career of the Sufyani, his conquest and sacking of Kūfa, his defeats at the hands of Shutayb, and the joining of the black flags from the Mashrik with the yellow flags from the Maghrib at the navel (surra) of Syria, i.e. Damascus. The death of Muhammad b. 'Abd Allah is reflected in predictions, contained in the accounts ascribed to Djabir and Artat, that the Pure Soul (al-Nafs al-Zakiyya), a descendant of the Prophet, would be killed in the strife about Medina on the Abdiar al-Zayt. The Mahdi will appear in Mecca, receive the allegiance of Shu'ayb, and after further fighting will defeat the Kalbi army and kill the Sufyani, According to Syrian prophecies, he will reside in Jerusalem. His reign will last 24, 30, 39, or 40 years and he will be succeeded by caliphs of his family or by the Rahtani. The Mahdi thus is not closely associated in these traditions with the end of the world, but some of them predict a second Mahdl who would conquer Constantinople and surrender the rule to Jesus upon his descent from heaven.

Despite the rapid spread of traditions about the coming of the Mahdl, opposition to the belief in him as expressed earlier by al-Haşan al-Başıl did not entirely disappear among the hadith scholars. The Yemenite Muhammad b, Khalid al-Djanudi clad this opposition into a hadith of the Prophet, providing it with an issed through al-Hasan al-Başri to the Companion Anas, "Matters will only grow in hardship, the world will only increase in backward movement, and the people in greed. The Hour will rise only in the worst of people. There will in no Mahdi but 'Isa b. Maryam''. The badith was given added prestige by the fact that al-Shatif (d. 204/820) transmitted it from al-Djanadi. Included by Ibn Madia in his Sunan, it was later interpreted by supporters of the belief in the Mahdl as meaning that no-one spoke in the cradle (mahd) except Jesus in that the Mahdi would rule only in accordance with the instructions of Jesus since only the latter, as a prophet, was infallible (ma'sam). Many hadiga experts, among them al-Nasa'i, and Ibn Kayyim al-Djawziyya, rejected it as inauthentic. Lingering doubts concerning the Mahdi may partly account for the absence of any traditions about him in the Sahis of al-Bukhari and Muslim. The Mahdi traditions contained in the canonical Sumni hadiga and al-Nasa'i as well as the Musmad of Ibn Hanbal were, however, numerous enough to provide a solld basis for the popular belief in the Mahdi.

Later developments. Traditions about the Mahdl were gathered also in the post-classical collections of hadith like those of al-Tabarani, ... Ḥākim al-Naysābūrī, and al-Bayhaķī. The eschatological rôle of the Mahdi became generally more pronounced. The view that the Mahdi would rule the Muslim community at the time of the descent of Jesus was commonly accepted doctrine were that he was identified with the leader of the prayer of the Muslims mentioned anonymously in earlier traditions who would offer to surrender his leadership to Jesus. Abu 'l-Hasan al-Aburi (d. 363/959) in his book on the merits (manāhib) of al-Shāfi's could claim a broad, successive transmission (tawatur) of Mahdl traditions giving certainty that he would be of the Muslim community and that Jesus would pray behind him. Some of the acts which, according to earlier traditions, Jesus was to perform after his descent were now ascribed to the Mahdi, who would also aid him in the killing of the Dadidial [q.v.]. The Mahdi was more and more associated, too, with the great Muslim conquests predicted in maldhim traditions for the final time of the world, especially those of Constantinople and Rome (Rümiyya), and was described as the ruler of the whole world. These tendencies are apparent in the traditions quoted by Abū Nu'aym al-Islahāni (d. 45%/1066), who composed at least three different collections of kadities on the Mahdl.

A new dimension in the career of the Mahdi appeared in the K. al-Tadhbira of Abu 'Abd Allah al-Kurtubi (d. 672/1072) who quoted meet traditions according to which he would first appear in Massa in the Sus in the Extreme Maghrib and only later would receive a second oath of allegiance in Mecca. He would, moreover, gather an army of Berber tribes and cross the straits to al-Andalus, whose earlier plight and spoliation at the hands of the infidels is graphically described. The Mahdl would then preach in the mosque of Seville, receive the allegiance of all the Muslims and conquer seventy towns of the Rum, Finally, he would sack the Church of Gold (kanisas al-dhahab), but = his followers would quarrel over the division of the staff of Moses found there, the Rum would gain the upper hand and pursue the Muslims in far as al-Payyum in Egypt before the final victory of the Mahdl. These traditions, according to one of which the Mahdl was to appear in 599/1202-3, are of late origin. They probably reflect the appearance of the IIII Ibn Tumart (d. 524/1130 [q.v.]) but express the hope for another Mahdi to reconquer al-Andalus. Ibn Tümart does not mention or allude to them in his description of the Mahdi. Ibn Khaldun, however, describes some similar beliefs propagated by western Suffs, Ibn Kasi (d. 536/2141), Ibn al-Arabi (d. 638/1140), Ibn Sab'In (d. 623-4/1226-7) and his disciple Ibn Abi Wāţii, quoting a work of the latter. These Şūfia, according to Ibn Kbaldün, predicted that the Mahdi would appear in the Maghrib. He further reports that many people until his own time expected the advent of Mahdi at the fortress (ribd!) of Massa and travelled there in the hope of meeting him and pledging allegiance to him. At the beginning of the 8th/t4th century, man pretending to be the Mahdi had gained some support there, but had man been killed by the chiefs of the Maşmida. Belief that the Mahdi would arise in Morocco remained widespread there until modern times.

Eastern and Egyptian tradition largely ignored this development. Treatises dealing specifically with the Mahdi, assembling large numbers of traditions from the earlier collections, were produced by late traditionists like Yūsuf b. Yahyā al-Makdisl al-Sulam! al-Dimaghki, author of a 'Ikd al-durar fi akhbar al-muntapar composed in 658/1260; al-Suyūţī (d. 911/1505), who in his al- Arf al-wards fi akhbar al-Makdi used Abū Nufaym al-Işishâni's "Forty hadiths on the Mahdi" as a base, adding to it extensively from other sources; and Ibn Hadjar al-Haytami (d. 973/1565) who, besides writing two treatises on the Mahdi, of which al-Kaul al-mukhtasar fi 'alamat al-Mahat al-muntapar is extent, included a discussion of the subject in his anti-Shi'l polemic al-Sawarik al-muhrika. The general tendency of these treatises was to harmonise the divergent traditions. A few questions still aroused controversy. While Abu Nucaym al-Istahani had clearly tayoured bolief that the Mahdi would be a descendant of al-Husayn, Ibn Kayyim al-Diawziyya, followed by Ibn Hadjar al-Haytami, held the traditions affirming that the Mahdi would be a Hasanid to be better authenticated and argued that God preferred the descendants of al-Hasau in this respect since the latter had voluntarily renounced the caliphate out of compassion for the Muslim community while al-Husayn had waged a war coveting it. This argument was refuted by 'Ali al-Harawi al-Kāri (d. 1014/1606) in his al-Mashrab al-wardi fl madhkab al-Mahdi, and 'Abd al-Rahman al-Aydarusi (d. 1192/1778), himself m descendant of al-Husayn, supported the view that a Husaynid would become the Mahdl. A theological problem arose about the prediction that Jesus would pray behind the Mahdi, Al-Taftazānī (d. 792/1390) argued in his commentary on the creed of al-Nasaff that, according to the sounder view, the Mahdi would follow Jesus in prayer since the latter, as prophet, excelled him in religious rank. This view was rejected by Ihn Badiar al-Haytami and others with the argument that the initial prayer of Jesus behind the Mahdi was meant to signify his subjection to the short's of Islam, not the superiority of the Mahdl. The fatter might therefore, as some traditions indicated, later pray behind Jesus. On the other hand, al-Suyuti, followed by al-Haytami, objected to the traditions raising the Mahdi in rank above Abu Bakr and Umar as in conflict with the consensus that | two caliphs were the most excellent of mankind after the prophets. The objection was rejected by 'Ali al-Karl and Muhammad b. 'Abd al-Rasul al-Barazandil 🗎 his al-Isha'a fi ashral al-sa'a (finished in 1076/1665-6) with the argument that the consensus in this matter did not extend to the future. Influenced by Suff ideas, they maintained that the Mahdl, being infallible (ma'sum) in his judgement, would excel the two caliphs.

A Suff doctrine on the had been expounded by Ibn al-Sarabi in chapter 366 of his al-Fuddid al-Makkeyys. He described the expected Mahdi, a

descendant of al-Hasan, in the Seal of the Saints (their al-awring), just as Muhammad had been the Seal of the Prophets. The Mahdi would impose the law of Islam with the sword and jesus would he one of his maries. He would be infallible in his iditihād without relying on legal analogy (£1948), and the futation of the schools would be his opponents while the Suff saints would in his natural supporters. These views were further elaborated in the Suff circles dependent on Ibn al-'Arabi's thought. A different Suff doctrine, refuted at length by 'All al-Karl, was that of the Indian Shaykh 'Abd Allah al-Hindi Makhdum al-Mulk [see 'ABD ALLAH BULTANFÜR! in Suppl.], who taught that both the Mahdl and Jesus would apply the legal doctrine of Abh Hanita. This view was still propagated by Hanafi skeyhh in Medina in the time of al-Barazandil, who succeeded in discrediting him. 'All al-Karl also consured the doctrine of the Mahdiyya who believed that their former skayhh, who had died in Khurasan, had been the Mahdi and considered all Muslims denying this claim as infidels [see MANDAWIYVA],

In spite of the support of the belief in the Mahdi by some prominent traditionists and Stifs, it never became an essential part of Sumal religious doorline. Sunal creeds mention it but rarely. Many famous scholars like al-Ghazāli avoided discussing the subject. This attitude often probably less motivated by doubts concerning the truth of the belief than by fear of encouraging politically disruptive movements in the Muslim community. Open criticism of the belief like that of Ibn Khaldun who, in his Musaddisa, undertook to refute the authenticity of all haddin concerning the Mahdi, was exceptional.

Among the Shifa, especially the Shi'l doctrine. more radical groups, longing for a restorer of justice and religion has usually been most intense. Belief in the coming of the Mahdl of the Family of the Prophet became a central aspect of the faith in radical Shiftism in contrast to Sunnism. Distinctively Shift was also the common belief in a temporary absence or occultation (*ghayba*) of the Mahdl and his eventual return in glory. As various members of the All al-Bayl were identified as the Mahdl but failed fulfill the expectations about him in their lifetime, their followers transferred their hopes to a second coming. The pattern was already set in regard to Muhammad b. al-Hanatiyya, whose death denied by the Kaysaniyya [q.v.]. They believed that 🌃 was hidden in the mountains of Radwa and would return to rule the world. Similar beliefs arose around Muhammad h. al-Hanatiyya's son Abū Hā<u>sh</u>im. (d. 98/716), the Diafarid 'Abd Aliah b. Mufawiya (d. ca. 130/748), Muhammad b. 'Abd Allah al-Nafs al-Zakiyya (d. 145/762), Diaffar al-Şâdik (d. 148/765) and manufacturies other 'Alids during the next centuries. The Shift Mahdl was commonly given the epithet al-Kā'im, the first one perhaps Muhammad b. al-Hanaliyya in his occultation. It has been suggested that the term may me connected with the epithet Adres found in Aramaic Samaritan texts and translated into Greek as kortos (see G. Widengren, Muhammad the Apostle of God and his ascension, Upppala 1955, 79; P. Crone and M. Cook, Hagariem, Cambridge 1977, 165). In Samaritan and gnostic usage, the term appears to have the meaning of "the living one". Whatever the origin of the Arabic term, it is clear that in Shifi usage it meet to be understood as the one who will rise and rule (see ga'rs at MUHAMMAD]. It was in common use before the end of the Umayyad age and largely replaced the term Mahdi in Imāmī tradition.

Doctrine on the ghayba of the Mahdi was greatly developed after the death of the seventh Imam Musa al-Kārim (183/799) among the Wāķifa [q.v.], who considered him the last Imdm and expected his return the Mahdl. While most of them believed that he had not died and was alive hiding, others beld that he had died and would rise from death. They relied on statements attributed to Imam Diaffar to the effect that the Mahdi was called the Karim because he would rise (yakam) after having died. A book on the ghayba was written by one of the founders of the Wākifa in Kula, al-Hasan b. 'All b. Abl Hamza al-Bata'ini. Other books on the ghayba are known to have been written by the Küfan Wāķifls 'Abd Alfāh b. Diabala (d. 210/834), 'All b. 'Umar al-A'radi, 'All b. al-Hasan al-Tatari (d. 253/876-7), and al-Hasan b. Muhammad b. Sama's (d. 253/876-7). A Wakifi was perhaps also Ibrāhim b. Sālib al-Anmāti (Kūfan. first half of the 3rd/9th century), author of a K. al-Ghayba. Books on the ghayba were, however, in the same period also composed by some ImamI scholars who believed in the continuation of the imāmate after Mūsā, like al-'Abbāc al-Nāshirī (d. 219 or 220/834-5) and the Kufan Fathl 'All b.

al-Hasan b. Faddal. The doctrine of the theybe thus well-documented by traditions of the Imams before the occuitation of the Twelfth Imam whom the majority of the Imamiyya came m consider as the Mahdi after the death of the eleventh, al-Hasan b. "All al-'Askarl, in 260/874. Such earlier traditions could now be used and adapted to support the doctrine of the Mahdiship of the Twelfth Imdm. Of Wakifl origin was, for instance, the tradition attributed to Imdie Muhammad al-Bakir and transmitted by al-Hasan 'All b. Abl Hamza and man applied to the Twelfth Imam: "In the Lord of this Order (sahib hadha alamir) there will be a precedent (summa) from Moses, a precedent from Jesus, a precedent from Joseph, and a precedent from Muhammad. As for the precedent from Moses, he will be afraid and watchful [khá²if yatarakkab); as for Jesus, it will be said about him what was said about lesus; as for loseph, imprisonment and concealment (al-sidin wa "l-ghayba); as for Muhammad, his rising with the sword, following his conduct and explaining his traditions. . ." The tradition clearly refers to the imprisonment of Müsä al-Kāzim and to the laise claim that he had been killed by his enemies. Also of Wakifl origin were traditions attributed to Imam Daffar about the two occultations (ghaybaldn) of the Mahdl like the following: "The Master of this Order will have two occultations. One will be longer so that it will even be sald, 'He has died'; and some will say, 'He has been killed'. No one but a few of his followers will remain toyal to him. None of his sons nor anyone else will have knowledge of his place except the client in charge of his affairs". The two absences referred to the two arrests of Imam Musa who had been briefly amprisoned under the caliph al-Mahdl before his final imprisonment by Harim at-Rashid from which iii did not return. Such traditions and now interpreted as referring to the Lesser and the Greater chayba [q.v.] of the Twelfth Imam. Twelver Shift doctrine on the Kalim-Mahdi and on his Occultation, based on traditions attributed to the Imams, was authoritatively elaborated by Muhammad b. Ibrāhīm al-Nufmānī (middle of the 4th/20th century) in his K. al-Ghayda, by Ibn Bábûya (d. 381/991) in his I kmd! al-din, and by Shaykh al-Tusi (d. 460/1068) in his K. at-Ghayba.

Imami traditions about the more of the Mahdi

after his advent largely reflect Sunni traditions. He will be the lord of the sword and rule the world. Jesus will pray behind him after his descent from heaven. This did not raise a theological problem in Sunnism, since the Mabdi, like all other Imdens, according to prevalent imami doctrine, excels all prophets except Muhammad in religious rank. Specifically ShIT is the expectation that the MahdI will force all Muslims to accept the Shiff belief. Imam Diaffar is quoted as stating: 'When the Ka'im of rises, he will offer the faith to every opponent (i.e. of 'All, nasib). Either he will enter in it truly, or he will cut his neck or force him to pay the dilaya as the non-Muslims (ahl al-dhimma) pay it now. He will gird himself with a travel bag we expel them from the towns to the countryside (saudd)". The Karim will also enforce the law as laid down by the Imams, and accordingly prevent Muslims from repudiating their wives except by the falak al-sunna. The Mahdi thus was expected to restore the shariful of Islam integrally, and this has always been orthodox Imami doctrine. More radical doctrine was propagated by the Karāmita [see KARMATI], who held that the Mahd! would abrogate the sharl's and bring a new mossage. According to al-Nawbakhti (Firak al-shita, ed. H. Ritter, Istanbul 1931, 62), they interpreted a statement ascribed to Imam Diafar, "If our Ka2im were to rise you would learn the Kur'an anew", in that sense. Similar ideas appear to be expressed in another statement ascribed to Imam Diaffar, "When our Kalim rises, he will bring a different order than what was before (dia a bi-amria ghayri 'l-ladhi kāna)".

Countering Sunni criticism, Imami apologetics endeavoured to prove that the description of the Mahdl contained in Sunni hadiths applied to the Twelfth I sades and that the longevity of the Mahdl implied in the doctrine of the ghayba was not unreasonable in with of revealed data about Khide, Jesus, and the Dadidiāl, and secular reports about long-lived men (mu'ammarin). Such apologetics gained considerable momentum in the middle of the 7th/13th century when several Sutual scholars supported the Imami belief that the Twelfth Imam was the Expected Mahdl. In 648/1250-1 the Syrian Shafi9 traditionist Muhammad b. Yüsuf al-Gandil al-Kurashi, later (658/1260) murdered in Damascus for co-operation with the Mongol conquerors, composed a K. al-Bayda fi akhbār şāḥib al-zamān III which he proved the Mahdiship of the Twelfth Imam relying solely on Sunni traditions. In 650/1252 Kamel al-Din Muhammad b. Talba al-Adawl al-Nistbini, a Shaiff scholar and former vizier of the Artukid al-Mailie al-Sa'ld of Mardin, completed in Aleppo his Majdio al-su'al /I mandkib al al-rasul in which he supported the imamate of the Twelve Imama and answered Sunni objections to the belief that the Twelfth Indm was the Mahdl. The Sibt Ibn al-Dlawel, shortly before his death in 654/1256 in Damascus, wrote his Tadhkirat khawass al-umma bi-dhike khasabis al-alimma assembling reports from Sunni about the virtues of 'All and his descendants, especially the Twelve Imoms, and at the end affirmed that the Twelfth Imdm was the Lord of the Time, the Expected Karim and Mahdi. In support, he quoted the following hadilly, terming it well-known (mashhar), "The Messenger of God said, 'At the end of time, a man of my descendants will me forth whose name is like my name and whose kunya is like my Annya. He will fill the earth with justice as it was filled with injustice. That is the Mahdl' ". He thus avoided one of the major Sunni objections

to the Mahdiship of the Twelfth Imdm, Muhammad b. al-Hasan, viz. that the hadith of 'Asim in its expanded form stipulated the identity of the father's of the Mahdl with that of Mil Prophet's father. Al-Gandil, on the other hand, quoted the testimony of al-Aburi that this stipulation had been added to the hadith by the Kütan transmitter Zā'ida (d. 160-1/ 777-8). A problem was also about the Sunni kadita, related by Ibn Hanbal and others, "The Prophet said, 'A community will not perish among whom I am the first, Jesus is the last, and the Mahdi is in the middle (ft wasatih)". This implied that Jesus would remain after the Mahdl and there would be -Imam before the end of the world, as against = cardinal Imami dogma. Al-Gandji therefore interpreted the hadily at meaning that lesus should the last caller (day) inviting mankind to accept islam but would not survive the Mahdi.

Testimony in support of the Mahdiship of the Twelfth Imdm by these Sunni authors, as also of later ones like the Maliki scholar Ibn al-Sabbagh al-lefāķusi al-Makki (d. 855/1451), a Maghribi resident in Mecca, and, more recently, the Hanaff Nakshbandi Shaykh Sulayman b. Ibrahim al-Kundurl al-Balkhi (d. 1294/1877 in Istanbul), was regularly noted by Imami apologists. The works of al-Gandil and Kamal al-Dln Ibn Talha were extensively quoted already by 'All b, 'Isa al-Irbili (d. 692/1293) in his Kashf al-ghumma fi ma'rifat ala²imma, which in turn won positive comment from Sunnt authors because of its extensive reliance on Sunot sources. Further support for the Mahdiship of the Twelfth Imam came from Sufi circles. Already Abû Bakr al-Bayhaki (d. 458/1066) had noted that some Suff gnostics (diama'a min all alhash/) agreed with the Imami doctrine about the identity of the Mahdl and his ghayba. The Persian Sufi Sade al-Din Ibrāhim al-Hammūyi (late 7th/13th century) supported Imami doctrine on the Mahdi in his Fard'id al-simte yn. The Egyptian Soff al-Sha'rani, while generally showing no sympathy for Shrism, affirmed in his al-Yawakli wa 'l-djawakir (written in 958/1551) that the Mahdi was a son of Imam al-Hasan al-'Askari born in the year 255/869 and would remain alive until his meeting with Jesus. His advent could m expected after the year 1030/1621. He based his assertion on the testimony of the Sun Shaykh Hasan al-Iraid, who claimed to have met the Mahdi, and on a spurious quotation from Ibn al-'Arabl's al-Futühät al-Makkiyya identifying the Expected Mahdi with the Twelfth Imam. This quotation of Ibn al-'Arabi was noted and accepted by both Imami and Sunni scholars. The Egyptian Shaykh al-Şabban (d. 1206/1792), in his 7s'4/ alrüghibin fi strat al-Mustaja wa-jadd'il ahi baytih altakists, consured Ibn al-'Arabl for supporting such a view against the clear evidence of the traditions accepted by Sunni scholars. Al-Şabbān was in turn taken to task for criticising 1bn al-'Arabi by Hasan al-Tdwl al-Hamzawl (q.u. in Suppl.), who in his Maskarik al-anwas (lirst published in 1275/1858-9) maintained that the Sufl gnostics were the most truthful interpreters of the prophetic tradition. In order to blunt the ShI'l implications of al-Sha'rani's statement, al-'Idwi quoted it, adding a thousand years to the hirthdate of the Mahdl and suppressing both the date for his advent and Shaykh Hasan al-frakt's claim to have met him. The Mahdi thus was born in 1255/1839 and was merely a descendant of the eleventh Imam, not the Twelfth Imam of the Shi'a. Al-'Idwi's false quotation of al-Sha'rani was copied by the Egyptian Shaykh al-Shablandil in his Núe al-abide fi manății al-nabi al-muhite composed in 1290/1873.

In pre-Fatimid Isma lism, the terms Mahdi and Kā'im were both used, as in Imami Shi'ism, for the expected messianic Imam. After the rise of the Fatimids, some of the predictions concerning the held to have been realised by the Fatimid caliph al-Mahdi, the founder of the dynasty, while others would be fulfilled by his successors. This theory was elaborated by the Kadi al-Numan (d. 363/974) in his K. Shark al-akbar where he quoted numerous traditions about the Mahdl from Sunni, Imami, and Zaydi sources and applied them to al-Mahdl and his successors, partially by interpreting them figuratively (see W. Ivanov, Ismaili tradition concerning the rise of the Falimids, London 1942, 97-122, Ar. texts, 1-31). The mane al-Mahdi was henceforth reserved to the first Fatimid caliph, while the eschatological Imam and Seventh Apostle still expected for the future was only called the Kāžim.

Among the Zaydis, whose doctrine ill not raise the nature of the Indone to a superhuman level, Mahdi expectations have generally been weak or ginal. The heresiographer Abu Isa al-Wacrak reported that some Zaydī groups (Diārūdiyya) expected the return of Muhammad b. Abd Allah al-Nafs al-Zakiyya, Muhammad b. al-Kāsim Sāhib al-Tātikāu (d. 219/634), or Yahyā b. 'Umar, who led a popular revolt in Kaia in 250/864. Their views have, however, left no trace in Zaydi tradition. A more serious Mahdistic movement arose in the Yaman around the Zaydi Imam al-Husayn b. al-Kāsim al-'(yān) (401-4/1010-13), who claimed to be the Expected Mahdl. His death was denied by his family and followers, known as the Husaynlyya, and his successors did not claim the title of Imam in expectation of his return. The sect of the Husayniyya, opposed by the majority of the Zaydis, survived until 8th/14th century. It is characteristic for the insignificance of Mahdl expectations among the Zaydla that the Sayyid Hamidan (7th/13th century), representing ZaydI orthodoxy, could recognise al-Husayn b. al-Käsim as the Mahdl, who had appeared at the time predicted by the Prophet, while censuring those of his supporters who raised his rank above that of the Zaydl Imams before him and refused to recognise those after him (see W. Madelung, Der Imam al-Qasim ibn Ibrahim, Berlin 1955, 198-201).

(W. MADELUNG)
AL-MARIDI, AND SAND ALLER MURANMAD, the

third Abbasid callph.

The son of the caliph ai-Mansur, he was born, probably in 126 or 127/743-5 in Idhadi in Khūzistān when his father was involved in the ill-fated rebellion of 'Abd Allah b. Mu'awiya [q.v.] against the Umayyads in that area. As toon as he was of age, his father began to train him in political affairs. In 141/758-9 he was sent to Rayy as governor of Khurāsan. He did not settle in Marw himself or take an active part in the campaigns against the various robels in the area, but remained in Rayy acting as an intermediary between the Khurāsāni supporters of the regime and the caliph in 'Irak, This role enabled him to build up a substantial following among the Khurasants, who were to be his main supporters in his struggle to secure the succession to the caliphate. In 144/762 he visited 'Irak briefly to marry his first cousin Rayta, daughter of the first 'Abbasid caliph al-Saffāh, before returning to Khurāsān, where he remained until 151/768. He had his own court in Ravy, and a new administrative quarter was added to the city during period of his residence.

Al-Saifah had laid down that al-Mansur should be succeeded as caliph by his nephew 'Isa b. Musa, but after his accession al-Mansur worked to secure a position for al-Mahdi; in 141/758-9 he was made 'Isa's heir, while in 147/764 pressure from the caliph, and from the Khurasani soldiers stationed in 'Irak, forced 'Isa to resign his position and accept al-Mahdi

as heir-apparent.

On the death of al-Mansûr, on the Pilgrimage of 158/October 775, al-Mahdi, who man already ■ Baghdad, succeeded to the throne without opposition. Al-Mahdi's policies were in many ways a continuation. of his father's, will like al-Mansur he continued torely on the Khurasani army and members of the 'Abbasid family as the main supporters of the régime. He to have emphasised more strongly than his two predecessors the religious nature of his office the role of the caliph as the champion of Islam. His regnal title of al-Mahdi, a title previously adopted by 'Alid pretenders to the caliphate, was an indication of this. He also showed his concern for religion by the enlargement of mosques, at Mecca and Başra and the Aksa in Jerusalem, by improving the water supply on the Pilgrimage route from Trak to the Hidiaz and by organising expeditions against the Byzantines. The concern for the hadidi and the dishad was part of a policy to establish the caliph = leader of the Muslim community as a whole. He also sought to maintain the purity of the religion by vigorous suppression of the zindiks [q.v.], dualist or gnostic heretics, some of whom were executed.

He attempted in heal the rift which had developed in the family of the Prophet between the 'Abbāsids and the 'Alids and which had led to the rebellion of Muhammad "the Purn Soul" in 145/762. He invited members of the 'Alid family to court and grant- them pensions, in well as trying to reconcile their traditional supporters among the people of Medina by recruiting a guard of Ansār and by the distribution of largesse. In the main, this policy seems to have been successful and there were no large-scale

'Alid disturbances during the reign.

Al-Mahdi's main adviser in his relations with the 'Alid was the maxiv Ya'\tilde{u}b b. Dawdd, who had made contacts with members of the family in prison and who in 160/777 placed his services at the disposal of the caliph. Ya'\tilde{u}b succeeded in reconciling with the caliph some prominent 'Alid dissidents, and in doing so acquired power, supervising almost the entire administration and most government appointments. He failed however, to win over the most active and militant 'Alid, 'Isa b. Zayd, who continued in hiding as a focus for opposition and this failure, coupled with resentment felt by many others at court against his influence, led to his fail

and imprisonment in 166/782-3.

The power attained by Ya'kûb points to the general increase in power of the bureaucracy and the secretaries (huttāb, sing. hātīb [q.v.]) during the reign of al-Mahdi. Until this time, the hattāb had acted as individual secretaries to rulers but now, under the leadership of the Barmakid [see AL-BARA-MIKA] family, they came to form an important pressure group at court. From 161/777-8, Yahya b. Khālid al-Barmakī became tutor and adviser to the young prince Haran, later the caliph al-Rashid, thus becoming one of the most influential figures court. The rise of the kuildo at this time provoked reaction among the leaders of the Khurāsāni army, who felt that their position was being threatened. and the caliph was warned that he was in danger of losing the support of his army by his great-uncle 'Abd al-Samad B. 'All, The tension between the bureaucrats and the military which originated at this time was to be a continuing feature of 'Abbasid politics.

Al-Mahdi's reign was in the main a period of peace and prosperity. There were disturbances in Khurāṣān, notably the prolonged rebellion of al-Muḥanna' [q.e.] between about 159/775-6 and 163/780,

which was only suppressed by considerable military effort. Elsewhere, Muslim armies expanded the influence of the caliphate; on the eastern frontiers of Khurasan, Farghana [q.v.] was attacked, and al-Ya'kûbî gives a somewhat fanciful list of eastern monarchs who are said to have acknowledged the caliph's authority, including the Kings of Tibet and China. There was also a maritime expedition against the unbelievers in Sind. As usual, however, the main military effort was concentrated on the Byzantine frontier. In 162/778-9 the Byzantines destroyed the Muslim outpost of al-Hadath [q.v.], and the caliph responded by sending his son Hārim on two expeditions in 163/780 and 165/782, which raided the empire without making any lasting territorial gains.

Al-Mahdi designated as his heirs two of his sons by his favourite wife al-Khayzuran [q.v.], Mūsā, who took the title of al-Hādi, and Hādan, who took the title of al-Rashid. Both these were given responsibilities in their father's lifetime. Mūsā in Baghdād, where he developed close links with the Kaurāsāni soldiery, and Hārūn in Syria and the Byzantine frontier regions. The arrangement was that Mūsā should succeed and be followed by his brother Hārūn, but there were indications that the caliph, persuaded by al-Khayzurān, was about to change these dispositions at the time of his death. Nothing had been done, however, when he died on 22 Muharram 169/4 August 785 Māsabaihān, probably as the result of a hunting accident.

AL-MAHDI (See IER TÜMART; AL-MARDIYVA).
AL-MAHDI, MURAMMAD B. HISMÂM B. 'ABD AL-DIABBAR B. 'ABD AL-RAHMÂN AL-NÂŞIR, I LE 'L-MALID, eteventh Umayyad caliph of Spain. He held power on two occasions, first as successor to Hispâm II al-Mu'ayyad [q.c.], and again in Sulayman b. Hakam al-Musta'in's [q.c.] place in the period of general rebellion which at the end of the 4th-beginning of the 5th/1th century immediately preceded the establishment throughout Muslim Spain of petty independent rulers, the Mulik al-Tawâ'if [q.v.].

The third of the 'Amirid hadjibs, 'Abd al-Rahman b. al-Mansur, surnamed Sanchol, from the moment he succeeded his brother 'Abd al-Malik al-Muzaffar, abandoned himself to all sorts of excesses and was able to take advantage of the weakness of the titular caliph, Hisham II al-Mu'ayyad, to get himself designated beir-apparent. This decision III once aroused the indignation of various members of the

caliph's family, thus excluded from in throne; they arranged that one of their number, Muhammad b. Hisham b. 'Abd al-Djabbar, a great-grandson of 'Abd al-Rahman III al-Nașir, who had many followers among the mob of Cordova, should head a rebellion. Advantage was taken of an expedition, which 'Abd al-Rahman Sanchol was to lead in person against the Christians of Galicia, to raise the standard of rebellion. On 16 Djumāda II 399/15 February 1009, Muhammad b. Hisham attacked the palace of Cordova, where the callph Hisham was with a small number of followers who had remained faithful to him. He captured the palace and at once took steps to make Hisham sign his abdication and had himself proclaimed caliph. The whole population of Cordova was in arms and plundered the 'Amirid town of al-Madina al-Zāhira [q.v.]. All the treasure accumulated there, including a vast sum in money, was seized and brought to the new caliph who, to destroy 'Amirid power for ever, demolished completely and set fire to the town which the great bddit al-Mansur had built only a few years before. At the same time, Muhammad b. Hisham, who had adopted the honorific lakab of al-Mahdi, took steps to meet the counter-attack expected from 'Abd al-Rahman Sanchol. Warned of what had happened in Cordova and of the destruction of al-Madina al-Zähira, the Addito, full of anxiety, pitched his camp at Calatrava (Kal^cat Rabāh [q.v.]) and endeavoured secure the fidelity of his troops, who mainly Berbers. He was soon forced to witness their detection and went to Cordova in the hope of finding new partisans there. But on the way back he was captured by emissaries of al-Mahdi in a monastery of the Sierra Morena and executed at the end of Diumāda II 399/1 March 1009. His body was crucified in Cordova.

Muhammad al-Mahdl, once the power was in his hands, soon alienated the principal Berber chiefs of his army as well as his relatives of the Umayyad house. A rebellion against him was planned by his adversaries. The Berbers put at their head Umayyad pretender, Hisham b. Sulayman b. al-Naşir, whom they proclaimed callph with the title al-Rashid, and laid siege to Cordova. Al-Mahdi made a sortle, routed them and the pretender was killed. The Berbers then chose a new Umayyad prince, Sulayman b. al-Hakam, and at the meet time appealed for assistance to Sancho Garcez and his Castilians. In spite of all the efforts of al-Mahdi, the blockade of Cordova became more and more strict. He then tried to put on the throne the caliph Hisham II b. al-Mu'ayyad whom he had himself deposed and then given out as dead, but this was in vain. On MI Rable I 400/2 November 1009 the palace of the caliph was in the hands of the besiegers. Al-Mahdi's only hope was to hide himself. The pretender of the Berbers, Sulayman, received the oath of alligiance at Cordova and assumed the honorific title of al-Mustafin bi'lläh.

In the following month, al-Mahdl was able to leave Cordova secretly and seek refuge in Toledo, where he was well received by the inhabitants. He then sought and obtained an alliance with the Catalans (Ifrandi) who marched with him on Cordova in Shawwal 400/May-June 1910. The town was taken and the second reign of al-Mahdl began with a bloody persecution of all the Berbers in Cordova. To avenge the wrongs of their fellow-countrymen in the capital, the Berbers in the army of Sulayman al-Musta'in returned to besiege the city. Al-Mahdl, betrayed by his retainers, was slain during the siege

in the palace in Cordeva by some 'Amirid slaves
Dhu '1-Hididla 400/23 July 1010. His first reign
had lasted nine months, the second less than two.

vizier of the later Nawwibs of Awadh. He started his career from the early reign of Nawwab Sa'adat 'All Khan (1798-1814) as a thakladdr (an officer of one of the revenue districts) of Shakla Muhammadi and then of Faydabad. His administration made the Maklas under his control exceedingly prosperous. He himself became fabalously rich and was made a minister. Early in the reign of Sa'ādat 'Ali Khān's successor Ghāzi al-Dīn Haydar (1814-27), Mahdi 'All lost his position because of his resentments at the interference of the Awadh Resident Colonal Bailtie with the Awadh administration. Much of his property was seized and he was imprisoned. After his release from prison, he moved to the British territory at Fathgarh in 1824 and began to live in a grand style. After the death of Chazi al-Din Haydar in October 1827, his son Nasir al-Din Haydar appointed Mahoti 'Ali as his ndio (chief minister). The Governor-General Lord William Bentinck was highly impressed by Mahdl 'All's administrative abilities and supported his schemes. Mahdl 'All reduced the salaries of undeserving favourites of the court, slashed the stipend of the ladies of the palace and even curtailed the expenses of the King. After four years of strong rule he was dismissed in 1832 in the pretext of behaving arrogantly towards the Queen Mother and an incompetent minister called Rawshan al-Dawla was appointed in his piace. The reforms introduced by Mahdi 'All were speedily reversed and the prosperity of the kingdom declined. All retired to Farrukhābād and died in obscurity.

MAHDI KHAN ASTARABĀDI, Misza (Mu-HAMMAD), court secretary and historian of Nādir Shāh of Iran (reigned 1148-60/1736-47), author of the Tairibh-i Nādiri (also known = Diahāngushā-yi Nādiri).

Little is known for certain about the life of Mirza Mahdi Khān, not even the dates of his birth and death. The tathalias by which he is sometimes called, Kawkabi, is likewise disputed (Shahdi, pp. md). He was presumably born at Astarabad, the son of m Muhammad Nasir, and apparently moved to the capital Islahan during the twilight of the Safawid dynasty or the Afghan occupation of Iran. According to documents in his collected official

correspondence (Mungka'dt; see Anwar, pp. sik, pandi: Shakidi, pp. mdi), he wrote m formal congratulation to Nadir 🚥 his capture of Işfahān 🖮 1142/1729. For the next seventeen years he served Nadir as head in the secretarist (municiple al-mamatik). then after his coronations as official historian (maks) a miwis). In spring of 1160/1747 he was sent together with Muşçafa Khān Bigdili Shāmid on an embassy to the Ottoman court in order to ratify the peace treaty recently concluded by Nadir, They had gone no farther than Baghdad when the news of the Shah's assassination overtook them, and the embassy was discontinued. Mirza Mahdi returned to Iran and spent the remainder of his life in retirement -whether at Mashhad, Tabriz or elsewhere is uncertain-completing the historical and philological works which he had begun during his service with Nadir. He died some time between 1162/1749 and 1182/1768.

Mīrzā Mahdī is chiefly remembered for his two histories of Nadir Shah, the Djahangusha-yi Nadirl and the Durra-yi nadira. The former is a detailed year-by-year record of Nadir's career, particularly of his military campaigns, though marred by an expedient eulogy of his patron; it became the inspiration and model for several histories of the subsequent Alsharid and Zand periods, notably the Taribh-i Giti-gushā of Mīrzā Şādiķ Nāmī. The Durra-yi nādira ("Rare pearl") treats the same material in the florid and abstruse style initiated by the Il-Khanid historian Wassaf, as a tour-de-force of forced metaphors and Arabic quotations, Mirzi Mahdi also made valuable contributions to Turkish studies with his Sanglakh, a Persian dictionary of eastern Turkish (Caghatay) based on the poetry of Mir 'All Shir Nawa", and with his Caghatay grammar, Maddel al-lugha.

Bibliography: Mirză Mahdi's works have been nublished in the following editions, which provide further information about the manuscripts available and the author's life and works: Durra-yi addira, ed. Sayyid Diafar Shahidi, Tehran 1341/ 1963; Djahangusha yi Nadiri, ed. Sayyid 'Abd Allah Anwar, Tehran 1341/1963 (this work was translated by Sir William Jones into French Histoire de Nader-Chah, Paris 1770, and into English in m abridged version, The history of the life of Nadir Shan, London 1773-both versions being uncritical and inaccurate); Maddel al-lughe, ed. E. Denison Ross, Calcutta 1910; Munsha'dt-i Mahdi, Tehran 1285/1868-9; Sanglaz, ed. Sir Gerard Clauson, GMS N.S. v. London 1960. See also L. Lockhart, Nadir Shah, London 1938, 292-6. (J. R. PERRY)

AL-MAHDI LI-DIN ALLAH AHMAD, a title and name of m number of Zaydi imams of the Yemm.

About 250 years after al-Hādl ils 'i-Hakk Yahya, the founder of the Zaydiyya in the Yemen, his direct descendant, al-Mutawakkil 'ala 'liāh Abmad, had, between 532/1137 and 566/1170, restored Zaydi territory to its extent in al-Hādl's time, with Ṣa'da, Nadirān and, for a time, also Zabīd and Ṣan'ā'. A generation later (593-614/1197-1217) the mountainous region from Ṣa'da in the north to Dhamār, south of Ṣan'ā', was again ruled by the Zaydi al-Mansûr bi'liāh 'Abd Allāh b. Hamza, not m direct descendant of al-Hādl, but of the latter's brother, 'Abd Allāh Al-Mansûr = twice able to enter Ṣan'ā', but his power was severely limited by the last Ayyūbid ruler of the Yemen, al-Mailk al-Mas'dd Yūsu' (612-26/1215-29). After the death of al-Mansûr in

614/1217, the Zaydi house min split, al-Hådi Yabyå b. al-Muhsin, a descendant of al-Hådi ila 'l-Håkk Yahyå, declaring himself inder in Şa'da, while al-Manyûr's sona asserted their right to the mamate further south. An attempt ill heal this long-standing rift within the dynasty was made by

1. Al-Mandi Li-Din Allan Ahmad B. Al-Husayn. His genealogy would appear to have been clearly estimated by the usually reliable Rasúlid genealogist, al-Malik ai-Ashraf 'Umar b. Yúsuf (Twrfat ai-ashāb, 101-2), m follows: Ahmad b. al-Husayn b. Ahmad b. al-Kāsim b. 'Abd Aliāh b. al-Ḥasim b. Ahmad b. Isma'li b. Abi 'l-Barakāt b. Ahmad b. al-Ḥāsim b. Abi 'l-Barakāt b. Ahmad b. al-Ḥāsim b. Abi 'l-Barakāt b. Ahmad b. al-Ḥāsim b. Abi 'l-Barakāt b. Ahmad b. al-Ḥāsim b. Abi 'l-Barakāt b. Ahmad b. al-Ḥāsan b. Ali 'l-Barakāt b. Ibrāhīm b. al-Ḥāsan b. 'Ali b. Abī 'Jakb.

In 646/1248 Ahmad proclaimed himself imam in the fortress of Thula, north-west of San'a', with the support of the Banti Hamza Zaydis, his father's family, and with the possible connivance of the Rasolid fief-holder of San'a', the sultan's nephew, Asad al-Din Muhammad b. al-Hasan, whose loyalty to his family was at best only lukewarm. Ahmad's position was strengthened by the murder in 647/1250 of Nür al-Din 'Umar, the Rasolid sultan, a crime which may have had the support of Asad al-Din Muhammad. The latter continued his fickle behaviour into the sultanate of al-Muzaffar Yusuf, son of Nur al-Din 'Umar, at times appearing to support his family, the Rasillids, against the Zaydi imam al-Mahdi Ahmad, at times flirting with the latter and showing open rebellion against the Rasulids. The mystery is why such an astute leader as al-Muzaffar Yüsüf put up with such behaviour, for his nephew seems to have been able to patch up his quarrels and disloyaltles with his uncle, the sultan, with no difficulty on more than one occasion. The position of al-Mahdl Ahmad improved for a time, for he see able to take Sanfa' in 648/1250; although harrassed by Asad al-Din, who held the fortress of Birush close by, he was able to extend his influence south m far as Dhamar. But within the year ai-Mahdi Ahmad had to ahanden Şan'a. Asad al-Din sold him Birash, but it was me account of this that the final breach between them occurred. Asad al-Din yet again made his peace with his uncle, al-Muzaffar Yūsuf. Al-Mahdi Ahmad's fate, however, was not to be decided by the Rasillids but within the Zaydi camp. Quarrels arose and a rival indm. Shams al-Din Ahmad, announced in 652/1254 in \$a'da. In the next year a Zaydi assembly pronounced Ahmad's deposition. He fought on with the remainder of his followers, but was killed in 656/1258 and buried in Dhu Blu (invariably written Dhibin in the sources).

Shams al-Din Abmad, who adopted the official title of al-Mutawakkil and recognised the Rasülids as his overlords, was at once challenged by a rival imam in the person of Abu Muhammad al-Hasan b. Wahhās. A number of other imams were recognised before

2. AL-MARDI 11-DIN ALLAR ARMAD B. YARYA B. AL-MURTADA b. Ahmad b. al-Murtadā b. al-Murtadā b. al-Murtadā b. al-Murtadā b. al-Murtadā b. Al-Murtadā b. Al-Murtadā b. Al-Murtadā b. Al-Murtadā b. Al-Murtadā b. Al-Martada b. Al-Martada b. Al-Martada b. Al-Martada b. Al-Martada al-Martada al-Martada al-Martada al-Martada al-Martada al-Martada al-Martada al-Dara killed la 193/1351 when thrown from his mule which had been frightened by a bird, a 1948, 'Abd Allāh b. al-Hasan al-Dawwari, with

other Zaydi notables, continued the Zaydi administration for a time on behalf of his sons who were all minors. The Zaydi 'niama', however, assembled in the Diamal al-Din mosque in San'a' and appointed Ahmad b. Yahyā as imām. 'Abd Allāh al-Dawwarl thereupon had 'Ali, the son of al-Nasir, proclaimed imam, and al-Mahdi Ahmad and those supporting him left for Bayt Baws where they were immediately besieged by the rival imam, 'All. For the remainder of that year and into 794/1392 the two claimants to the Zaydi imamate fought for supremacy. Al-Mahdi Ahmad was caught in Mathar, south of Şanta', by forces of his rival, 'All, and languished in prison until 801/1399, ■ period of www years. la that year he was treed with the help of his jailers. He lived on, however, until \$40/1437, when he died near Hadidia of the plague. Ironically, enough, his erstwhile rival the Imam 'All died # San's of the plague in that same year.

The choice of Ibn al-Murtada as Imam was a mistake, inasmuch as be lacked the necessary military and administrative ability. On the other hand, he had another qualification in perfection. As a result of a careful education and a thirst for learning from his youth upwards, he wrote a great deal, dogmatic, legal and paraenetic; he was also a poet and worked at grammar and logic. The kindness of his warders, who supplied him with ink and paper, enabled him to compose the law book al-Ashar fi fith al-a'imma alajhdr (Berlín ms. 4919) on which he wrote a commentary. His most valuable work a still his theological and legal encyclopaedia, ni-Bahr al-sakhkhar (Berlin mss. 4894-4907) on which he likewise wrote a commontary. Although not the work of m original scholar, it is a rich and well-arranged compilation, which deserves attention, if only for the part of the introduction which compares the various religions, as the distinctions between them are seen from quite a different point of view to that of al-Agh arl m al-Shahrastani.

About 80 years after al-Mahd! Ahmad b. Yahya, from 922/1516 onwards, the Turks had begun to occupy Yaman and to hold it with varying fortunes isee Kuth al-Din al-Makki, al-Bark al-yamani fi 1-fath al-Uthmans, in S. de Sacy, in Notices et extraits, iv, 412-504, and A. Rutgers, Historia Jamanac sub Hasano Pascho, Leiden 1838). In his struggle with them al-Mansur billiah al-Kasim b. Muhammad, a descendant of al-Hadi in the seventeenth generation, was able in to. rooo/1591 to restore the present imamate in San'a' (see A. S. Tritton, The rise of the Imams of Sana, Oxford 1925). Of his sons, Muhammad al-Mu'ayyad succeeded him. Even in his reign, but still more after his death in 1054/1644, when his successor Ismā'it, another son of al-Ķāsim, was making his way with difficulty against his many brothers and nephews, one of al-Kāsim's grandsons began to come to the front, afterwards the Imam

3. AL-MARDÎ LI-DIN ALLÎR ARMAD B. AL-HASAN B. AL-KASIM. His father was not Imām, but distinguished himself in the wars against the Turks and was also m scholar. In 1051/1641 he mm in Mecca with many members of his family on the pilgrimage. Just at the accession of Ismā'll, he set out with another cousin against San'a'. At first he came to terms with the Imām, but then fought in different places for his mm hand, e.g. at Thulā and again in the Djabal Wināb. In 1070/1659 he won Hadramawt for Ismā'll, to which the Zaydis had been summoned by the disputes for the throne. When in 1087/1676

on the death of Isma'll he himself assumed the imámate, a nephew, al-Kāsim b. Muhammad al-Mu'ayyad, proclaimed himself imam and was recognised particularly in the remoter territory in the south towards Tihama. A Zaydl assembly of leading Sharlis and 'ulama' met, at which Ahmad was with some difficulty recognised as the legitimate findm. Although this did not mean that he enjoyed the authority III a sovereign, since his rivals and the other amirs remained independent as before, yet peace and security reigned in the country. But Ahmad b. ai-Hasan died soon afterwards in 1092/1681 in al-Ghiras was Shibam, which had been built by the first Turkish conqueror Hasan Pasha, possibly from a bullet wound, sustained in action against . recalcitrant tribe. A notable feature of his comparatively uneventful imamate was his banishment of the Jews from Şan'a', the razing of their synagogue and the building of the Diala mosque on its site (1000-1/1679-80). After the short and weak reign of his son al-Mutawakkil Muhammad (to 1097) 1686), family fends broke out again. Among the later imams of this Kasimid dynasty another Ahmad b. al-Husaya b. al-Kāsim (from 1221/1806) again bore the official title of al-Mahdl ii-Din Allah.

(R. STROTHMANN-[G. R. SHITE and J. R. BLACKBURN])

At-MARDI 'UBAYD ALLAH, the first "manifested" (gāhir) Ismā'lli Imām and the first caliph of the fāṭimid dynastyin Iirlķiya; while the historicity of this fact is conclusively established, there is doubt as to the Fāṭimid origin of 'Ubayd Allāh and subsequently as to the authenticity of his imāmate in the Ismā'lli line.

It would be pointless however, before giving an account of his activity as a sovereign, to digress upon the thorny subject of the mash of the first Fățimid monarch, to which the author of the present article has, morcover, elsewhere devoted substantial consideration (see Bibl.). This study will be confined therefore to exposing the essential features as a means of bringing to light the political and social conditions in which the Ismā'lli da'ess developed in the Orient even before the imamāte fell to 'Ubayd Allāh, then in the Maghrib, on the eve of the foundation of the Fāṭimid caliphate.

The question is whether 'Ubayd Allah-'Abd

Allah according to the Isma Tis, who reject the diminutive form of his name on which Sunni and Khāridil authors agree-possessed an 'Alid ascendancy through a family relationship with Isma'll, the seventh hidden I man, or whether he was quite simply the great-grandson of the day Maymun al-Kaddah [see ABD ALLAH M MAYMUR]. The documentation currently available is insufficient to provide a conclusive answer. It may nevertheless be asserted definitely that it was the seventh I mam, Isma'll [d. = 145/762] who laid the foundations of the Isma'ili movement, then his son Muhammad b. Isma'il who elaborated the doctrine and organised the preaching (da'wa) with the valuable assistance of the dd's Maymun al-Kaddah. It could be concluded that this da'wa in favour of the 'Alid descendants of the Husaynid branch was thus initiated in the period of secrecy (seer), that is, at the beginning of the second half of the 2nd/9th century, and contimued until the end of the 3rd/9th century, to be concluded finally with the "manifestation" (public) of the Imam al-Mahdi.

No sure light can be thrown upon the order of certain succession in which the imamate was transmitted during this long period of secret preaching, and how the imamate effectively passed from the line of Ismā'll to that of the family of al-Kaddāb, because of the variety of contradictory and impassioned opinions which our Sunni and kināridii sources have reproduced with the obvious zeal of their authors. Among the Ismā'lii authors themselves, profound disagreements have survived, depending on whether the sources consulted mm works of doctrine intended for public consumption (sāhir) or esoteric texts reserved for the initiates (bālin).

However, whether al-Mahdi be an authentic 'Alid or a descendant of al-Kaddah, it is appropriate to stress the importance of his role in the considerable development of the da-wa at the moment that was obliged to make it public, beginning from his home in Salamiyya and promulgating it across Persia, Lower Mesopotamia, Syria, Bahrayn, Yeman, Egypt and even the distant Maghrib.

Nourished by the political and social unrest fomented among the Nabataean, Aramaean and Zandi masses in the East, Copts in Egypt and Berbers in Ifrikiya; strengthened, at the time of the decline of the Abbāsid empire, as a result of the spectacular development of the Karmatl or Carmathian movement which extolled the same revolutionary ideal of political reform and egalitarian justice; perfectly organised and covering the various "constituencies" of the Islamic world (dintur), the Ismā'lli preaching ultimately entered, just at the time that al-Mahdi acceded to the imâmate in 285/898, a decisive phase, that of its Maghribi diversion.

Two decisive events influenced this movement of the datwa in the direction of the Maghrib; the Karmati dissidence in the East and the successes of the apostleship of the dast Abb 'Abd Alish in Lesser Kabylia in the West. As for the schism hetween the Karmati movement and the centre of the dasma, it took place at the same time that the imamate fell to al-Mahdi, whose authority the new Karmati chiel, Zikrawayh, refused to recognise. It was thus to fend off the formidable threat posed to Salamiyya that al-Mahdi resigned himself to fleeing this town and setting out towards the far Maghrib at about the end of summer 299/902.

In fact, the apostleship undertaken behalf of the Imām by the da's Abū 'Abd Allāh in this country, among the Kutāma Berbers of Lesser Kabylla,

developed into an open insurrection against the littleigan kingdom of the Aghlabids. Al-Mahd' made his way to Sidjimassa, in the furthest Maghrib, there to await the final victory of Abu 'Abd Allah and his Kutami partisans. His stay in this town was to last five years, until the day that Abu 'Abd Allah, having conquered on his behalf the kingdom of the Banu 'l-Aghlab, arrived there solemnly to present him with power and to escort him to Ifrikiya, where he took possession of the throne at Rakkada on Thursday 20 Rabi' 11 29/6 January 910.

On his accession, the first Fatiruld sovereign was 36 or 37 years old, having been born at 'Askar Mukram in 250 m 260/873 m 874. Isma'lli and Sunni anthors agree in attributing to him qualities of tenacity and prudent wisdom which proved to be of great benefit to him in the course of various vicksitudes between the time of his flight from Sulamiyya and his triumphal entry into Rakkāda.

Al-MahdI was officially proclaimed caliph on the day following his arrival, Friday 21 Rable II 297/7 January 910. The edies of outhronement and proclamation emphasised the restoration of the imamate in the line of descent of the Prophet and of his heir (wast), through his daughter Fatima, and the recovery of the caliphate usurped by the Umay-

yads and the 'Abbasids.

Immediately upon his eathronement, al-Mahdi took in hand the responsibilities of state, letting it be known that he intended to exercise personally the power gained on his behalf by Abū Abd Allāh. He thus eclipsed the prestige of the latter, his brother Abu 'l-Abbā's and certain Kutāma chieftains who, offended, were not slow to foment a conspiracy against him. But, assisted in his role as sovereign by Arab dignitaries who railied to his cause, having earlier served the Aghlabid amirs, al-Mahdi did not hesitate to rid himself of the da't Abū 'Abd Allāh, who was executed along with his brother and their Kutāmi accomplices.

With the same determination, al-Mahdi set about consolidating his authority through energetic suppression of the internal agitation provoked by the elimination of Abu 'Abd Allah. He quelled in rapid succession an attempted insurrection at al-Kaşr al-Kadim, a riot at al-Kayrawan, a rebellion in Tripoli, a revolt by the clan of the Mawstnat in the land of the Rutama and an uprising in Sicily. Having thus pacified his territories, taken firm control of his Arab and Berher subjects and contained the threat of Khāridit tribes (especially the Zanata) hostile to his regime, he rapidly set about establishing in the foundations of the former Aghlabid kingdom a stable and powerful state which he was careful to endow, at an early stage, with a new capital, al-Mahdiyya [q.v.]. Built = a fortress. this coastal site was designed to ensure the security of the sovereign and to serve as an instrument for his policy of prestige and hegemony. For, in order to bring to a successful conclusion his twofold function of Imam and caliph, the first Fatimid monarch was obliged mones to conduct outside his frontiers a tireless campaign on three fronts simultaneously: against his two Muslim rivals, the Abbasids in Egypt and the Umayyads of Spain in the western Maghrib, and the Christian enemy, the Emperor of Byzantium, in Sicily and Calabria.

In view of the fact that the proclamation of the Fatimid caliphate imposed on him the obligation to overthrow both the Umayyad and 'Abbasid "usurpers", al-Mahdi no doubt at first contemplated invading Muslim Spain, where the power of his Cordown rival had been considerably weakened by the revolt of Inn Hafsün. Since the latter had been quick to piedge obedience to him, on his entry into Raktada, the Fāṭimid sovereign sent substantial troops to the western Maghrib to bring the area under his authority and to spread fear on the threshold of the Iberian Peninsula. But internal difficulties and his inability to impose tasting authority on the muraly tribes, especially those of the Zanāta group, beyond Tāhart, seem to have tempered his ambitious towards al-Andalus, the conquest of which represented an unacceptable risk.

Egypt, on the other hand, offered easier pray and to invade it was indubitably a less perilous enterprise. Also, it was only natural that al-Mahdi's attention should be drawn towards the East, where he felt the equally imperious obligation to combat

his other rival, the 'Abbasid sovereign.

So al-Mahdi was not slow launch against Egypt, in 301-2/914-15, a powerful force commanded by his son and heir presumptive, Abu 'l-Kāsim, the future al-Kā'im bi-amr Alfāh. Initially, the course of the expedition proceeded in his favour. But after capturing Alexandria, Abu 'l-Kāsim failed before al-Fustāt, and not being capable of confronting the army of the 'Abbāsid general Mu'nis, he retraced his steps towards liftkiya.

Despite its lack of success on the military level, this expedition was to prove beneficial to the prestige of the Fatimid cause through the dissemination of Isma'ill propaganda on the banks of the Nile and in other provinces of the 'Abbasid empire. Al-Mahdl returned to the attack in 307-8/919-21 with a second expedition commanded by the same Abu 'l-Kāsim. At first, this project developed as favourably as the preceding, with the capture of Alexandria and the occupation of the Fayyom. But when the Fatimid fleet encountered disaster at Rosetta, and the battles before al-PusjAt turned to the advantage of the troops of Mulnis, Abril-Kasim was forced for the second time to retreat and return to Ifrikiya. However, the beir to the Fatimid throne took the opportunity afforded by this incursion to the banks of the Nile to assert afresh his family's claim to the caliphate and to call on the peoples of the East to rebel against the 'Abbasid "infidels" and to support the cause of the descendants of Fătima.

Al-Mahdl seems to have organised, shortly before his death, a third expedition against Egypt. In fact, this third attempt, attributed to the year 323/915, took place at the very beginning of the reign of his successor, al-Ka'im, who must have held very dear to his heart the sending of troops against the country where he had suffered two consecutive defeats. In any event, this third Fâțimid mid against Egypt was, on the military level, mandled mid against Egypt was, on the military level, finitless as its predecessors. Before his death, al-Mahdl must have realised how inadequate his forces were compared with those of his two Muslim rivals, being forced to admit that the new Fāṭimid state was not yet sufficiently strong to overturn either of its hereditary enemies.

To satisfy the sacred obligation of dishad against the Christian enemy, al-Mahdi displayed the same amount of energy in campaigning against the Rum in Sicily and in Calabria. The first raid against the south of the Italian peninsula took place during the year 305/918. The Fatimid troops captured Reggio and returned with much booty and many espetives. The second incursion was launched from al-Mahdiyya in the summer of 310/922. With a fleet

of twenty galleys, IIII Fāṭimid officer Masfud b. Ghālib al-Wāsūli took possession of the fortress of St. Agatha and made prisoners of its inhabitants.

Two years later, the chamberlain Djaffar b. 'Ubayd, known = "Şu'lük", led = third raid, with Palermo m his starting-point. He captured Brussano and Oria and returned to al-Mahdiyya with vast riches. The resounding success of this campaign had the effect of inducing Byzantium to conclude a treaty. But the annual tribute agreed for Calabria was slow to reach al-Muhdiyya, and hostilities resumed in 315/927. Continuing until 318/930 under the command of the slave Sabir, the Fatimid incursions proceeded victoriously against Tarento, Salerno, Naples and Termoli. Eventually the tribute was paid, hostillties were suspended and the treaty remained in force until the death of al-Mahdi. Preoccupied by Bulgarian imperialism, Byzantium allowed the Fâtimid sovereign to subjugate Apulia and Calabria and to reinforce the supremacy of Islam in Sicily.

Al-Mahdl died in al-Mahdiyya on 15 Rabis I 323/3 March 934. On the eve of his death, he could congratulate himself on having successfully performed his double task as Imam and as first Fatimid calliph. Under his aegis, the daswa emerged from its secular period of "secrecy" (satr), and flourished rapidly in the East and in the Maghrib. He had the skill and energy to conduct moderate but firm policies within his provinces, and to wage tireless warfare beyond his frontiers to affirm the right of the descendants of Fatima to lead the Muslim world. Thus, under his rule, the Fatimid empire embarked successfully on the first phase of its long history.

MAHDIDS, m dynasty of Zabid in the
Yemen claiming descent from the pre-Islamic
Tubba's of Himyar.

1. History. The family took its name from the father of its first leader, 'All b. Mahdi, who died in 554/1159. All was brought up with a strong traditional Islamic education by his father in Tihama. Though much given to quiet meditation, 'All also acquired a reputation for eloquence. He travelled widely too, performing the pilgrimage each year and meeting 'uland' from all corners of the Islamic world. The famous historian-poet, 'Urnāra, is our earliest source for the Mahdid period. He tells us that he much attracted by 'All's early teachings and visited him personally every month (Kay, Yaman, 92). During the period 531-6/1136-42, 'All preached openly in Tihama. So sympathetic to his words was the Nadjahid queen in Zabid, 'Alam, that he and his followers were exempted from the sharadi normally payable on land. In 538/1143 Ali felt sufficiently strong mattack the Nadiābid town of al-Kadra', north of Zabid, but he and his supporters driven off. They fled to the mountains where they remained until \$41/1140. In that year 'Alam, the Nadiabid queen in Zabid, against the advice of her advisers, allowed 'All and his supporters to return to Tihama. 'Alam died in 545/1150, an event which signalled the opening of a long, ruthless and extremely cruel campaign conducted by the Mahdids against Zabld and the surrounding area of Tibama from the mountains above. The town stood firm against appalling acts of terror, 'All was compelled in 549/ 2134 I journey to the court of the Zuray'id ruler in Dhū Djibla, Muhammad b. Saba'. 'Umāra too was present at the meeting and tells us that 'All left empty-handed. The Zuray'id refused to assist him against Zabid (Kay, Yaman, 94-5). 'All began to intrigue among the Nadjahid amos and in 551/1156 he engineered the murder of Surür al-Fatiki, a key figure in the declining Nadjahid house. Despite the brave resistance of its inhabitants, Zabid finally fell to 'All b. Mahdl in 554/1159. The latter had just only established himself in the town, however, when he died.

The events which followed the death of 'All are difficult to unravel and our sources differ in their accounts. He was succeeded either by two sons jointly, Nahdl b. 'All and 'Abd al-Nahl b. 'All, — by the former only. Whatever the truth of the matter, the Mahdids consolidated former Nadjāhid territory in Thams, made peace with the Zuray'ids based in Aden and al-Dumluwe, and raided other areas in the south, notably Lahdl and al-Dianad. Mahdl died in 559/1163.

'Abd al-Nubi assumed full control for the Mahdid house, and the plundering and looting begun under his father, 'All, continued with renewed vigour. Not only the southern areas of Labdi and Abyan were attacked, but also raids were made north in Tibâma into the territory of the Sulaymani sharifs. In such a raid Wahhas b. Ghānim, the Sulaymani leader, was killed in 560/1164, an act which may well have helped to bring about the Ayyubid conquest of the Yemen. nine years later by Turan Shah b. Ayyub, the brother of Saladin (Smith, Ayyübids and early Rusulids, ii, 32-3, 41-2, 46). 'Abd al-Nabl's thirst for territorial gain continued. Talizz and 1bb fell in 56z/1265 and he moved on to besiege Aden in the week year. The siege dragged on until 558/1172, when the Zuray'id ruler of Aden, Hatim b. 'Al!, arrived in San'a' to beg for assistance to raise the siege from a fellow Isma'II, the ruler of San'a', 'All b. Hatim of Hamdan, The latter agreed to help, and with strong tribal support, the Zuray'id-Hamdan alliance put the Mahdids to flight in 569/2773, thus relieving Aden. 'Abd al-Nabi and his battered forces retired to Zabid. Soon afterwards Turan-Shah arrived in northern Tihama with his Avyubid forces from Egypt. Joining up with the Sulaymanis, who were eager to avenge the Mahdid killing of their leader, the Ayyobids swept southwards through Tihāma, taking Zabid and arresting 'Abd al-Nabi and his brother Ahmad. Both were executed by strangulation by the Ayyibids in 571/1176, after what appears to have been a Mahdid attempt to regain control of Zabid.

2. Religious doctrines. 'Umāra's account of Mahdid doctrines is perhaps an oversympathetic one. He tells us that 'Abd al-Nab! followed the Hanafi madhhab, but regarded sin as infidelity (a view which inevitably led to the charge that he was a Khāridil) and thus punishable by death. Capital punishment was also prescribed for all those who opposed his teachings, as well as for wine drinking, singing and unlawful sexual intercourse. Property was held in common and a communal pool of horses, military equipment etc. we maintained. All other sources took a less charitable view of 'Abd

al-Nabi's politico-religious leanings. He is painted as a man of great evil, plundering we looting in a mad attempt to conquer the world. Rather than punish wine-drinkers, he was himself a drunkerd, they inform us, and a womaniser into bargain. Certainly, the Kharidil label stuck and Abd al-Nabi is depicted in Yemeni and non-Yemeni alike as a fanatic whose removal from power in the Vernen was of sufficient importance to Saladin in Egypt to bring about the Ayyübid conquest under his brother, Turin-Shah, in 569/1173. The causes of the Ayyübid conquest were of course numerous and complex (cf. Smith, op. cit., ii, 31-49), but it is not beyond the realms of possibility that the presence of this "evil Kharidil" in the Yemen did add weight to the argument in favour of bringing the Yemen under Ayyübid control.

Bibliography: The earliest source of Mahdid activities is 'Umara's Ta'rith, found in H. C. Kay, Yaman, its early mediaval history, London 1882, with English translation: a whole section of chapter 3 of the present writer's The Ayyubids and early Rusulids in the Yemen, GMS, XXVI/2, London 1978, 56-62, with full references, is devoted to the Band Mahdi, and the references to them in a section on the reasons for the Ayyubid conquest of the Yemen is given in the text above; other important sources, mainly still in ms. form, for the Mahdid period are as follows: al-Djanadi, al-Suiāk fi jabahås al-'ulama' wa 'l-mulük, Chester Beatty ms. 3110, i and li; al-Khazradil, al-Kifaya wa 11-19am, etc., Leiden ms. 805, and al-Ihd al-fäkhir al-hasan. tto., Cambridge U.L., ms. King's 72; 'Imad al-Din Idels, Kant al-ahhyar fi surfrifat al-siyar wa "l-ahhbar, British Library ms. Or. 4581; Isma'll b. al-'Abbas, Fáhikat al-zaman, de., Rylands ms. 253; Ibn al-Daybac, Kurrat al-Suyan fl akhbar al-Yaman al-mayman, now published in 2 vols., ed. Muhammad b. 'All al-Akwa', Cairo 1977; the late Zaydl chronicle of Yahya b. al-Husayn, Ghayat al-amani, etc., ed. S. A. F. Ashout, Cairo 1968, 2 vols., is occasionally of value; the principal non-Yemeni sources which mention the removal of 'Abd al-Nabl as being a cause of the Ayyubid conquest of the Yemen are Abû Shama, Rawdataya, i, 552; Ibn al-Athir, xi, 261; Ibn Wasil, Mujarridi, i, 238; Ibn Khallikar, tr. de Slane, i, 284, iv, 504; Malgrizi, Khifai, il, 37. (G. R. SMITH)

AL-MARDIYYA, formerly called AL-MA'MORA, a town of Morocco, on the Atlantic coast at the mouth of the Wadi Sabû (Sebou), built on a rocky promontory which dominates the valley of the river. Situated on the southern extremity of the plain of Charb and 20 miles to the north-east of Salé (Saië), it enjoys a geographical position of the first importance. A port has been created here for ships of heavy tonnage, which cannot sail up the Wadi Sabû as far as the river port of Kultra (at-Kunaytira, Kénitra [see Kantara]) situated 6 miles as the crow flies from the mouth of the river.

It is generally agreed that the site of al-Mahdlyya corresponds to that of one of the earliest Phoenician settlements founded by Hanno in the 5th century B.C. on the Atlantic coast of Morocco, so, the factory of Thymiateria. Nothing is known of the later history of this foundation and we have to wait till the 4th/10th century to get the first mention in Arab writers of the town at the mouth of the Wadl Sabu under the names al-Ma'mūra ("the populated, the flourishing"), Halk ("the mouth") al-Ma'mūra or Halk Sabū. According to the chronicler Abu'l-Kāsim al-Zayyani, the modern town was founded

by the short-lived dynasty of the Bank Ifran [q.v.] which settled on the Atlantic side of Morocco at the end of the 4th/10th century. In the second half of the 6th/12th, the Almohad sultan 'Abd al-Mu'min built there we of his dockyards for his navy (dår al-jind'a). Later, down to the 10th/16th century, al-Ma'mūra's history is obscure; it was a small trading centre to which a few European ships came for the products of the country.

Al-Ma'mūra, when the Christians of the Iberian positions and their offensive against Morocoo, was one of their first objectives; on 24 June 1515 a large Portuguese fleet anchored at the mouth of the Wādi Sabū and a landing force of 8,000 men occupied the town without a blow being struck. The Portuguese made themselves a strong base in al-Ma'mūra, built fortifications there, remains of which still exist, but they were only able to hold it for a short time. The Muslims drove the Christians out of al-Ma'mūra at the end of the person of the strong very leavy losses upon them.

Al-Ma'mara re-enters history when III the end of the 10th/16th century it became a formidable nest of European pirates, who, under the leadership of an English captain, Mainwaring, practised piracy along the whole Atlantic coast and became a terror. It is the seafaring centres of Europe. This state of things was put an end to when Spain, which in 16th had occupied the port of Larache (al-'Ari'igh [q.v.]), if little farther north, made I landing III al-Ma'mūra in Radjab 1023/August 1614, after negotiations with the Moroccan ruler, the Sa'did Mawiây Zaydân. The town was taken and the Spanish fleet withdrew, leaving a strong garrison of 1,500 men. The captured town was given the name of San Miguel de Ultramar.

The Spanish occupation of al-Ma'mūra was to last 67 years, during which it was several times fiercely attacked by the Mustims, particularly the "volunteers of the faith" (mudjāhidīn), who mobilised to drive the Christians from the various points on the coast where they had established themselves under the active leadership of the chief al-'Ayyāshī of Salé. The principal attacks so San Miguel de Ultramar were delivered in 1628, 1630 and 1647. In 1092/1681, the 'Alawid sultan Mawläy Ismā'il laid siege to the town and finally took it by storm. He then gave it the name of al-Mahdiyya; the name of al-Ma'mūra only survived that of the great forest of cork oaks which lies between Salé and the lower valley of the Wadi Sabū.

It may be noted that, for a few years at an earlier date, the name al-Mahdiyya had been borne in Morocco by the little military station founded by the Almohad caliph 'Abd al-Mu'min on the site of the future Ribāţ al-Fath (Rabat), on the south bank at the mouth of the Wādī Salā (the modern Wād Bū-Regreg). Al-Mahdiyya was occupied by French troops in zorr.

Fairly important remains survive at al-Mahdiyya, dating from the brief Portuguese occupation, the Spanish occupation or from the time when it was definitely retaken by the Musilms. Around the citadel (kasha) runs a continuous rampart with a citch. These defences are entered by two gates; one, very massive and with Arabic inscriptions, dates from the 11th/17th century. The other, a simple posteru, dating from the Spanish occupation, opens on the steep slope which runs down to the sea. Inside are are ruins of the Musilm governor's palace of the 18th century. Between the foot of the citadel and the bank of the Widi Sabu for a length of the sea.

and a breadth of about 40 m might still be seen buildings consisting of a series of square chambers completely isolated from one another and each protected by a double wall. These were probably granaries, which need not be earlier than the end of the rith/tyth century, and m not, as has been suggested, of the Phoenician period.

(E. Lévi-Provençal)
A1-MAHDIYYA, a town in Tunisia which owes its name to its founder 'Ubayd Allah al-Mahdi [297-322/909-34 [9.9.]); situated as the coast and lim. In the south of Tunis, it is the regional capital of a province of which the population, 218,000 inhabitants at the time of the 1975 census, is estimated in 1980 at 247,000. The population of the town, numbering 12,000 inhabitants in 1905, has grown steadily to 14,937 (1946 census), 18,494 (1956) and 21,788 (1966).

Foundation.

The creation of al-Mahdiyya by the Fatimids responded to a need which had already made itself felt since the end of the previous epoch, that of the Aghlabids. The last andes of this dynasty had in fact left Kairouan (al-Kayrawan) for Tunis. When prospecting along the coast beyond Tunis, which did not attract his choice, in the search for the site to be selected for the creation of his new capital, the Isma'lli Shiq Mahdi followed the same motivations, with the additional concern of security. A post regular prediction has him prophesying the insurrection of Abu Yazid al-Nukkāri [e.v.], the violent thrust of which was broken only by the ramparts of al-Mahdiyya, and thus gives a hagiographical explanation of its foundation. In fact, besides considerations of prestige and the constant concern of founders of dynasties throughout Muslim history to mark the new order through the creation of a new capital, the preoccupations of the Mahdi were more immediate: to build defences, at a good distance and in a secure place, against an eventual assault by Sunn's implacably hostile to the Shi^{els}s, a storm whose spicentre could be nowhere other than Kairouan. The Khāridil menace was at that time less predictable.

The chosen site offered ideal security safeguards for me dynasty possessing a powerful navy, this being inherited from the Aghlabids. Built on me spur projecting some 1,400 m. into the sea, and approached by "a road narrow as a shoe-lace" (al-Mukaddasi, Aisan al-takāsīm, partial ed.-tr. Ch. Pellat, Algiers 1950, 17), the town was impregnable from the land, which explains the choice of 'Ubayd Allāh who, after the failure of his attempted invasions of Egypt, was obliged to secure his bases, for an indefinite duration, in Ifrikiya.

Numerous written and archeological sources indicate that ancient settlements, Punic and Roman, preceded the Fățimid occupation of the region. Arabic texts preserve the memory of Diumma, usually identified with the ancient Gummi. But there is nothing in suggest that the peninsula itself had been "occupied by in urban settlement before the

4th/roth century" (A. Lézine, Mahdia, Paris 1965, 17). 'Ubayd Allāh thus chose to build, in 300/912-13 (Ibn 'Idhārī, Bayān, ed. Colin and Lévi-Provençal, Leiden 1948, i, 169), on a vírgio site and, the work completed, he inaugurated his new capital on 8 Shāwwāl 308/20 February 92r (Ibn 'Idhārī, Bayān, i, 184; al-Ķādī al-Nuʿmān, Iftūāk, ed. W. al-Ķādī, Beirut 1970, 275, ed. F. Dachraoui, Tunis 1975, 372-8).

city of refuge, al-Mahdiyya was surrounded by a defensive wall of unusual thickness (8.30 m.), which followed the coast and of which a long section to the north is still recognisable. A rampart 175 m. in length barred the entrance to the isthmus, and was preceded, at a distance of 40 m., by an outer wall. Access to the town was gained by means of an iron gate decorated with bronze lions, leading through a domed vestibule 35 m. long by 5.10 m. broad. Only this vestibule, known as al-Sakija al-Kalla, is still today entirely upright. The capital comprised a palace for the Mahdi and another for his son and successor al-Kâ'im, administrative buildings, subterranean storehouses for occeals. wells, cisterns, and one mosque which, eroded by the sea and disfigured by extraneous constructions, fell into ruin; recently-in the 1960s-it has been completely restored to its original state under the direction of A. Lézine. The town was also equipped with an arsenal and, on the southern side, a fortified and sheltered inland port, a port which, although mecessarily a reconstructed ancient installation, as might be supposed, was probably designed on the model of a Carthaginian harbour.

History.

A royal town and a citadel, al-Mahdiyya never heavily populated, being limited by its narrow intra-mural space. The bulk of the population resided in the suburb of Zawlia, which was also the commercial sector. Al-Ka'im (322-34/934-46) encircled this suburb with a ditch. In 332/943 there broke out the revolt of the Nukkāri Khāridii Abū Yazid, nicknamed the "Man on the Donkey." The latter, having stormed Kairouan, laid siege to al-Mahdiyya (Djumādā II 333—Şafar 334/January-October 945), its ramparts saving the Fatimids from a defeat which seemed certain. After the final suppression of the revolt, Isina'll al-Mansor (334-41/ 946-53) nevertheless abandoned the town, which thus lost its capital status, and moved, towards the end of Safar 337/September 948, to his new residence of al-Mansúriyya, built in the outskirts of Kairouan "on the very site of his victory over the Man on the Doukey" (F. Dachraoui, Le califat fatimide au Maghreb, Tunis 1981, 217).

Al-Mabdiyya regained its role as capital, for the last time, as a result of the Hilalian invasion which forced the Zirid al-Mu⁵izz b. Badis to take refuge there (27 Sha'bān 449/29 October 1057). It became, from this time onward, in capital under threat, and danger also came from the sea, in 480/1087 "Plaens and Genoans conquered Mahdia and Zawila, which they pillaged and burned" (H. R. Idris, Zirides, Paris 1962, i, 288). In 517/1123, the town was attacked, unsuccessfully, by the Normans. In 529/1134, it was subjected to its sea and land assault by the Hammādids. Finally, with the treaty of 536/1140-1, the Normans of Sicily imposed harsh conditions on the town, a prelude to its seizure by Roger II (2 Safar 543/22 June 1148), which marked the end of the Zirid dynasty.

Blockaded, from 12 Radiab 554/30 July 1159,

by sea and land by the fleet and army of 'Abd al-Mu'min b. 'Ail, the Normans were forced to capitulate Muharram 555/21 January 1160, and al-Mahdiyya was ruled by an Aimohad governor. Four decades later, Muhammad b. 'Abd al-Karim al-Radiradi al-Kumi-of the tribe of 'Abd al-Mu'min-allied himself with the Banh Ghànnya, declared himself independent the beginning of the caliphate of al-Mutawakkil 'alà 'llàh In 602/1205, the town was recaptured, along with the whole of Ifrikiya, by the caliph, who restored its fortifications.

Under the reign of the Hafsids, during the years 658 and 686/1286 and 1287, numerous hiwns in the Sahel, including al-Mahdiyya, were sacked by the Admiral Roger of Lauria, acting on behalf of the Aragonese, Then, from 718 to 723/1318-23, Abit Darba, a son of Ibn at-Libyant, ruled the town as independent possession. In 739/1338-9, al-Mahdiyya was recaptured from the hands of a certain Ibn Abd al-Ghaffar who had taken possession of (), and in cs. 761/1360 its fortifications were again restored by the Hafsid minister Ibn Tefradin. In 1390, between 20 July and 20 September, it was subjected = attack by a veritable crusade conducted by the Genoese with support from French and English knights. The town resisted, but was obliged to pay tribute to have the siege raised.

At the end of the reign of the Hafrids, the town was the object of bitter contention between the Turks and the Spanish. The latter besieged it in 1509, then established a garrison there in 1539 after the capture of Tunis by Charles V, But Dragut took possession of it the following year. Temporarily driven from the town, he returned and remained in control until 8 September 1550, which date the admiral Andrea Deria captured the place behalf of Charles V, who destroyed the town's defences in 1554 before abandoning it.

In 1689 there was an outbreak of plague in the city, and in 1740 it was deserted by its population. a population severely punished by Ali Pasha for its loyalty to his uncle. In 1848, the Christian population of the city was judged sufficiently important to justify the creation of a parish, In 1856, an outbreak of cholera claimed many victims. In spite of its cautious stance during the uprising of 1864, incited by the doubling of the mejba tax, "Mahdia, a city without defences, was pillaged on 25 April by the neighbouring villagers" (J. Ganlage, Les origines du protectorat français en Tunisis (1861-1881), Paris 1959, 228), and was ruined, as was the whole of the Sahel, by the combined effects of the expedition of Zarrenk and the depredations of creditors and usurers.

After the establishment of the Protectorate, al-Mahdivya was endowed with its first French school in 1884, became a judicial seat in 1885, and was not slow to participate actively in the nationalist movement. On August 1920, a demonstration against the cost of living developed into a riot; on 21 March 1925, the city responded to the call for a general strike demanded throughout the country by the Destour in protest against reforms which were judged insufficient; and from 18 to 20 April 1933, again at the behest of the Destour, there were new demonstrations against the burial in Muslim cemeteries of naturalised French Tunisians.

The urban development of al-Mahdiyya naturally corresponded to the fluctuations in its history. The suburb of Zawila, obliterated by the Hilâlian assault, was rebuilt in co. 597/1200, 1000 in the

period, a little further to the north-west, there is the first mention of the village of Hibûn. Then from the 16th century purvaid, the character of the town was changed completely as a result of the ethnic element introduced by Turkish garrisons, with the additional influx, after 1609, of Moors driven out of Spain. Today, 60% of the urban population of al-Mahdiyya is composed of descendants of Kouloughlis [see Kul-oghlu], representing, in this respect, the highest proportion in Tunisia, with perceptible effects on names and customs.

The two principal riches of al-Mahdiyya consist of olive-growing and fisheries. The cotton plantations, mentioned in the 18th and 19th centuries (Lucette Valensi, Fellahs tunisiens..., Lille 1973, 219), have today disappeared. Industries associated with olive-growing and fisheries—the sardine industry in particular—have on the contrary undergone large-scale expansion, and activities such as ollextraction, refining, soap manufacture and the can-

ning of food, etc., are flourishing.

The city has today overflowed its original isthmus and is developing along two arterial axes: towards S[ax], and especially in the direction of Sousse. Its leading literary figures, dating from the early Hafsid era, are two poets. Abû 'Amr 'Uthman al-Kaysi, known by the name of Ibn 'Urayba (d. 659/1260), and Ibn al-Simat (d. 690/1291). Also worthy of mention, from the point of view of Süfism, is the kulb [q,v] ai-Dahmani (d. 621/1224), a disciple of Abû Madyan [q,v].

AL-MAHDIYYA, I movement in the Egyptian Sudan, launched in 1881 by Muhammad Ahmad b. 'Abd Allah (Muhammad al-Mahdi) for the retorm of Islam. It had from the outset a political and revolutionary character, being directed against the Turco-Egyptian regime (al-Turkiyya), which it overthrew, establishing a territorial state. Under the Mahdi's successor, the Khalifa 'Abd Allah [see 'Abd Allah and Khalifa, iv], this developed essentially into a traditional Islamic monarchy until its existence was

terminated by the Angle-Egyptian reconquest (1806-8).

t. Mandist antecedents. Only one previous mandist claimant seems to have originated in the Nilotic Sudan before the Turkiyya, a 17th-century Stiff ascetic, Hamad al-Nahlan alias Wad al-Turabi. His claim was rejected by the Fundi [q.v.] king of Sinnar, Badi II. He is represented as clashing with the tax-gatherers of Badi III (cf. S. Hillelson, Sudan Arabic texts, Cambridge 1935, 174-93). The immediate antecedents of the Sudanese Mahdiyya are to be found in a mood of eschatological expectation, which appears first in Egypt in the late 18th and 19th contunes, reflecting the popular consciousness that traditional Islamic society was threatened both by infidels from without and despots within. Mahdist expectations were thus attached to Dieza'irii Ghazi Hasan Pasha [q.v.] during his expedition against the duumvirate of Ibrahlm Bey [q.v.] and Murad Bey (Djabarti, 'Adjabio, ii, 114), while m insurrection against the French in 1799 was headed by a mahdist claimant of Maghribl origin ("Adid"ib, iii, 58). A revolt in Upper Egypt against Muhammad All Pasha in 1822-3 was led by another mahdist claimant (CAll Mubarak, al-Khitaf al-diadida, xiv, 76). A manifesto against the Sudanese Mahdi mentions a predecessor in Khartoum (al-Khurtum [q.v.]), Ibrāhim al-Sudani, of whom nothing further is known (Shukayr, Ta'rikk al-Säddn, ili, 379): the suggests a person of southern Sudanese origin. The Sudanese Mahdiyya was thus the latest and most successful of a cluster of mahdist movements which, while formally presenting themselves in religious terms, had markedly social and political aims.

2. The revolutionary situation in the Egyptian Sudan. During the sixty years preceding the outbreak of Mahdiyya, profound changes had affected the traditional society and Islam of the Nilotic Sudan, culminating merevolutionary situation. Muhammad 'All Pagha's conquests (1820-1) ended the independence of sedentary and nomadic groups. His establishment of a centralised and autocratic administrative system with its unaccustomed fiscal burdens (undoubtedly aggravated by corruption and extortion) had a traumatic effect. Moreover, the demands of modernisation in Egypt meant that the officials in the Sudan were rarely of high quality or integrity.

One group whose political and social status declined under the Turkiyya was that of the indigenous of religion (sing. faki < fakih), who during the previous three centuries | fulfilled | range of functions as teachers of the Kur'an and Shari'a, Suff leaders, arbitrators, and intercessors with the rulers. The establishment of an orthodox hierarchy of 'ulama', serving in government mosques, and integrated into the judicial system, created a rival group of religious leaders. Although individual members of the old faki families took advantage of the greater opportunities to study at al-Azhar and enter the official hierarchy, there remained a fundamental incompatibility between the fakis and the government-supported 'miama', whom the Mahdl was to designate 'uland' al-10'.

Developments in the two decades preceding the Mahdiyya heightened the tension between the Turkiyya and the inhabitants of the Egyptian Sudan. The vigorous autocracy of Khedive Ismā'll (1863-79) [q.v.] made the power of government feit once after the comparative laxity which had begun in Muhammand 'All Pasha's last years and continued under his the summer sultanate of Dar

Für [q.v.] was annexed in 1874. Since the middle of the century, traders seeking ivory and slaves had thrust into unexplored regions far up the White Nile and the Bahr al-Chazal [q.v.], outside the Muslim and arabised northern Sudan, and completely beyond the control of the Turco-Egyptian officials. The slave-trade that was fed from these regions was a scandal to Europe. To bring the south and west under his administration, and thereby to suppress the slave-trade, was m principal aim of the kiedive.

The implementation of this policy would in any event have antagonised vested interests, particularly the diaspora of northern Sudanese, the Danakla and Disfallyyun [q.v.], who were involved in the slave-trade, and who ranged from petty dealers (dialida) = merchant-princes such = al-Zubayr Rahma Manstir, the master of the western Bahr al-Ghazal and the conqueror of Dar Für. The situation was rendered more critical by the khedive's recruitment of Europeans and Americans = carry out his plans; this employment of Christians in high office shocked the conservative piety of the Sudanese. Chief among these expatriates was the British officer Charles George Gordon (cf. Bernard M. Allen, Gordon and the Sudan, London 1931), who as governor of the Equatorial province (1873-6) and governor-general of the Sudan (1877-9) played a leading part in the attempts to establish khedivial administration in the south and to suppress the slavetrade. With their inadequate resources, Gordon and his colleagues attained only limited success. The deposition of Isma'll (June 1879) and followed by Gordon's withdrawal, and the comparative feebleness of their successors in Cairo and Khartoum facilitated the drift towards insurrection in the Sudanese provinces.

 The early career Muhammad al-Mahdi (1844-81). Muhammad Ahmad b. 'Abd Allah was born in 1844 in the province of Dongola [4.0.]. His father was | boat-builder, and when Muhammad Ahmad was a child the family moved to Karari on the Nile, a few miles north of Khartoum, where there was an adequate supply of timber. After their father's death, Muhammad Ahmad's brothers followed his trade, but he himself underwent a traditional religious education within the Egyptian Sudan. He early showed a propensity towards asceticism and Sulism, and in 1861 he attached himself to Shaykh Muhammad Sharif Nur al-Dā'im, the grandson of the founder of the Sammaniyya forthe in the Sudan. When his brothers moved for timber to Aba island in the White Nile, he accompanied them, and from 1870 made his headquarters there. His pious reputation gained him many followers, a development which was the probable cause of a breach with Shaykh Muhammad Sharif, in consequence of which Muhammad Ahmad attached himself to a rival leader of the Sammāniyya, <u>Sh</u>ay<u>kh</u> al-Kura<u>sh</u>ī wad al-Zayn (d. 1878). In 1882 he was joined by the man who was to become his most intimate disciple and his successor head of the Mahdist state, 'Abd Allah b. Muhammad (q.v.), who meet from the Ta'a'isha Bakkara [q.v.], cattle-Arabs of Dar Für. A mahdist expectation was abroad III the Egyptian Sudan, and was shared by Muhammad Ahmad himself. There was evidence of it in Kordofan (Kurdufan) [q.v.], which he visited about his time. Abd Allah b. Muhammad had, some years previously, saluted al-Zubayr Rahma as mahali —a role which the conqueror of Dar Für declined. It is probable that 'Abd Allah played a decisive part in the spiritual crisis of which the outcome was Muhammad Ahmad's claim to be the Expected Mahdl. This the first secretly communicated to his disciples at Abā (March 1881), and then to other adherents during a second visit to Kordofan. The public manifestation (public of the Mahdl took place on 29 June 1881. Letters were sent to various notables urging them to raily to him, and he announced his divine mission in a telegram to the governor-general.

While the Mabdiyya had in its origins many characteristics of a movement of social and political protest, aspects were subsumed in the founder's primary aim: the reform of Islam, encompassing both the cult and the society. Like previous reformers, notably [bn Abd al-Wahhāb (q.u.), M envisaged the restoration of the primitive Islamic umma governed by the Kur'in and the Sunna, Unlike Ibn 'Abd al-Wahhab, however, Muhammad Ahmad was deeply impregnated by the emotional and imaginative quality of Süfism. He his movement not merely as the revival of Islam, but as the recapitulation of the life and order of the primitive summa: a divinely ordained correspondence between Urzeit and Endzeit. He presented himself appointed to the supreme succession (al-khildfo al-kubrd) as Successor of the Apostle of God (Khalifal Rasul Allah), while his leading disciples were the successors of the Rightly-guided Caliphs. Three of these were appointed soon after the Manifestation. 'Abd Allah b. Muhammad's status was recognised in his title of Khalifat al-Siddik, i.e. the successor of Abū Bakr. An early follower, 'All b. Muhammad Hilû ('All wad Hilû) was appointed the successor of Umar (Khalifat al-Färth), and the Mahdl's young son-in-law, Muhammad Sharff b. Hamid, was appropriately named the successor of 'All (Khalifat al-Karrar). The appointment of successor of 'Uthman was offered to the contemporary head of the Sanūsiyya, Muhammad al-Mahdi, whose co-operation Muhammad Ahmad was anxious to obtain, but the offer, made in May 1883, was ignored. By another parallelism with the Prophet, the Mahdl styled his followers Ansår.

The official 'ulama' endeavoured to confute the mahdist claims of Muhammad Ahmad by stating the orthodox Sunni doctrine of the mahdi and demonstrating Muhammad Ahmad's failure to conform to the criteria laid down in Hadith. He defended his position by reasserting his divine election, weyed in a colloquy (hadra) by the Prophet. At the same time, he emphasised where possible points of conformity with Hadith. Thus he adapted his name to Muhammad b. 'Abd Allâh, emphasised his descent from the Prophet, and changed the name of his rendez-vous in Kardolan from Djabal Kadir to Mässa.

4. The Mahdl's kidirs and disked (1882-5). The authorities at first underestimated the Mahdi's challenge, but when a small military expedition sent to arrest him was routed (August 1881), the matter was taken seriously. The Mahdi and his Ansar meanwhile made a withdrawal (the highes) to Diabal Kadir in the Nüba Mountains. The remoteness of this place rendered military operations by the government difficult (two expeditions were defeated in December 1881 and May 1882), while it formed an appropriate base for attacks on government positions in Kordoian. From southern Kordofan and Dâr Für the Mahdi could draw on a vast reserve of Bakkara tribesmen, whose propensity to raiding found a sanctified outlet in this warfare. Since the MahdI regarded only those who accepted his mission as true Muslims, such lighting and designated gibble [q.v.]. The government troops were, however, capable of prolonged resistance in fortified positions, and an attempt to storm the provincial capital El Obeid (al-Ubayyid) on 8 September x882 was mailtre. Hencelorward the Mahdi relied upon siege-tactics, and the tribal lorces were supplemented with meorps known as the dishidiyya, largely recruited from captured government troops of southern Sudanese origin. They were provided with firearms, which the Mahdi was anxious to keep out of the hands of the undisciplined tribal warriors.

The surrender of El Obeld (19 January 1883) gave the an administrative centre, and Kordofan formed the nucleus of a territorial Mahdist state. In the meantime, khedivial control had been further weakened by the British occupation of Egypt (September 1882) and the reluctance of the British government to undertake commitments in the Sudan. An Egyptian expeditionary force was, however, organised with Col. William Hicks, a retired Indian Army officer, as chief of staff. Advancing through difficult country from the White Nile into Kordofan, it am annihilated by the Ansar at Shaykan (5 November 1883). The Mahdi was now 🔤 master of the west. Där Für and Bahr al-Ghazal were surrendered by their European governors in December 1883 and April 1884 respectively. Meanwhile, 'Uthmán Dikna (Osman Digna), from z mercantile family of Suakin (Sawakin) had been sent (May 1884) to raise the Bedja [q.v.] of **iiii** Red Sea hills, a mission in which he was largely successful through the support of influential faki, Shaykh al-Tahir al-Madidhub, so that by the end of February 1884 only Suakin itself remained in Egyptian bands.

Khartoum and the riverain areas to the north were now threatened. At this juncture, Gordon sent out by the British government, primarily to report on the military situation, but he was also appointed (at his own request) governor-general by the khedive. Acriving at Khartoum (February 1884), he produced a succession of plans for the future of the Sudan while the Ansar closed in on the city. 'Uthman Dikna's successes closed the route from the Red Sea to the Nile, while the fall of Berber [g.v.] to marmy of Angar (May 1684) cut the river line to Egypt. Military pressure on Khartoum itself was increasing, and between April and October 1864 the Mahdi brought up his main forces from El Obeid I Omdurman (Umm Durman) opposite the capital. Weakened by siege, the city tell on 23 January 1885, Gordon being killed in the fighting.

The fall of Khartoum marked for all practical purposes the end of the Mahdl's *djihid*. He was now the ruler of the chief provinces of the Egyptian Sudan from Dongola to Bahr al-Ghazāl, and from the Red Sea to Dar Für. He ordered the evacuation of Khartoum, and made his own capital at Omdurman, where he died after a short illness (22 June 1885).

5. The rule of the Khalifa 'Abd Allah (1885-98). The Mahdi's death confronted the Ansir with two problems, one practical, the other ideological. First, who was to take the Mahdi's place as ruler of the nascent state? Secondly, how was the Mahdi's death to be explained, since he had claimed a universal mission to restore Islam, but had achieved only a conquest within the boundaries of the Egyptian Sudan? The problem of the succession was in appearance quickly solved when a council of notables in the Mahdi's house immediately after his death gave their allegiance (bay'a) to 'Abd Allah b. Muhammad. Already in the critical period of political development following the fall of RI Obeld, the Mahdi had conferred plenary powers — 'Abd Allah b.

m that he was henceforward the deputy of the Mahdl (hhalifat al-Mahdi), although he did not use this title until after the Mahdi's death. He was, furthermore, the commander of the largest body of tribal warriors concentrated in Omdarman. His political and military pre-eminence was recognised in his election as the Mahdi's successor. This event suggested how the ideological problem arising from the Mahdl's death could be handled. A proclamation stressed the parallel between the succession of Abū Bakr al-Siddik to the Prophet and that of Khalifai al-Siddig to the Mahdi, and urged the Ansar III follow the example of the early Muslims, who had fought for their faith after the Prophet's death. There was other propaganda, much of it of a visionary or mystical nature, to legitimise 'Abd Allah's

His position was not, however, uncontested. Khalifat al-Karrar Muhammad Sharif was the ostensible leader of the Ashraf (i.e. the kinsmen of the Mahdi), a group whose overweening pretensions the Mahdi himself had rejected in his last days. The Ashraf were the elite of the sedentaries from the northern riverain areas and their diaspora, known as awidd al-balad [q.v.]. This comparatively sophisticated group had little in common with the Bakkara tribal warriors, whose ascendancy was assured by the accession of the Khalifa. Within twelve months be had defeated a conspiracy hatched by the Ashraf in Omdurman and their kinsman Muhammad Khālid, the governor of Dar Für. The Khalifa's fellowtribesmen or their clients replaced the Mahdi's appointees in the provincial governorships, with the exception of 'Uthman Dikna, who essential to handle the Bedja. In 1888-9 the Khalifa enforced a man emigration of the Tafalisha, who were settled in Omdurman and im vicinity. Although awide albalad continued to be indispensable in the civil service and judiciary of the Mahdist state, they had lost political power, and a dangerous rift opened between them and the ruling Bakkara.

Having established his authority, the Khalita sought to fulfil the programme of conquest which had been cut shortly by the Mahdi's death. The dishid was actively pursued for several years at heavy cost to a people suffering from the effects of the revolutionary war and population movements. The Christian kingdom of Ethiopia under John IV was a principal theatre of the dishad, although the lighting should be more in the historical context of conflicts going back to the Fundi period. A successful raid by Humdan Abu 'Andja, and of the Khalifa's clients, penetrated to Gordar (January 1888), and took booty and slaves, while in the following year tafter Abū 'Andia's death) King John was killed in battle at al-Kallābāt (March 1880), a victory which was widely publicised by Khalifa. These were however incidents in border-warfare, resulting in no significant territorial gains.

The second main objective of the djihld was Egypt, now firmly under British military and political direction. An invasion had been planned before the Mahdl's doath, the Dja'all general 'Abd al-Raḥmān al-Nudjihmī being its intended commander. The project hung fire for several years, although al-Nudjihmī made his headquarters at al-'Urdī (New Dongola) in Nov. 1886. The Khalila's mistrust of solds al-balad led wencroachments at al-Nudjihmī's command, which he was compelled to share with a Ta'a'ighl. In the summer of 1889 the Mahdist force at last advanced on Egypt, but on 3 August was annihilated at Toski (Tughiti), north of Wādī Ḥalfā,

al-Nudjumi himself being killed in the lighting. There was no further attempt at invasion, although there were raids, sometimes serious, into Egyptianheld territory.

A similar stalemate developed in the west and south. The Für had never been reconciled to the recent loss of their independence, and after the withdrawal of Muhammad Khalid, a member of the old royal clan sought to re-establish the sultanate (1887). He was overthrown by the new governor, 'Uthman Adam atlas <u>Dj</u>and, a young kinsman of the <u>Kh</u>alffa, who in the following year suppressed a still more dangerous revolt. This me headed by a charismatic leader known as Aba Djummayan, who claimed the vacant position of successor of 'Uthman, Abb Diummayea's death from smallpox somewhat relieved the position of the Ansar, who defeated the insurgents outside El Fasher (a)-Fashir [q.v.]), the provincial capital (February 1889). Dianú showod himself to be a competent governor, but on his early death (September 1890), the combined provinces of Dar Für and Kordofan passed into the less capable management of another of the Khallia's kinsmen, Mahmūd Ahmad.

The pagan southern regions, so recently brought under the khedivial administration, were never integrated into the Mahdist state. Although (as mentioned above) Bahr al-Ghazāl had fallen in 1884. its governor Karam Allâh Muhammad Kurkusāwi, a Dunkuläwl trader by origin, withdrew his troops in October 1885 to light the Rizaykat Bakkara of Dar Für. Thereafter, Bahr al-Ghazai drifted out of Mahdist control. The Equatorial province 🚃 even more remote from the centre of the Mahdiyya, Its governor since :878 had been Emin Pasha (Eduard Schnitzer, of Silesian Jewish origin, and the last of Khedive Isma'li's expatriate officials), who in spite of mutiny and two Mahdist invasions (1885, 1888) held out until forcibly rescued by H. M. Stanley (1889). The second invading force, however, established a garrison at al-Radidiaf, which maintained sporadic contact with Omdurman by steamer. The Mahdists held little more than the river line, and their position was challenged by former government troops, who had refused to be evacuated by Stanley, and who were led by Fadi al-Mawia Muhammad, an officer of southern Sudanese origin. Al-Radidial became a place of banishment for political and other prisoners.

The year 1889 marks the end of the militant phase of the Mahdiyya. The following period saw the stabilisation of the Khallfa's autocracy within a territorial state limited for all practical purposes to the Muslim and arabised regions of the northern Sudan. A factor in the decline of militancy was the great famine of 1888-90, the effects of which were aggravated by imigration of the Ta'a'isha to Omdur-For the second time, the Khalifa's authority was challenged by a revolt of M Ashraf in Omdurman under the leadership of Muhammad Sharif (November 1891). After some desultory firing and a few casualities, a formal reconciliation was effected by Khalifet al-Fdrik 'All b. Muhammad Hill on terms advantageous to the Ashral. The danger once past, the Khallfa proceeded to destroy his opponents piecement. Muhammad Sharif himself was arrested in March 1892, and sentenced to imprisonment by a special tribunal. Thereafter the Khallfa's autocracy was unchailenged. His only intimates in matters of government were his half-brother Ya'kab, who as his wastr (but without the title), and his ----"Uthman, who about this time received the honorific of Shayah al-Dis, and was trained for the eventual succession.

While the Khalifa thus strengthened his position internally, there was increasing European pressure the frontiers of Mahdist state. Suakin, which alone among the garrisons of the Red Sea area had not fallen to 'Uthman Dikna, formed the base for a campaign against the local Ansar after the Anglo-Egyptian victory at Toski. The operations, early in 1891, culminated in the capture of Utiman Dikna's headquarters at Tokar (Takar) in Feb. 1891. Although still a nulsance, he was no longer a threat to the Anglo-Egyptian forces in the vicinity. In the previous year Eritrea had been constituted an Italian colony. A Mandist raid into the territory was routed (December 1893), and in July 1894 the Italians with the prior agreement of the British government occupied Kasala [q.v.]. The loss of this important strategic position was even more serious than that of Tokar, but in spite of making a threatening demonstration in Omdurman, the Khalifa did not take the offensive. The Italian presence in Eritrea was equally threatening to Menelik II, who had emerged as the ruler of Ethiopia after the death of John IV. In 1895 he sought to establish friendly relations with the Khailfa, but his overtures were repulsed. He repeated them in 1896 after his victory over the Italians at Adowa, and further embassies were received to Omdurman in 1897 and 1898, but no practical military or political co-operation resulted.

A more remote European danger appeared in the far south, when Belgian expeditions from the Congo Free State began to advance towards the Upper Nile and Bahr al-Ghazāl. In 1892 Fadl al-Mawlā Muhammad and his followers entered the service of the Congo Free State, he himself being recognised as the governor of the Equatorial province. In the following year, mandet force was sent to strengthen the garrison at al-Radidjāf. Its commander, 'Arabi Dafa' Allāh defeated and killed Fadl al-Mawlā (January 1894), and combated the Belgians with some success. His isolated position and precarious communications with Omdutman were, however, insuperable difficulties, and in February 1897 he lost al-Radidjāf to melejian force.

By his time the final assault on the Mahdist state developing. In March 1896 the British government authorised an advance by the Egyptian army into the Mahdist province of Dongola. While the pretext for the invasion was afforded by the Italian defeat at Adowa, the real reasons lie in British foreign policy and the international situation in the time (see G. N. Sanderson, England, Europe and the Upper Nile, 1882-1899, Edinburgh 1965). The Egyptian expeditionary force, commanded by Sir H. H. Kitchener, constructed mailway as it advanced up the Nile from Wadi Halfa. By the end of September 1896 the province was completely occupied. In the following year, Kitchener was authorised to make a further advance. A second railway constructed across III Nubian desert, reaching the Nile at Abd Hamad, and was extended southwards as the Anglo-Egyptian force advanced. Warned by the loss of Dongola, the Khalifa summoned Mehmüd Ahmad with the bulk of his forces from the west to defend the approaches to Omdurman. He proved to be an irresolute commander, lacking in 🔳 initiative. His base was al-Matamma [q.v.] in Dia all territory. Its inhabitants refused to evacuate their town, which Mahmud Ahmad took by force of arms-an incident which confirmed the batred of ewidd al-balad for the Ta'a'isha. Once established there, Mahmud Ahmad min reluctant to move northwards to confront the invaders, who were steadily advancing along the river-line. Abu Hamad fell in August 1897, and the important route-centre of Berber was evacuated in the same month. Mahmad Ahmad, faced with increasing desertions and shortage of supplies. was ultimately goaded to advance. His army (augmented by troops brought in by 'Uthman Dikma) overwhelmed = 8 April 1896 at the battle of the Atbara [q.v.], and he himself was taken prisoner. The Anglo-Egyptian advance continued, and the Mahdist state received its death-blow at the battle of Karrarl, often called the battle of Omdurman (2 September 1898). Ya'kûb died in the fighting but the Khalifa escaped, and remained a fugitive for over a year. Finally, he and a handful of Ansar were defeated by Sir Reginald Wingate in a skirmish (24 November 1899) at Umm Diwaykarāt on the White Nile, in which he was killed. 'Uthman Shaykh al-Din was made prisoner, and died in the following уеаг.

6. Institutions of the Mahdiyya. The rapid development of the Mahdiyya into an armed rebellion, then | a territorial state, necessitated the improvisation first of a command-structure, and secondly of administrative system. During the lifetime of the Mahdl, the key position in both these respects was occupied by the Khalifa 'Abd Allah. He commanded the Black Flag (al-Raya al-Zarka'), the largest of the three divisions of the army, consisting of the western Bakkara tribesmen, and in addition he beld the title of amir dinyily el-Mahdiyya, implying an oversight of the fighting forces as a whole. His two colleagues commanded smaller divisions, the Khaiffa 'Ali the Green Flag (al-Râya al-Khadrâ') composed of Balikara from Kordofan and the White Nile, and the Khailfa Muhammad Sharlf the Red Flag recruited from audid al-balad. As previously mentioned, the Mahdi conferred plenary powers on the Khalifa 'Abd Aliah in January 1883. The title of amir beid by subordinate officers, who in the early stages of the Mahdiyya had commanded virtunily autonomous tribal or local contingents. In May 1884 the Mahdi ordered this term to be discontinued, probably because of its overtones of worldly rank, and substituted 'Amil, but meet has remained in popular usage until the present. With the emergence of a territorial state, the chief officers bemilitary governors of provinces (sing. imdea, later 'imdla).

The successes won in the dished made the establishment of a financial system argently necessary, since the Mahdi had constant difficulty in preventing the tribesmen from appropriating the booty. A treasury (bays al-mail) had probably been organised at Kadir, and after the fail of El Obeid, the seem formally appointed his friend Abmad Sulayman as its commissioner (amin bays al-mail). The sources of revenue at this time were two: booty (ghanims) and a levy of grain and cattle, which the term sadd was applied. As under the Turkiyys, Ottoman, Egyptian, Austrian and Spanish coins to in circulation. After the taking of Khartoum, the Mahdi minted gold pounds and silver dollars. He was the first Sudanese ruler to exercise this prerogative.

Although the Mahdl envisaged a restoration of the primitive Islamic umms, soon found himself obliged to give judicial decisions and to promulgate administrative regulations which were in effect legislative acts. Many of these resulted from the revolutionary war, e.g. rulings concerning broken marriages and irregular unions, and questions of

landownership. Undesirable customs regarded as repugnant to Islam were prohibited. The Mahdi's judicial functions were widely delegated to his officials, and one specifically judicial officer was appointed with the title kādī al-Islām. Ahmad 'All, who held this post for twelve years (1882-94), had been a judge in Dar Für under the Turkiyya.

These military and administrative institutions developed further during the reign of the Khalifa. A detachment of the dihadiyya, the regular corps first formed during the siege of El Obeid, was stationed in the Kara, i.e. Fort Omdurman of the Turkiyya. After the revolt of the Ashraf in 1891 the Khallfa felt the need of a reliable bodyguard. This created by expanding a corps of orderlies, the mularimiyya. By 1895 it consisted of 9,000 or more troops under the general command of 'Uthman Shaykh al-Din. A civil service, recruited chiefly from amidd al-balad and Copts, staffed the departments and treasuries of the capital and the provinces. Many of its members had occupied similar posts under the Tuskiyya; went on werve the Condominium. Already in the Mahdi's time a regular chancery procedure had been established, and the surviving archives of the Mahdiyya as a whole have been estimated at 50,000 pieces. The bulk of them me now in the Central Records Office in Khar-(see P. M. Holt, The Mahdist archives and related documents, in Archives, v/28 [1962], 193-200). Despatches were sometimes exchanged almost daily between the ruler and his provincial governors. The provinces fell into two categories; - outer circle under military governors with their was fiscal and judicial establishments and garrison troops, and of metropolitan provinces, which were fiscal areas rather than administrative units, and were tributary to the treasury in Omdurman,

The history of the office of amin bays al-mai illustrates both the institutional elaboration and the Increasing autocracy of the Khalifa's reign. Ahmad Sulayman, the first amin, was a partisan of the Ashraf, and was disgraced in April 1886. His sor, Ibrāhim Muhammad 'Adlān, had been a merchant in El Obeid. His reluctance to extort grain for the soldiery during the great famine led to a clash with the Khalifa and his execution (February 1890). His successor, al-Nur Ibrahim al-Diraylawi, another former merchant. Tenure of office became increasingly precarious; one commissioner was twice appointed and twice removed, and the last year of the reign saw three treasurers. At the same time special treasuries were established, of which the most important were the treasury of the muldsimiyya and the Khalifa's privy treasury. The sources of revenue had meanwhile changed. With the ending of the dishdd, ghanima sank into insignificance. Zakar continued to be levied and also fifr, a poll-tax paid the end of Ramadan, Zakat was also paid customs-dues, originally at the rate of 21 %, but al-Dirayfawl imposed a further 10%, and this might indeed be taken at several points on the route. Fines were imposed on smoking and drinking, and the goods of other offenders were liable to confiscation. In addition, merchants and others might required to pay "contributions" (taberrusat) to the treasury. The minting of dollars at Omdurman continued, but the silver was increasingly debased. The minting of gold had ceased with the Mahdl's pounds, which were soon driven out of circulation by Gresham's Law.

The history of the judiciary is similar. Ahmad 'All held office m kādā al-Islāw until May 1894, when he

lost the Khallia's confidence, and me thrown into prison. His successor, al-Husayn Ibrāhim wad al-Zahrā', had been trained at al-Azhar, but his overzealous adherence to the principles of the Sharf's led to a clash with Ya'kub. He was imprisoned and put to death, probably # the _____ of 1895. The title of \$4¢i al-Islam seems to have died with him. Already in the time of Ahmed 'All there was a deputyjudge (wakil al-makkama), and the two seem usually to have acted in concert. By the end of the Khalifa's reign, the chief judge had six deputies (mammab), two of whom had special duties in connection with the muidsimiyya. In addition, there were special courts in Omdurman for the market, the quay and the treasury. Both in the capital and the provinces, the judicial officers were dependent on the Khalifa and his governors, and deferential to their wishes.

7. Subsequently developments, Although the Anglo-Egyptian reconquest overthrew the Mahdist state, Mahdism continued to be a powerful force, particularly in the west. The movement was virtually proscribed in the early years of the Condominium by Wingate, who was governor-general from 1899 to 1916. The surviving leaders were held in prison, the use of the Mahdl's devotional manual (rātib) was forbidden, and several religious risings were suppressed. The revival of the Mahdiyya in a new form was the achievement of a posthumous of the Mahdi, 'Abd al-Rahman (1885-1959), whose considerable political talent found opportunity changing political circumstances during and after the First World War. To many Ansar be was a charismatic tigure, regarded by al-Nabi Isa, and hence as having an eschatological role. To his westernised followers, he was rather a nationalist leader, the patron of the Umma Party, which was founded in 1945, and has continued to play a leading part in Sudanese politics. In one modern view, the Mahdl is seen as mudjaddid, and the Mahdiyya as a reformist but essentially orthodox movement.

AL-MAHDJAR (sometimes in the plural, al-Mahadiir), name given in Arabic to places in Northern, Central and Southern America to which Lebanese, Syrians, Palestinians and other Arabs have emigrated (hadiara). The towns whose names recur most often in modern Arabic líterature are New York, Sao Pãolo, Rio de Janeiro and Buenos Aires; there has developed there, in the first half of the present century, a characteristic literary movement, the vestiges of which have not yet been completely effaced; but these are not the only locations on the American continent where emigrants from the Near East have settled and where they have published, in Arabic or in the national languages (English, Spanish or Portuguese), bulletins, journals, periodicals and books with the object of promoting understanding of the Arabs and their heritage, or in furtherance of their political causes of the moment.

The flow of emigration towards the New World originated in what was then known as Syria (the land currently comprising Lebanon, Syria and Palestine) at the end of the roth century and the beginning of the 20th, attaining its highest point in North America in 1913; the tide began to ebb in the period following the First World War as a result of obstacles placed by the United States in the way of immigration, with the limitation on numbers of immigrates and with legislation on nationality, passed in 1924, which almost put end to it, although the influx of emigrants into

South America continued.

The causes of the emigration were primarily economic. Among the Lebanese—who left their country in the greatest number—the inhabitants of the mountain region were deprived of agricultural land after the establishment of the régime of the mulagarisfiyya (see LUBNAN), inaugurated in 1861 (and modified in 1864) in the wake of the intercommunity religious disturbances of 1860 and following intervention by the European states, and by France in particular. This régime accorded administrative autonomy to the mountain region, which possessed meagre financial resources, having first detached from it its fertile plains and ports.

A section of the population was thus forced to leave the mountain region and to seek employment in Beirut and other Lebanese towns. This was the first phase; subsequently, some individuals left their homeland and made their way to Egypt and other African countries. When emigration to America became possible, some groups of Lebanese, insignificant in size, travelled there. After 1881 the scale of the movement accelerated, as the first emigrants enticed their compatriots with glowing reports of the financial opportunities that existed in America, while tourists, shipping companies and their agents added further encouragement, to such = extent that at the beginning of the 20th century wirtual epidemic had arisen and almost half the inhabitants of Lebanon left their country. The contagion spread to the cities of the interior (Homs, Damascus and Aleppo) and to the mountains occupied by the 'Alawites, whence it is estimated that a seventh of the population chose to become exiles. Some Palestinians had preceded the Lebanese, and others accompanied them. By the final phase of the movement, the total number of immigrants from Greater Syria who were settled in the United States and Canada exceeded half a million, attaining close to double this figure in the cities of Central and South America.

At the time, the movement was encouraged among the Christian population of Syria not only by economic factors-including the oppression of the peasants by their feudal lords, the monopoly over lands and goods exercised by the monastic communities, the oppressive burden of taxation, disastrous crop-failures, the slump in the natural silk market caused by the success of artificial Japanese silk sold cheaply and the diversion of international traderoutes following the excavation of the Suez Canalbut also on account of psychological factors aroused by a hated social and political situation; detestation of the foreign authority which governed them and always regarded them with suspicion, religious conflicts which culminated in the events of 1860, persistent sectationism, corruption of an administration in which bribery was rife, the subjection of the (aithful to religious leaders who collaborated with the feudal lords in oppressing and robbing them, the suppression of public liberties, the alienation experienced by the entire population in the time of 'Abd al-Hamld, the posting of young Arabs to distant theatres of war, widespread ignorance and the rule of anarchy in all facets of existence.

On the other hand, there was talk of those advantages of emigration which constituted powerful incentives: the prospect of making a fortune, numerous opportunities for finding work, respect for public liberties, the acceptance by society of personal ambitions, the judgment of people by their actions and their abilities rather than on the basis of their origin and class, the properties and dignity of all citizens without discrimination and the rule of order and of law.

The Syrians in general and the Lebanese in particular had been in contact with the West and its culture since Bonapacte's expedition to Egypt (1798-1801) and the creation of scientific institutions in this country in the time of Muhammad 'Ali [q.v.]. These contacts IIII been reinforced by the religious missions which began to arrive in Lebanon in the period when the son of the ruler of Egypt, Ibrahim Pasha [q.v.] was governor of Syria (1832-40), and which expended their activities following IIII installation of the regime of the mutasarrifiyya (1861).

founding schools, cultural associations and charitable societies, importing presses, translating and publishing books. These contacts were also encouraged by the presence of tourists and members of the French expedition who stayed on Lebanon for it full year after the events of 1860. These constant contacts with the West and the learning of the languages spoken there, in addition to the common religion which it shared with the majority of the future amilgrants, reinforced their admiration for this part of the world and its principles, in particular those of the French Revolution and its well-known slogan, and strengthened their desire to migrate it.

When these factors are considered in conjunction with segraphical position of Lebanon and Syria, facing the West from the opposite shore of the Mediterranean, and the hereditary zest for trade and travel characteristic of the Lebanese, descendants of the Phoenicians as they are, and also their eagerness to travel far in search of favourable opportunities, it is possible to understand the deep alguificance of this quasi-collective migration towards the New World and the dispersal of this

race throughout the globe,

the first instance, the emigrants were attracted to the United States; subsequently, they turned their attention towards the South, still virgin territory and offering greater employment opportunities than the North, on account of sparseness of population, the vest some of agricultural land requiring manpower, emergent industry and the wide range of opportunities for commerce. Opportunities for emigration to South America were enhanced following the visits to Palestine and Lebanon undertaken in 1877 and 1887 by the Emperor of Brazil Dom Pedro II and the conclusion, in 1892, of an agreement between the Ottoman and Brazilian governments establishing the conditions of immigration. This emperor, who spoke Arabic, favoured the settlement of emigrants in his country as a oi contribution towards its prosperity and furthering the exploitation of agricultural land, and he promised them aid and assistance. Argentina offered similar attractions with its enormous tracts of land requiring cultivation and its untepped material resources. Waves of immigrants therefore made their way towards South America, m such an extent that their number amounted to 100,000 in Argentina alone, and Brazil accepted more than half a million. For their part, the Palestinians preferred the states of Central America or Chile and Mexico.

After disembarkation, these foreigners settled in the poorer quarters of the towns which they had chosen, usually because they had relatives there, and attempted to make a living through street-trading and hawking. Those who succeeded (the minority), would open manuall shop, and some found opportunities for expansion, in some cases even becoming industrialists prosperous merchants [see piktrys].

The people among whom they lived had little respect for them. They called them Turks, because they came from a land dependent on the Ottoman Turkish state, and in some instances they were treated in the same light as the Mongols, members of the yellow race; the immigrants themselves aware of the need to correct the image which had formed in the minds of Americans.

Initially, they believed that their exile was temporary and would last no longer than the time needed to amass sufficient money a support themselves

and their families at home; this same time-period, it was hoped, would muchanges in living conditions in their own country. But must settled and accustomed to their must existence, seeing their businesses prosper and their children growing up in this multiple, learning its language and becoming attached to it, they contemplated staying there permanently, in spite of the pain involved in the awareness of exile must be pain involved in the awareness of exile must be pain involved in the awareness.

There can be no doubt that it in response to the need to communicate among themselves in their exile, and in the other hand to follow events occurring at home, that they were led to produce a number of minor Arabic newspapers; these began appear with the arrival of the first waves of immigrants in the closing years of the 19th century, but in the South and the North of the continent.

It was in New York in 1892 that the first newspaper, Kawkab Amirika, appeared, followed by al-'Asr [1894], al-Ayyām (1897), al-Hudē (1898) and Miriêt al-Gharb (1899). In Brazil, the oldest one, al-Fayhā' (1895), was followed by four others: al-Raķib (1897), al-Şarāsil (1898), al-Mandpir (1899)

and al-Saudb (1900).

Subsequently, the need was felt to form associations and literary societies to serve the interests of the immigrants, unite their energies and support their social institutions. Al-Diam'iyya al-sariyya al-muttahida came into existence in New York in 1907, and other associations followed. In Brazil, numerous clubs were founded, of which the most important was al-Nodi al-himsi, and literary societies subsequently came into being. But literary life prospered at an earlier stage in North America, for the following reasons: immigration there had a longer history, printing-presses had been established there are a relatively early date and writers of talent had been living there since the end of the previous century. Amin al-Ribani [see AL-Ribani] arrived in New York in 1888, followed by Diabran Khalll \underline{Dia} brån $\{g.v.\}$ in 1895, the poet Nudra Haddåd in 1897, then, at the beginning of the century, the two poets Nasib 'Arida and Rashid Ayyub in 1905, Nudra's brother, the journalist 'Abd al-Maslb Haddad in 1907, Mikha'll Nu'ayma [q.v.] and lityya Abn Mädl [q.v. in Suppl.] in 1911. Printing-presses proliferated to such an extent that six were in existence by 1910, producing, besides newspapers, some remarkable literary reviews, such = al-Funda (1913) which was edited by Nasib Arida, and al-Salik (1912) edited by 'Abd al-Masth Haddad.

Amín al-Rihānī began to write in newspapers III the end of the last century; his extremely vivid language had III oratorical nature and displayed III marked penchant for innovation. He had published three of his books before Diabran's first, al-Māsikā, appeared in 1905. The concerns of his people, both in the makājar and in their homeland, pre-occupied him, and he set himself to preaching liberation in the widest sense of the term, political, social and intellectual, and to attacking in his articles and books (al-Muhālaja al-hulāthiyya, al-Muhāsi we 'l-hāhin, Zanbakai al-fawr, hhāridi al-harim) inertin, bigotry symptomatic that his first work published in the mahājar is intitled Ta'rīkh al-hawra al-firansiyya.

For his part, Djahran began in 1903, while still residing in Boston (which he not leave for New York until 1912) to publish his articles in the newspapers al-Muhddjir (1903), al-Hudd and Mir'dt al-Garb. He appears to have been more forceful than al-

Rhant and inclined to challenge traditions directly. Because he loved painting, imagery dominated his writing, and his education and experience endowed him with burning real and a penchant for idealism. His style reveals a poetic soul close to the sources of inclined in hysticism inherited in the West by the various romantic movements. He put together in his first books "Ard" is al-musidia inclined al-musidiamarrida (1908), al-Admida al-musidiamarrida (1918), al-Admida al-musidiamarrida (1912) and Dam" a ma-initiama (1913), his articles and novels which had been published in the newspapers of the musidiam and in the two reviews al-Fundin and al-Sa'ila.

Like al-Rihāni and Diabrān, Nu'ayma also possessed a pronounced taste for innovation. He retained from his theological studies, undertaken in Russia between 1906 and 1911, a profound religiosity and, like Diabrān, a tendency towards mysticism; he considered it necessary to go beyond the sensory organs in order to arrive at the reality of things, but he did not have the same ardour of feeling and he was sometimes more capable of effecting a synthesis. After theology, he turned to the study of law and literature at an American university. This training enabled him to improve his precision of expression and to attain a better equilibrium between the elements of the work of art; his knowledge of Russian literature also enhanced his aptitude for psychological analysis.

In this way, these men of talent, m well in the writers and poets who joined them later, were able to prove their literary abilities and, almost forty years after the arrival of the first waves of immigration in New York they found the means enabling them to found, after the end of the First World War, an association which had the object of "stimulating the literary spirit" and of establishing the norms of literary work. In 1920 they formed al-Rabija alhalamiyya, entrusting the presidency to the "doyen" Djabran and the post of secretary to the "counsellor" Nu'ayma. Included among its members were the poets fliyya Abii Madl (1890-1957), Nasib 'Arida (1887-1946), Rashid Ayyab (1871-1941). Nudra Haddad (1881-1950) and his brother 'Abd al-Masib (1890-1963) and a number of less prolific writers, of whom the best known was William Catzellis (1879-1950), treasurer of the Rābita. They decided m make the review at-58'th the pulpit from which to address the public.

Literary reviews in Lebanon and South America soon began reprinting specimens of their work in and in prose, delighting in the strong innovatory tendency that they revealed, to such mextent that their reputation became wider and their influence on the literary life of the Arabs was accentuated.

But after the formation of the Rabita, Diabran wrote nothing more in Arabic, except for a lew articles, and he turned to the English language in which he composed eight books, of which The Prophet is considered the most significant work of his entire corpus. He gives his prophet the name al-Mustafa and, in wery engaging poetic style, puts into his mouth, in the manner of Nietzsche with Zarathustra, the outcome of his interpretation of existence and of man.

The other members of the Rābifa continued to write in Arabic. Mikhā'il Nu'ayma collected his articles of criticism and published them in a book intitled al-Ghirbāl (1923); from this work it is possible to draw all the rules of criticism representing the most important characteristics of the writing of the Rābifa: preach innovation, to uphold the truth,

to relate literature to life and always to make it revoive around man and his vital problems. Nu'ayma is also the author of a series of short stories and articles which he subsequently inserted in his narrative collection, Kán IIII kán (2937), in the Kiklib al-blurāhil (ca. 1936) and in the first part of his philosophical novel Mudhakhidi al-Arhaih (1949). Before the formation of the Rābila, he had published his only dramatic work, al-Abā's we 'l-banda (1917), in which he took the part of the younger generation and attempted to reconcile classical and dialectal forms in dialogue.

The majority of the members of the Rabita wrote in verse and in prose, but it is the poets among them who still occupy the prominent piace. Iliyyà Abū Madi, whose collections of verse composed in the makdiar were published before (vol. ii of his Dieda, 1019) and after the formation of the Rabita (al-Diadawil, 1927 and al-Khamd'il, 1946) was a poet of such fecundity, such ardour of fealing, such penetrating sensibility and appealling style that he continues to enjoy the widest reputation. He is followed by Nasib 'Arida, all of whose poetry was published in his single divola, al-Armah al-babira (1946), who displays a very sensitive and troubled soul. For their part, Rashid Ayyub, author of al-Ayyübiyyüt (1916), of Aghāni 'i-darwish (1928) and of Hiya 'i-dunya' (1939), and Nudra Haddad, whose single diwan in intitled Awrok al-kharif (1941), their poetry reveals the weight of nostalgia, anguish and love of mankind which essentially characterises the literature of the mandier and the charm of style which marks its form.

However, the Ribija did not monopolise the entire immigrant literary movement in North America, and there remained, outside it, renowned men of letters and journalists including Amin al-Riban, pioneer of the literature of the mahdjar, the poet Mas'ud Samāba (1882-1946), whose poetry was powerful, versatile and rich in metre, the historian Philip Hitti (Hitti), who contributed, through his historical works composed in English, to making the Arabs, their history and their civilisation known to the West, the journalist Na'um Mukarzal, proprietor of al-Hudā, his brother Sallum who published numerous periodicals, and many other poets and writers.

The Rabija lasted more than ten years (1920-31); with the death of its doyen Djabrán (1931) and the return of Nu'ayma to his homeland (1932), it was dispersed, but other members continued their literary production for a certain length of time.

To give due credit to the Rabita, it must be recalled that the literary press which made known to the world the best of the production of mandier is owed to three of its members, al-Fanen to Nasib 'Arida (1913), al-Sa'ia to 'Abd al-Masih Haddad (1912) and si-Samte to Iliyya Abû Madi (1929); that, through the combined action of all its members, there came into being the first modern literary movement to present to readers of Arabic = kind of literary school, in spite of Individual disagreements; that genres such as biography, the short story and the philosophical novel only became known in Arabic literature as a result of the artistic form that these writers gave to them; that one of its members, 'Abd al-Masib Haddad, preserved in his original histories published under the title Hikayat almakdier (1931), documents relating to the first phase of the immigration which contain precise and living details with which history is not normally concerned; that the effects of their reformist movement on Arabic society are almost important in its consequences in the literary domain, since they aimed to reconstruct the Arabic personality on new social foundations characterised essentially by love, in principle drawn from the Gospel; and that their activity in the cause of renewal gave firm support to that which into existence in the Near East through the influence of the Dieses of Mutran, of the Apollo group and its disciples, and that the latter movement perhaps thereby gained a stronger voice, clearer in and greater homogeneity.

With the demise of the Rabita, the centre of gravity of literary activity shifted towards Brazil, where the first association had been founded under the name Rivah al-Ma'arri (1900) by Na'am Labaki, but had ceased III exist long before the First World War when its founder returned to his homeland in 1908; its members then took to holding in their homes what could be described | literary salons. Subsequently, in 1933 Michel al-Ma'luf face AL-MACLUF succeeded in founding an association which took the name al-'Usba al-andalusivya; this title - chosen by the mumbers of the group because they were conscious of the fact that they lived among a people originally from the Iberian peninsula, in the south which their Muslim Arab ancestors had been assimilated with the population. and they believed that they were rediscovering al-Andalus in this "New Andalusia". It seems to be an established fact that numerous Muslims of Spain. who had been forced to convert to Christianity after the end of their rule in 1492 and the decision of Philip III in 1609 to expel the Arabs and to try them before the courts of the Inquisition, took part in campaigns of exploration and conquest in the New World. The peoples of South America thus retain in their culture and their blood traces of the civilisation and the blood of the Arabs of al-Andalus; these wisible in their languages, appearance, customs and social traditions, which are familiar to Arab immigrants and encourage them to believe that here they can become attached III their roots.

The 'Usba fulfilled its linguistic and literary mission with the most of important societies founded by the immigrants, numerous schools established for teaching the Arabic language (for example, fifteen thousand pupils were educated school of Mw'allim Wadi' al-Yazidil), various social institutions sponsored by clubs which prganised, for their support, festivals in the course of which members of the Usha delivered speeches and recited their poetry, in addition to the festivals which took place on the occasion of various national cerenomies; it was also assisted by journals and reviews of which the most important were al-Shark. edited by Müsä Kurayyim and al-Andalus alfiedids, edited by Shukr Allah al-Djurr, which published the literary work of its members, sometimes also campaigning me behalf of opposing political opinions and thus supplying other motives for original creation to men of letters whether they belonged to the association or not.

At first, the latter had chosen as its platform al-Andalus al-djadida which one of its members, Shukr Allah al-Djurr, published la Rio de Janeiro; two years after its foundation, in 1935, It established its own organ to which it gave its name, al-Usbs, and of which the editor-in-chief was another of its members, Hable Mas*ud. The 'Usba and its review lasted until 1953, by which time it had been considerably enfeebled by death and by the return of the exiles to their homeland. With it, there came to

the end the second literary movement of the makejar and the torch of makejar literature was extinguished; that remains of it today are a few timid flames here the there on the American continent which still resist the assaults of time.

In North America, the mahdiar built up the prestige which it enjoys both there and in the Near East prose rather than poetry, in spite of the influence exercised by the Mandhib of Diabran. the Hams al-disside of Nutayma and the poetical works of Ilivva Abs Mads and Nestb 'Arida, in turning the modern poetic movement towards the heart and the soul of man and in reforming the linguistic form and the music of verse, in spite also of the debt owed to the ploneers, al-Rihani and Disbran, for the development of the "poem in prose" which is highly regarded in certain Arab circles. In the domain of Arabic rhetoric, Diabran created a kind of school of his own, with his style that me harmonious, warm and wrapped in a maze of symbols and colourful images, both pleasing and elusive to the senses. His prose and that of Nufarma applied, on the other hand, to major subjects concerning man, society eriticism, for which versification is inappropriate a account of the concentrated texture of Arabic; in addition, they tackled in prose the majority of literary genres. It is by means of this depth and this universality that their prose and with it, the Rabita kalamiyve and the works of the mandjar = a whole, have acquired the prestige that they anjoy in modern Arabic literature.

In the case of the 'Usbw, it is verse which absolutely dominates the work of its members, under the influence of the inherited taste of the Arabs for poetry, in a milieu constantly looking back towards its Andalusian past. It is by means of this poetry that the activity of the mahdiar occupies a place in modern Arabic literature for which the credit belongs to the most prolific and gifted poets of the 'Usba: al-Shā'i al-Karawi (Rashid Salim al-Khūrī, born in 1887, emigrated to Brazil in 1913), Ilyās Farbāt (born in 1903, emigrated in 1920) and Shuke Allāh al-Djurr (born in 1905, emigrated in 1920) and Shuke Allāh al-Djurr (born in 1905, emigrated in 1920).

It may be noted, in general, that the poets and writers of South America was deeply attached to their literary and general intellectual heritage on account of the admiration that they felt for it; this is why they kept their eyes fixed upon it when seeking inspiration for their poetic works, while Diabran and Nusayma, in the North, showed little interest in this boritage and Abu Madi, 'Arida, and the other poets of the Rábija ignored it completely, even if they read ancient works. Al-Ribani appreciated the latter and translated fragments into English, without, bowever, allowing himself in be bound by literary tradition. In addition, their works were dominated, in a general manner, by the originality and innovation which earned them their reputation and enabled them to exert their influence on modern Arabic literature. It seems in fact that these two tendencies were caused by the influence of the milieu; in the North, American society removed authors from their literary heritage, while those in the South were brought closer to it, as has been shown. This also accounts for the fact that the most eminent writers of the North have displayed linguistic weaknesses, amounting in some was to misunderstanding of the rules of Arabic (see the article intitled Nakli al-dafādit, in al-Ghirbdl), while in the South there poets (llyas Farhat in

particular) who imitated the glories of the past and celebrated the Bedouin life, camels and tents; and even those who me distinguished by clarity and sensitivity of expression (e.g. al-Shā'ir al-Karawi and Shafik al-Ma'lūi, have never lapsed into the of excessively affected language, must though the nature of Lebanon and the poetry that emanates from its atmosphere have exerted their influence on their poetic images.

This difference between the North and South is revealed in the content in well as in the form. In North America, men of letters are for the most part interested hi general human problems, both in their verse and their prose; they are broadly concerned with the destiny of whose soul they wish to save from the oppression of material civilisation. Christianity and the ancient oriental religious, western romanticism, the works of which they have read in part and the writers of mystical tendency (Blake, Emerson, Whitman and Thoreau) have left their mark on their literature, while those of South America address themselves to national questions and the interests of their compatriots who had stayed in their homeland, to such an extent that they commemorated some national festivals and honoured past and present rulers and writers of their country. But this did not prevent the poets of the South from writing historical dramas and excelling in long compositions, for example Ald bisdt al-rih by Fawzi al-Macitif, Abkar by his brother Shafik or Mu'allahat al-are by Ni'ma Kāzān.

In Buenos Aires, the poet Georges Saydah (1893-1978) attempted in 1949 to establish a new literary association III which he gave the name al-Rābija al-adabijya, but it ceased to exist two years later. Literary production in Argentina has remained limited to the personal and prolific efforts of the poet and prose-writer llyas Kunşul (1914-81) who has been succeeded in this respect by his younger brother Zaki (emigrated III Argentina in 1918). The work of these two writers and that of George Saydah is dominated, like the literary output of all men of letters of the South, simultaneously by concern for the national problems of their country of origin and by the desire to respect the purity, versatility and correctness of expression.

A few further remarks should III made concerning the efforts still being exercised today by immigrants in South and Central America, but also in the North. to spread through the American continent awareness of numerous aspects of their general literary heritage, ancient well as modern, with books such Kalila wa-Dimma, the Muhaddima of Ibn Khaldan, the Mu'allahat, the Rikla of Ibn Battūta, the Luremiyyat and the Risalat al-Ghuftan of al-Mafarri, and the Ikili of al-Hamdani, as well as certain works of Diabran, of Nurayma, of Aba Madi, of al-Shafir al-Karawi, of Fawzi al-Mariof and of his brother Shafik and of others. Philip Hitti has also edited Arabic texts (including the Kildb al-14ibar of Usama b. Munkidh, 1930) and has written in English his History of the Arabs (8th ed., 1963). History of Syria (and ed., 1957) and Lebenon in history (1957). Certain of his colleagues have applied themselves to making known the heritage of the Arabs, their customs, their legends and their stories. Arabs who emigrated to other states of the continent (Canada, Mexico, Venezuela, Chile and the republics of Central America) have left a large number of books and periodicals in Arabic and Spanish which also have the purpose III making known the Arabs and their culture; in addition, they translated English, Spanish and Portuguese texts and in this respect played an important role in the cultural exchanges necessary between peoples.

In general fashion, the influence of the mahdiar on Arabic literary thinking remains alive today, since its poets and its writers are still read; most of all, they have influenced authors of comunitic tendency, both in the Maghrib and in the Maghrib, Manfalūti and Shābbī for example. Their critical thinking, represented in particular in al-Ghirbāl by Nu'ayma, has contributed to the moulding of one of the most eminent modern critics, Muhammad Mandūr (1007-64) [a.v.].

It is now possible to summarise the common characteristics iiii the literature of the mahelion in North and South America in the following fashion: dominance of the sentimental tendency of the authors on account of their expatriation and nostalgia for their native land; love of nature to the extent that it is made iiii object of worship, through the images of its beauty and serenty that they have brought with them and the consolation that they find therein in their distant exile; a penchant for reflection iii the things of this world with poetic insight and lyricism in the manner of treating them.

With these specialities and with the individual and collective differences revealed by their works, the emigrants have conferred some of them a world-wide renown (especially The Prophet by Diabran, which has been translated into some than fifty languages, and Ali biral al-elt by Fawri al-Ma*[0f] and a special place in modern Arabic literature. This particular and singular nature of their literary production is due to the particular and singular violence of their experience.

(*ABD AL-KARIN AL-ASHTAR)
MAHIM, MAHAM, m town in the district and

taksti of Robtak in India, on the road connecting Dihli and Hansi, situated in lat. 28° 58' N. and long. 76" 18' E.; it was formerly in the Pandjab, but since 1947 has fallen within the Indian Union (Hariana State). It was probably founded by Radiput princes, but was allegedly destroyed at the end of the 12th century by Mufizz al-Din Muhammad Chüri [see GRURIDS]. The Diami' Maschid has an inscription from the reign of Humayun, recording its construction by Begam Sultan in 1531, and another from Awrangzib's time, recording its completion or restoration in 1667. In 1732, Mahlm and its district passed in the Nawwabs of Farrukhnagar, and later in the century it me harried by the Sikha and Marathas. From 1793 it was the centre of a potty principality carved out by an Irish adventurer George Thomas, but passed into the control of the British East India Company in 1803. The population of the Rohtak District according to the 1971 Census of India was 2,785,534, 98.49 % of which - Hindu and 0.62 % Muslim.

(C. E. Bosworth)

MAHIM, a port of India, with an island fort and two creeks forming a harbour, about 60 miles! 90 km. north of Hombay. The large village of Kēlvē the opposite bank of one creek is now incorporated with it in one municipality named Kēlvē-Māhim, which distinguishes it from the suburb of Māhim on Bombay island. The man is also spelt Mahim and, in Bahmani records, Mahā'im.

It was known to have been included in the possessions of the Dihli sultanate in the mid-8th/t4th century, from which it passed the Gudjarāt sultanate, of which it became southernmost port on the north Konkan coast. At the time of Gudjarāt-Bahmani friction, in \$33/1430, the Bahmani governor of Dawlatābād. Khalaf Hasan, Malik al-Tudidjār, occupied it, on receipt of a report that its Gudjarāti commander had died. At that time, the Bahmani northern maritime outpost was Thānā; hut a counter-attack by the Gudjarātis successfui, thanks to the first recorded serious clash between Dakhni and Āfāķi elements in the Bahmani armies, and not only was Māhīm regained but Thānā aiso taken.

In \$96/1490 a Bahmani rebel amir, Bahādur Gliāni, koludi of Goa, engaged in piracy and predations on the north Konkan coast up to Cambay, sent will fleet of 200 raiding ships to attack Mahim, which caused the sultan Mahmad I of Gudjarāt [q.v.] to request the Bahmani sultan to put an end to Bahādur's depredations (text of letter in 'Ali Tabāṭabā, Burhān-i ma'āḥir, 147). (He was eventually defeated in 900/1494 by that Sulṭān-Knii, who thereby received the title of Kuṭb al-Mulk and later became the first rular of the Kuṭb-Shāhī sultanate [q.v.]).

In 920/1514 the Portuguese, negotiating with the Gudiarat sultan for permission to establish a base at Diu, were offered instead sites elsewhere, including Mählm (Atonso d'Albuquerque, Commentaries, Eng. tr. W. de G. Birch, Hakluyt Soc. 1875-84, iv. 93-105); these they refused, but by 938/1532 Mählm was in their possession, and they are recorded as successfully defending it against the Mughais in 1021/1612. It eventually fell to Shivadit [see Marathias] by 1068/1658, but in 1101/1689 Stdl Yäght Ehän, the Mughai (Habshi) admiral at Djandilra, engaged against the Marathias, took Mählm among other coastal forts (J. Grant Duff,

History of the Markettas, Bombay 1878, 274-6).

(I. Burton-Page)

MAHISUR, MAYSUR, conventional spelling Mysonz, a former princely state of British India, new the sees of a component state of the Indian Union called Karnataka, with its capital at Bangalore, and also the name of the town which

was the dynastic capital of the state.

The native state was a landlocked of South India, lying between lata. 11° 36' and 15° 2' N. and longs. 74° 38' and 78° 36' E. and with an area of 29,433 89, miles. Its population in 1941 was 7,329,140, over 90% of this being Hindu; the Muslim minority was overwhelmingly Sunnl. Mysore city, the seat of the Mahārādjās of Mysore, les in lat. 12° 18' N. and long. 76° 39' E at an altitude of 2,493 feet. The principal language of the princely state and also of the present Kamataka was and is Kanarese or Kanada, spoken by approximately 65% of the population today, but Telugu, Tamil, Hindi and Marathi are also spoken on the frinces.

z. Geography and history. Geographically, the Mysore princely state boundaries comprised what is essentially an undulating table land, with rocky hills and ravines, and with the steep mountain barrier of the Western Ghats forming the western limits and the Nilgiri Hills the southern ones. Mulaimagici rises to 6,317 (set; the mountains are lushly forested, the timber being exploited commercially, and rainfall can be as high as 360 inches per aunum at the crest of the Western Ghats. This heavilywooded hill country of western Mysore has traditionally been known as the Malnad, whereas the open country of valleys and plains in the east, where rainfall may be as low as 20 inches per annum, is known as the Maydan or Bayalshime. Drainage here is mainly eastwards to the Bay of Bengal, with the main river systems of the Kaveri or Cauvery in the south and the Kistna . Krishna in the north; none of these rivers or their tributaries is navigable within the boundaries of the princely state, but they have always been used, e.g. by the me of dams, for brigation purposes and, in the present century, for hydro-electric power generation.

Popular etymology connects the Mahisir with Skr. makisa- "buffalo" (lit. "powerful"); the of the town is certainly old. The first contacts with the Muslims were in the time of the Hindu dynasty of the Hoysalas (ca. 1022-1342), chieftains from the Western Ghats region with their capital at Dvárasamudra (see on them, J. D. M. Derrett, The Hoysalas, a mediaeval Indian royal family, Madras 1957). In 1310-11 the Dihii Sultan "Alà" al-Din Khaidil's general Malik Kātūr or Malik Nā" ib marched into South India and made the Hoysala ruler Vira Ballāla III tributary to Dihii [see kātatols], and Dvárasamudra masacked and razed by an expedition seat by Chiyāth al-Din Muhammad b. Tughluk [q.v.] in 1327.

After 1336 there arose in the southern tip of India the last great Hindu dynasty there, that of Vidiayanagara, and the radias gradually took Mysore after the disappearance of the Hoysalas. This involved disputes with the Muslim kingdom to the north of the Bahmanis [q.v.], and after the break-up of the Bahmani state in the early 16th century, disputes with the successor-state of the "Adilbhabis in Bidjapar [q.vv.]. The radias of Vidjayanagara were generally successful in keeping the Muslims ou of Mysore till 1565, when a coalition of the sultan

of Bidjapar, of Golkonda (the Kuth-Shahls [q.vv.]), of Ahmadnagar (the Nizām-Shāhls [q.vv.]) and of Bidar (the Barid-Shāhls [q.vv.]) defeated Rāma Rādjā at the battle of Tālikota, leading to the sack of Vidjayanagara itself. Nevertheless, his descendants established the Rāma Rādjā dynasty in Mysore, and it was from one of these that English merchants in 1639 secured the grant of what became Fort St. George at Madras — the Coromandel coast in place of the earlier site at Masulipatam.

Mysore now flourished under the wodiyar feudatories, who gradually assumed de facto power, acquiring in 1620 Shrirangapattanam (Seringapatam). The power of the Muslims in Eldjäpür www withstood, until in 1636-7 the Mughai Emperor Awrangzlo [q.v.] crushed the independent power of the Eldjäpür and Golkondä sultanates. Mysore, was, however, able to establish a modus vivadi with Awrangzlo on w basis of common hostility to the rising power of the

Marāthās [q.v.]

The mid-18th century years saw the rise in Mysoro of the Muslim general Haydar 'All, who under the commander-in-chief or dalawiyi Nandjarādi acquired an access of prestige through his repelling Maratha incursions. Haydar 'All's prestige became such that in 1760 his help against the British was sought by the Comte de Lally in the French possession of Pondicherry, and he became virtual ruler of Mysore under the Radia, withstanding the British and the forces of the Nizām of Haydarābād [q,v,] till his death in 1782 (see HAYDAR 'ALI KHAN BAHADUR for details]. His son and successor in office Tipu Sultan instituted a strongly Muslim policy, including the forcible conversion of Hindus and measures against the production of elcohol and opium. On the death of the Radia in 1796, the traditional ruling family was suppressed by Tipu Sultan. His policy against Britain and her ally the Nighm involved a continuation of his father's alliance with France, and diplomatic approaches were made in far affeld in to Bonaparte in Egypt and to the courts of Kabul and Istanbul. His ambitions were, however, ended at the battle of Seringapatam in May 1799 [see Tieth SULTAN for details).

The line of the Mysore Radias was now restored in the person of the five-year old Krishna Rādjā Wadiyar (June 1799) under British protection and with Col. Arthur Wellesley (subsequently the first Duke of Wellington) as civil and military ruler during his minority (sc. till 1811). The Radia's later extravagance and misgovernment brought about an internal revolt in 1830 at Nagar (Haydar 'All's old foundation of Haydarnagar), which led to the Governor-General of India, Lord William Bentinck, appointing a Mysore Council, with commissioners exercise the substance of power there. Krishna Radia did not die until 1868, when his adopted son was recognised in his valid successor, and in 1881 the local dynasty recovered responsibility for admimistration, the civil and military station of Bangalore alone remaining in British hands.

Over the next decades, internal growth brought rising prosperity to Mysore state, with expenditure on roads, metre gauge railways and irrigation, together with the first electric power station in the subcontinent at the Cauvery Palls. In 1947 Mysore acceded to the Indian Union, and the Maharadja Sri Jayachamaraja Wadiyar became the new Mysore State's first governor. With the administrative moorganisation of 1953 and 1956, under the pressure of South Indian demands for ethnic and linguistic administrative units, the State (as that comprising

essentially Karanese speakers) received additional territories in the west which gave it a coastline on IIII Arabian Sea and it acquired the name of Karnataka; the much-increased area is now 74,037 sq. miles/191,757 km². The total population is 37,043,451 (1981 estimate), and the population of the state capital Bangalore is 1,540,741 and of Mysore city 355,685 (both 1971 census figures). The state is one of the educationally advanced in the Union, with four universities and 31% of the population literate in 1971.

2. Monuments. The only significant building to survive from the Bldjapari incursions, a mosque at Sante Bennar (co. 1047/1637) in Shimoga District, owes little to 'Adil Shahi influence as it was built from the granite of a temple to Ranganatha on the same site, with a groined roof and pointed arches. It is most remarkable for a stepped square tank surrounded by eight towers, with another at the centre, in the mixture of Hindu and Islamic forms characteristic of Vidiayanagara. The building is said to have been desecrated, and became known = musafir-bhana. The subsequent, but limited development of Muslim architecture did not begin until the Mughal invasion of 1098/1687, when it can be traced from the Diam!' Masdids at the new administrative centre of Sira and at Hiribidanur next Gauribidanur, and tombs at both places. At the latter, where the mosque faces the Dargah of Niyamat Bi (properly the tomb of Husayn Shah) across a pool, the influence of Bidiapor [q.v.] is evident in the careful modulation of the foursquare tomb walls with panelled anches, the prominent guldastas at the corners, the shape of their finials, and the dome set on a lotus-petal base, with hemispherical profile above; the mosque dome too is bulbous in the other Bidiapurl fashion, though here given a different, turnip-like profile, and it has a tall minaret shaft engaged at each frontcorner with lesser ones at the back. The merious are articulated with smaller guidastas at intervals, and the front wall by blind arches pierced by openings below. The combination of massfid, tank, and mausoleum is repeated at Kolar, where the maddara (q.v.) or cemetery houses twelve members of Haydar 'All's [g.v.] (amily, but the building, with six internal pillers and a dome placed off-centre over Haydar's father. is of little interest.

Although the Sangin Diami's Masdjid at Taramandalpet, Bangalore, follows the earlier pattern, with a prominent fretted parapet around the prayer-hall roof, and minarets at the front corners taller than these at the rear, these may not be original, as the roof was damaged in action and restored in 1836. The substructure is attributed

to the Mushal period. The Masdiid at the hill fort of Midigesi has its strongly tapered minarcts set on massive square towers at the front corners of the hall, with battered angles framing a wellproportioned, three-arched tacade. The relatively tall upper works are again crowned with a fretted parapet. Such mindrs, with domical finials, have become symbolic, like their 'Adil Shahl counterparts, rather than functional. The Masdiid-i 'All at Shrirangapaitanam represents the culmination of this type, as built by Tipu Sultan [q.v.] [dated 1201/1786-7). The rectangular precinct wall, which houses an internal verandah, encloses a high terrace with a row of rooms at the front, and the prayer hall at the back. Though the flat roof of the hall is raised on multi-cusped arches, and the panelled wall outside is relieved by blind arches to match, its front is trabeated, with slender columns supporting a neat entablature. This runs between the squared bases of two immense minarets which rise in three octagonal stages, with elaborately pinnacled balconies, to prominent bulbous domes. The facets are set off by diagonal and vertical rows of small openings, and the domes are gadrooned. A small room to the west forms the migrab. The unusual plan is due, again, to the re-use of a temple site. The interior

carries five Kur'anic inscriptions. Tombs of a square format surmounted by a dome are again found at Cannapatiana, In that of Sayyid Ibrahim the small central cell surrounded by a flat-roofed verandah an simple octagonal stone columns of Hindu derivation; the dome is only slightly bulbous, and its pointed profile is distinctly Iranian. The Salar Mas ad Dargah at Tonnur is a more ambitious example of the same type, with a flat roof sustained by four piliars, and a peristyle of six fluted and tapering ones each side, surmounted by a latticed parapet that almost conceals the dome. There were balusterlike minars at each corner of the terrace. The Makbara of Ibrāhīm Khān Kila dar at Kumbarpet in Bangalore, dating from Haydar 'All's rule, has a particularly squat bulbous dome ... a square chamber, surrounded by merions on fretted bases. Baluster columns with matching guldasias are engaged at each corner, and two smaller ones at midside. In the Mausoleum of Haydar 'All and Tipa at Shrirangapaifanam, dated 1195/1782 (the year of Haydar's death), the two types of tomb are combined: the cubic mass of the walls rises through a verandah of black serpentine columns to more than twice in height, with a large bulbous dome above. Both the verandah and the central block have Chadjdies surmounted by slotted parapets and the usual panoply of bulging guidestes; those below are skilfully reduced in scale. The upper walls of the block carry a single range of moven blind cusped arches on meh face. The dome, though rising from a boldly scooped lotus base, and crowned with a mahāpadma, is flatter than those at Bldjapur; even so, the tomb is clearly related to such buildings as the mausoleum of Shah Karlm. The interior is decorated with the tiger-stripe mouchettes typical of Tipu, and there is meulogy in Persian inscribed on the west wall; the ebony doors iniaid with ivery are a restoration due to Lord Dalhousie.

Palaces. The Mughal Fort at Sira, with its palace and gardens (Khān Bāgh) is said to have stimulated Haydar 'All, who was made pubadār of the province, to create his own retreats at Bangalore and Shrirangapaffanam; little of it now remains. The Haydar-nāma of 1784 confirms his interest in build-

ing, naming these in particular (ARASM [1930], 101-2). The palace buildings, such as that below the Fort at Citaldrug, were erected with tail timber columns; in most cases, this has unfortunately led to their destruction. That at Bangalore (bullt 1192-1203/1778-89, survived until 1868) had four halls on the upper storey, each opening onto two balconies. Tipu Sultan held his darbar from a dikarehhā looking down on his courtiers at ground level. The remaining part has fine tapering columns set on lotus bases. Paintings show that it had a lofty columned half three bays by five open on me side, with balconies forming measuring on the other, flanked by a solid, two-storied block of the same height either end; the flat roof rested on lines of cusped arches, with heavy brackets for the chadidia, and balusters above framing the varied tracery of the parapet. Tiph's principal palace at Shrirangapatfanam, dismantled in 1807-9, was in the middle of the north side of the Fort. The main hall was also open am ma side. His private apartments, guarded by four tigers chained in a narrow passage, were one side of a square, the other three being storehouses full of goods. The Lal Bagh Palace, at the eastern end of the island, has also vanished; drawings show it to have been of the name type, though the flanking blocks are columniated with seven narrow bays traversed by balconies, and the parapet is reduced to display a studing of guidastas. The format seems to stem from the Baradari at Adjmer via the Shish Mahall at Lahawr [q.v.], and may be compared with the Athar Mahall at Bidjapur [q.v.] (1000/1591), we well so 18th-century parallels in the Gopal Bhawan III Dig, Bharatpur. One fine example remains in the Darya Dawlat Mahall built by Tipa m a summer palace in the Dawlat Bagh to the east of the Fort in 1198/1784. It is set on a substantial plinth, and the tapering wooden pillars with their prominently moulded bases and reoded shafts are used to form a verandah all round, with a deep chadidia and a fretted parapet in four tiers punctuated by small rounded finials. The three central arches, which though cusped arm almost semicircular, open on to a tibdra hall through a matching set on paired shafts. The two lateral bays an each side, which are wider, employ a rounded, shouldered arch to articulate the end peristyles, and the two-storeyed flanking blocks within them, here set back behind the verandah and opening onto the tibdra through two ranges of cusped areades, with a flat, diapered cailing above. The façade to the river on the north, and that to the south, are identical, the building being square. There are three rooms on each side of the upper floor, and a central hall with projecting balconies. The whole interior is panelled with small blind arches and cartouches, richly painted and gilded, and is remarkable for a series of wall paintings depicting military successes and civil ceremonies, where individuals can be identified. Buchanan's description of the gardens at Bangalore (1800) shows that they followed the usual pattern of square plots, mill allotted to a different plant, with five cypresses at the sides bordering the walks. In those laid out by Tipil, the irrigation system of masonry channels was very prominent.

Bibliography: Scattered references can be found in the Annual reports of the Mysors Archaeological Department (ARMAD), continued the Annual reports of the Archaeological survey of Mysors (ARASM) from 1927 to 1943, though unfortunately Muslim buildings receive much

MÄHIYYA 1261

less attention than Hindu ones, and information is cursory. The most useful are, for Shrirangapattanam, ARASM (1935), 51-65, with plates; for Tipu's palace and the Fort at Bangalore, soid. 24-8; for Cannapattana and its tombs, ibid., 21. For Hiribidanar, see ARMAD (1913-14). 20: for Kolar, ARASM (1930), 21-2; for Naudi, ARASM (1932), 57-63; for Sante Bennur, ARASM (1937), 60-1; for Midigesi, ARASM (1938), 10-11; for Tonnur, ARASM (1939), 27; and for Bangalore Fort, ARASM (1940), 37-9. The Mysore gazetteer, Bangalore 1930, ed. Rao, ii/1, 370-7, provides a little extra material, but no illustrations. Early pictures of Bangalore and Shrirangapatianam can be found in Lt. James Hunter's paintings (1804-8) at the Government Museum, Bangalore, reproduced in M. Fazlul Hasan, Bangalore through im centuries, Bangalore 1970, in Charles Gold, Oriental drawings, London 1806, in Robert Home's Select pieus in Mysore, London 1974, and his London 01 Seringapatam, Description Further descriptions can be found in Dr. Francis Buchanan's A fourney through the countries of Mysore, Canara and Malabar, London 1807 (repr. Madras 1970). The Darya Dawlat Mahall is illustrated in O. Reuther, Indische Palaste und Wohn-Muser, Berlin 1925, pls. 164-5. See also Ziyaud-din Desai, Mosques of India, New Delhi 1971, 71-2 and plate. (P. A. ANDREWS)

MAHIYYA (A.) "quiddity". On the construction of this technical term, al-Tahanawi provides interesting information. There are several explanations. One of them derives this word from the interrogative mā hawa? ("what is it?"). In this case, it is to be noted that the yas of the misba has been added, the waw suppressed and the ta' marbaja termination given in order to change the word from the adjectival to the substantive form. Another explanation derives it from md, with the addition of the yd' of the nisba and of the ta' marbata. The original form would then In ma'iyya; the hamsa has subsequently been transformed into a has on account of the proximity of the articulation points. This and would therefore not be, as in the previous explanation, the interrogative particle (quid ess?), but that which introduces the reply to the question quid?: "[it is] that which . . . " In the same manner, kayfiyya is the term for a response to the question kay?? ("how?"), and kamiyya is the response to the question ham? ("how much?").

The first explanation is appropriate in the context of the sense given by logicians to the word mākiyya; it is that which replies to the question: what is this? It expresses the genus (diss), while the question ayym skay' haves ("what kind of thing is it?") relates to the species (nam'). It is thus a case of the tidera. Whi in fact, the mākiyya replies to two questions at once. In the Kitāb al-Hudād ur Book of definitions, Ibn Sinā writes with regard to the hadd: "It is that which indicates the quiddity of a thing, this being the perfection of its existence in the land of the specific difference" (Arabic text, 11). This question will be encountered again with regard in the issuiva.

The second explanation accords better with the usage of theologians and metaphysicians. The mahipys is that through which a thing is what it is (ma bih al-shap' havea havea). This is the to to five alvat of Aristotle. In this sense, the term is synonymous with essence (ghat [q.v.]) and with reality (habiba, of. Shifa's, Ildhiyyai, i, 31). This reality, like quiddity

and essence, is beyond the universal and the particular, the existent and the non-existent, meaning that it can express not only the genus but also the individual essence, not only that which exists in beings themselves (fi 'l-a'yān), but that which does not exist thus, while existing in thought (fi 'l-dhilm; cf. Shifa', ibia., 32).

In the expression: "that through which a thing is what it is", the particle bi- (through) should be understood in the sense of causality (al-sababiyya): that, on account of which a thing is this thing (alame alladki bi-sababiki al-shay' dhalik al-shay'). But this cause is not the active name (al-facil), which is that through which a thing exists externally (fi 'l-khāridi'), not that through which a thing is such a thing. It is thus a case of the internal cause which dictates that a thing is what it is, From this point of view, it follows that the action of the active cause (ather al-fa'il) is applied not to the quiddity in itself and as such, but to its relation to existence (wudjad). This is the thesis of the Peripatetics and of those who say that it is not quiddity as such which is "placed in the being" (madifals); the active cause places it in the being and clothes it with the attribute of external existence (yadi'al almākiyya muttaşifaton biki [= al-wudjūd] fi 'l-hhāridf). On this important notion of madiful, cf. Fakhr al-Din al-Razi, al-Mabühith al-mashribiyya, 1, 52. This is another case of the distinction between essence and existence which characterises the thought of Ibn Sina. For him, in fact, the active cause and the final cause are concerned with existences, while the material cause and the formal cause are concerned with essences."A thing may be an effect (ma'lul) in relation to its quiddity and to its reality; it may be an effect in its existence. It is possible to express this through the example of the triangle: its reality depends on the area and on the line which is its side; area and line constitute it as a triangle and it has the reality of triangularity (kehihat almuthallethiyya), the area and the line being as its two material and formal causes. But from the point of view of its existence, it depends on yet another cause. This is neither a cause which constitutes its triangularity, mu a cause which is part of its definition; it is the efficient cause in the final cause which is the efficient cause of the causality of the efficient cause" (Ishardt, iii, 441-2). "Of every thing which is such that existence does not enter into the comprehension of its essence (dhat), it may be said that existence is not for it a constituent which enters into its quiddity" (ibid., 474).

But when it is said that quiddity is that through which a thing is what it is, it may be objected that there is not an alterity between a thing and its quiddity of such a kind that a line of causality can be represented between the two. But what is meant by this is, that the thing, to be what it is, needs nothing other than itself. Nevertheless, if this definition of quiddity is taken literally, there is the possibility of confusion between quiddity and accident, especially particular accident, since the risibile (al-dabik) is that through which man is risibilis, capable of langhter. But if this definition is understood in the sense of a thing which, to ill what it is, needs nothing other than itself, it applies only to quiddity, since if man is capable of laughter, it is because he is reasonable, not the reverse. Thus quiddity expresses the essence as distinct from accidents, particular or otherwise. This is why, according to al-Tahanawi, philosophers begin their researches by distinguishing clearly between quiddity

1262 MÅHIYYA

and its accidents. Ibn Sina writes on this subject (K. al-Nadjat, 6-7): "The essential is that which constitutes quiddity from that to which it is attributed. But to define the essential (al-dhdfi), it is not sufficient to say that it signifies that which is inseparable, since many inseparables are not essential. Neither is it sufficient to say that it signifies that which is inseparable in existence and which cannot be truly separated in the imagination (walks), in such a way that if it were to be suppressed in the imagination, there would thereby be destroyed its object of attribution in existence. In fact, many inseparables are of this nature: for example, the fact that the sum of the three angles of a triangle is equal to two right-angles. This is an attribute of all triangles; it cannot be separated in existence, nor suppressed in the imagination ... And yet, it is not essential". It is a consequence of the reality of the triangle, but it does not enter into its definition. The same applies to all concomitants (lawarim) "which we attached to a thing when its quiddity has been established". The essential is that which is such "that it is impossible to comprehend the essence of the object of attribution without having first comprehended that the signification of this essential belongs to it." Such is the case for "man" and "animal".

Ibn Sina notes that the terms makiyya, hakika and shall may be taken synenyms. But babiba and dhal are applied most of the time to quiddity considered in its relation to existence on the exterior of thought, whether this quiddity be universal or particular. But when it is particularised, it is called ipseity (humiyya). In this sense the following passage from the K. ai-Filpis is be read: "All things have a quiddity and an ipseity. But quiddity is not ipseity and does not enter into it. If the inseity of man were his quiddity, the representation that we have of the quiddity of man would be his inseity, and when we described what man is, we would describe him in terms of "this is a man" and would know his existence: every description would imply a judgment. Nor does ipseity enter into the quiddity of these things, unless it is constitutive of it and the representation of the quiddity cannot be perfected without it. It would be impossible to suppress it from quiddity in the imagination and the relationship of ipseity to "man" would be like the relationship which corporality and animality have with him; just as if man is understood as man, it is not doubted that he is a body and an animal, so it would not lim doubted that he exists. But it is not so." The hawiyya of Zayd is to be distinguished from that of 'Amr. But, as noted by Fakhr al-Din al-Razi (Mabahith, i, 49), the humanity of one, in other words his quiddity, does not differ from that of the other. In denying the alterity of the humanity of Zayd in relation to that of Amr, we man only this: "Humanity we such is humanity and nothing mem; where that of Zayd is other than that of Amr, this is something that comes from the exterior". Thus quiddity, in the true sense of the word, must be considered in itself and for itself, as pure representation, separate from any judgment of existence or of attribution. Al-Razi (ibid., i, 48) declares explicitly: "Equinity (farasiyya) as such is nothing other in itself than equinity. It is in itself neither unique, nor plural, nor existent, nor non-existent . . . Unity III an attribute that is attached to it; with it, it becomes unique; and similarly, in that it corresponds to numerous things, a character of generality may be found in it. But in itself, equinity is only equinity". Another term is related to makings; this is inviva.

Ibn Sina speaks of it at length in the Shifa' (Madkhai, 10-46). His thought may be summarised by mrans of an example which he himself employs. Take the term hassis ("endowed with sensibility"). Arising from the genus (dissm) "body", it is interposed mu specific difference (fast) to define the animal. It is essential for the animal and for the man to be these bodies endowed with sensibility. Nevertheless, this single essential characteristic which is expressed by the term kesses does not suffice to indicate the quiddity of the animal or of the man. The same may be said of "reasonable" in relation to the definition and the quiddlty of man. Now Ibn Sina observes that the logicians make man a species of animal, but they do not do likewise with "reasonable". The same statement applies to the terms "animal", and "endowed with sensi-"body", bility". However, the specific difference is important, for, if the genus and the species say what a thing is insofar as it is this thing, the specific difference is that which enables it to be distinguished (tamyis) from other things and provides for an exact response to the question: what kind of thing is this? This being so, the makiyya represents a notion which may be applied equally to numerous things; the inniyya represents the notion by which a thing may be distinguished (yatamayyan) from others. The militys expresses the genus of the species, the innivys expresses the specific difference. However, Ibn Sina draws attention to the fact that it is by no means impossible that that which indicates the inneyys of certain things may indicate the mahiyys of certain others. For example, hastes, in relation to "man", "borse", "bull", does not indicate the quiddity, but only the innivya, whereas hayawan bassas ("living creature endowed with sensibility") are presses it perfectly. But in relation to "endowed with sight (basir), with hearing (sami'), with the sense of touch (lamis)", this same term hazafa denotes a quiddity. In spite of these distinctions, it is apparent that on occasion Ibn Sind uses these two words side by side in the same sense. The word isniyya may be translated by the Scotist term of "ecceity".

Alongside these concepts of the Peripatetics, attention must be drawn to the point of view of the philosophers who stressed the role of illumination (al-Ishrakiyyan). For them, the action of the active agent is applied to the quiddity itself, which "follows" Ill as light follows the sun. It is reason which, subsequently, separates means from existence. Thus al-Suhrawardi of Aleppo, in Hikmat al-ighrah (186, I 193), explains that "that which is placed in exist-(al-madi'al) in quiddity, not existence; given that existence is only a rational consideration (i'libar 'agill). It follows that a thing has its inseity (Augusta) by manus of its emanent raus (min fillatik al-fayyādiyya) ... It can happen illat I thing disappears when agents of corruption appear, while its cause in emanation remains; this is because it depends on other causes which are transient. It can happen that a thing has a cause of production (hudath) and a cause of internal consistency (thibat) which are different, as in the case of a statue: in effect, the cause of its production, which is the person who makes it, and the cause of its internal consistency, which is the dry nature of the element. But it may be that the cause of internal consistency and the cause of production are one and the same, as in the case of the receptacle which gives to the water [that it contains] its configuration. Now the Light of lights is at the same time the came of existence of all existing things and the cause of their MÄHIYYA

internal consistency . . . In a word, there is no distinction, according to this point of view, between assume and existence other than see of reason. On the level of the Light of lights, which is the rause whence all things emanate, there is no need to distinguish the four causes of Aristotle in order to attribute to him only an efficient causality which does nothing but give existence. It is in its unity and by the same right the perfect muse of essences and existences. It is total agent which gives to each being its existence, its quiddity, its material and its end. Al-Suhrawardl has another argument besides to show that the effect of the cause through emanation is not existence without essence. We may consider for example the darkness. "If it is non-existent, it is not realised (laysa bi-hasil); so its existence is not an existent, since it is, itself (like the darkness) non-existent (mo'dam). Now if we perceive existence and == judge that it is not an existent, that which we understand by existence is other than what we understand by existent. If we then say: the darkness exists, that which we have taken to be non-existent, of which the existence was not realised, then is realised, it follows that the realisation of existence is something other than realised existence, such that there will be an existence for the existence . . ., and m on ad infinitum, which is absurd". (ibid., 64-5, § 56). In more simple terms, if it is necessary to give existence in order for it to exist, it will be necessary to give existence to the existence of existence, and un on ad infinitum.

The theories of Ibn Rushd regarding quiddity are much closer to the thinking of Aristotle. They are also distinguished by his opposition to the Avicennan concept of essence and existence, and by his method which consists in leaving physical realities in order to raise oneself to metaphysical realities. He is interested primarily in the quiddities which belong to bodies and which are "attributes (still) which exist in them and through which these bodies become active existents" (Tahājut, 359, § 92). He writes further: "Starting with the individuals which are in conformity in species, intelligence grasps a unique signifying intention

(marna) in which they are associated. It is the quiddity of this species. But this intention is not divided by that whereby individuals = such are divided, that is by place, position, material factors, nn account of which they proliferate. It is thus necessary that this intention be neither generable, nor corruptible, and that it not disappear with the disappearance of the individuals in which it exists" (ibid., 573-4, § 38). Thus quiddity is distinguished from accidents: "The fundamental principle in accidents is that they depend something other than themselves, while the fundamental principle in quiddities is that they depend on themselves, except that which happens to generable and corruptible things owing to the fact that quiddities need . subject (manda')," By virtue of the doctrine of Ibn Rushd on being, which is fundamentally and essentially by substance, the quiddities will be in the strongest sense quiddities of substances and will follow the hierarchy of substances, from sensible and mobile substances, to intelligible and immobile substances.

As for inniyya (which Bouyges vocalises anniyya in his writings), it is in beings, in the true sense, "a signifying intention of thought (ma'nā dhinā), meaning that the thing on the exterior of the soul is in accordance with that which is in the soul. Consequently, that which it indicates is synonymous with truth (sādik). Inniyya is that which is indicated by the existential copula (al-rābita al-wedjūdiyya) in judgments of attribution (fi 'l-hadāyā al-hamaliyya).
